Bibliography	3047
Index	3057

Foreword

by Kenneth E. Bressett

There is probably no other United States coin that has been as thoroughly studied, as avidly collected or as well known to numismatists and the public alike, as the silver dollar. The mighty American dollar has been given a place in history so greatly revered that in many cases popular stories far exceed its factual record. The dollar is seen as a symbol of the strength and financial power of this nation, and an icon of all that it represents. Unfortunately, many of the concepts we have about these coins are not entirely accurate.

In this book author Q. David Bowers now takes us beyond the myths and fantasy for an objective look at the nature of the American silver dollar, and its authentic place in history. The story is one that covers the history of our nation, the role of the dollar, and many interesting background stories about people who were involved with producing these coins. In addition to the masterful work done by Mr. Bowers in this compilation, he was assisted by scores of others who helped with research and suggestions. The most prominent of these are R.W. Julian who contributed historical information, and Walter Breen who provided numismatic facts and research.

The full list of contributors reads like a Who's Who of numismatics. No source of information has been overlooked to make this the most factual reference ever produced on the subject of United States silver dollars. In the pages to follow are details about every issue for each date and mint. Varieties are shown with clear illustrations, and everything is arranged in chronological order for easy, instant access to every listing. Pricing history is given for all coins, at 5-year intervals from 1860 to the present.

Collectors will welcome this work as the single definitive source of information about America's largest silver coin. Of particular importance is the style in which this book is written, with all known facts and theories presented for students to ponder in cases where no concrete answers are known about certain problem coins. Information not presented in this book is simply not known at this time. What is given is not just "everything you ever wanted to know about the subject," but probably much more than most collectors ever thought existed.

Those who invest in coins will find this work an absolute necessity. It not only gives a detailed price history for all of these coins for the past 130 years, but includes detailed estimates of how many coins may still exist in all grades. The scarce Proof coins are given special attention because of their high value and position of esteem by both collectors and investors. In these listings are surprises and revelations never before imagined by most students of the series. Regardless of one's involvement or reason for owning any of these coins, this is one part of the text that will add greatly to understanding of rarity and appreciation of these coins.

Historians, too, will cherish this book. Included with the discussion of dollars for each date, is a section that deals with the happenings of that time. Here you will find little known or remembered facts about what was going on throughout the country at the time these coins were made. For me, this is the most fascinating part of the book. It makes the coins come to life when they are placed in a setting with the events that were going on around them at the time of issue. Likewise, I can now relive the history whenever I see a coin of some particular date that triggers my memory of what was happening that year, or what dollars were being made at that time.

Dollars were the first silver coins to be made at the Mint in 1794. They have a long history of being issued in nearly every year thereafter, even though they were not needed or even wanted in many periods. It seems likely that the dollar coin will be continued, in some form, well into the future. It truly is the symbol of our nation, and a coin that is the *sine qua non* of every American collection. With this book in hand, students,

collectors and investors are at last armed with factual information that can be used to good advantage to better understand and appreciate these coins for what they really are . . . and to enjoy owning them to the fullest.

The only question left unanswered by this book is "how did anyone ever successfully collect these coins without such a guide?" This is not a work that one can pick up and put down after finding select answers to the question. There is just too much entertaining information to be had on every topic. Plan to spend several enjoyable evenings with this text to acquaint yourself with its scope. Then use it frequently to expand your knowledge of how silver dollars fit in with the history of America. You will never again look at another one of these coins without seeing it in a new light.

Acknowledgements

John W. Adams generously offered the use of books from his library. **Charles Adkins** provided information concerning rarity levels of Morgan dollars. **Tony Adkins** submitted a 1903-S “Micro s” dollar for examination. **David W. Akers** sent information concerning a particularly well-struck specimen of an 1857 silver dollar. **Dean H. Albert** shared memories of the Treasury release of silver dollars in the early 1960s. **Robert H. Allen** corresponded about trade dollar varieties. **The American Numismatic Association** lent numerous publications from its library (ANA Resource Center). **The American Numismatic Society** provided much information and also made arrangements for Margaret Gray to study library materials, including auction catalogues. **The American Philosophical Society** furnished an illustration and also information concerning Franklin Peale. **Bruce Amspacher** provided information concerning rarity levels of Liberty Seated dollars, Morgan dollars, trade dollars, prooflike coins, and other data, and also copy-read much of the manuscript and made many valuable suggestions. The **ANACS** grading service provided information concerning certain issues. **Wayne Anderson** gave the author a book on Richard P. Bland (of Bland-Allison Act fame). **Victor Annaloro** corresponded concerning Gobrecht dollars. **Donald Apte** provided information about an 1884 trade dollar he handled. **James R. Arnold** corresponded about a variety of 1877-S trade dollar.

Charles Barasch furnished information about 1884 and 1885 trade dollars he handled. **Dr. George C. Barber** provided information concerning a Gobrecht dollar. **Andrew Barnett** sent information about his prized 1898 Proof dollar. **Ruth Bauer** reminisced concerning her experiences as a dealer in silver dollars, including during the release of the Treasury hoard in the early 1960s. **Pete R. Bishal** reviewed the Morgan dollar manuscript and made many valuable suggestions, especially concerning historical information. His knowledge concerning 1878 Morgan dollars is second to none, and his re-

view of the author's theories, especially with regard to the “over tail feathers” coins, is appreciated. **Leonard R. Bolzan** corresponded about a trade dollar variety. **Harry X Boosel** sent information concerning the 1873-S Liberty Seated silver dollar and his activities with the Cash Room in Washington in the 1930s. **Remy Bourne** sent the author many nineteenth-century newspapers, line engravings, and other ephemera for historical research and for consideration as illustrations. **A'Delbert Bowen, M.D.**, furnished descriptions of trade dollars in his collection. **Wynn Bowers** read sections of the manuscript and also did research in the Boston Public Library. **Walter H. Breen** provided detailed data concerning die varieties and also granted permission to use information in his *Encyclopedias*, one on Proof coins and the other on colonial and other U.S. coins. In addition, he reviewed much of the manuscript and made many valuable suggestions. **Kenneth E. Bressett**, editor of *A Guide Book of U.S. Coins*, read parts of the manuscript and made many valuable suggestions, including commentary on Chapter 6 (the 1801-2-3-4 novodels). In addition, he wrote the foreword. **J. Alan Bricker** corresponded about rarity scales. **Rodger W. Bridwell** shared recollections of the silver dollar market of the early 1960s. **Larry Briggs** read the manuscript sections for Gobrecht dollars, Liberty Seated dollars, and trade dollars and made several valuable suggestions. **Dan Brown** provided historical information. **Colin R. Bruce III**, of Krause Publications, furnished several illustrations. **Roger W. Burdette** corresponded concerning 1795 dollars with silver plugs. **Ray Burns** provided a rare silver dollar for examination.

Francis Campbell, American Numismatic Society librarian, helped with Mint reports and other data and made arrangements for Margaret Gray to be “in residence” studying auction catalogues on my behalf. **Carl W.A. Carlson** reviewed the pedigree chains for certain rarities and added valuable information; 1884 trade dollars were a special interest. A large debt of gratitude is owed to the late **Neil**

Carothers, whom I never met, for his book, *Fractional Currency*, is not only quoted at length in the present work, but reading it prompted me to search for and read numerous nineteenth-century texts on money and economics. **Douglas Cass** was interviewed about his experiences in buying trade dollars in the Orient in the 1980s, and provided additional information on the series. **E. and C. Cavin** sent data on an 1836 Gobrecht dollar. **Armand Champa** provided access to certain publications in his library of numismatic books. **George Chesek** corresponded about Liberty Seated dollars. **Lynn Chen**, American Numismatic Association librarian, responded to numerous inquiries concerning the borrowing of catalogues, Mint reports, and books. **William Christensen** provided information concerning the collection of John Willem and granted permission for use of data in his September 5, 1980 sale. **Elvira Clain-Stefanelli**, curator of the National Numismatic Collection, Division of Numismatics, American Museum of History, Smithsonian Institution, furnished certain artwork pertaining to the development of the Liberty Seated motif and helped in other ways. **Robert Cohen** shared his ideas and observations concerning 1964-dated Peace silver dollars. **Jack Collins** furnished advice in several areas, copy-read part of the manuscript, and sent information concerning his specialty, 1794 silver dollars. **Larry Comer** sent information about trade dollars in his collection. **Robert H. Cornell** contributed information about trade dollars. **William H. Cowburn, Jr.** corresponded concerning trade dollars. **Joe Coyne** provided information for this manuscript. **Alan D. Craig** corresponded concerning 1859-O and 1860-O dollars. **William Creech**, National Archives, assisted with research.

Charles Davis furnished a copy of a scarce auction catalogue. **Claude Davis, M.D.** provided die data for Gobrecht dollars. **Beth Deisher** loaned the voluminous *Coin World* archival files on the great Treasury release of silver dollars 1962-1964, the 1964 Peace dollar, the G.S.A. sales, and other aspects of the silver dollar series. **Tom DeLorey** corresponded on various matters, including early silver dollars, Liberty Seated dollars, and Morgan dollars, and made many valuable suggestions after reading the manuscript. In addition, he provided many insights concerning the coining process, die making, planchet preparation, and related matters. **Pat Delvisco** discussed varieties of 1875 trade dollars. **Hamilton Dix**, U.S. Mint, was helpful in many ways.

William J. Domoracki gave details of a trade dollar in his collection. **Scott Douglas** provided information about a trade dollar. **Frank Duvall** corresponded about trade dollar varieties. **Dan Drykerman** provided pedigree information and assisted in other ways.

Richard P. Edlund, M.D. sent information about an 1836 Gobrecht dollar. **Marc Emory** corresponded about a high-grade 1875 trade dollar. **Joe E. Erickson** furnished information about Morgan dollars.

David Fell reviewed the manuscript section for 1794-1804 dollars and made suggestions. **Bill Fivaz** gave data concerning certain interesting die varieties, furnished certain photographs (including many of the enlarged illustrations of varieties), read and commented upon the manuscript, discussed minting procedures, and helped in many other ways. **John J. Ford, Jr.** reminisced concerning silver dollars, rare and common, that he handled with New Netherlands Coin Company. **Harry J. Forman** accompanied the author on a memorable visit to the Mint and also furnished recollections concerning quantities of silver dollars he has handled professionally, with special emphasis on his activities during the 1950s and 1960s. **Les Fox** granted permission to quote from his writings on silver dollars. **Roberta French** did most of the typesetting. In addition, she drafted much of the text for the chapter on commemorative silver dollars, using notes and other information furnished by the author. **Sam E. Frudakis** provided information concerning an 1870-S silver dollar. **Kathy Helgesen Fuller** read much of the manuscript and made many valuable suggestions.

Peter Gabby corresponded about 1836 Gobrecht dollars. **Bruce M. Gamble** corresponded about a trade dollar variety. **Frank Gasparro**, former chief engraver of the U.S. Mint, submitted first-hand recollections about how he designed the Eisenhower and Susan B. Anthony dollars. In addition, during his tenure he warmly greeted the author during various visits to the Philadelphia Mint. **John W. Gearhart** corresponded about a Gobrecht dollar. **Ralph W. Giesecke** corresponded about a trade dollar variety. **Ira Goldberg** told of various hoards of silver dollars handled by his firm, Superior Stamp & Coin Company. **Elliot Goldman** provided several coins for study. **Kenneth Goldman** shared information concerning certain silver dollar rarities which passed through his hands. **Mike Golonka** provided

information about a 1921 Peace dollar variety. **Roy E. Goodman**, American Philosophical Society, provided information concerning Franklin Peale. **Margaret Graf** assisted the author with research during the early 1980s when the present book was in its initial manuscript stages. **John P. Graff** sent information about an 1875-CC trade dollar. **James C. Gray** provided information concerning die varieties and alignments of Gobrecht dollars, assisted with the study of Liberty Seated issues, reviewed many ideas and concepts, and helped in other ways. **Margaret Gray** assisted with historical and numismatic research, including in the library of the American Numismatic Society. **Robert P. Guardiano** corresponded concerning 1844 and 1867 Liberty Seated dollars. **Jeff Gwynne** corresponded about a trade dollar.

Stella Hackel, director of the Mint 1977-1981, made arrangements for the author to visit the Philadelphia, Denver, and San Francisco mints and to take photographs and do research there. **David Hall**, founder of the Professional Coin Grading Service, granted permission to use information from the *PCGS Population Report* and from his various articles on silver dollars. **James Halperin** corresponded about an 1804 dollar his firm (Heritage) handled in 1989. **John Hamrick** shared details of a hoard of trade dollars he handled in the 1970s. **Larry Hanks** told of rarities he has handled, including an 1804 dollar. **Andrew P. Harris, M.D.** provided information concerning varieties in his collection and critiqued part of the manuscript. **Jon Harris** submitted information concerning a notable collection of high-grade Liberty Seated dollars. **Reed Hawn** provided information concerning his 1804 silver dollar. **Leon Hendrickson** provided pedigree information concerning rarities and furnished recollections of the Redfield and Continental-Illinois Bank hoards. **Alan Herbert**, columnist for *Numismatic News*, commented on die varieties and made many valuable suggestions. **John W. Highfill** granted permission to use information in his book, *The Comprehensive U.S. Silver Dollar Encyclopedia*. **Robert A. Hochman, M.D.**, furnished information about a trade dollar variety. **Michael J. Hodder** assisted with coordinating several aspects of data gathering during the early stages of the project when he was a member of the Bowers and Merena staff, and made many very valuable suggestions after he became an independent numismatic consultant. **Robert W. Hoge**, curator of the ANA Museum, provided

information and photographs concerning the Bebee and du Pont specimens of the Class III 1804 dollar. **Dean Hollon** sent information about trade dollars. **Greg Holloway** furnished information about the King of Siam 1834 Proof set containing an 1804-dated dollar. **Wayne K. Homren** lent a copy of Dr. Henry Linderman's *Money and Legal Tender* book. **Walton Hood** furnished information concerning rarities he has handled. **Don Hosier** made available an 1802 Proof restrike dollar for examination. **Dean F. Howe** shared his research concerning the population of Morgan dollars in various grades, as expressed in his book, *Morgan Dollars, an In-Depth Study*. **Robert Hughes** furnished recollections of the Redfield silver dollar hoard and gave his estimates of the numbers of various dates and mintmarks involved. **James W. Hunt** corresponded about trade dollars. **Rick Hutchison** corresponded about an 1876-S trade dollar. **Larry Hylton** sent a trade dollar for examination and evaluation.

Jeff Isaac furnished an 1878-CC trade dollar for study.

Marvin Jacobson provided much information concerning the rarity of trade dollars, including the various types of 1875 and 1876 and chopmarked pieces, and furnished correspondence with John M. Willem. **Stuart W. James** corresponded concerning his extensive holding of trade dollars. **James Jessen** discussed a silver dollar rarity in his collection. **Robert Johnson** provided information concerning silver dollar hoards, trade dollars he handled in the 1950s, and other information. **Elizabeth Jones**, chief engraver of the U.S. Mint 1981-1991, assisted the author with various research in Mint records and made available various historical galvanos and other items from the Engraving Department. **William T. Jones** provided information about a Gobrecht dollar. **Glenn Jorde** discussed trade dollar varieties. **R.W. Julian** wrote the narrative chapters giving the historical background of silver dollars and trade dollars. In addition, he questioned me on numerous statements, made numerous corrections, and suggested further areas of inquiry. Further, he provided mintage figures, die production figures, and other data from Mint records. My debt to him is immense.

Arthur M. Kagin provided data concerning rarities. **John Kamin** sent information about a specimen of the 1885 trade dollar and shared his observations concerning certain issues of Morgan and Peace dollars. **Frank and Laurese Katen** provided coins for study. **James D. Ketterman** corresponded about an

1876 trade dollar variety. **Robert J. Klippstein** sent historical information about an 1885 trade dollar. **Den Komaromi** provided information about die varieties. **Lawrence Kerrigan** furnished information about silver dollars and trade dollars. **Hyunni Kim** corresponded about trade dollars. **Joseph Kirchgessner** proofread the trade dollar section. **Kenneth W. Kissel** sent information about an 1876 trade dollar. **David S. Klinestiver** corresponded about Gobrecht dollars. **Robert C. Knepper** sent information about a Gobrecht dollar. **Gerald L. Kochel** provided a 1795 dollar for examination. **George Frederick Kolbe** corresponded concerning early numismatic publications. **Taewon Kong** sent information about a trade dollar. **Lawrence C. Korchnak** sent information about an engraved 1879-O dollar. The late **Abe Kosoff** provided historical information. **Victor W. Kramer** sent information concerning a Gobrecht dollar. **John Kroon** reviewed sections of the manuscript and provided many valuable suggestions concerning Liberty Seated silver dollars; in addition, he discussed numerous matters involving logic, rarity, mathematical estimates, and history. **Gary W. Kullberg** sent several printed items.

Fred L. Lake provided out-of-print numismatic publications. **David W. Lange** sent information about a 1798 dollar variety. **Doug Law** described Gobrecht dollars in his collection. **Julian Leidman** told of the numerous rare issues he handled over the years, commented on sections of the manuscript, and suggested sources for additional information. **Robert D. Leonard** provided information about the Parisian Varieties counterstamp on 1876 trade dollars. **Grant Lessley** corresponded about trade dollars and submitted a group of trade dollars for examination. **Paul Levine** corresponded about a trade dollar variety. **The Liberty Seated Collectors Club** furnished certain photographs through Weimar W. White. **The Library Company of Philadelphia** furnished an illustration. **Sam Liebovich** corresponded about an 1836 Gobrecht dollar. **Ray Lindsey** corresponded about an 1876-S trade dollar. **David Lindvall** furnished trade dollar die variety information. **Edward J. Linkner, M.D.** provided information concerning an 1884 trade dollar struck in copper. **Jesse Lipka** provided a coin for study. **Kevin Lipton** provided information concerning rare trade dollars. **Newton G. Lockwood** provided information about trade dollars. **Russell J. Logan**, John Reich Collectors Society, granted permission to use

certain information published in the *John Reich Journal*. In addition, he reviewed the manuscript for 1794-1804 dollars and made many valuable historical and numismatic comments and suggestions. **Jim Loyd** reviewed the manuscript in its entirety and made many valuable technical, numismatic, and style suggestions, including in "The Year In History" compilations. **Andrew P. Lustig** corresponded concerning silver dollar rarities.

Alastair S. MacDonald sent an 1836 Gobrecht dollar for examination. **Michael M. Magdic** furnished technical information concerning Gobrecht, Liberty Seated, and trade dollars. **A. George Mallis** wrote an essay concerning the collecting of Morgan dollars for use in the present book, submitted a list of his favorite specialized die varieties, and reviewed sections of the manuscript. **Dwight Manley** provided suggestions concerning rarity ratings and gave information about several hoards. **Steve Markoff** furnished recollections concerning quantities of silver dollars. **J.P. Martin**, American Numismatic Association Authentication Bureau, furnished information concerning die varieties of 1895 Morgan dollars and characteristics of certain counterfeit and altered silver dollars, and helped in other ways. **James M. Matthews** furnished several early silver dollars for study. **James R. May** sent a 1798 dollar for study. **Dr. John McCloskey** corresponded concerning Liberty Seated issues and gave permission to use data published in *The Gobrecht Journal*, publication of the Liberty Seated Collectors Club. **Lois McGuire**, Superior Galleries, provided certain illustrations of early dollars. **John M. McDonough**, general manager, ANACS, corresponded concerning guarantees and gave permission to quote population reports. **David J. McHenry** furnished detailed information concerning Eisenhower and Anthony dollars, including information on striking quality, lustre, availability, rarity and distribution. **Joseph Melanson** provided a Barney Bluestone catalogue listing silver dollars. **Mark Mendelson** corresponded about varieties of trade dollars. The late **Lester Merkin** related his experiences with 1922 High Relief Peace dollars and other rarities. **Ed Metzger**, Whitman Coin Products division of Whitman Publishing Co., Inc., granted permission to use historical pricing data from various editions of *A Guide Book of United States Coins*. **Michael D. Michel** corresponded concerning the rarity of certain trade dollars. **Ed Milas** provided information concerning rare silver dollars and trade dollars he has handled. **Jay C. Miller** gave details

concerning an 1801 Proof restrike dollar. **Warren Miller** reviewed the manuscript on early silver dollars 1794-1804 and made many valuable suggestions. **Wayne Miller** corresponded with the author and gave permission to use quotations from *The Morgan and Peace Dollar Textbook*. **Clifford Mishler**, president of Krause Publications, granted permission to reprint descriptions from the Bolender book on early silver dollars, of which Krause is the copyright holder. **Mike Murphy** corresponded about trade dollars in his collection.

The late **Stephen K. Nagy** told of his experiences with rare Gobrecht dollars, restrikes, and other items. **Samir Naib** sent information about trade dollar varieties. **Chris Napolitano** commented on the Liberty Seated and trade dollar sections of the manuscript, assisted with die studies of rare Liberty Seated dollars, and did research at the American Numismatic Society on behalf of the author. **The National Archives** provided much Mint data. **Robert S. Neale** furnished information about a trade dollar variety. **Darrell Neidigh** furnished die variety information for Liberty Seated, Eisenhower, Anthony, and trade dollars and shared the records he compiled over a long period of time. **Eric P. Newman** shared numerous nineteenth century advertisements, cartoons, articles, and other ephemera featuring the Morgan dollar and trade dollar, and read portions of the manuscript. He also furnished several early silver dollars for illustration. **Donald Nigro** sent information regarding an 1876 trade dollar. **The Numismatic Guaranty Corporation of America, Inc.** made population data available from its *Census Report*. **James P. Nunan** corresponded about trade dollars. **Robert A. Nylen**, curator of history at the Nevada State Museum (in the former Carson City Mint building), provided photographs of the Carson City Mint.

Edward C. Olsson corresponded with the author about die varieties of silver dollars and trade dollars.

John Pancratz shared his recollections of a hoard of 1903-O Morgan dollars. **Jay Parino** sent information concerning rare silver dollars and trade dollars he has handled. **Jesse Patrick** contributed an essay on die characteristics of Proof trade dollars. **Eric Patterson** furnished Proof restrike 1851 and 1852 dollars for study. **Martin Paul** provided information about several important rarities he handled over the years. **Robert Paul** corresponded about early dollars. **Richard Peloquin** sent a 1796 dollar for examination. **Dale R. Phelan** reviewed sections of the

manuscript and made valuable comments concerning population estimates and other areas, including history and economics. **Jim Pinkerton** sent information about an 1876 trade dollar. **Beth O. Piper** analyzed PCGS and NGC population data and auction records and assembled a broad base of data. **John Jay Pittman** provided information concerning 1858 and other early Proof dollars. **Donna Pope**, director of the Mint 1981-1991, arranged for several visits to do research at various U.S. mints. In addition, through her office in Washington she and her staff helped in many ways. **The Professional Coin Grading Service, Inc.** made population data available from its *Population Report*.

David Queller assisted with pedigree information and provided trade dollar pattern photographs.

Ginger Rapsus provided data on 1885 trade dollars. **Jim Reardon** furnished information concerning the availability of various issues of Eisenhower dollars. **Jules Reiver** helped in many ways with research concerning early silver dollars 1794-1803, provided negatives of specimens in his collection, discussed various die varieties and the rarity thereof, and commented on the manuscript draft. **Stephen T. Richter** shared information concerning his 1795 dollar overstruck on a dollar of 1794. **Peter Rishel** furnished an 1875-CC doubled die trade dollar for examination. **Fred Roberts** corresponded about silver dollars. **James Roberts** furnished information about a Gobrecht dollar. **F.M. Rose** provided information about chopmarks on trade dollars. **Maurice Rosen** shared his experiences with several issues of silver dollars and trade dollars and critiqued several sections of the manuscript. **John N. Rowe, III** provided pedigree information for 1884 and 1885 trade dollars. **David Rubin** corresponded about Gobrecht dollar and trade dollar varieties. **P. Scott Rubin** helped with price data and pedigree chains for certain rarities. **James F. Ruddy** furnished recollections of buying U.S. trade dollars in Hong Kong in 1960. **Margo Russell** shared her recollections of the issuance of 1964-D Peace silver dollars. **Joseph Rust** helped with information about trade dollars and made several valuable suggestions.

Harry E. Salyards, M.D., made many valuable suggestions and additions concerning early dollars, Gobrecht and Liberty Seated issues and read most of the manuscript; he helped greatly with the "year in history" entries as well. **R. Sander** furnished information about trade dollars. **Raul Santovenia** sent information concerning trade dollars. **Michael**

Saum lent a mirrorlike "Chapman Proof" 1921 Morgan dollar for study. **Rich Schemmer** corresponded about mint error dollars. **Bert A. Schlosser** sent information about trade dollars. **Hugh Sconyers** provided historical information concerning precious metal prices and told of the background of the purchase by A-Mark of the Redfield silver dollar hoard; he also provided information on rarities he and the American Rare Coin Fund, L.P. have handled. **Anthony M. Scirpo** corresponded about prooflike Morgan dollars. **W.E. Seton** provided information concerning mintmark sizes on trade dollars, and other data, and loaned coins from his collection. **Dr. Charles Seward** furnished a Gobrecht dollar for study. **Jonah Shapiro** shared his memories of the 1962-1964 Treasury release of silver dollars and the coins he handled. **Jack Shaul** provided information about trade dollar varieties. **John Skubis** shared his recollections concerning buying silver dollars in quantity in the 1950s, and his relationship with the San Francisco Mint. **Garn Smith** corresponded about Eisenhower and Susan B. Anthony dollars. **Harry E. Smith** made Liberty Seated dollars and trade dollar die varieties available for study. **Pete Smith** provided information concerning A.M. Smith, who once owned an 1884 trade dollar in copper. Photographs of coins in the National Coin Collection at the **Smithsonian Institution** were used in various sections of the manuscript. **Leo Soucek** corresponded about trade dollar varieties. **Harvey G. Stack** made several suggestions regarding the 1804 silver dollar, 1884 trade dollar, and other rarities, and gave permission to use information, illustrations, and prices from past catalogues. **Larry Stack** provided a rare Gobrecht dollar for study. The late **Norman Stack** granted permission to quote his writings in various catalogues. **Alan M. Stahl** facilitated research by Chris Napolitano, on behalf of the author, at the American Numismatic Society. **J.T. Stanton** made suggestions concerning several sections of the manuscript. **Dr. Robert Stark** furnished information on varieties and pedigrees of 1794-1803 dollars, and reviewed the manuscript for this section of the book. **John A. Steffen** corresponded about trade dollars. **Dr. James A. Stiles** provided information concerning several important trade dollars. **Kari Stone**, editor of *COINage* magazine, searched through back issues and provided copies of numerous articles pertaining to silver dollars and trade dollars. **David Sundman** sent information about quan-

ties of Morgan dollars distributed in the 1950s, and commented on Susan B. Anthony dollars.

Norman Talbert provided coins for photography. **Don Taxay**, for a period of years in the 1960s, conversed and corresponded concerning restrikes, Mint history, and other matters. **Anthony Terranova** corresponded concerning an 1884 trade dollar he handled and discussed rarities in the 1794-1803 series. **R. Tettenhorst** provided pedigree information and a 1795 silver dollar for illustration. **Kenneth G. Townsend** corresponded about Gobrecht dollars. **David Enders Tripp** provided data concerning Virgil Brand's purchases of rarities.

Robert Vallone corresponded concerning an 1878-S trade dollar variety. **Leroy A. Van Allen** reviewed the manuscript sections for Morgan and Peace dollars and made valuable suggestions; he also provided information concerning trade dollars with die doubling. **Frank Van Valen** made important suggestions and contributed much to the Eisenhower and Susan B. Anthony sections. **Mark Van Winkle** sent information concerning trade dollar varieties. **Lauren Vaughan** of the U.S. Mint Office of Public Affairs provided information concerning Susan B. Anthony dollars, their distribution, and the current (1993) storage arrangements of undistributed supplies. **Cornelius Vermeule** granted permission to quote from his book, *Numismatic Art in America*. **Jeffrey Vogel** sent information about an 1876-S trade dollar.

Jack Wadlington lent a specimen of a Proof 1853 dollar and furnished other information. **Richard Wagner** sent information concerning an 1836 Gobrecht dollar. **Don Whaley** corresponded about an 1836 Gobrecht dollar. **Robert E. Whigham, Jr.** corresponded about varieties of trade dollars. **Jack White** sent information concerning the 1876-CC trade dollar with doubled die reverse. **Weimar W. White** reviewed much of the manuscript, corresponded frequently, and made numerous valuable suggestions, particularly in the Liberty Seated silver dollar section; in addition, he furnished two photographs. **Larry Whitlow** corresponded concerning certain rarities he has handled over the years. **Rick Wilcox** corresponded concerning his experiences in collecting silver dollars. **Adna G. Wilde, Jr.** corresponded concerning trade dollar varieties. **Lisa Williams** discussed a rare silver dollar variety with the author. **Douglas Winter** provided valuable informa-

tion on silver dollars 1794-1803, Liberty Seated dollars, and trade dollars. **Sheldon Wirt** made an 1851 restrike dollar available for study.

Mark Yaffe provided information about an 1804 silver dollar he bought and sold in 1989.

Special Credits

The author gratefully acknowledges Cliff Mishler and Krause Publications, copyright holders of M.H. Bolender's 1950 work, *The United States Early Silver Dollars from 1794 to 1803*, for permission to use verbatim die descriptions (which in any event have mostly been modified for use in the present text). The extensive research of Douglas Winter was also utilized for early dollars.

For Morgan and Peace dollars, the author is grateful for permission given by the authors to use excerpts and/or cross-references to the following books: John Highfill: *The Comprehensive U.S. Silver Dollar Encyclopedia*; Wayne Miller: *The Morgan and Peace Dollar Textbook*; Leroy C. Van Allen and A. George Mallis: *Comprehensive Catalog and Encyclopedia of Morgan & Peace Dollars*.

Walter H. Breen provided data revised in many instances from that in *Walter Breen's Complete Encyclopedia of U.S. and Colonial Coins*. Kenneth E. Bressett and Ed Metzger, of the Whitman Division of Western Publishing Co., granted permission to use historical prices from *A Guide Book of U.S. Coins*. Robert Korver gave permission to quote from *The Coin Dealer Newsletter* and *The Certified Coin Dealer Newsletter*.

Coin World, *Numismatic News*, and *The Numismatist* each published the author's call for information concerning certain aspects of silver dollar history, varieties, and other areas, and granted permission to quote information from their pages.

Amos Press and Beth Deisher, of *Coin World*, provided historical information (particularly concerning the Treasury releases of silver dollars in the early 1960s) and granted permission to quote from Keith Zaner's "Trends" listings.

Bowers and Merena Galleries credits: Mark

Borckardt, senior numismatist at Bowers and Merena Galleries, studied the silver dollar market from the 1860s to date, compiled price histories, formulated die linkages for early silver dollars, copy read much of the text, did much research work (especially with prices and auction appearances of 1794-1803 dollars), and helped in many other ways. The composition, layout, and formatting was by the Graphics Department of Bowers and Merena Galleries, Inc. Lee Lilljedahl, Graphics department manager: proofreading; Roberta French: typesetting and production; Sarah Cochrane: formatting; Jennifer Meers: project coordination, formatting. Others who helped: Kristen Aiton, Linda Heilig, and William Winter. Cathy Dumont photographed and printed nearly all of the 55 mm. coin pictures. Susan Novak did much work on "The Year in History" segments from the year 1922 onward, and helped with correspondence and research. Andrew W. Pollock III helped with certain technical information, read the manuscript, studied the market for 1794-1804 dollars, and made many valuable suggestions. Raymond N. Merena helped coordinate the project and assisted in other ways.

My book, *Commemorative Coins of the United States: A Complete Encyclopedia*, was used for much of the information pertaining to commemorative silver dollars from 1900 to 1991; certain credits in that book are not repeated in the above acknowledgements.

Other credits are given in the text, footnotes, and bibliography.

Acknowledgements by R.W. Julian

R.W. Julian acknowledges the help of the following in the preparation of the historical chapters of the present work:

Q. David Bowers, Walter H. Breen, Mary T. Brooks, Carl W.A. Carlson, John J. Ford, Jr., N. Neil Harris, Eleonora Hayden, Alan Herbert, Michael J. Hodder, Hope Holdcamper, Ernest E. Keusch, Donald King, Eric P. Newman, William E. Sherman, and Samuel M. Upton.

About the Author

Q. David Bowers is the author of over three dozen books on various subjects, primarily numismatics. Titles include *The History of United States Coinage* (written for The Johns Hopkins University), *United States Gold Coins: An Illustrated History, Coins and Collectors*, *The American Numismatic Association Centennial History* (2 volumes, 1,742 pages, written for the ANA, published 1991), *Commemorative Coins of the United States: A Complete Encyclopedia*, and others. More of his books have won Book of the Year Award honors given by the Numismatic Literary Guild and Robert Friedberg Award honors given by the Professional Numismatists Guild than have the works of any other author.

He is an award-winning columnist for two periodicals: *Coin World* and *The Numismatist*.

Q. David Bowers served as president of the Professional Numismatists Guild (1977-1979) and the American Numismatic Association (1983-1985). He

is a recipient of the highest honors given by those organizations, The Founders' Award and the Farran Zerbe Award. A 1960 graduate of the Pennsylvania State University, he received the Distinguished Alumnus Award from that institution's College of Business Administration in 1976.

With Raymond N. Merena, he is owner of Bowers and Merena Galleries, Inc. and Auctions by Bowers and Merena, Inc., of Wolfeboro, New Hampshire.

His books in other fields include *The Encyclopedia of Automatic Musical Instruments* (a 1,008-page work selected by the American Library Association as one of the most valuable reference books of the year), *The Moxie Encyclopedia* (the history of a famous beverage), *Nickelodeon Theatres* (a history of early movie theatres), *A Guide Book of Automatic Musical Instruments*, *Treasures of Mechanical Music* (with Arthur Reblitz), *Harrison Fisher* (with Ellen H. Budd; biography of the artist), *Muriel Ostriche: Princess of Silent Films* (biography of the actress), and the forthcoming *Thanhouser Films: An Encyclopedia and History* (to be published in three volumes; history of one of America's premier silent film studios).

Style Notes

CAPITALIZATION: In original mint reports, newspaper articles, etc., capitalization was erratic. Trade dollar was often capitalized as Trade Dollar or Trade dollar, standard dollar (referring to a Morgan or Peace silver dollar) was often capitalized as Standard Dollar, etc. In the present text, numismatic usage has been followed, and denominations are not capitalized (nor is the hyphenated form trade-dollar used; this appeared in some government documents). Grades of coins such as Very Fine, Extremely Fine, Uncirculated, Proof, etc., are capitalized, per current standard numismatic practice, and quotations from early auction catalogues, etc., have been edited to reflect this.

CATALOGUE LISTINGS of silver dollars and trade dollars reprinted to show auction and fixed prices over the years are arranged by date and variety; the order of presentation in the original auction catalogue or price list may have been different (for example, B. Max Mehl often listed coins separately in categories by mints). For the sake of brevity, abbreviations have been used for grades (see **GRADING** below). For the sake of consistency, overdates are expressed as, for example, 1802/1; in the original listings, descriptions varied—such as 1802 cut over 1801, 1802 over '01, etc. In many instances, descriptions of star placements on early dollars have been standardized to modern terminology, such as Stars 9x7. Most standard descriptions of dies adapted from Haseltine or Bolender have been deleted from auction lot descriptions, as such descriptions can be found in the individual sections for varieties. For example, an entry in a 1952 Bolender auction originally appeared as follows: “1795 silver dollar. B-3. Flowing hair in six curls, the third one from the top turns and touches the fourth curl. The only variety with 16 berries in wreath, 8 on each branch. Strictly Very Fine, sharp even impressions. Scarce variety, Rarity-4. Plate. (Both obverse and reverse of this very coin used in book for illustrations on plate I.) Geo. M. Parsons Coll’n. \$70.” In the present text, it has been edited to this: “1795 B-3. Flowing hair. Strictly VF, sharp even impressions. Plate. (Both obverse and reverse of this very coin

used in book for illustrations on plate I.) Geo. M. Parsons Coll’n. \$70.” Information about the die characteristics and rarity of 1795 B-3 can be found under the section on 1795 Flowing Hair dollars. Original auction catalogue notations such as “1850 New Orleans issue” have been changed to 1850-O, etc. Certain catalogue descriptions, especially those published after about 1960, have been edited for length (sometimes to the point of just indicating the date, variety, and grade), as have been long descriptions of 1804 dollars and certain other rarities from all time periods; otherwise it would not have been possible to include information from such a large number of auction sales.

CURRENCY: The term *currency*, used in the late twentieth century to mean paper money, had multiple definitions in the nineteenth century. It was popular to refer to anything that circulated, including copper, silver, and gold coins, as currency. In other words, currency referred to media of exchange that were *current* in circulation.

DEXTER and SINISTER: The terms dexter (the heraldic indication of right) and sinister (the heraldic indication for left) are used to describe the eagle’s anatomy in certain issues. For example, on the trade dollar the eagle’s dexter leg refers to the eagle’s right leg, which is on the left side of the coin (and to the observer’s left). Similarly, the dexter wing of an eagle refers to the eagle’s right wing (to the observer’s left).

EDITING: Quoted passages have been lightly edited in some instances. Auction catalogue listings have been condensed in many instances, to primarily reflect the date, variety, grade, and price. Spelling errors have been corrected.

FOOTNOTES: Footnotes in all instances, including quoted material, are those of the author of the present work (QDB). Original footnotes are included in parentheses in reproduced quoted material such as Mint reports.

GOVERNMENT: The word *government*, when used in a general sense, as in government policies, United States government, etc., is not capitalized.

The same applies to *federal*. In original quotations capitalization was inconsistent.

GRADING: Grading terminology follows that in *Official Grading Standards for United States Coins*, by the American Numismatic Association. In addition to numerical grades such as EF-40, MS-60, etc., adjectival grading is used in connection with older prices, sale results, and catalogue listings (as numerical grading for silver dollars was not standardized in its present form until 1986). Certain grades have been abbreviated: Very Good = VG, Very Fine = VF, Extremely Fine = EF, About Uncirculated = AU, Uncirculated = Unc., Mint State = MS. These grades have also been standardized in price quotations, such as listings in advertisements reproduced from *The Numismatist*. For example, in the present text, EF (for Extremely Fine) is used for consistency, although original listings also included such variations as XF, E. Fine, Ex. Fine, Extra Fine, Exceedingly Fine, etc.; what is standardized in the present text as AU (About Uncirculated) sometimes appeared in advertisements as Nearly Uncirculated, Almost Uncirculated, Uncirculated with rubbing, "slider," "super slider," etc. The terms Uncirculated and Mint State are synonyms.

MINTS: Various mint reports, etc., often refer to the Carson Mint or the Mint at Carson; the present text, except in direct quotations, follows the numismatic nomenclature of Carson City Mint. The word Mint, when capitalized by itself without mention of a city, refers to the Philadelphia Mint.

NAMES: The name of the sculptor is spelled in this text as Augustus Saint-Gaudens. Original spelling was erratic, and such variations as Augustus S. Gaudens and Augustus St. Gaudens (very common) have been changed to Saint-Gaudens. Early Mint official Henry Voight's surname also appears as Voigt in Mint records. R.W. Julian has used the Voight spelling. John W. Haseltine's surname has been misspelled as Hazeltine in innumerable books and catalogues (*e.g.*, the entire section of Haseltine's *Type Table* reprinted in the 1945 catalogue of "The World's Greatest Collection"); in the present text such errors have been corrected.

NOVODEL: The term *novodel*, long standard in Russian numismatics for pieces made by an official mint in later years from backdated dies, is applied to certain issues as 1801-2-3 "restrike" Proof dollars, 1804 dollars, 1853 Proof dollars, and certain other

issues of which no originals were ever made. (Technically, *novodel* can also refer to specimens struck from original dies at a later time; I prefer *restrike* for this use.) I prefer this to, for example, "antedated fantasy" (Newman and Bressett referring to the 1804 dollar), *pièce de caprice* (Don Taxay and others), etc., although these terms are also applicable in certain instances. On the other hand, the term *restrike* implies the issuance at a later date of coins from the *same dies* earlier used to make originals in the year indicated on the dies. This is not applicable to 1801-2-3 and 1853 Proof dollars, as no Proofs were struck of these in the years stated on the dies; the dies were created at a later date.

OFFICIALS: Such words as *director* and *secretary* are capitalized only when used contiguously with a person's name. Thus, director of the Mint and secretary of the Treasury are capitalized when used as Director of the Mint Henry Richard Linderman (or Mint Director Henry Richard Linderman) or Secretary of the Treasury Sherman, but not as Henry Richard Linderman, director of the Mint, etc. Original use in the *Annual Report of the Director of the Mint* and other government publications was inconsistent.

RESTRIKE: Refers to a coin struck from original dies, for numismatic purposes, at a date significantly later than on the obverse die. Also see *novodel*.

SCARCE, RARE, etc. The terms *scarce*, *rare*, etc., are relative. A Morgan or Peace dollar considered scarce or rare may be much more plentiful than a Liberty Seated dollar described as such. In any event, the Universal Rarity Scale (URS) is specific.

SINISTER: See DEXTER above.

SUBSIDIARY: The term *subsidiary*, as related to coinage, refers to coins worth less in bullion or melt-down value than their face value. After implementation of the Act of 1853, lesser silver denominations became subsidiary coins (as the three-cent piece had been since 1851), but the silver dollar remained of full (or better) value. After 1873, when the silver dollar became subsidiary, it was popular practice in Mint reports and elsewhere to use the term *subsidiary* to refer to silver coins having a face value of less than a dollar, and not to silver dollars. Thus, for example, in 1921 subsidiary coinage referred to denominations from the dime to the half dollar, not to silver dollars, although all denominations from the dime to dollar had bullion values less than their face values.

Silver Dollars
—and Trade Dollars of the—
United States
A COMPLETE ENCYCLOPEDIA

Volume I

By Q. David Bowers

CHAPTER 1

About Silver Dollars

GETTING ACQUAINTED

by Q. David Bowers

Writing this Book

This book had its inception in the 1960s when I started keeping notes on many of the silver dollars that went through my hands. A serious start was made on the manuscript in the early 1980s, when my then-secretary, Margaret Graf, coordinated many of my notes and ideas. Then, several other book projects intervened, especially the creation of *The American Numismatic Association Centennial History*, which, when all was said and done, amounted to 1,766 pages in two volumes and saw the light of day in the summer of 1991.

In the meantime, I had commissioned two of America's most accomplished numismatists, R.W. Julian and Walter H. Breen, to supply certain information for my forthcoming book on silver dollars. Bob Julian created a truly great historical overview of the series, and Walter H. Breen provided technical notes on the varieties which had come to his attention (many of which had been described in his *Encyclopedia of U.S. and Colonial Proof Coins* and his somewhat similarly titled *Walter Breen's Complete Encyclopedia of U.S. and Colonial Coins*). In addition, in 1991 and 1992, Breen supplied much other data in correspondence and went over the manuscript with a fine-tooth comb.

Utilizing the efforts of other numismatists past and present, and using much information from the vast fund of publications to follow and in the Bibliography, I have endeavored to create a single volume which on a coin-by-coin basis will aid the serious collector and historian to learn a great deal about any issue in the series, whether it be a common 1881-S Morgan dollar, a scarce 1859-S Liberty Seated dollar, a very rare 1922 High Relief Peace dollar, or even the silver dollar which has achieved the ultimate in rarity (none is known to survive) the

1873-S Liberty Seated dollar.

I have had a great deal of enjoyment creating this book, a *catalogue raisonné* of the silver dollar and trade dollar denominations. I hope some of that pleasure is transmitted to you as you skim the following pages, perhaps pausing to read in detail the areas that interest you the most.

Sources of Information

When Dr. William H. Sheldon wrote *Early American Cents* (published in 1949), he did so because he had always wanted to read such a text, but none was available. Taking the matter into his own hands, he created an orderly delineation of one cent pieces from 1793 through 1814.

Similarly, in the course of cataloguing major collections, handling rarities, and in the daily business of professional numismatics I have always wanted a single reference on United States silver dollars (and trade dollars) to which I could turn for the answer to this question or that. To be sure, there are many excellent texts on the denomination, and the works of Leroy C. Van Allen and A. George Mallis, Wayne Miller, and the compendium of articles coordinated by John Highfill each deserve a place on the bookshelf of every serious collector. Similarly, it would be difficult to imagine a serious numismatist who did not consult *Walter Breen's Complete Encyclopedia of United States and Colonial Coins* on a frequent basis. And, for early issues, one cannot forget Milferd H. Bolender's *The United States Early Silver Dollars from 1794 to 1803*. John Willem's book on trade dollars is likewise important.

Before going on to other books, let me say a few words about the third edition of the Van Allen-Mallis book, *Comprehensive Catalog and Encyclopedia of Morgan & Peace Dollars*, one of the finest numis-

matic references in *any* specialized field. I heartily recommend it as a key item in your numismatic library—as a valuable source of information on die engraving, assaying, and minting techniques—in addition to its main thrust, which is an in-depth detailing of every minute die variety of Morgan dollar known to exist, plus an excellent discussion of Peace dollars.

Beyond these texts, Don Taxay's invaluable *Counterfeit, Mis-struck and Unofficial Coins*, 1963, and *United States Mint and Coinage*, 1966, provide data on how the Philadelphia Mint operated both openly and, especially during the middle to late nineteenth century, clandestinely as well, becoming at one point, in Taxay's words, a workshop for the private gain of Mint officers and employees.

The Gobrecht Journal, the official publication of the Liberty Seated Collectors Club, has printed many superb articles on silver dollars and trade dollars over the years, information in print which is especially useful for the theories and ideas proposed concerning the rarity and availability of certain issues. For example, how rare is an 1871-CC dollar? This question has been debated several times. How rare is the Proof-only 1858 dollar? *The John Reich Journal* and the *Journal of the Silver Dollar Collectors Society* are likewise valuable for the many informative articles they contain.

In American numismatics there are only a few instances in which an entire book has been devoted to a single United States federal coin issue. Among these are three about silver dollars. The first and perhaps the best known is Eric P. Newman's and Kenneth E. Bressett's *The Fantastic 1804 Dollar*, published in 1962. This dandy volume serves up a delightful mixture of technical and scientific data, historical information, theories, and irreverent (to numismatic icons and traditions, that is) commentary, and is, in my opinion, a "must read" book for everyone; never mind the fact that only a few of us will ever be able to handle or own a precious 1804. I owe a large debt of gratitude to this book for much of the information appearing in Chapter 6. The second is Mike Carter's study of the 1921 Morgan dollar. The third is Jack Collins' book (in preparation), *1794: The History and Genealogy of the First United States Dollar*.

There are 200 volumes, one for each year, of the *Annual Report of the Director of the Mint*, a set of pamphlets and books which, to me, has always been a veritable gold mine of information. However, data in Mint reports must be taken with many thousands of grains of salt. Although Walter H. Breen, Don Taxay, and others have used delivery dates of certain early coins (1795 dollars are but one example) and have broken them down to create precise mintages by type within a certain year, in most instances Mint reports do not support such accuracy. Among Mint reports can be found production figures for such non-existent coins as 1810 dimes, 1816 half dollars, 1799 and 1803 quarter eagles, 1801 half eagles, and 1802 eagles, while figures for certain known coins are omitted, as in the instances of 1832 half cents, 1823 cents, 1824 quarter dollars, 1870-S half dimes and silver dollars, and 1841 quarter eagles.

Further, it was the practice of the Mint to keep earlier-dated dies on hand and to use them in subsequent calendar years for coinage. Thus, dollars reported to have been coined in calendar year 1804 were almost surely all dated 1803 or before. There is no consistency in this regard, for in some instances, such as the 1802/1 dollar obverses, the Mint corrected dates used for coinage later than the date first placed on the dies. Although precise numbers furnished by the Mint, numbers created by interpolation by Walter H. Breen, and figures gained from other sources are used, the reader should not take these (nor mine) as the final word, especially for coins dated prior to 1840, and for Proofs and restrikes of all years. The true, accurate figures may never be known.¹

By now, I have mentioned more books and other printed sources than anyone can comfortably carry at one time, but there are still more to come:

Periodicals such as the *American Journal of Numismatics*, published quarterly from 1866 through the early twentieth century, contain much worthwhile information on the silver dollar series, but not as much as do *The Numismatist*, the official journal of the American Numismatic Association, a compact periodical published monthly (with some exceptions) from 1888 to date; and *The Numismatic Scrapbook Magazine* issued from 1935 through February 1976. In more modern times there have been *Numis-*

¹ In the course of doing research for another book, *Commemorative Coins of the United States: A Complete Encyclopedia*, I learned from the Mint staff that Mint sales figures of Proof coins, commemoratives, etc., of our own time, while announced with precision, are really not precise. In all instances, a "final figure" has been given to the public, but some additional coins or sets have been set aside for future contingencies, mail losses, etc.

matic News, *Coin World*, *Coins* magazine, and *COINage*, to mention some of the main weekly and monthly publications.

Beyond all of these, which by now amount to a multi-shelf library of things to read, consult, and contemplate, there are thousands of auction catalogues, not only modern ones put out by my company, New Netherlands Coin Co., Kagin's, Lester Merkin, Pine Tree Auctions, Stack's, Heritage Galleries, Superior Stamp & Coin Co., Mid-American Rare Coin Auctions, Pacific Coast Auction Galleries, Christie's, James Kelly, Sotheby's, Spink & Son, Ltd., and others, but also nineteenth and early twentieth century offerings by Edward Cogan, S.K. Harzfeld, J.W. Scott, Ben G. Green, S. Hudson and Henry Chapman, Capt. John W. Haseltine, W. Elliot Woodward, Thomas L. Elder, Ed. Frossard, B. Max Mehl, and many more.

Still, that is not all. Silver dollars have been a popular investment vehicle for thousands, perhaps even millions, of American citizens, and to aid them in their decisions a host of printed matter has been created over the years. Investment newsletters, dealer price lists and bulletins, *The Coin Dealer Newsletter* and related periodicals put out by the same issuer, coin population reports of the Professional Coin Grading Service and the Numismatic Guaranty Corporation of America, bulletins on counterfeits issued by the International Numismatic Service, the American Numismatic Association Authentication Bureau, the Professional Numismatists Guild, etc., and more, each contribute valuable information.

Outside of numismatics there is much to read about silver dollars. *Niles' Register*, published in Baltimore from 1814 to 1847, was an early-day equivalent of *The Wall Street Journal* and provided financial and other news to its readers on a weekly basis. By reading my set of these (originally owned by the Bank of the United States, later by the U.S. Treasury, and, still later, by the Federal Reserve, before it was deaccessioned), economics of the early nineteenth century came alive. Contemporary newspapers, government data, the *Congressional Record*, biographies of elected officials (Thomas Hart Benton, Charles Sumner, Daniel Webster, John Sherman, Richard P. Bland, *et al.*), Treasury reports, books and pamphlets on "the silver question," and economics studies, contributed still more.

An interesting thing about nineteenth century accounts of economics and money, a number of which were published in England (and treat as part

of their texts the economy of America), is that relatively few writers had a true understanding of the changing relative values of gold, silver, and paper notes in American commerce. All sorts of conflicting data, theories, and versions of history are encountered. The same goes for texts about the U.S. Congress and its activities during the nineteenth century. In my opinion, far and away the best single text ever written on coinage in relation to the American economy is Neil Carothers' *Fractional Money*, published in 1930. If I were asked to name the 10 most valuable single books for the numismatic researcher, Carothers' work would be on the list. Interestingly, it was not written as a numismatic book at all, nor was it ever circulated widely in the collecting fraternity. Rather, it was a book on American economics and fiscal history as related to copper, nickel, and silver coins.

Heretofore in numismatic publications, little has been said about prevailing economic conditions. One can read standard texts on just about every American series of interest to collectors, and find details about market prices, rarity, and die varieties, but virtually nothing about the milieu in which the coins were struck and used. To be sure, Dr. William H. Sheldon in his *Early American Cents* addressed the problems facing the Mint, and John M. Willem devoted nearly all of his superb book, *The United States Trade Dollar*, to economics, but other exceptions are few and far between. Of course, there is the possibility, counter to my own preferences, that the average reader wants little of economics or economic history.

In the course of research for the present work, I was impressed by the close connection silver dollars had with the American way of life. While from the 1870s through the early twentieth century, silver dollars and "the silver question" were popular subjects of articles, books, and cartoons, beyond that, coins were an important aspect of commerce, banking, bullion transactions, and export trade since the founding of our republic. They were and are an inseparable part of American history. Because of this, I have interpolated under the Additional Information heading some data, as "The Year XXX In History," pertaining to non-numismatic aspects of American life and progress, with the thought and sentiment that such will help you, as it did me, appreciate the arena in which silver dollars and trade dollars were minted and used. Of course, the casual reader can skip over such information easily and

concentrate solely upon the numismatic details, of which there are probably more than enough to satisfy even the most ardent lover of coin trivia!

Those who like to read about concealed treasure will enjoy the hitherto unpublished details of the vast cache of valuable Morgan dollars secreted in the Cash Room at the Treasury Department in Washington—as exposed in interviews with Harry X Boosel, Harry J. Forman, Jonah Shapiro, and others.

Silver Dollars Over the Years

Silver dollars form one of the most interesting chapters in American coinage history. The vast panoply of designs, varieties, rarities, mysteries, controversies, hoards, and other features make this one of the most fascinating of all denominations.

The 1794 dollar—how many were minted? Why are the stars arranged differently on the right side of the obverse?

The 1795 dollar—why did the Mint insert silver plugs in some?

The 1797 dollar—when were most dollars bearing this date made?

The 1801, 1802, and 1803 Proof novodel dollars—were they made in 1801, 1802, and 1803, or were they made in the 1830s, or could certain of them been made as late as the 1870s?

The 1804 dollar—is it truly “The King of American Coins,” or, as Eric P. Newman and Kenneth E. Bressett have suggested, is it an impostor to the throne?

Is the 1836 Gobrecht dollar a pattern or a regular issue? How can one tell if such a coin is a restrike?

The 1845 Liberty Seated dollar—why is it a rarity in Uncirculated grade?

The 1870-S Liberty Seated dollar—how rare is it?

The 1873-S Liberty Seated dollar—will any be discovered?

What is the “tail feathers situation” among 1878 Morgan dollars?

The 1883-S Morgan dollar, or the 1894-S dollar, or the 1890-CC dollar, or the 1903-S dollar, or the 1879-O dollar (or virtually any other Morgan dollar you care to name)—how many were distributed, how many were melted, how many exist today in Uncirculated grade?

Will anyone ever find an 1887/6-S Morgan dollar? What are the chances?

The 1921 Peace dollar—why is it not recognized as a separate type?

Why were so many 1922 High Relief Peace dollars melted?

The 1934-S dollar—how rare is it?

The 1964-D Peace dollar—does one exist today?

Why are Uncirculated low-mintage 1878-CC trade dollars more plentiful than Uncirculated high-mintage 1876-CCs?

Such questions contribute to the fascination of numismatics.

As the largest silver denomination made for circulation in America, the silver dollar always has been popular with collectors. The series (including later clad-metal issues without silver) can be divided into convenient categories:

1. Early silver dollars dated 1794-1804. These are of three design types: (a) Flowing Hair obverse, Small Eagle reverse, dated 1794-795. (b) Draped Bust Obverse, Small Eagle reverse (the “small eagle” being different from the preceding, however), dated 1795-1798. (c) Draped Bust obverse, Heraldic Eagle reverse, dated 1798-1804.

2. Gobrecht silver dollars dated 1836 and 1839. The 1836 has no stars on the obverse and stars on the reverse, while the 1839 has stars on the obverse and no stars on the reverse. (1838 Gobrecht dollars are strictly patterns.)

3. Liberty Seated silver dollars dated 1840-1873. These are of two types: (a) Without Motto, 1840 to 1865 plus the anomalous 1866. (b) With IN GOD WE TRUST, 1866 to 1873.

4. Morgan silver dollars dated 1878-1921.

5. Peace silver dollars dated 1921-1935, plus the supposedly vanished 1964-D.

6. Eisenhower dollars dated 1971-1978.

7. Susan B. Anthony dollars dated 1979-1981.

8. One-ounce silver bullion “eagle” dollars 1986 to date.

9. Trade dollars (actually, a separate denomination) dated 1873-1885.

10. Commemorative silver dollars 1900 Lafayette to date.

Each of these dollar types forms a section of the present work.

Some Favorites

My first silver dollar was an 1886 Morgan, grade unknown and later lost, given to me at birth—an omen of what was to come in my life!

In addition to owning and having read much numismatic and historical literature on the subject, I

enjoy silver dollars and have handled more than my share of them, ranging from multiple examples of the famed 1804 and 1870-S, and what may be the finest 1794, to the rare 1884 and 1885 trade dollars, and more—including countless common coins.

I have to be objective here; and while it is professionally stimulating to handle an Uncirculated 1794 Flowing Hair silver dollar, buying and selling thousands of common-date Morgan dollars pays the electricity, insurance bills, etc., at the office. One of the most enjoyable times I have ever had in my career was looking through unsorted Treasury-stored bags of Liberty Seated silver dollars, not of rarities or of Mint State coins, but of worn pieces from 1840 through 1873.

Of the over 200 distinct major date and mintmark varieties of silver dollars and trade dollars delineated in detail in the pages to follow, I consider the following to be especially interesting. Devotees of Currier & Ives prints have their "Favorite Fifty," as do collectors of Ampico reproducing piano rolls. Such publications as *The Book of Lists* indicate the human desire for ordering and ranking things.

Here, then, is my list of some favorites in the silver dollar series, selected not because they are more valuable or less valuable, but because each has an interesting story behind it. No one will ever form a collection of just these dollars, for to do so would be to omit many other deserving coins. If the list has any use, it is to point out that dollars do not stand alone as dates or mintmarks but, rather, are part of history. Here goes:

- 1. 1794 Flowing Hair silver dollar. I selected this because above all other dollars, it was the one coin that was *de rigueur* in any nineteenth century collection of American silver dollars; to lack a dollar of this date was to fall short of the mark. In reinforcement of this, any catalogue containing a 1794 dollar was apt to single it out as a highlight. Moreover, and more importantly, it is the first silver dollar of our nation, our finest and highest denomination silver coin sent out to the world to demonstrate America's declaration of coinage independence. The Continental Congress denominated its own currency in *Spanish* dollars. Now with the 1794 dollar and its descendants, hopefully American silver dollars would soon be the coin of the realm. As if another distinction were needed, the 1794 is one of three silver dollars (the others are the 1804 and 1921 Mor-

gan) which has had a study written solely about it. Jack Collins' book, *1794: The History and Genealogy of the First United States Dollar*, now in preparation, is expected to be published soon.

- 2. 1795 Flowing Hair dollar with a silver plug at the center, produced at the Mint during the planchet preparation process. This plug was added to the planchet before striking, possibly to increase the weight or, as Roger W. Burdette and Kenneth E. Bressett have suggested,¹ to bring the fineness to the authorized government standard. As of 1993, the precise circumstances surrounding the coining of these plugged 1795 dollars are a first-class mystery.

- 3. 1797 9 Stars Left, 7 Right; Small Letters on Reverse silver dollar. I selected this as a representative of an elusive die variety in the silver dollar series, a coin which more often than not is seen in well-worn grades; that is, when it is seen at all, for it is indeed rare. And yet, the coin is not particularly expensive. Although it is nearly as rare as the 1794 dollar and perhaps a half dozen times rarer than an 1895 dollar, the 1993 edition of the *Guide Book* prices a VF-20 coin for \$3,500, certainly not a king's ransom. A spectacular specimen of this issue would be one in EF-45 or AU-50 grade. Here is a coin which the investor conditioned to believe "only MS-65 coins are worth buying" will surely ignore, a fact that will be appreciated by silver dollar connoisseurs who don't like the market competition from unknowing amateurs with fat wallets! The 1797 9 Stars Left, 7 Right, Small Letters on reverse silver dollar has never been the subject of an investment recommendation or discussion, to my knowledge.

- 4. 1804 silver dollar. More sentences, paragraphs, and pages have been written on the 1804 silver dollar than any other half dozen American coin varieties combined. During the late nineteenth century and early twentieth century any numismatic writer worth his salt felt moved to give an opinion or even write a position paper on this coin. Officials of the Mint felt likewise. The coin was an embarrassment, prized rarity, fraud, object of desire, or any one of many other things. In general, writers either loved the 1804 dollar or hated it; there seemed to be no middle ground. In 1962 the controversies permanently yielded to facts with the release of a book by Eric P. Newman and Kenneth E. Bressett, *The Fantastic 1804 Dollar* (which, incidentally, I think is one of the most masterful books in American numismat-

¹ Letters to the author, 1992.

ics). Since then we haven't read as many articles about the coin, and most cataloguers of 1804 dollars today quote or paraphrase the book. Just as the Hollywood cliché says, "Don't read your publicity—weigh it," all of the printed commentaries about the 1804 dollar, pro and con, have only served to increase its fame and market price.

- 5. 1836 Gobrecht silver dollar with name on base. Representing the first silver dollar minted for circulation in over 30 years, and having a very interesting story about the evolution of its design and the signature of the engraver, this coin is high on my list of numismatic favorites in the dollar series. This issue, too, has its mysteries, and the circumstances surrounding the production of these dollars in various die alignments have not been fully unravelled.

- 6. 1844 Liberty Seated silver dollar. I picked this date as an ideal representative of the early dates in the Liberty Seated series. The 1844 has one of the lowest mintages of its era and is the only dollar to have four elements ("quad stripes") in each shield stripe on the obverse; all others have three elements.

- 7. 1854 Liberty Seated silver dollar. I selected the 1854 because it represents a mystery of sorts. Although 33,140 were minted (about twice as many as the 1844), dollars of 1854 are rarely seen in any grade, and even worn examples were considered to be rarities only four years after they were struck. Other Liberty Seated dollars have their secrets, and I could have picked another date (such as 1855) as well, but the 1854 will do nicely.

- 8. 1870-CC Liberty Seated silver dollar. I like the Carson City Mint. Without honor in its own country at the time—local silver producers did not like the mint—the Carson City facility has a fascinating history and turned out a short but very illustrious series of dollars of this design, the 1870-CC being the first. I am not alone in liking the Carson City dollar of this date; it has been the subject of several excellent studies and discussions published in *The Gobrecht Journal*.

- 9. 1878 7 "over other feathers" Morgan silver dollar. This is an absolutely fascinating coin. Why in heaven's name would a bunch of Mint officials get wrought up about eight feathers in the eagle's tail being "wrong"? No one cared about feathers in the tails of innumerable coins minted before then, and no one has cared since. I wondered about this, and while writing this book, concluded that the number of tail feathers was not a primary concern at all at the Mint in 1878. In fact, I concluded that there is

no such coin as an 1878 "7 over 8 tail feathers." I renamed the variety "1878 7 over other feathers," for reasons mentioned in the section devoted to the issue. The whole story of the production of the 1878 dollar is almost beyond belief, and the result was a profusion of varieties that constitute either a numismatist's dream or nightmare, depending upon one's view. Anyway, the 1878 7/other tail feathers is a nice representative souvenir of all of the goings-on.

- 10. 1884-CC Morgan dollar. This issue should have been a rarity. Just 1,136,000 were minted in rough and ready Carson City, and by all rights most of these should have been melted long ago, and those that do exist should be in rather decrepit condition. However, would you believe that of this number, 962,638, amounting to 84.7% of the original mintage, were still in the hands of the Treasury Department after March 1964? It is true! And numismatists are richer for it. Now, anyone can own a should-be-rare 1884-CC! While on the subject of 1884 dollars in general, I should mention the mysterious, unexplained 1884 Philadelphia Mint "dot" varieties. Certainly, these are fascinating to contemplate, and yet a few years ago I had never heard of them.

- 11. 1903-O Morgan dollar. Go back in a time machine to the summer of 1962, when the 1903-O had far and away the highest price of any Morgan dollar in the *Guide Book*. At \$1,500 it outranked the 1893-S, 1895, and all others in price. Survey all of the leading dealers and collectors in the United States in 1962 and see how many ever owned an Uncirculated 1903-O. You will be lucky if you can find even 10 people who had done so. Here, indeed, is a great rarity. In fact, in 1941 when B. Max Mehl offered the William Forrester Dunham Collection the 1903-O was singled out as one of its prime rarities. Lo and behold! In October 1962 hundreds of thousands of 1903-O dollars, each as sparkling and brilliant as the day it was made, were brought to light from Treasury vaults. Now, like the 1884-CC, anyone can own one. What a story could be written about the 1903-O alone!

- 12. 1921 Morgan silver dollar. This coin was made from hastily prepared, poor relief dies and was produced in a hurry. The result is arguably (but not much argument is needed) the worst silver dollar ever to bear the imprimatur of our country. And, it is the most common of all Morgan dollars. Ugly + common = interesting? Perhaps yes, perhaps no. However, I have included it as an example of how

Uncle Sam shouldn't do things. Also, it was made under provisions of the 1918 Pittman Act, a blatant government give-away of millions of dollars to the silver mining interests.

• 13. 1922 High Relief Peace dollar. Proofs of this coin, well struck and made for presentation or numismatic purposes, were everything the High Relief 1921 Peace dollar should have been, but wasn't. Of course, the 1921 Peace dollar was the first of its kind, so perhaps I should have picked it instead. However, the 1922 also has an aura of mystery—which, in my opinion, always makes a coin more desirable. In fact, numismatists were not generally aware of the variety until the 1961! Collector (later, dealer) Lester Merkin dazzled and amazed onlookers when he displayed a piece from his collection at that time. As evidence that new discoveries are constantly being made, R.W. Julian revealed, after studying some earlier research notes in September 1992, that tens of thousands of 1922 High Relief Peace dollars were struck for circulation and then melted. Heretofore, numismatists assumed that only Proofs had been struck.

• 14. 1928 Peace dollar. This coin, a representative of the Low Relief Peace dollar design of 1922-1935, has the smallest mintage in the series, but it is neither the rarest nor the most expensive today. It, too, has a special story, and the story is about cornerstones. More about this later in the section on 1928 dollars.

• 15. 1979 Susan B. Anthony dollar. The public used this coin as a whipping boy for the perceived problems swirling about the administration of President Jimmy Carter. Although any coin collector who had earned a C grade in Numismatics-101 could have said that it would be mistaken for a quarter dollar due to its similar size, and although the image of Susan B. Anthony was chosen for purely political reasons, I still like it. Perhaps it was because I was there at the creation. I visited with Chief Engraver Frank Gasparro a number of times at the Mint and at special ceremonies, and I watched the coin design as it progressed from its earliest stages. Besides, a collection of the three dates and three mintmarks of Anthony coins—nine coins totally, if you don't count minor variations—looks rather nice when displayed in a holder. No, it is not the "King of American Silver Dollars," as the 1804 has been called, and is not even in the royal court. Perhaps it is like a cat peer-

ing through a distant door to see the king, or visiting the castle only to frighten a little mouse under the royal throne. Still, it represents the era of its creation and, in my opinion, enriches the dollar series.

• 16. Trade dollar. Which one to pick? I will leave this up to the reader. I've picked 15 coins; now it is your turn. The 1873 is the first trade dollar, and perhaps it should be considered. Or, what about the 1875-S over CC, the only overmintmark in the series? How about the 1878-CC, minted briefly and in small quantity, halted by Treasury order, and the vast majority officially melted? How about a common 1877-S with a few chopmarks, illustrating that it did its duty in China? Or, how about the rare and possibly legitimate 1884, or the sneakily-made, but exceedingly rare (just five are known) and quite desirable 1885? When I was a teenager contemplating the wide world of American numismatics, I wistfully imagined that possessing the unreachable 1884 and 1885 trade dollars would be the peak of satisfaction.

Ruminations

When I think of silver dollars I think of how they were actually used. While writing this book I came across a letter from Calvin Farrar, of Waterford, Maine, who was attending Bowdoin College in the same state, and whose tuition and expenses were being underwritten through the kindness of a Waterford physician, Leander Gage, M.D. A letter from Farrar to Gage, October 3, 1834, noted in part:¹

Dear Sir—

I take the liberty to direct this letter to you, supposing it will not be unacceptable though I have nothing particularly interesting to communicate. If however you should derive as much pleasure from its perusal as I receive in writing it, I shall esteem both my time and paper well spent— I am well aware that I have been very remiss in writing to you heretofore—more so than I ought to have been—but as I cannot possibly devise any excuse that would exculpate me in your opinion, I shall not offer any apology for past neglect, but I assure you I will endeavor to do better for the future.

I spent two years in college, and I am happy to state upon a retrospection of the past I have no reason to regret that I ever entered "old Bowdoin"— It has certainly been the happiest period of my life thus far—and I trust the privileges that I have enjoyed in the interim have not been wholly abused—or the "fields of knowledge" that have surrounded me wholly unexplored— The course of study pursued here has been on the whole pleasant and interesting. . . .

I am compelled to ask you for a "round" sum of money and I wish to do it in as handsome and polite a manner as I

¹ Copy of letter furnished to the author by the Bowdoin College Library, Brunswick, Maine.

am able. This round sum is no less than 75 "round silver dollars." Don't be surprised! For I will prove it out to you mathematically that I really need it which I suppose will be sufficient to insure me the sum specified—I shall prove it out to you by simple addition—you will see it as very easily done. . . .

The letter and money I shall be anxiously looking for—I shall expect to receive it in a week or fortnight, at most, after the reception of my letter—my love to Mrs. Gage and your children.

Respectfully yours—C. Farrar

Presumably, young Farrar received his dollars, not in paper money or by bank draft, but as requested—*silver* dollars. Were any of them United States silver dollars dated 1794? Or were they Mexican dollars? We will never know, but what fun it would be if we had a numismatic record of the 75 coins involved!

School and dollars mentioned together reminds one of the old nursery rhyme of unknown provenance:

A dillar, a dollar,
A ten o'clock scholar,
What makes you come so soon?
You used to come at ten o'clock,
And now you come at noon.

Early dollars of the type Calvin Farrar received, assuming they were Philadelphia Mint products and not Mexican dollars, were of the general class that newspapers and a later generation of numismatists called "dollars of our daddies," the dollars of long ago, the dollars from the mists of time before the Liberty Seated series, although the term has been used by some to cover Liberty Seated silver dollars as well.

George Washington as a lad is said to have thrown a silver dollar across the Potomac River or, perhaps more accurately, a Spanish-American eight-real coin across the Rappahannock. Unfortunately, this was long before the first Philadelphia Mint dollar, dated 1794, saw the light of day. However, there are indeed presidential connections with dollars, including a very nice 1836 Gobrecht which was included in a 1992 auction sale, and which specifically traced its pedigree to 1836, when President Andrew Jackson sent it to his sister.¹

While "presidential dollars" may exist, most surviving coins are more egalitarian; they were used by the common man. In the 1790s such coins as dollars of 1794 and 1795 circulated up and down the East Coast, the territory that constituted the limits of the

United States at the time. Unfortunately for later historians, newspapers did not print much in the way of articles on everyday life, and we can only suppose that the cash drawer of a wayside tavern in Vermont, or the leather purse of a ships' chandler on Pearl Street in New York City, jingled with a few silver dollars. One 1795 dollar and another dated 1800 found their way to the proprietor of Houck's Panacea (a patent medicine put up in greenish-hued glass bottles in Baltimore), who stamped his advertisement on them and coins of other denominations. "Prepared solely from vegetable matter," this potion is said to have been good for whatever ailed you.

One 1794 dollar traveled north to the Granite State, where the editor of *The New Hampshire Gazette*, December 2, 1794, was moved to comment as follows, in part:

"The *tout ensemble* has a pleasing effect to a connoisseur; but the touches of the graver are too delicate, and there is a want of that boldness of execution which is necessary to durability and currency."

(His comment confused the effects of die misalignment with those of shallow engraving; his final clause suggests that such coins would not long remain legible in circulation, and therefore be suspected of being worn to below acceptable weight.)

During this era it was popular for Englishmen to visit America, Britain's former colony. In autumn 1795, Sir Rowland Winn (later, Major the Lord St. Oswald) is said to have visited Philadelphia and to have obtained coins there, perhaps even going to the Mint itself, but this is not documented. Alternatively, he may have acquired them from an intermediary such as Captain Hawkins Whitshed, who, in 1796, sold United States coins to Sarah Sophia Banks (whose collection was divided in 1818 between the Royal Mint and the British Museum—which got her 1794 dollar).² What is known is that he added to his cabinet an assortment of United States coins from half cents to silver dollars, in the last category being two Mint State specimens of 1794 and three dated 1795. These augmented his collection, consisting primarily of ancient Greek and Roman and early British issues.

Years later, in 1964, a descendant brought these coins to Christie's auction rooms in London, where the British, ancient Greek, and other coins in the Lord St. Oswald Collection Sale attracted but passing notice, while all eyes were focused upon the two

¹ Catalogue of the James D. Brilliant and William R. Sieck Collections, Bowers and Merena, January 1992.

² Per an undated (received April 1992) letter from Jack Collins to the author.

stars of the sale, the pair of 1794s. Among those in attendance were American dealers Lester Merkin, Norman Stack, and James F. Ruddy.

While verified “adventures” of early silver dollars of the 1794-1803 era are few and far between, the existence of so many worn ones today attests to their popularity and use in the late eighteenth and early nineteenth centuries.

More Musings

Liberty Seated dollars, first minted in 1840, were fairly popular in American commerce up until early in the 1850s, when the price of silver rose to the point at which the coins became worth more in bullion value than face value, and many were melted or exported. The story of Liberty Seated dollars is rather checkered, but immensely interesting. Particularly fascinating to me is that not all of the facts are known today, that contemporary accounts differ, and that there is ample room for more research to be done. *The Gobrecht Journal* has provided a forum for many opinions over the years, and in reading back issues it is interesting to see how ideas and rarity estimates have changed through time. All researchers benefit from the efforts of others, and appreciation must be given to those who were willing to write the first paper on how rare a particular variety is, or to give its characteristics. Such initial efforts are, in effect, targets to shoot at. However, they must not be treated unfairly in light of later knowledge. I enjoy reading Dr. Montroville W. Dickeson's *American Numismatical Manual*, published in 1859, and Augustus Heaton's *Mint Marks*, 1893, and I am deeply appreciative that those authors took time from their lives to write books that laid the foundation for later generations of numismatists to build upon.

In the 1960s and 1970s, many dealers involved in Treasury releases (and other distributions, such as the Redfield hoard of Morgan and Peace dollars) kept much information to themselves and were not willing to share it. Many groups of coins overhung the market, and many dealers believed that the price would be hurt if it was known that 100 of this coin or 500 of that one existed. I have kept notes on silver dollars for quite a few years. Over a period of time, certain people who were reticent to speak earlier have become more free with their information. Because of them, I believe the data in this book are more valid than information printed in any other earlier text.¹

There will always be diverging interests. Collectors and dealers owning a particular coin often hope that it is as rare as possible, while an objective researcher endeavors to present the facts as they exist. Each of these perspectives must be considered.

Anyone can make estimates, and if they are given as that—estimates—and not facts, there is always the opportunity to change them in the future. Over the years I have written hundreds of auction and fixed price catalogues and have made countless thousands of statements. I do not hold that each one is accurate if reproduced today, for the dynamics of numismatics change, new information comes to light, and we all learn in the process. Without doubt, some of the finest auction catalogues ever written were turned out by the New Netherlands Coin Company in the 1950s and 1960s. And yet, I was reading one of these the other day and noticed a description for an 1836 Gobrecht dollar, and no mention was made of the die alignment, something that would be described now by anyone who had even the most rudimentary knowledge of Gobrecht issues. But, in the 1950s and 1960s it wasn't, and my catalogues didn't have this information either.

Coins as Part of the American Scene

Occasionally, an engraved or stamped Flowing Hair, Draped Bust, or Liberty Seated dollar comes on the market, attesting to its use as a sentimental remembrance in a wedding or birth observance, or, possibly, its utility as a pocket piece. Several have inscriptions pertaining to the Civil War and may have been carried by a Johnny Reb or his northern counterpart. The shame of it all in numismatics is that worn coins and counterstamped or engraved coins are often dismissed by “connoisseurs” who prefer glittering Proofs. I recall that once a gentleman from New Jersey approached me about forming a collection of colonial American coins in gem Uncirculated grade. I told him that with the exception of a few issues such as the 1773 Virginia halfpenny, 1795 Talbot, Allum & Lee cent, etc., such a goal was an impossibility. In fact, among certain Vermont coppers the finest known specimen might be only Very Good or Fine. He mumbled something about why would anyone want to collect such things, and pursued the matter no further.

Of course, there is nothing wrong with gem Proofs, and, supplies permitting (which they don't),

¹ For this reason, the figures in this book render obsolete those given in my 1979 book, *Adventures With Rare Coins*. I am always learning new things.

everyone should have a full set of Proof Liberty Seated dollars. However, the image that Proofs and high-grade Mint State coins exist of many dates often prevents collectors from enjoying what is available and is readily at hand, say a well-worn but very interesting common 1841. Perhaps it was carried on the battlefield in Shiloh, Chickamauga, or Manassas. Such pedigrees are forever unknowable, but it is certain that a coin worn down to the point of near smoothness has been to a lot of places and has done a lot of things. Our numismatic predecessors did not have delusions of grandeur when it came to high grades of coins. One of the lessons to be learned from examining auction catalogue listings of Liberty Seated dollars included in famous collections of the late nineteenth and early twentieth centuries is that grades such as Very Fine and Extremely Fine were the norm for many coins dated in the 1840s and for the mintmarked issues.

While it is popular to state that Morgan dollars went from coining press to bag to storage to melting pot (or to later release to delight collectors), the incontrovertible evidence of wear seen on many dollars of this type attests to their everyday use as coins of the realm, if primarily in the West. It is not to be overlooked that many citizens of the West did not like paper bills; people there preferred "hard money." Saloons, gambling parlors, bordellos, and other establishments of the mining camps used silver dollars far into the night, and the chances are that a well-worn 1881-S would spin many tales if it could.

It is fascinating to contemplate the stories that silver dollars hide between their surfaces.

Numismatic Narratives

In addition to historical tales about the largest American silver denomination, there are numismatic narratives to relate. For the present book I have secured the recollections of Harry Forman, Ruth Bauer, John Skubis, John Jay Ford, Jr., Robert Johnson, Jonah Shapiro, Leon Hendrickson, and others who were deeply involved.

As no one knows how many of a given Morgan silver dollar were melted under the Pittman Act of 1918, and as no one knows how rare a given issue is in MS-60, MS-63, or some other grade, just about anyone can issue predictions; sometimes the more fanciful, the better. As such, Morgan (and, to a lesser extent, Peace) dollars have been oil to grease the skids of investment newsletters. If someone were to run an advertisement in *Coin World* or *Numismatic*

News with this title: "10 Morgan Dollars Likely to Double in Price in a Year," he would get dozens of times more orders than if he were to place a notice soliciting orders for a study titled "Die Varieties of 1795 Silver Dollars." Such is life. The almighty dollar (pun intended) raises its head once again.

In the years since 1960, more has appeared in print in numismatic periodicals concerning Morgan and Peace dollars than about all silver denominations combined. Silver dollars have gone from the realm of the collector to the brokerage houses of New York City. At one time, bid and ask prices for 1881-S silver dollars were advertised on a daily basis in *The Wall Street Journal*! Bags of 1,000 worn silver dollars (by now thoroughly sorted through to remove anything numismatically desirable) are still traded as a commodity. I wonder if anyone ever looks in the bags. I am reminded of a long-ago audit at the San Francisco Mint (chronicled elsewhere in this book), when some "silver dollars" bagged at the mint years earlier turned out to be—would you believe—iron washers?

While I personally prefer reading about numismatic history to reading about silver dollar investment predictions, there is not the slightest doubt that tens of thousands or even more owners of Morgan and Peace dollars are in it for potential profit. Take away the game of investing, and they are out. Of course, even in the game of investing they might be out, but this is another point. Certainly one of the best-selling silver dollar books of all time is Les and Sue Fox's *Silver Dollar Fortune Telling*, which went through several editions through the mid-1980s.

Without doubt, fortunes could have been made if you had bought bags of Mint State silver dollars years ago, and probably fortunes can be made today if you buy the right coins. However, the greatest "fortune" is in the enjoyment of owning the coins themselves, an asset almost always overlooked by writers on the subject of investment.

How curious it is that the greatest profits in the silver dollar market have been made by *collectors* who have acquired their coins for numismatic purposes, with collecting foremost in their minds and investing a distant second consideration. On an early page of *Silver Dollar Fortune Telling*, 1985 edition, is a picture of an 1895 Morgan which cost \$38 when Herbert Bergen, a past president of the American Numismatic Association, bought it in 1946. "It was next sold to silver dollar collector Kent Brennan of Spokane, Washington at auction in 1979 for \$34,500."

A nice profit this, and I congratulated the late Herb Bergen, whom I knew quite well, on the remarkable returns from his coin "investments." However, Herb was not an investor. Instead, he was a collector, and a very serious one. Even when he could no longer travel on his own, he was sufficiently involved in numismatics that he would have his grandson drive him from his home in Fullerton, California to my office (in Los Angeles at the time) so we could "talk coins." Herb collected just about everything from colonials to gold, with a special interest in die varieties of early quarter dollars. In our many discussions, I never heard the word *investment*. And yet, Herb's *collection* far outranked just about every investment one could compare it to on Wall Street, in the real estate market, or just about anywhere else.

The point of this is that a fine, high-grade, historical, and intellectually stimulating collection has the potential of being a fine financial investment as well, especially if you go about acquiring coins by using *numismatic knowledge*. I could go on and on about the virtues of building a numismatic library, learning about coins, etc., but this is not the place.

It is interesting to read about coin prices and investment, and this area furnishes a separate possibility for enjoying silver dollars, especially in a rising market. To this end, I have included in the present book a study of price movements of various silver dollars and trade dollars at five-year intervals from their time of issue to the present. These figures have been supplemented with ample material from auctions, advertisements, and dealers' price lists.

CHAPTER 2

Value and Rarity Ratings

by Q. David Bowers

Market Values and Rarity Ratings

Among the data I give for each variety of silver dollar listed in this book, there are two variables: (1) market values and (2) rarity estimates.

Market Values

Market values in the present text are compiled from various sources. Most prices from about 1860 (when coin collecting began to become popular in America) through the early 1930s are taken from prices realized in auction sales and appearances in dealers' advertisements and catalogues. There were no reliable, regularly issued valuation guides. Prices tended to be very erratic. In 1880, a Proof 1873 Liberty Seated dollar could be valued by one dealer for \$1.25 and another for \$2. In 1900, a Proof 1881 trade dollar would be valued by one seller at \$1 and another at \$1.50, while a third would list a buying price of 50¢ (at the time, trade dollars were worth only melt-down value, not face value). Market prices given for pre-1930 intervals in my charts are, for the most part, approximations.

For market prices from the early 1930s to date, sources of information have included the *Standard Catalogue of U.S. Coins* (published from 1934 through 1958 by Wayne Raymond and others), *A Guide Book of U.S. Coins* (published from 1946 to date; the first edition bears a cover date of 1947), auction prices realized (from dealers' catalogues and their prices, Krause Publications' series titled *Auction Prices Realized*, and the earlier *Rome's Prices Realized*), *The Coin Dealer Newsletter* (1963 to date), market value guides published in *Numismatic News* and *Coin World*, and dealers' price lists and advertisements. There has been no single source of information relied upon. The prices listed take into consid-

eration many listings observed.

Although prices are charted at five-year intervals such as 1935, 1940, 1945, etc., ample auction prices realized listings and dealers' advertisements are given for many intermediate periods. At no time in American numismatic history has there been a standard price at which all specimens of a coin in a given grade have been bought or sold. Indeed, as will be seen by comparing contemporary auction records and advertisements, prices varied, often by a great amount. In addition, such listings from auctions and advertisements will give you a window on the coin market as it developed and changed. For example, in the Peace dollar series you will learn, as I did when I first read the data, that the 1923-D was considered to be a rarity, then the 1924 and 1925 were—long before the 1934-S was recognized as a key date. And, what a surprise it was when I learned that early in the present century the rarest of all Morgan dollars was—not the 1892-S, not the 1893-S, not the 1895—but the 1889-S, a coin today considered fairly common! In fact, at one time a Mint State 1889-S was worth *twice as much* as an Uncirculated 1892-S and 1893-S and Proof 1895 *combined*!

My objective in the price charts is to list the average market price a knowing buyer would pay a knowing seller to obtain a nice quality example of the grade listed at the time interval indicated, and to show how prices and market preferences have varied over a long period of time.

Grading

In the nineteenth century there were no grading standards. One person's Extremely Fine might be equivalent in quality to another's Uncirculated. Minute distinctions were not made. A coin was sim-

ply listed as Uncirculated. If it was particularly nice, it might be called choice or a gem. However, there was no consistency. Proofs were simply listed as Proofs.

In the mid to late nineteenth century, grading was impressionistic: Proofs were described as "fine" or "very fine," high-grade business strikes were catalogued as Uncirculated or sometimes "nearly Proof," and below that, "barely circulated," "VF," "Fine," "ordinary," etc. "Good" sometimes meant "nice" or "average," while "Fine" meant above average; because of this, descriptions of "Good" and "Fine" from catalogues of the 1860s cannot be translated to the specifically defined Good and Fine grades we know today.

Grading continued in a haphazard manner until the late 1950s and 1960s, when rising market values placed great premiums upon small differences in grade levels. Books by Brown & Dunn (*A Guide to the Grading of United States Coins*, 1958) and James F. Ruddy (*Photograde*, 1970) laid the framework for *Official Grading Standards for U.S. Coins*, published in 1977 for the American Numismatic Association. This guide adopted a 1 to 70 point numerical scale based upon that given by Dr. William H. Sheldon in his 1949 book, *Early American Cents* (a system based on market price levels, originally devised for 1794 cents and later extended for use on one-cent pieces of the 1793-1814 years). Over a period of time and the course of publishing four editions, the ANA expanded the Sheldon scale to include many intermediate numbers, including the use of every number from MS-60 to MS-70, such as MS-61, MS-62, etc.

Notwithstanding such "precision," descriptions of coins were adjectival, and those seeking to fix the grade of a given coin had to determine what "a few marks" meant, for example. Grading ran amok in the 1970s and early 1980s, and advertisements offered coins not only in MS-61, MS-62, etc., but sometimes with plus and minus signs, such as MS-63+++ (whatever that means). There was no consistency in the application of such nomenclature. The best-known grading service at the time was the American Numismatic Association Certification Service (ANACS), and even it was apt to vary widely. Dealer Harvey Stack displayed a gold dollar that was sent to ANACS on one occasion and was graded AU-50; but on a return trip to the same service a month later it came back at MS-60, a difference of 10 points, and an elevation from a worn grade to an Uncirculated one. My own firm submitted a silver dollar three

times and received three different grades for it. Because of this, price-grade data prior to 1986 are very unreliable.

In 1986 a change occurred. Interpretations were tightened. For starters, the American Numismatic Association Board of Governors announced on February 20, 1986 that coins officially graded earlier by ANACS as MS-65 were now, under new, stricter interpretations, often in the MS-60 to MS-63 range. The Professional Coin Grading Service (PCGS) was founded in the same year by David Hall, and used interpretations stricter than those used by ANACS and most collectors and dealers earlier. To endeavor to maintain consistency, PCGS established a grading reference collection. In 1987, the Numismatic Guaranty Corporation of America (NGC) was founded by John Albanese, and also used conservative interpretations. Differences of opinion continued to occur, but they were not as widespread as earlier. As a result, data from 1986 to date are more dependable.

For market values 1986 to date I use more detailed grading distinctions than I do for earlier years.

Rarity Ratings

Put simply, rarity ratings are educated guesses as to how many specimens of a given coin exist in a given grade category. I base my estimates on a wide variety of sources, including auction appearances, grading service population reports, dealers' price lists, opinions of consultants to this book, the number of coins I have personally seen, etc.

Rarity ratings change over a period of time as more coins are examined and more specimens come to light. In 1974 a blundered date 1872 business strike Liberty Seated dollar was first described in numismatic literature. No one had ever heard of it before, although regular 1872 Liberty Seated dollars were common. As time went on, more coins were examined. Now, in the early 1990s, the 1872 blundered date dollar is common, and it is realized that probably about a third of all known 1872 coins have this feature!

Similarly, in 1961 *Coin World* asked me to verify a new discovery: a 1938-D Buffalo nickel with the D mintmark over an S. No one had ever heard of this variety until one turned up in the hands of a New York numismatist. The 1938-D/S was publicized and was considered to be a major rarity. More and more were found, and it became only "scarce." Today, thousands have been identified, and the variety is common.

Of course, in numismatics some varieties have remained rare. So far as I know, no new specimens of the 1884 and 1885 trade dollar have been found since 10 of the 1884 and five of the 1885 came to the attention of collectors in 1907-1908.

Rarity cannot be absolute, except in the case of coins in which only a few were struck, and that number is known, and each specimen can be specifically identified today. Few if any dollars fit into that category. Instead, we are confronted with a variety of guesses, estimates, proclamations, theories, etc.

A question arises as to whether "stories" should be printed. For example, *Walter Breen's Complete Encyclopedia of U.S. and Colonial Coins* states that a bag of 1,000 Mint State 1872 Liberty Seated dollars came to light in the early 1960s. However, this cannot be verified today, even by Walter H. Breen, who recalled that he heard of it years ago from Harry Forman (who, in turn, told me recently that he knew of only a few dozen single Mint State coins, not a bag). I mention the bag in this book, but also mention that it is unverified, and tell the story why. I consider this better than completely overlooking the 1,000 coins described in Walter H. Breen's *Encyclopedia*, for if I overlooked them, then certainly some later writer would say: "Bowers' book states that a couple hundred Mint State 1872 dollars exist, to which must be added the 1,000 mentioned by Walter H. Breen, for a total population of 1,200," or something in this vein.

Similarly, Stephen K. Nagy told me that "hundreds" of 1801-2-3 Proof novodel dollars (called "restrikes" during this lifetime) were minted. If anyone should know, he should—as he and his partner, Capt. John W. Haseltine, handled many "fancy pieces" secretly produced at the Mint years earlier. However, in the absence of the appearance of hundreds of such 1801-2-3 Proof novodels on the market over the last century, this commentary is not included in the estimates I give of the population of these issues today.

Weimar W. White, a contributor to this book, commented as follows:¹ "[Calculations are preferable to] hearsay evidence. It is a terrible injustice to place a stigma on a coin such as the 1872 dollar by suggesting (as some do) that 1,000 were released, and not have concrete evidence that such a bag ever existed. This kind of stigma affects collectors' attitudes toward the coin, and it may not deserve it."

In my own experience I can cite an instance in the late 1950s when a well-known dealer told me that he had personally seen a holding of over *one million* 1934-S Peace dollars in storage at the San Francisco Mint. I made a note of this at the time and, since, have mentioned it in several articles. In the course of research for the present book, I re-interviewed the same dealer, and he had no recollection of having made such a comment, and stated forthrightly that he had never seen such a hoard! Apparently, in the late 1950s, it made a "good story."

While a number of "good stories"—many of them doubtless true—are given in the text, the population estimates are not based upon unsubstantiated stories or rumors, but are derived from what I consider to be facts. Thus, my estimate of the surviving number of Mint State 1872 dollars does not include the spectral bag of 1,000 coins just mentioned. Nor, as noted, do my estimates of the number of 1801-2-3 Proof novodel dollars known include the phantom "hundreds" mentioned by Stephen K. Nagy. Still, some of these stories may come true someday. Over a long period of years I have witnessed first-hand a number of unbelievable hoards, and, in fact, have sold some of them. I recall handling a group of four gem 1876-CC twenty-cent pieces from a Baltimore bank vault from a group of eight found there; hundreds of prooflike 1879, 1880, and 1881 gold dollars from a similar source; and, of course, the hitherto unbelievable release of 1903-O dollars in 1962.

Rarity vs. Certification Reports

Some modern researchers prefer to base their opinions primarily upon certification service population reports and auction data, whereas I tend to use these but to take them with a grain of salt, sometimes with a whole shaker full. (More about auction data later.)

With regard to population reports published by NGC and PCGS, there are many issues of which just a fraction of those known have been certified. In fact, in 1992, PCGS founder David Hall stated that in his opinion, just 5% to 10% of the gems of certain Morgan dollar issues had been certified. As gems are more likely to be submitted for certification than are lower-grade coins, in his opinion even tinier percentages have been graded of lesser pieces.

Further, population report data are often skewed by the resubmission of the same coins. I recently

¹ Letter to the author, April 3, 1992.

purchased a rare Mint State Liberty Seated dollar that was submitted four times to a grading service before I got it. Thus, the population reports for that service show four specimens instead of one. Bruce Amspacher told me of an 1854 silver dollar that had been submitted to PCGS six times. Andrew P. Harris, M.D., advised me of a single rare Uncirculated 1878-CC trade dollar that appears in a grading population report as four coins.

As further examples of this, I mention a recent edition of the *PCGS Population Report*, which informed its readers that no specimens of the 1801 Proof "restrike" (novodel) dollar had been certified, that *five* Proof-64 specimens of the 1802 Proof "restrike" (again, novodel) had been slabbed, and that one Proof-65 1803 "restrike" (again, novodel) dollar had been checked. It is hard to make much out of these data, in my opinion.

A West Coast dealer told me of resubmitting a 1916-D dime to a leading grading service over two dozen times until *finally* it came back graded MS-65. A Massachusetts dealer told of a 1796 half dollar which was graded AU-53 when he owned it, but a year or two later, after multiple resubmissions to a grading service, it "improved" to MS-62.¹

Notwithstanding such resubmissions and other inconsistencies, it is probably the case that when a large number of coins are studied over a spread of different dates or varieties, the emerging patterns are relevant. In the following study, use has been made of comparisons based upon the numbers of Liberty Seated and Morgan dollars certified in higher grades, for example. In series in which most pieces were originally sold to collectors, and few to the general public, NGC and PCGS data are the most valuable. Examples include Proof Liberty Seated, Morgan, and trade dollars.

Grading was, is, and probably always will be, subjective. However, in a *relative* sense the population reports are a very useful guide, as long as the population is not too small and also if the coins have sufficient market value, especially if they are worth \$100 or more (lower value coins in many instances are not submitted, as certification can cost \$10 to \$20 or more per item). When thousands of coins are involved—such as with many Morgan silver dollar issues—some excellent conclusions can be drawn. If, for example, 10,000 specimens of Coin A have been

certified in MS-63 grade, but just 2,500 of Coin B in like grade, it is a sure bet that Coin B is the scarcer of the two, and it is probably also safe to say that Coin B is about four times more elusive.

Continuing the above example, it is dangerous, however, to conclude that 10,000 (or even 20,000) represents the entire population of Coin A. There may be dozens or hundreds of bags hidden away. Further and as noted, if a coin is of low value, certification service reports have little meaning. Relatively few EF, AU, or low-grade Mint State 1921 Morgan dollars have been sent in for certification, as certification costs nearly as much as the coins are worth.

Still further, it has been my observation that higher value Mint State and Proof coins held in private collections are often (in old-time holdings, *usually*) not certified, whereas those appearing in modern auction sales are likely to be certified by a grading service. As an example, as of September 1992, none of the five known 1885 trade dollars had been certified and, as noted earlier, no Proof restrike 1801 dollars had entered the portals of NGC or PCGS.

Auction Data

In the instance of great rarities—examples include the 1804 and 1870-S dollars and the 1884 and 1885 trade dollars—many if not most have changed hands publicly through the auction route. In contrast, expensive but not super-rare coins—the 1879-CC and 1889-CC Morgan dollars are examples—change hands mainly through private transactions. I estimate that of a given 100 Mint State 1879-CC dollars which change hands, only 5 or 10 appear in auction catalogues.

The farther we go down the rarity scale and the more common a coin is, the smaller is the percentage changing hands across the auction block. The 1881-S dollar is very common in Mint State, and each year tens of thousands change hands. Relatively few are sold via the auction route.

In general, auction data are skewed to make common coins appear rarer than they really are, and rare coins appear more plentiful. As an example, a survey of leading auction sales of Morgan dollar collections reveals that just about every cabinet to be sold contained one (not 100 or 1,000) 1881-S dollar

¹ Weimar W. White suggests that over a large number of coins submitted over a long period of time, differences caused by resubmissions of a single coin tend to average out. He cites an article, "A Comparison of PCGS and NGC Population Reports," by David J. Locker, *The Numismatist*, September 1991, as a concurring opinion on the same subject. Letter to the author, May 3, 1992.

and just one Proof 1895. The former coin exists by the millions, and of the latter probably only 500 or 600 exist. If I were to compile listings of the contents of every significant Morgan dollar collection sold at auction during the last century, 1881-S would appear more times than 1895, but would not appear to be *thousands of times more common*, as it really is.

Auction data are useful, but only as a part of a broad-based market research program.

Differing Opinions

In particular, in the Liberty Seated series estimates of the number of 1859-O and 1860-O dollars released in the late 1950s and early 1960s, and the number of these two varieties known today, drew varying opinions among previous writers and students of the series who communicated with me during the research stages of this book. Weimar W. White believes that in total just 1,000 of these were released, divided into about 300 1859-O and 700 1860-O,¹ while others (cited in the text) place the numbers at 3,000 and 6,000 respectively.

In my opinion, those who wish to base their estimates solely or primarily upon the number of coins certified since 1986 (when the encapsulation of coins began with PCGS) and auction appearances should do so, and those who wish to use a broader base should do this. I believe that only a fraction of the coins in existence have been certified and/or have appeared in recent auctions. This is particularly true of lesser value coins and coins in grades below about MS-63. Of the rarities and higher value coins that have appeared in auctions during the past several years, many have been certified. Weimar White pointed out that in 1991, 39% of the Mint State Liberty Seated dollars auctioned and 39.8% of the Proofs were certified.² Probably, this percentage will increase as years go on.

Further, surveys conducted by the Liberty Seated Collectors Club may give interesting *relative* figures for rarity, but not absolute numbers. Although my company, Bowers and Merena Galleries, Inc., has encouraged its clients to join the L.S.C.C. and other organizations, in practice relatively few do. I estimate that of a given 100 clients who buy Liberty Seated dollars from us, fewer than 10 belong to the L.S.C.C. Similarly, we have sold numismatic refer-

ence books to tens of thousands of buyers over the years, of whom probably no more than a few hundred have seen fit to join the Numismatic Bibliomania Society, an active group dedicated to the enjoyment of coin periodicals, books, and ephemera.

Opinions of collectors and dealers are apt to vary on the subject of rarity, and to vary widely. I cite one representative instance, that of the rarity of the 1845 Liberty Seated dollar in worn grades. In his 1985 book, *The Liberty Seated Dollar 1840-1873*, Weimar W. White suggests that "under 250" (to use his exact words) 1845 silver dollars exist. Dale R. Phelan, another experienced observer of the Liberty Seated scene, states that the number is "more like 1,500 to 2,000+."³ My own estimate, as given in this book, is that 900 to 1,400 exist in VF-20 to AU-58. I do not give an estimate for lower circulated grades, from Fair-1 to Fine-15, but probably several hundred exist at those levels. The point is that knowledgeable, well-intentioned people can have widely differing opinions.

The present book provides a target to shoot at, and rarity estimates, if found to be incorrect, can be changed in future editions.

Rarity Terminology

How rare is it? With "How much is it worth?" this is one of the two most asked questions in numismatics.

Answers differ. Such adjectives and phrases as "common," "scarce," "rare," and "very rare" are apt to vary in meaning from one user to another. Moreover, what is "rare" in one series may be "common" in another.

For example, among Morgan silver dollars, there are thousands of Mint State 1879-CCs known. The General Services Administration sales of the 1970s distributed 4,000 coins from U.S. Treasury holdings, and, in addition, thousands of others exist, perhaps about 10,000 totally. However, any cataloguer of a collection of Morgan dollars would probably call a Mint State 1879-CC a *rare* coin. Few would dispute this.

On the other hand, among Hard Times tokens of the 1832-1844 era there is a variety catalogued as Low-54 (from Lyman H. Low's 1900 guide to the series), bearing on the obverse a kneeling slave, and

¹ Letter to the author, April 2, 1992.

² Letter to the author, May 17, 1992.

³ Letter to the author, April 19, 1992.

the inscription AM I NOT A WOMAN & A SISTER. Perhaps 500 to 1,000 of these are known. In absolute terms, Low-54 is at least 10 times more elusive than a Mint State 1879-CC dollar. Even so, within the context of the Hard Times token series, the Low-54 is *common* or, at best, *scarce*. It certainly is not *rare* or *very rare*.

Clearly, adjectival terms are not very useful, except to experts who probably already know whether a given issue is rare.

In *The Macmillan Encyclopedic Dictionary of Numismatics*, Richard G. Doty commented as follows:¹

Unfortunately, there is no universally agreed-upon formula for such a [rarity] scale. Most often, Europeans use one with symbols, ranging from C (common) through R-1 (rare) to R-8 (extremely rare—only two or three known). Americans, on the other hand, use a variety of scales; one of the best-known combines symbols and numbers. . . . The marriage of rarity and price is a complex one. Rarity plays a part in the sense that a rare coin is apt to be worth more than a familiar coin in the same condition and in the same series. . . .

The interjection of rarity information in a price list or auction catalogue makes fascinating reading. In the 1950s and 1960s, John Jay Ford, Jr. was fond of using a series of R letters—one R for rare and four Rs for extremely rare—to indicate the elusiveness of a particular coin, a system based upon nineteenth century European practice. There is no doubt that a commanding, indeed imperious, RRRR after a lot description tended to compel action on the part of the bidder, perhaps like a tiger growling GRRRR! However, the reader didn't have a clue whether RRRR meant that 2 were known or if 20 existed.

Early Scales for Rarity

Over the years a number of numismatic writers have proposed scales to denote rarity. A comprehensive list of these efforts would occupy many pages. Those given here are a sample of the rarity scales used past and present in the American series. I begin with selected early scales from the nineteenth century.

• **Joseph J. Mickley (July 1858):** A pamphlet published by Philadelphia numismatist and antiquarian Joseph J. Mickley, *Dates of United States Coins, and Their Degrees of Rarity*, contained an early effort at propounding a rarity scale for U.S. coins. The scale was elementary and consisted of these letters: C = Common, R = Rare, and V.R. = Very Rare.

For silver dollars, these ratings were given: 1794 R, 1795 to 1803 C, 1804 V.R., 1840 to 1850 C, 1851 and 1852 V.R., 1853 C, 1854 R, and 1855 to 1858 C. In July 1858 when the study was published, Mickley could not have known that the 1858 Liberty Seated dollar would prove to be a Proof-only date; no coins would be made for general circulation.

• **Montroville Wilson Dickeson, M.D. (1859):** Dickeson's book, *The American Numismatical Manual*, which appeared in print in 1859, was the first widely-circulated popular book on coin collecting published in America.² It was perhaps fitting that it should also be the first to include a rarity scale. Dickeson's scale was simple and consisted of three dots: • = scarce, •• = rare, and ••• = very rare.

In the early silver dollar series, Dickeson gave the following ratings: 1794 •••, 1795 •, 1796 •, 1797 ••, 1798 (no rating; hence, not rare), 1799 (no rating), 1800 (no rating), 1801 •, 1802 •, 1803 •, 1804 ••, 1805 (*sic*; Dickeson saw this date listed in a Mint report, but did not know that it referred to Mexican dollars on hand, not new U.S. dollars coined) •••.

For later dollars, Dickeson gave these estimates of rarity: 1836 •••, 1838 •••, 1839 •••, 1840•, 1841-3 (no ratings), 1844 ••, 1845•, 1846•, 1847 (no rating), 1848 •, 1849•, 1850•, 1851 •••, 1852 •••, 1853 •, 1854 ••, 1855 •, 1856 •, 1857 •, and 1858 •.

• **W.C. Prime (1861):** In *Coins, Medals, and Seals*, published in 1861 by Harper & Brothers, New York City, W.C. Prime used a rarity scale from 1 (the most plentiful) to 6 (greatest rarity). The author advised this:

The table of comparative rarity is based only on six orders. It is of course impossible to distinguish all coins exactly by these six numbers. Thus the dollar of 1804 might well be ranked as more rare than almost any other of the coins. But the table will serve the purposes of the collector without more minute distinctions.

In the early silver dollar series, Prime published the following ratings: 1794 Rarity-6, 1795 R-2, 1796 R-2, 1797 R-2, 1798 R-1, 1799 R-1, 1800 R-2, 1801 R-2, 1802 R-2, 1803 R-1, and 1804 R-6.

For later dollars, Prime gave these estimates: 1836 R-6, 1838 R-6, 1839 R-6, 1840 R-3, 1841 R-2, 1842 R-2, 1843 R-2, 1844 R-2, 1845 R-2, 1846 R-2, 1847 R-2, 1848 R-2, 1849 R-2, 1850 R-2, 1851 R-6, 1852 R-6, 1853 R-2, 1854 R-4, 1855 R-2, 1856 R-2, 1857 R-1, 1858 R-5, and 1859 R-1.

• **Sylvester S. Crosby (1875):** Crosby's *The Early Coins of America*, published in 1875, included a rar-

¹ Published by Macmillan Publishing Co., New York, 1982, p. 276.

² Two later editions of this book were published in 1860 and 1865 under the slightly revised title, *The American Numismatic Manual*.

ity scale ranging from C (common) through R (rare), plus R-2, R-3, R-4, R-5, and the highest degree, R-6. The ratings were not otherwise defined. The same scale was later used by Henry C. Miller and Hillyer C. Ryder in *The State Coinages of New England*, 1920.

• **Lyman H. Low (1900):** Lyman H. Low in his work, *Hard Times Tokens*, published in 1900, used this scale: V.C. = very common, C = common, N.C. = not common, S = scarce, followed by Rarity-1 through Rarity-8, with R-8 being the highest degree.

The pioneer scales for rarity used by Dickeson, Prime, Crosby, Low, and others in the nineteenth century were useful in their time, as *within a given series* they gave a *relative* idea of rarity. Thus, the reader of Prime's work obtained the useful information that a 1794 dollar was notably rarer than a 1797, and the 1797 in turn was rarer than a 1798. Still, there was no way of knowing whether one 1794 dollar existed, or 100, or 1,000. All the reader knew was that it was high in the order of rarity.

Modern Rarity Scales

The twentieth century has seen numerous rarity scales proposed and used. Among these are the following:

• **Adams and Woodin (1913):** In *United States Pattern, Trial and Experimental Pieces*, published in 1913, Edgar H. Adams and William H. Woodin proposed a scale for rarity that employed definite quantities:

Rarity-1 = 501 or more known to exist, R-2 = 301 to 500, R-3 = 101 to 300, R-4 = 76 to 100, R-5 = 51 to 75, R-6 = 36 to 50, R-7 = 26 to 35, R-8 = 21 to 25, R-9 = 16 to 20, R-10 = 13 to 15, R-11 = 9 to 12, R-12 = 6 to 8, R-13 = 4 to 5, R-14 = 2 or 3, and R-15 = unique, just one specimen extant.

With the Adams-Woodin scale a numismatist had specific quantitative information. An R-14 coin was an object of great rarity, as just two or three were known. If a specimen was offered at auction, the collector would do well to "reach" for it, knowing that it might be years until another became available. On the other hand, a pattern coin designated as R-5, if offered in an auction, would not have compelled such urgency. Unfortunately, many of their ratings were guesswork; others—most of all in the R-10 to R-14 range—were inflated, deliberately, in a scheme aimed at their prime customer, Waldo C. Newcomer.

• **Dr. William H. Sheldon (1949):** In *Early Ameri-*

can Cents, published by Harper & Brothers in 1949, Dr. Sheldon gave the best exposition of rarity seen in any reference work to that point. "One of the most neglected questions in the literature on cents is that of rarity," he wrote, continuing as follows:

Competent students in the field have always been hesitant to express an opinion on the rarity of a die because they were aware of how easy it is to be mistaken. No one can ever know for certain just how many examples of a particular variety exist, since there is no way of canvassing the entire supply of cents in one lifetime. Also, there is the possibility of a new "find," in which a whole keful of a particular variety may turn up. . . . Rarity will remain to some extent a matter of opinion, subject to revision in the light of further experience, and ratings on rarity should be accepted in charity for what they are, namely, an author's best guess on the subject. . . . The Scale for Rarity which I use is a simple 8-point one. . . .

Dr. Sheldon's Scale for Rarity is as follows: R-1 = common, R-2 = not so common, R-3 = scarce, R-4 = very scarce (population estimated at 76-200), R-5 = rare (31-75), R-6 = very rare (13-30), R-7 = extremely rare (4-12), and R-8 = unique or nearly unique (1, 2, or 3).

The Sheldon Scale became the most accepted rarity shorthand in American numismatics. Still, it had its problems. When applied to the series of trade dollars, for example, both the 1884 and 1885 issues would be listed as R-7 in the Sheldon Scale, even though there are 10 known 1884s and just five 1885s. The only known 1870-S \$3 coin, the Eliasberg Collection specimen now in the Harry Bass Foundation Collection, would be described as simply R-8 under the Sheldon Scale. However, there is a world of difference between being unique and being one of three known, and yet R-8 applies to both categories.

In a letter, Dale R. Phelan pointed out the inadequacy of the Sheldon Scale by noting that the 1913-S half dollar, the 1845 Liberty Seated dollar, and the 1921 Morgan dollar are all R-1 per the Sheldon rating; and yet perhaps 1,000 or so 1845 dollars exist, multiple thousands of 1913-S halves, and millions of 1921 dollars.¹

• **Other rarity scales:** Various authors have proposed other rarity scales. Examples include the scale from R-1 to R-11 suggested by Grover C. Criswell in his book, *Confederate and Southern States Currency*; Wayne Miller's R-1 to R-12 scale used in his *Morgan and Peace Dollar Textbook*; the R-1 to R-10 scale given by David W. Akers in *A Handbook of 20th Century United States Gold Coins*; and the R-1 to R-10 scale (different from the Akers scale) used by George and

¹ Letter to the author, April 18, 1992.

Melvin Fuld in *U.S. Civil War Store Cards*.

Several other authors have proposed modifications of the Sheldon Scale by adding intermediate adjectival-numerical designations. *United States Pattern, Experimental and Trial Pieces*, by Dr. J. Hewitt Judd, 1959, suggested this: R-1 = over 1,250, R-2 = 501-1,250, R-3 = 201-500, R-4 = 76-200, R-5 = 31-75, Low R-6 = 21-30, High R-6 = 13-20, Low R-7 = 7-12, High R-7 = 4-6, R-8 = 2 or 3, and Unique. Variations on this theme were later employed by Don Taxay in *Scott's Comprehensive Catalogue and Encyclopedia of U.S. Coins*, by Don Kagin in *Private Gold Coins and Patterns of the United States*, and by others.

M.H. Bolender, in his 1950 opus, *The United States Early Silver Dollars from 1794 to 1803*, used an eight-point scale, but did not state what each step meant. Presumably, it was a copy of the Sheldon Scale; but then, Bolender called one variety Rarity-6, although he had seen only a single example.

The Universal Rarity Scale

I propose the Universal Rarity Scale—one that is mathematically sound in its progression and relationship among its divisions, and one that will be applicable to any series. Stated simply, it is a geometric progression of numbers, rounded off for convenience in use, with each category containing about twice as many members as the preceding category. The proposed Universal Rarity Scale uses a simple geometric progression of numbers, as 1, 2, 4, 8, 16, 32, etc. (see the rightmost of each number pair):

PROPOSED SCALE DRAFT:

Universal Rarity Scale-1 = 1 known, unique
 URS-2 = 2 known
 URS-3 = 3 or 4
 URS-4 = 5 to 8
 URS-5 = 9 to 16
 URS-6 = 17 to 32
 URS-7 = 33 to 64
 URS-8 = 65 to 128
 URS-9 = 129 to 256
 URS-10 = 257 to 512
 URS-11 = 513 to 1,024
 URS-12 = 1,025 to 2,048
 URS-13 = 2,049 to 4,096
 URS-14 = 4,097 to 8,192
 URS-15 = 8,193 to 16,384
 URS-16 = 16,385 to 32,768
 URS-17 = 32,769 to 65,536
 URS-18 = 65,537 to 131,072
 URS-19 = 131,073 to 262,144
 URS-20 = 262,145 to 524,288

URS-21 = 524,289 to 1,048,576
 URS-22 = 1,048,577 to 2,097,152
 URS-23 = 2,097,153 to 4,194,304
 URS-24 = 4,194,305 to 8,388,608
 URS-25> = same progression

The suggestion was made to me by John Kroon, and seconded by J. Alan Bricker, that the Universal Rarity Scale could be simplified by rounding off the numbers in higher categories. For example, URS-16 could be 16,000 to 31,999, URS-17 could be 32,000 to 64,999, etc. While this takes the URS away from precise mathematics, it makes it easier to use. Thus, I give the final form of the URS as follows:

THE UNIVERSAL RARITY SCALE

Universal Rarity Scale-0 = None known
 URS-1 = 1 known, unique
 URS-2 = 2 known
 URS-3 = 3 or 4
 URS-4 = 5 to 8
 URS-5 = 9 to 16
 URS-6 = 17 to 32
 URS-7 = 33 to 64
 URS-8 = 65 to 124
 URS-9 = 125 to 249
 URS-10 = 250 to 499
 URS-11 = 500 to 999
 URS-12 = 1,000 to 1,999
 URS-13 = 2,000 to 3,999
 URS-14 = 4,000 to 7,999
 URS-15 = 8,000 to 15,999
 URS-16 = 16,000 to 31,999
 URS-17 = 32,000 to 64,999
 URS-18 = 65,000 to 124,999
 URS-19 = 125,000 to 249,999
 URS-20 = 250,000 to 499,999
 URS-21 = 500,000 to 999,999
 URS-22 = 1,000,000 to 1,999,999
 URS-23 = 2,000,000 to 3,999,999
 URS-24 = 4,000,000 to 7,999,999
 URS-25 = 8,000,000 to 15,999,999
 URS-26> = same progression

Application of the Universal Rarity Scale

For the numismatist, the Universal Rarity Scale permits accuracy not hitherto known. For example, an 1884 trade dollar (10 known) is URS-5, while an 1885 (5 known) is URS-4. The 1870-S \$3 and 1873-CC No Arrows dime, each of which is unique, are each URS-1. The 1873-S Liberty Seated dollar, of which none is known to exist, is URS-0.

The same scale used to evaluate the preceding can also be used to evaluate an issue of which hun-

dreds of thousands of coins are known. Thus, we know that the General Services Administration disposed of 675,000 Mint State 1884-CC dollars in the 1970s, and, in addition, probably a hundred thousand or more Mint State 1884-CC dollars were released before then. Under the Universal Rarity Scale, the Mint State 1884-CC can be described as URS-21 (500,001 to 1,000,000 known). A 1989-S Proof set (of which 3,005,776 were sold) is URS-23.

With the Universal Rarity Scale, collectors of modern Proof sets, silver dollars, Hard Times tokens, large cents, and other series can all talk the same language.

I conceived the idea of the Universal Rarity Scale during the course of doing research for this book. In examining many price lists and auction catalogues in the silver dollar series I realized that the Sheldon scale was meaningless. Under the Sheldon Scale, a Mint State 1879-CC dollar, a "scarce" or "rare" coin to any specialist in the Morgan dollar field, would be listed as R-1, or "common," as, perhaps, 10,000 Mint State coins are known. Similarly, a Very Fine 1893-S Morgan dollar would be R-1 per Sheldon. In fact, not a single business strike Morgan dollar issue would be even R-4 on the Sheldon Scale! Listed as R-1 on the Sheldon scale would be the elusive 1879-

CC as well as the very common 1881-S. Under the Universal Rarity Scale, the Mint State 1879-CC would be URS-15, while the common 1881-S would be URS-22. The seldom-seen Proof 1895 would be URS-11. In Mint State, the very rare 1893-S would be URS-6.

In the present text, I give an estimate of the actual number or number range I believe exist, and then follow it with the Universal Rarity Scale number. For example, for a given coin this notation may appear:

"Approximate population MS-63: 40 to 60 (URS-7)"

If the lower number in an estimated population falls in one URS category and the higher number falls in a higher URS population, the lower number is used, as:

"Approximate population MS-63: 400 to 600 (URS-10)"

By means of the URS notation, anyone wanting to quickly compare rarities of various coins across different series can do so easily.

Should anyone else wish to use it, the Universal Rarity Scale is available without license or credit line. A satisfactory way to use it is as follows: "1885 trade dollar. URS-4."

CHAPTER 3

Historical Background

THE EARLY DOLLARS OF THE U.S. 1794-1804

by R.W. Julian

Coinage Background

With the fall of Rome in the fifth century of our era, there arose in Europe a collection of petty kingdoms. It was not until the age of Charlemagne (768–814) that the practical concept of the great nation once more was seen in Europe. Under this ruler trade was encouraged, and coinage was used by the common man for the first time in centuries.

Prior to Charlemagne, traders and merchants were more accustomed to using gold coins, but beginning about A.D. 755 the French issued small thin silver coins called deniers. A few years later, King Offa of Mercia (an early English kingdom) struck high-quality silver pennies. For centuries the English were known for issuing the best coinage in Western Europe, and it was widely imitated in other countries.

As European trade began to expand there was a need for a larger coin than just the simple penny—or one of the numerous equivalents struck throughout the continent. In 1202 the city-state of Venice introduced the *grosso*. By the end of the century most European nations had issued similar coins. Beginning in 1280, for example, King Edward III of England struck the *groat*, equivalent to four pennies.¹

With the introduction of the *grosso* and its imitations, trade became less confined. Payments were made easier for larger amounts. Gold began to be struck in quantity during the thirteenth century, although West Europeans had used Byzantine gold for centuries. However, the power of Constantinople was visibly declining during this period, and its coinage was increasingly debased.

The First “Silver Dollar”

A combination of small gold coins and larger silver served Europe reasonably well into the fifteenth century, but the ever-growing trade within the Continent and abroad mandated increased supplies of coin. In 1486 Archduke Sigismund of Tyrol struck the first dollar-sized silver coin. Its formal name was *guldengroschen*, but this was soon shortened to *gulden* or *guldiner*. It was meant to be equivalent with the *gulden*, one of the important European gold coins.

Sigismund was a pioneer in the field of large silver coins and proved to be well ahead of his time. It was not until about 1520 that the counts of Schlick in Bohemia (later part of Czechoslovakia) took the *guldiner* concept to its logical conclusion and began the striking of large silver coins on a regular basis.

Most of the silver for the Schlick coinage came from rich mines in the valley of St. Joachim (Joachimsthal). These coins became known as *Joachimsthalers*, which was soon shortened to *thalers* (or *talers*). By the middle of the sixteenth century large silver coins, based on the *thaler*, were being struck all over the continent. Many of the countries simply used a derivative name to show the value of their coinage. Sweden, for example, struck *dalers* while Dutch provinces coined *Leeuwendaalders* (lion dollars) from 1575 to about 1713. Petty German states in particular coined *thalers*, and even multiple *thalers* became almost common. These coins were frequently used as commemoratives and royal propaganda for the ruling house.

¹ The *groat* is minted today for special ceremonial purposes, for use in British Maundy sets. It has not been used as currency since the nineteenth century.

Spanish-American Silver Coins

In Spain, where vast wealth from the New World was pouring into her coffers, the government chose to coin pieces of *eight reales*, roughly equivalent to the thaler. Mints were established in the Americas to coin silver, and it was not long before the eight reales denomination was struck there also. However, most of the silver struck until the middle of the eighteenth century at Spanish-American mints was in the form of the extremely crude "cob" coins, well known to collectors. Such silver pieces were made by slicing planchets off the end of long silver bars, or "cobs." Mexico City was the first (in 1732) of these mints to abandon the old hammered coinage in favor of the screw press.

Coins of the American Colonists

In what is now the United States permanent settlements from England were established as early as 1607 at Jamestown, but it was decades before the colonists had much in the way of coined gold or silver. Prior to 1650 most trade in this country was on the barter system, and coins were as rare as the proverbial hen's teeth.

In 1652, in an effort to bring stability to the marketplace and also provide a circulating medium to the hard-pressed colonists, the Massachusetts General Court authorized the famous "NE" silver coinage. These first crude coins, which were struck for only a short time, used Spanish eight reales as well as Dutch daalders for their raw material. The Massachusetts coins were lighter than their British counterparts to keep them from circulating outside Massachusetts Bay. Later issues of Massachusetts silver had a tree on the obverse ("pine tree shillings," etc.). The coinage ended about 1682.

This first coinage by the English colonies in America was due to the interregnum in England. King Charles I had been beheaded in 1649 and the government was effectively controlled by Oliver Cromwell, soon to become the Lord Protector. Cromwell did not especially concern himself with colonial affairs, unlike the royal government, and many of the colonies were virtually independent until Charles II recovered the throne in 1660.

Most of the Spanish and Dutch silver coin that was brought to the colonies came from the well-

known—and illegal—commerce with the West Indies and Africa, the so-called triangular trade. Slaves and rum were key ingredients, and profits were taken in silver and, to a lesser extent, gold. The English government had enacted strict mercantile laws to keep the colonists from trading with areas reserved for English merchants, while Spain forbade all Englishmen to trade with their colonies. Neither prohibition was very effective against the Yankee ship captains, however.

By the 1690s at the latest, the term "dollar" was in widespread use throughout the English colonies in America to describe the Spanish eight reales and the Dutch daalder. The latter was usually called a *Lion Dollar* to distinguish it from the Spanish dollar of eight reales. Contracts requiring monetary payment in silver coin almost always stipulated the Spanish or Lion dollar by name because of their reputation for quality.

The Dutch, for internal political reasons, began to strike fewer Lion dollars toward the end of the seventeenth century, and by 1700 they were virtually a thing of the past. In America the Spanish dollar gradually became the single accepted standard of value and the yardstick by which all other monies were judged. Colonies had begun to issue paper currency in the 1690s, and its circulating value depended upon the rate of conversion into Spanish silver coin.

It should be noted that the Spanish dollar was not the only silver coinage to be used in the colonies. The Mexico City Mint—as well as several others—struck a considerable number of fractional pieces, such as half real, real, and two reales coins.² Other denominations were made but never achieved widespread use.

American Paper Dollars

In November 1766 Maryland authorized the issuance of paper money with dollar denominations. These were issued early in 1767 and constitute the first official use of the dollar as the name for a monetary unit in the colonial American economic system. Values from 1/9th of a dollar to \$8 were issued. It was a historic moment when the Maryland government officially recognized what the public had been using in terminology for decades.

¹ These coins were the basis for the nicknames of certain coins in this country: the two reales was one fourth of a dollar, or "two bits." The frequent pricing of 12-1/2 cents or 6-1/4 cents seen up until the time of the American Civil War simply refers to the real and half real coins and their value in terms of a dollar.

For some curious reason little numismatic attention has been paid to this first issue of "dollars." There were 12,000 printed of the \$1 value. For those who collect the dollar, there could be no finer way to begin a collection than with the Maryland issue of 1767. In due course other colonies adopted this policy, and in 1775 the Continental Congress ordered currency printed in dollar denominations.

One of the great numismatic mysteries of the colonial era is the so-called Continental "dollar" of 1776. Almost certainly the original dies were prepared in order to strike a silver dollar, equivalent to the Spanish eight reales. It did not take long for those behind this issue to realize that bullion was going to be a problem, not to mention the potential of inflation from ever-increasing amounts of paper being issued. Those who believe that the 1776 Continental dollar was semi-official can point to the fact that the Continental Congress did not issue a one-dollar bill from 1776 to 1778, perhaps in hopes that a dollar coin could circulate.

The rapid inflation in the United States after 1777 doomed any proposals for a hard currency until the rebellion was over. With the coming of peace in early 1783, official thoughts turned to coinage once more. Minister of Finance Robert Morris, on his own authority, had patterns of silver and copper made. None of these, however, was of dollar size.

Federal Mint Proposals of the 1780s

Various proposals were made in the 1780s for a federal mint. All foundered on a lack of money as well as general opposition to such plans by those with a vested interest in producing large quantities of copper coins, such as state governments. One of the most interesting suggestions, however, was formulated by Thomas Jefferson in 1785-1786. He recommended a coinage of gold, silver, and copper. The largest silver coin was to be a dollar, containing 375.64 grains of pure silver while the ratio of gold to silver in the coinage system would be set at 1 to 15.47.

Throughout the 1780s, during an era of hard times, the Spanish dollar—and its fractions—remained the money of choice for the broad mass of citizens in America. These coins were always in short

supply, but used by the common people in purchasing the necessities of life. Copper coins from a variety of sources¹ were also used.

In 1787 the Constitution was adopted by delegates in Philadelphia. Over the next few months a majority of state legislatures ratified it. The new government, under President George Washington, took office in New York City during the latter part of 1789, but in early 1790 moved to Philadelphia. (The capital was removed to Washington, D.C. in 1800.) It was not long after the arrival of delegates in Philadelphia that Congress began seriously to consider the state of the nation's economy in general and its monetary system in particular.

Major events sometimes need but a tiny push to become reality and thus it was with our monetary system. An obscure South Carolinian named John Hinckley Mitchell was well acquainted with Matthew Boulton, the famed English private coiner and inventor.² Mitchell decided, with very little input from Boulton, to become the latter's agent in America in an effort to obtain a lucrative minting contract for American coinage.

Mitchell sent the proposal for contract coinage to the government and, in due course, this was forwarded to Secretary of State Thomas Jefferson, newly returned from his diplomatic post in France. Jefferson was asked to pass on the proposal for several reasons, including his involvement in the 1786 coinage schemes and his known dislike of having money coined abroad.

As expected, Jefferson advised Congress to disregard the Mitchell effort although the Secretary of State admitted that Mitchell's coinage (*i.e.*, Boulton's) was the best in the world. Because Boulton was not mentioned in Jefferson's report to Congress, some numismatic writers were later misled into believing that Mitchell had his own mint in Europe. One wonders what Boulton thought about all of this.

Hamilton Reports on the Monetary System

Congress, as a result of Jefferson's message, asked Secretary of the Treasury Alexander Hamilton for a complete report on a mint and monetary system.

¹ Including pieces struck under contract from or by the states of Connecticut (1785-1788), Vermont (1785-1788; actually, Vermont did not join the Union until 1791), New Jersey (1786-1788), and Massachusetts (1787-1788).

² Boulton, who was associated with James Watt (well-known maker of steam engines), developed sophisticated presses and other coining devices which permitted coins to be struck at high speeds to standards more uniform than could be accomplished in the past.

Resolution Establishing the Mint

Congress of the United States:

AT THE THIRD SESSION,

Begun and held at the City of Philadelphia, on
Monday the sixth of December, one thousand seven hundred and ninety.

RESOLVED by the SENATE and HOUSE of REPRESENTATIVES of the United States of America in Congress assembled, That a mint shall be established under such regulations as shall be directed by law.

Resolved, That the President of the United States be, and he is hereby authorized to cause to be engaged, such principal artists as shall be necessary to carry the preceeding resolution into effect, and to stipulate the terms and conditions of their service, and also to cause to be procured such apparatus as shall be requisite for the same purpose.

FREDERICK AUGUSTUS MUHLENBERG,
Speaker of the House of Representatives.

JOHN ADAMS, *Vice-President of the United States,*
and President of the Senate.

APPROVED, March the third, 1791.

GEORGE WASHINGTON, *President of the United States.*

DEPOSITED among the ROLLS in the OFFICE of the SECRETARY of STATE.

 Secretary of State.

Reproduction of the resolution establishing a federal mint, March 3, 1791.
(From *Illustrated History of the United States Mint* by George C. Evans)

Hamilton and his small group of employees worked on this project for the next several months and asked many experts, such as merchants and importers of gold and silver, searching questions designed to collect the maximum amount of information.

The secretary also ordered careful assays of silver and gold coins to be made, especially on those of Spain. It was clear that the Spanish silver dollar, or eight reales, would be the basis of our silver coinage, and Hamilton was determined to learn all that he could. The Spanish, because of internal problems with their economy, were somewhat secretive about their coinage and had reduced the amount of silver in the dollar and its fractions without making this fact known. One source indicates that the Spanish dollar in 1791 was supposed to contain about 375 grains of pure silver, though it is not clear if all their mints were that accurate in the final product.

In determining the precise weight of the pure silver in the Spanish eight reales coin, Hamilton had to consider two points: the weight and fineness of the coins being issued in 1791 and the amount of pure silver in the average piece of eight circulating in the western hemisphere. Because of the change in the purity prior to 1791, the secretary decided to use the amount of pure silver in the average coin. Some scholars later charged that this was a mistake, and the 1791 Spanish mint purity ought to have been used, but this view has equal problems. Hamilton was forced to work in a vacuum. However, his study was the best that could be done in a nation far removed from the money markets of the world, London and Amsterdam.

Federal Mint Authorized

Hamilton's report was presented to Congress on January 28, 1791, and has long been considered a classic in its field. Because of the complex nature of the report and the several different topics covered, it took the congressmen considerable time to digest all that had been presented. At length, on March 3, 1791, Congress passed a resolution authorizing the president to establish a mint and hire those persons necessary to carry out the work.

Although, in close scrutiny, the resolution actually was of little direct value and nothing was accomplished under its mantle, still it showed the resolve of the legislators to have a mint and national coinage. (It is interesting to note that nineteenth-century mint directors, especially those in office before 1850, considered the March 1791 resolve to be the

basis of the mint system and not the law of April 1792.) The president was simply unable to accomplish much under the terms of a joint resolution.

President Washington's annual address to the joint Congress for 1791 came on October 25, and he pointed out to the assembled legislators that the resolution was hardly what was needed; instead a law should be passed that would spell out in necessary detail what was to be done. Merely saying that there should be a mint was not enough. The Senate responded by appointing a special committee, chaired by Robert Morris, to draft the necessary legislation.

The Morris committee, after its own investigation, proceeded to write a draft bill for consideration by the full Senate. On December 21, 1791, Morris formally presented the bill but parliamentary considerations dictated that little real debate would occur until after the third reading although it is not clear if the bill actually was read in its entirety; then as now, it is likely that such regulations were honored more in the breach than in reality.

At any rate the committee agreed with Hamilton that the dollar would contain 371.25 grains of silver, but on the other hand should have a gross weight of 416 grains, producing the odd fineness of 1485/1664 (892.4+/1000). Congressmen felt that this was necessary, one would assume, in order to have the prestige of a dollar coin equal in size and weight to the famous eight reales of Spain.

New Coins to Portray Washington?

When real debate began on the bill in the Senate, on January 9, 1792, the question of the pure silver in the dollar was barely broached, if at all. (The official record in that era merely reported the general thrust of speeches, not the actual words.) The most controversial section of the Morris draft legislation concerned the placing of the current president's head on the obverse of the silver and gold coins.

After heated debate, the Morris draft bill was accepted by the Senate more or less intact; it was then sent to the House of Representatives. The House chose to read the legislation with great care and it was not until March 24 that representatives got around to formal discussion of the bill and its merits.

The House rejected the concept of the president's head on the coinage and replaced it with one of their own: the head of Liberty. The revised version of the bill was returned to the Senate, which refused to accept the Liberty head provision and re-

An artist's conception of the initial coinage of 1792 half dimes. In actuality, the striking is believed to have taken place in the cellar of John Harper, a Philadelphia saw maker and machinist, for the Mint premises were not ready. (From *History of the First United States Mint* by Frank H. Stewart.)

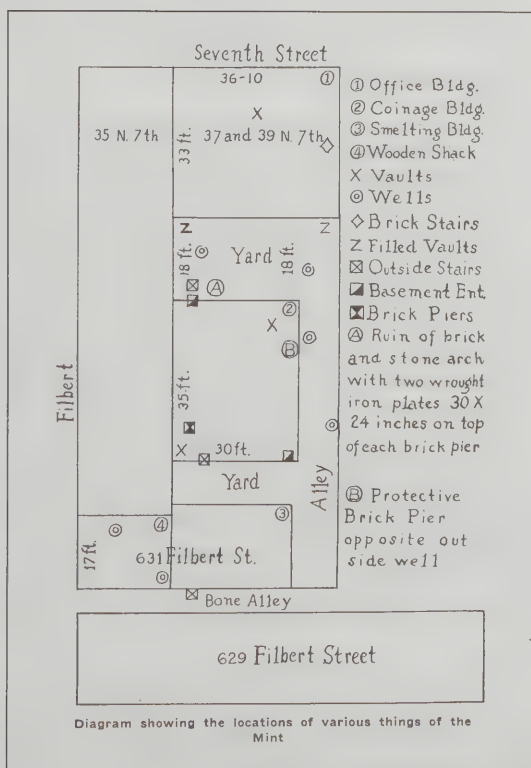

Diagram of buildings of the first United States Mint, with the front of the Mint located on Seventh Street. (From *History of the First United States Mint* by Frank H. Stewart.)

affirmed the original stand. The House now did the same as before and the bill was returned once more to the Senate; the latter finally gave in and accepted the House version. President Washington signed the bill into law on April 2, 1792.

There is a tradition that the president personally lobbied House members in order to kill the provision about the presidential profile appearing on the coinage. While this may well be true, it also seems likely that the Chief Executive would at least have been consulted by Senator Morris before the draft bill had been submitted and thus given his approval of the idea. Perhaps Washington, after the House debate, had a change of heart and persuaded key Senators to vote for the House version.

With the adoption of the April 2 law the nation was now on the road toward a mint and coinage. It would be many years before the system worked for the benefit of all citizens, but the seed had been planted and would grow into an impressive tree as the years passed.

Flowing Hair Dollars 1794-1795

David Rittenhouse

Well before the adoption of the new Mint law on April 2, 1792, President Washington had chosen David Rittenhouse, an eminent scientist of international renown, as the first director of the new institution. Because of poor health, Rittenhouse had been loath to accept the post and even then had agreed only to a temporary directorship.

Once the Mint law had been signed by the President, Rittenhouse was free to proceed, although he had already taken some tentative steps toward putting the new institution on a sound footing. In particular he had engaged, probably in March, an artist named Birch to engrave cent dies; this same artist would also do the half disme and disme dies in the weeks following the adoption of the law.¹

One of Rittenhouse's early choices for his staff was Henry Voight (or Voigt), a watchmaker of Philadelphia, to be the first chief coiner. Born in Pennsylvania, Voight had nevertheless gone to Germany before the Revolution to serve an apprenticeship in a small German mint. According to his own statement, he had learned all the skills necessary for a

mint except that of engraving. It is thus ironic that Voight also served as unofficial engraver at the Mint between December 1792 and June 1793.

Although 1,500 half dismes were struck in July 1792, from silver believed to have been supplied by the president, nothing was said of striking dollars or even half dollars. Until September 1792 the institution was housed in the cellar of a private Philadelphia building—at Sixth and Cherry streets—owned by John Harper. The latter not only sold items of value to the Mint, but had been one of the coiners of the New Jersey copper cents in the 1780s.

On July 31 the foundation stone (not cornerstone as is sometimes stated) was laid by David Rittenhouse, and construction of the coinage building, or “shop” as it was to be called by Chief Coiner Voight, got underway. There was also a double building at the front of the Mint lot (facing Seventh Street) whose construction was started shortly thereafter. In early September 1792 progress was so far advanced that Rittenhouse was able to move staff and machinery into the new location.

The Beginning of Regular Coinage

Cent coinage began in late February 1793. The symbolic ceremony was probably held on February 22 (even in those days Washington's birthday was widely honored), and full-scale striking was underway within a few days. The first official delivery of coined money was made on March 1, 1793. (The 1792 half disme coinage is a special case.)

Albion Cox joined the staff of officers in May 1793 as assayer and was to serve until his death in late November 1795. Cox was born in England, but had been in this country during the 1780s as the foreman for John Harper in the New Jersey coppers; he had been forced to flee to Britain at the end of the decade to avoid imprisonment for debt. Cox actually paid his New Jersey debt, on an installment plan up to his death.

Congress had stipulated in April 1792 that the bonds of the chief coiner and assayer be for \$10,000 each, an enormous sum for the period. Because of these high amounts, neither Voight nor Cox was able to find sureties to meet the requirement, and thus only copper was coined in the first year of regular operations, 1793. Rittenhouse turned to Thomas

¹ One of the minor mysteries of the early Mint is the correct name of this artist. In the nineteenth century it was thought to be “Bob” Birch, but this was based on the appearance of that name in the 1793 fiscal records, where he is recorded as selling medicine to the Mint. As this was almost certainly for the horses, it is more likely that Carl W.A. Carlson's preference for English artist William Russell Birch is the better choice. Another contender is Robert Birch, apparently a different person from “Bob” Birch.

Jefferson to solve the impasse. Toward the end of 1793 the secretary of state appealed to Congress to lower the amount of the bonds.

Although Treasury Secretary Hamilton should have been placed over the Mint, Secretary of State Thomas Jefferson was instead chosen by the president. He had, after all, been involved in a significant way with the coinage schemes of the 1780s, but the president also felt that Hamilton was far too busy with other matters to be involved with the Mint. This turned out to be a mistake as the Treasury refused to cooperate when the Mint needed bullion in periods of low coinage during the 1790s.

Design for the 1794 Dollar Created

Once Jefferson had made the request to Congress, it was clear that the decision would be favorable, but then as now the legislators were in no hurry. Well before the congressional action of March 3, 1794, however, reducing the bonds for the chief coiner and assayer, respectively, to \$5,000 and \$1,000, Engraver Robert Scot had begun work on designs for the silver coinage. Just when this process began is uncertain, but it is likely that the engraver was at work no later than the middle of January 1794.

Judging from the adopted design, Scot may have been instructed to use the Liberty head designed for the cent by Engraver Joseph Wright in August 1793. Scot's copy is not exact, but the overall relationship is reasonably clear. The head is gazing at a somewhat higher angle, and the liberty cap has been removed, but otherwise there is little real difference. The government obviously considered Wright's Liberty head to be an outstanding artistic success.

Scot also may have been told to use Wright's eagle from the pattern quarter dollar of 1792, although the head was turned and the base changed to a rock instead of the earlier globe. The Scot eagle was somewhat less refined than that executed by Wright, but under the circumstances was well done for the period. Appropriate lettering encircled the eagle and the design was complete; no wreath was present on this first approved drawing by Scot.

One of the great misconceptions of American numismatics is that the engraver was solely responsible for a particular design. With minor exceptions, primarily while James B. Longacre served as engraver in the 1850s and 1860s, the designs were almost always dictated by higher authorities—the director played a key role in this work—and the en-

graver then produced drawings to match his instructions as closely as possible. (A typical example of the director ordering a particular style of artwork was to occur in 1891 when Mint Director Edward O. Leech ordered Chief Engraver Charles E. Barber to use certain French coins and medals as a guide in the preparation of the Liberty head coinage. Barber had some freedom of artistic expression, but only to the extent that it was permitted by Leech.)

Little is known of precise dates in 1794 for dies and patterns, but it is known that Frederick Riche was hired for 18 days' work in May, and it is likely that Riche worked on the dies for copper coins while Scot executed hubs for a half dime pattern.

How Dies Were Made

At this point it is necessary to explain just how dies were created prior to 1907, when an entirely new system was introduced. (The system in effect during 1794 was heavily modified in 1837 and again, to a lesser extent, in 1867, but the general idea remained the same.)

After the artwork was accepted for use, the engraver carefully cut in relief the head of Liberty (the head appeared just as it did on the finished coin) or eagle as was required. For the obverse the head of Liberty was punched into a blank die, and then the necessary lettering and date were also punched in. For the reverse a similar operation took place except that the hub was of an eagle. The dies were then hardened and made ready for use in the coining press.

Pattern Half Dimes

Pattern half dimes from designs by Scot, but based on the Wright work of 1793, appear to have been struck in May or June 1794. The only known specimen, in copper, is in the National Numismatic Collection in the Smithsonian Institution. There is no question of the denomination as it is written out as *half dime* on the reverse. The pronunciation was almost certainly *dime* as at present; the spelling was modernized at the Mint in the late 1820s. Changes of this type invariably reflect public usage.

The patterns were examined very carefully by top government officials and it was decided that the design was not quite all that was wanted. Someone, probably Jefferson or the president, decided that a wreath was necessary on the reverse and that the spelled-out denomination was no longer wanted. Britain did not put written denominations on its

coinage while France had just begun to. It is likely here that we see the influence of the pro-British party (Jefferson favored France) in which Hamilton played a key role. It appears to be one of the few times that the Treasury secretary was able to decide a matter affecting the coinage before he left office at the end of January 1795.

Not only was it felt that the half dime design had flaws, but this denomination was not even to be the first silver coin struck officially under the provisions of the 1792 law. Someone, perhaps Hamilton again, persuaded the president that only the largest coins commanded respect in foreign eyes and that the dollar should be the first coin struck. It is also likely that the public demand for half dimes had lessened since 1792; perhaps more Spanish coins of low value (the half real was worth 6-1/4 cents) had been imported into the country.

Creating the 1794 Dollar Dies

After the decision had been made to scrap the proposed coinage of half dimes and begin with the silver dollar, Scot went back to the drawing board to produce sketches of the changes required by the top officials. The fully written-out denomination was duly eliminated (on the dollar and half dollar it would be found only in the edge lettering until 1807) and a wreath was added around the eagle. The new sketches were approved in due course, perhaps in June 1794, and Scot began to cut the necessary hubs for the dollar dies.

The hubs for the dollar, being intended as a coin of prestige for the United States, were executed with great care by Scot, who also had to contend with his more ordinary duties of producing dies for the copper coinage. No doubt he was visited by Jefferson and Washington from time to time to see how the work was progressing. (The president's official residence was on High Street, only a few blocks from the Mint.)

It is likely that the hubs were finished by mid-September 1794. The Liberty head, being the most important, would have been completed first and inspected very carefully for flaws, especially by Director Rittenhouse. Scot then began work on the eagle punch.

The letter punches, used to put in the necessary wording on the obverse and reverse, were executed by Frederick Geiger, who had been hired in early 1794 by Rittenhouse to improve the quality of the letter fonts then being used. Geiger, an expert in

cutting type for books and newspapers, had been an indentured servant and had been brought over from his native Germany in the 1780s by Benjamin Franklin Bache, grandson of Benjamin Franklin. (Geiger did not stay all that long at the Mint, leaving in search of greater wealth. He sought to invent a perpetual motion machine, but died while working on it.)

Copper Patterns Struck

Scot's first set of dollar dies had no stars on the obverse and but a single specimen, in copper, is now known to exist. It was long thought that this pattern was struck from the unfinished regular dies, but it is now realized that a completely different obverse die was involved. In retrospect, of course, the discovery makes sense as it is very rare that an unhardened die is used to strike anything but the softest of metals; otherwise the die is easily damaged.

The copper patterns, of which possibly a half dozen or so might have been made for official inspection, were carefully examined and found wanting in the balance scale of artistry, although they did conform to the 1792 Mint Act. One of the officials suggested putting stars on the obverse, as a form of replacement for the rejected chain design on the 1793 cent. Fifteen stars, to symbolize the number of states then admitted to the Union, were added to the obverse die. This may have been attempted on the first obverse but almost certainly failed as it is very difficult to make changes on hardened dies, especially those which have been used to strike coins or patterns.

Illegal Standard Adopted for Silver

A new dollar obverse was soon executed by Scot, probably in late September or early October. All that was now needed to strike the first silver dollars was a sufficient supply of planchets for the coining press.

The first deposit of silver was made by the Bank of Maryland on July 18, indicating that Rittenhouse had made known, in May or June 1794, to the banking community and merchant/importers that deposits of silver would be accepted for coinage. The first such deposit was composed of French coin, a considerable part of which was of billon (a mixture containing less than half silver). Assayer Albion Cox said that it was worth \$80,414.30-1/2; well, he said it was worth that much, but actually it was worth more than that—and thereby hangs a tale. . . .

In the spring of 1794, when all was being put in readiness for the beginning of silver coinage,

The illustration above is from a painting by Edwin Lamasure and is an artist's conception of what the first Philadelphia Mint looked like in the 1790s. The original is in the Congress Hall Collection. Frank H. Stewart, author of *History of the First United States Mint*, stated that it showed "the Mint buildings as a group and was made from measurements, photographs, and descriptions by various persons."

Stewart went on to say, in part: "I was compelled to give up the hope of ever finding an old print or sketch of them [the Mint buildings], and it occurred to me that it would be a job worthy of one of America's foremost artists. With that thought in mind, I made an arrangement through The Osborne Company [a leading printer of calendars and advertising art at the time; apparently they had this particular artist under contract] to have Edwin Lamasure paint the picture after I had obtained all of the data available. From the information at hand, a pen and ink sketch was made under my direction, and from that sketch, Lamasure, who has since deceased [Stewart wrote these words in 1924], painted the group of three buildings known as *Ye Olde Mint*. The Osborne Company made color plates which were duly copyrighted. Later I had Captain Frank H. Taylor of Philadelphia, make a revised sketch showing a Conestoga wagon.

"In the picture the yard bell, pump, watchdog, and other small details are depicted."

John McDowell, a local carpenter inspected the Mint building before its destruction and furnished Stewart details of the coinage building roof. Further: "The cupola placed on the coinage building was sketched from one of the same period on the old City Hall." Still further: "The next building back of the coinage building may possibly at some time have been connected with the coinage building by bridge or stairway because the advertisement of the Mint property in the *American Centennial* mentions the coinage building of brick about 30 by 68 feet, which would, if correct, indicate that the coinage and smelting buildings were figured as one building. It says the building was two stories high, but inasmuch as the Seventh Street front building is described as three stories, the supposition is plausible that there was a half story on the coinage building at that time, as there was on the Seventh Street building.

Assayer Cox carefully considered the strange fineness mandated by Congress ($1485/1664 = .8924+$) and decided that he really didn't think much of their work. Instead he felt that .900 was much easier to work with and the computations would be far less complicated. Cox approached Rittenhouse and persuaded him that silver coinage of .8924+ would turn black in daily use but .900 would not. Incredibly, the director accepted the bizarre argument and ordered that coinage begin at .900.

In an even more incredible move, and to hide the illegal standard, Rittenhouse accepted another of Cox's arguments: to leave undisturbed the gross weight of 416 grains. The dollar would now contain 374.4 grains of fine silver in place of the 371.25 mandated by law. This effectively changed the ratio of gold and silver from the legal 15 to 1—as adopted in 1792—to an illegal 15.13 to 1. (The change was not made just for the dollar, but for all silver coinage.) The secret was well kept, with only Henry Voight at first being told. In late 1794 the new melter and refiner pro tem, David Ott, also had to be informed. Neither Jefferson nor Washington was told, both men learning of it in the fall of 1795.

Supply of Silver is Obtained

On August 29 David Rittenhouse and Charles Gilchrist each brought two deposits of silver, in ingot form, to the Mint for coinage; the four deposits were probably made from melted-down Spanish dollars. The two Rittenhouse entries were for \$1,706 and \$295, respectively, while those for Gilchrist were worth \$1,307 and \$47. Why both men made such odd deposits on the same day is unclear, but they were close friends which would help explain it.

There are two possible reasons for the curious small deposits, either of which has merit. The most likely explanation is that each man was acting for a friend or relative who wished to remain anonymous. The second is that Rittenhouse wanted to have more deposits as this would impress congressmen generally opposed to the Mint. On the day following the four deposits, the Bank of North America also brought in silver ingots, worth more than \$22,000. This was the final deposit of silver in 1794.

The French coin was slow to be refined and very expensive in the process. In January 1795 congressional investigators were told that it had cost more than \$2,500 to refine the Maryland deposit and the melter and refiner, was not yet finished with it. The law required that silver be coined and paid off in the

same order as deposited, but Rittenhouse realized that strict adherence to the law would seriously delay the start of coinage, hence the deposits by himself and Gilchrist.

Rittenhouse asked the Maryland Bank for written authority to coin their silver out of the proper legal order, which meant that the director's could be used first. Permission was quickly granted as Rittenhouse had explained the problems that were involved.

Silver deposits Nos. 2 through 5, those by Rittenhouse and Gilchrist, were of ingots, almost certainly, so that the first regular coinage could not be identified as coming from Spanish or French coins. In this way the first American silver dollar would not have an origin, but rather be of "new" metal, just like the nation itself. This kind of symbolism was quite popular in the early Republic.

Preparing Silver for Coinage

There were many operations to be gone through before the Rittenhouse and Gilchrist silver became coin of the realm. After the alloy was checked for accuracy (*i.e.*, at the illegal standard of 900/1000), the ingots were remelted and poured into new molds. The new ingots were gradually flattened between powerful rollers until the thickness of the remaining strip was that of the dollar itself. Planchets (blanks) the size of the dollar were now punched out.

Once the planchets had been made, there were still several operations before coinage could take place. The blanks were annealed (heat softened) before coinage so that they would take a good impression from the dies. One of the last steps was to put each blank in the Castaing machine, which rolled the planchets between a set of parallel bars, impressing into the edge the legend "HUNDRED CENTS ONE DOLLAR OR UNIT" and ornamentation.

The last step (before the edge was lettered) was to individually weigh each planchet; those which weighed more than 416 grains had a file applied to remove metal from one of the faces until the weight was correct. Those which were too light were rejected and later melted, to go through the process all over again.

Coinage of 1794 Dollars

On October 15 all was in readiness, and a ceremony was almost certainly held, celebrating the

beginning of silver dollar coinage as well the regular coinage of precious metals in the Mint. Chief Coiner Voight delivered 1,758 silver dollars, all dated 1794. Voight also had on hand, but did not deliver, a considerable number (perhaps several hundred pieces) of coins that had not struck up well and would thus have brought discredit on the Mint had they been released. The excess pieces probably contained the remaining Rittenhouse silver plus some belonging to Charles Gilchrist.

Many of those pieces which were officially delivered by the chief coiner had a defect well known to modern-day specialists in the dollar coinage of 1794-1795. The lower left part of the obverse, as well as the corresponding area of the reverse, was weakly struck because the die faces were slightly out of parallel (from the first strikes onward; the only known 1794 trial piece from regular dies in copper shows this weakness). The weakness was also due to the use of a press designed to strike coins no larger than a half dollar. There was simply no way to get the necessary strong blow required to bring up the dollar design in full.¹ Scot had cut the dies in very shallow relief for just this reason, but the problem still remained.

Of the 1,758 coins struck on that long-ago day, Jack Collins estimates that about 120 to 130 still exist, mostly in lower grades although a small number of superb, well-struck specimens exist in modern collections.² Any 1794 appearing at auction is a signal event and usually brings out the dedicated collectors who appreciate the beauty and history behind this famous coin. Rather than detract from the numismatic value, however, the weakness at the lower left is a mark of the problems faced by Rittenhouse and his fellow officers.

Every one of the dollars struck on October 15 was paid over directly to David Rittenhouse although the Mint books showed that he was not paid until after the Maryland deposit had been cleared from the accounts in 1795. The director made every effort to spend the coins or exchange them for Spanish dollars so that as many persons as possible would learn of the new American silver dollar.

It has been speculated that it was standard policy at the early Mint to have a selection of coins on hand for sale to visitors at face value. English tourists in 1795, for example, are said to have been able to purchase various early U.S. coins, including dollars of 1794. It is known that at least by the late 1820s coins were furnished at face value to numismatists. Coins were sold to visitors until after 1900 although of course the kind of coins on hand depended upon the year in which the visitor asked to purchase souvenirs and the supply of available coins on hand.³

Dollar Coinage Suspended

Rittenhouse ordered dollar coinage to cease until a better press could be found. To this end he directed that, with outside help, Mint workmen construct a new and more powerful press, for "dollars and medals in particular." It would not be finished for some months and in the meantime depositors had to be paid in silver coin. It was necessary to proceed with all due speed in order to encourage others to bring silver for coinage. The director did report, however, on October 28 that "a large parcel" of dollar planchets was on hand waiting for the new press.

Half dime dies were prepared in 1794, at some unknown time, but were not used in that year. Instead, they were held over until February and March 1795. The director had decided in November 1794 that the half dollar, for the time being, was to be the most important coin and ordered that preparations be made for a major mintage of this denomination. Coining had just gotten underway in late November 1794 when the rolling mills (which flattened the ingots) broke down. It required considerable time and trouble to repair the damage.

While the Mint was gearing up to renew silver coinage, public criticism of the Mint had grown to the point that there was a congressional investigation chaired by Representative Elias Boudinot of New Jersey. The congressmen were not told of the illegal standard although their final report made in February 1795 did suggest changing the standard to

¹ These coins were struck by a screw-type press using manpower.

² Jack Collins has identified 118 different specimens by photographs or unequivocal descriptions, as of December 1992. (Per telephone conversation with the author, December 18, 1992.)

³ When the Mint Cabinet was instituted in 1838, the curator had on hand copper cents of the preceding decade or two which were available for sale or exchange to interested collectors. Later, Proof coins were available at a premium. At the turn of the twentieth century, Mint visitors could buy business strikes for face value. It was reported that Indian cents and gold quarter eagles were popular in this regard.

900/1000 along with a corresponding decrease in the gross weight. The report cleared the Mint officers of incompetence, but did state that further work was necessary to bring the institution to a point where it could better serve the public.

New Dollar Press Completed

Chief Coiner Voight was able to resume half dollar coinage in January 1795, still using the dies of 1794. This coinage was very heavy, with about 270,000 pieces being struck by the middle of April. About 250,000 of these were dated 1795. A few were made after the beginning of May, when the dollar press was finally completed, but half dollar coinage soon trickled off to nothing. Half dimes were coined on occasion throughout the year, but were not of great economic value.

On May 6, 1795, the first delivery of silver dollars from the newly-completed press was made, amounting to 3,810 pieces. These almost certainly included, as planchets, some of the lightly-struck dollars from October 15 that Chief Coiner Voight had refused to deliver to the treasurer of the Mint. One 1795 dollar is known with the clear undertype of 1794. More may have been made, but many of the originals were very weakly struck and the undertype would have been easily obliterated when recoined with dies of 1795. The belief that 1794 dies were used in 1795 is without foundation, in the writer's opinion.

For reasons that are presently unclear, the first silver dollars reserved for the annual meeting of the United States Assay Commission were not laid aside until May 16, 1795, when three pieces were put into a special chest in the treasurer's vault. No meeting had been held in 1795 and none was to come in 1796. The first meeting, which tested all of the silver coinage struck since May 1795, was not held until March 1797. More than 100 silver dollars were tested at that time.

Dollars of 1795

There is little in the way of real variation for the Flowing Hair dollars of 1795. Two reverse dies have three leaves beneath the wings, in place of the normal two. Breen reports that many of the planchets used for the 1795 dollar coinage are defective in some way or other, which is understandable in view of the relatively crude operations of the early Mint.¹

From May through October the coinage of silver dollars was heavy, but not all of these were the Flowing Hair type introduced in October 1794. At some unknown date, probably at the end of September, the design was changed to the Draped Bust obverse, which continued to be coined through March 1804. Existing Mint records are silent concerning this all-important change in design.

DeSaussure Named Director

Director David Rittenhouse, worn out by bouts of ill health and increasingly sharp criticism of the Mint, notified the president in the spring of 1795 that he would resign his post as of June 30. He was replaced by Henry William DeSaussure of South Carolina, an old friend of Washington's. DeSaussure did not arrive for a few days into July, but soon threw himself into the work. He expedited the beginning of gold coinage, the first delivery of which, 744 half eagles, took place on the last day of July.

Upon his arrival at the Mint, DeSaussure was informed of the illegal standard for silver coinage then in use. The new director, as he later stated, decided to continue the 900/1000 fineness based on the great reputation and "weighty precedent" of David Rittenhouse. It was also a convenient way of shifting blame to someone else.

DeSaussure also took steps to redesign the silver coinage though it is not clear just why this was done. He may have decided this for himself, and then simply cleared the matter with Washington and Jefferson, or the idea may have come from one of these two men. Present thinking is that DeSaussure was responsible for the change and persuaded his superiors to go along with the idea. It is likely, of course, that the change was made in order to blunt some of the criticism still being directed at the Mint, primarily by enemies of the Washington administration.

(The design change will be discussed in the section on the Draped Bust dollar.)

Technical Matters—Assaying

In the earliest days of the Mint, deposits came in a variety of shapes and finenesses, and it was the duty of the assayer to test the bullion to find out its value and fineness. Albion Cox became assayer in 1793, but it was not until the summer of 1794 that the first deposit of precious metal was tested.

¹ In 1991 Q. David Bowers wrote several accounts concerning multiple specimens of 1795 Flowing Hair dollars that had been struck with silver plugs at their centers, possibly from adding metal to underweight planchets.

Until 1835 the Mint assayer tested the fineness by the cupellation method, but in that year the humid system was adopted. A small amount of metal—only a few grains—was scraped from the bullion and the amount of pure metal was then determined.¹ There was some variation in the manner in which gold and silver were assayed.

The assayer did not necessarily test all incoming deposits because some, such as well-known foreign silver and gold coins, had a fixed value by law. The best known examples of these were the Spanish eight reales (dollar) and gold doubloon. French and Portuguese coins were also heavily deposited in the early days.

Once the assayer had certified the weight, fineness, and value of the deposit, the treasurer of the Mint issued a certificate, stating these facts, to the owner. On most occasions the true owner of the bullion would then wait until coins were made and paid over to him. Sometimes, however, the deposit certificate would be sold to a bank or importer having need of coined gold or silver. The deposit certificates were also used as loan collateral.

The Melter and Refiner

When the assayer had finished with the bullion, it was turned over to the melter and refiner, an office not provided for in the original Mint law of April 1792. The position was, in fact, not created until March 1795, but from the summer of 1794, David Ott served as melter and refiner *pro tem*. In 1795 Joseph Cloud received the permanent appointment.

The melter and refiner first melted the bullion, although this had sometimes been done by the assayer in order to get good mixture for his tests, and then he added base metal (copper) or silver to bring the bullion to the desired fineness, usually a small amount below the legal standard. Ingots were now made, about a foot in length and from one to three inches in width. The thickness varied, but was usually about one-half inch. The denomination of the coin intended to be made from the particular ingot determined the exact dimensions.

The Coiner

Silver ingots were turned over to the coiner, with the usual receipts being given by all parties con-

cerned. These receipts were preserved for the quarterly accounting so that each officer would have protection against theft or dishonesty on the part of another.

The coiner placed the ingots between powerful rollers and gradually flattened them until the desired thickness was obtained. The ingots were frequently cleaned and annealed (heat-treated to soften the metal) between rollings. The rolling mills in the 1790s were subject to mechanical breakdowns on a fairly common basis, and it was for this reason, perhaps more than any other, that coinage was interrupted in those years.

When the ingots had been properly flattened, the strips were "equalized" (made the same width) in the *drawing machine*. The strips of gold or silver were again heat-treated and cleaned and then planchets (blanks) were punched out in a special machine designed for just this purpose. The Mint had only one of these machines, capable of about 10,000 pieces per day, in 1795, but more were obtained as time went on.

The assayer had already made the ingots a bit on the low side for fineness. When molten silver or gold hardens there is a tendency for the richer solution to settle toward the center of the ingot; the punched-out blank would then have been too high in fineness had the melter and refiner not taken this precaution.

The planchets were weighed after being cut out to see if they were within the legal tolerances. If too light the blank was rejected, melted, and the whole process was started over again. Heavy blanks were filed down by adjusters, who worked in stuffy rooms with little ventilation; breezes would have disturbed the delicate scales required to determine exact weight. After 1862 only gold coins and silver dollars were adjusted by hand. The other denominations were simply remelted if they were too heavy or light. As a general rule, only women were employed as adjusters because of their higher perceived tolerance and ability for such work.

After being washed and heat-treated once more, the blanks were put through the edge-marking (Castaing) machine to have the edge impressed with the proper markings. Planchets were placed between two parallel bars, one fixed, one movable, each bearing half the edge device, a workman

¹ For those readers interested in the technical aspects of these two ways of assaying bullion, the work by Don Taxay, *The U.S. Mint and Coinage*, Arco, 1966, is highly recommended. Additional material will be found in the appendix detailing the manner in which the system operated in 1896.

A gallery of paintings illustrating directors of the U.S. Mint from 1792 through 1851. (From *Illustrated History of the United States Mint* by George C. Evans.)

cranked the movable bar to impart the design. For the silver dollar this consisted of the wording HUNDRED CENTS ONE DOLLAR OR UNIT in capital letters with ornaments between words.

Before being struck, the blank was once more cleaned, but there was also a dilute acid treatment (usually sulfuric) to remove any surface oxidation. The blank was now sent to the coining rooms, to receive the impressions from the dies.

Coining

Prior to 1836 the Mint used only screw presses, in which weighted arms were swung by strongly-muscled men. The screw was driven downwards with great force, and the planchet was transformed into a coin by being squeezed between the obverse and reverse dies. There was an improved automatic feeding mechanism installed in the presses in 1795, apparently at the suggestion of John Harper.

In March 1836 the steam press was introduced to the Mint but did not strike silver dollars until the more general coinage that began in 1840. (The knuckle-action steam press operates on a different principle than the screw press.) David Gilbert, an employee of the Philadelphia Mint, invented an improved press in 1858, while in 1874, Coiner A. Loudon Snowden devised additional modifications. Several technical changes have been made since that time, but in essence a device similar in principle to the steam coining press of 1836 is still in use although it is now operated with electrical motors.

Draped Bust Dollars, 1795-1803

When Henry William DeSaussure became director of the Mint on July 9, 1795, in place of David Rittenhouse, he was faced with a situation few men would have wanted. Attacks on the Mint were still going on, fanned by political enemies of the president. There was widespread belief that the institution had not done its job in providing coins to the public, especially in the precious metal denominations.

There was a certain amount of criticism of the current designs on the silver coins (though modern collectors generally consider the Flowing Hair design a good one). DeSaussure expedited the first coinage of gold (the initial delivery of 744 half eagles

was made on July 31) and soon concerned himself with the designs on the silver coinage.

It is not at all clear who instigated the design change although conventional wisdom, based on little more than the fact that DeSaussure happened to be Mint director at the time, says that he was responsible for the new head of Liberty, called the Draped Bust design by modern collectors. It may just as easily have been Thomas Jefferson, who, as secretary of state, was the cabinet officer in charge of Mint affairs.¹

Gilbert Stuart

In the 1850s Mint Director James Ross Snowden became deeply interested in the history of the Philadelphia Mint and interviewed many persons in order to learn as much as possible. One of the individuals with whom he discussed Mint affairs was a descendant of Gilbert Stuart, the famed early American portrait painter. The Stuart family member told Snowden that his ancestor had designed the Liberty head introduced to the silver coinage in 1795. This is the sole known basis on which the Stuart name is attributed.

In the nineteenth century it was quite common for extravagant claims to be made about the doings of ancestors in the Revolutionary War era. Had all of them been true, General Washington would have had an army 10 times its real size and the British would have been defeated in a few weeks, not years. One of the most notorious of these claims was the myth of Betsy Ross sewing the first flag.

However, in dealing with the Stuart family tradition, we are more than likely hearing the truth as it was transmitted over several generations. It must be remembered that in the 1850s there was no great national interest in coins, although several hundred avid collectors were active whereas a handful had existed a decade before. The Stuart descendant would thus have had little incentive to fabricate a story, for the simple reason that little was to be gained and all to be lost should Snowden locate documentary evidence to the contrary.

Whatever the true course of events, it remains probable that Gilbert Stuart did redesign the silver coinage as was claimed by his descendant. It is, on the other hand, somewhat unlikely that DeSaussure

¹ In numismatic research and publication, as in other areas of inquiry, one person's theory often becomes the next person's authoritative quotation and the third person's accepted fact. In the present book, R.W. Julian and Q. David Bowers have endeavored to use as much original source material as possible, in preference to existing theories.

was the one who approached Stuart to do the work; this would have been Thomas Jefferson or the president, either of whom would have known the artist quite well.

It is not of course certain when Stuart began the task, but judging from other facts, he probably was at work on the designs by sometime in the latter part of July 1795. The artist realized that he was doing something that could affect how the nation was perceived at home and abroad and would have taken his time. He no doubt prepared several drawings so that the top officials would have something to choose from, rather than just one set. None of this work is known to have survived, however.

Some numismatists believe that Ann Willing (Mrs. William Bingham) was the ultimate model for the draped bust figure of Liberty, though this cannot be proven. It may well be that Stuart had her in mind for the profile, but barring further discoveries of documentary material, which is highly unlikely, the best that we can do is to say that this is entirely possible.

The Mint director was given an early look at the sketches because the engraver, Robert Scot, would have had to examine them also to see if they were suitable for coinage. DeSaussure and Engraver Robert Scot gave their nods of approval, probably for more than one drawing, and the several sketches sent to the president and secretary of state for the final choice. Soon the decision was made and one of Stuart's drawings accepted as the new Liberty head.

John Eckstein

Once the drawings had been approved, probably toward the middle of August, they were sent to John Eckstein, who was called by one of his fellow artists a "thorough-going drudge" in his field. Eckstein, who was paid \$30 on September 9 for his work, executed a pair of plaster models, not of the whole coin, but just the Liberty head and reverse eagle/wreath combination.

Until relatively modern times it was an accepted practice for artists to prepare plaster models of designs for coins or medals as a guide to cutting the dies. At the present time plaster or other composition models are made as the first step and then used to prepare the dies via a reducing machine. Some engravers in the past prepared their own plasters while others, such as assistant engraver Anthony C. Paquet, in the 1850s and 1860s, had them done by specialists in the field.

Robert Scot

At any rate the plaster models were delivered to Engraver Robert Scot for the necessary die work. (John Smith Gardner, an assistant engraver, had been at the Mint since November 1794 and during September would have worked on regular coinage dies while Scot prepared the new dollar hubs. Scot, however, would also have been involved in the regular dies as it is unlikely that he would have worked continuously on the new design without a break. The change was not that urgent.)

In preparing the new dies, Scot used the same technique employed for the Flowing Hair dies of 1794-1795. He first carefully cut a head punch for Liberty, as it was by far the most important part of the design, and then worked on the reverse hub for the eagle. The steel hubs were finished rather quickly, as it is believed that coinage of the Draped Bust dollar began about the end of September 1795.

Because Scot is thought to have worked slowly on most occasions, questions have been raised as to whether he did both hubs (Liberty head and eagle) that were necessary for the new dies. It is quite possible that John Smith Gardner did the reverse hub (the eagle) while Scot did the other. This would have still left Scot with the most important part of the work and the credit as well.

Coinage Begins

Whatever the precise way in which the hubs were done, they were soon completed and used to create new working dies for the dollar coinage. There would have been a test, to make certain that all was well, and then Director DeSaussure would have ordered formal coinage to begin. Considering the time needed to prepare hubs from Eckstein's models, the most likely date for such an order was October 1, which would mean that 78,238 Draped Bust dollars were struck in the remaining days of 1795. However, this is mere supposition and the number may well be above or below that, depending upon the exact date that Draped Bust coinage commenced. Some estimates are under 50,000 pieces.

For the reader who wishes to choose his own figure, the following list of deliveries for silver dollars in late 1795 will prove helpful:

September 12 - 4,260
September 24 - 4,000
October 3 - 15,000
October 7 - 6,000
October 10 - 14,500

October 17 – 23,368

October 24 – 19,370

The last-named delivery was the final entry for dollars during the year.¹

By the mid-September, Director DeSaussure decided that he had heard enough criticism to last him forever and informed the president that his resignation was being submitted. It was not to take effect until the end of October, thus allowing the government a reasonable amount of time to find a replacement. The Mint had not even begun to strike the new Draped Bust dollars when the director sent in his letter of resignation. President Washington must have now wondered to himself if the Mint would ever be a going affair.

In his parting letter to the president, dated October 27, DeSaussure reviewed the problems facing the Mint as well as those matters which he thought had been accomplished. He discussed the illegal 900/1000 silver coinage standard, almost certainly the first time that the president (and thus the secretary of state as well) had been informed of the matter.

It cannot have been an easy time for anyone at that point; the cat was out of the bag and something would have to be done—and soon. DeSaussure suggested that Congress be approached to change the standard to conform with practice but the administration realized that this would create additional problems, including lengthy explanations of why Congress had not been informed of the whole business in 1794.

Boudinot Named Director

During October, Washington and Jefferson managed to persuade Elias Boudinot to become the third director. Not only had this former congressman been in charge of the Mint investigation during the winter of 1794–1795, but he was also a distinguished statesman who had served as president of the Confederation government in 1782–1783 when

the Treaty of Peace with Great Britain had been signed. His list of accomplishments was long, and the president could not have made a better choice.

On October 28 Boudinot arrived at the Mint and was immediately informed of the illegal standard for the silver coinage. The new director, known for his strict integrity, ordered that the 900/1000 fineness for the silver coinage be stopped at once and preparations made to resume the coinage on the legal standard, 892.4+/1000.² Boudinot also directed that all accounts be brought up to date so that his tenure of office would start on a clean slate and not be tainted by actions of the first two years of operation.

The officers made strong efforts to settle their outstanding accounts in the shortest possible time. By the latter part of November all was in readiness to resume the coinage of precious metals, both gold and silver. Boudinot ordered the coinage of half dimes as his first silver coinage. Nearly 34,000 coins of this denomination were struck and then delivered on November 26.

All seemed to be going well, but on the day following the delivery of half dimes, Assayer Albion Cox died suddenly of apoplexy (stroke) in the midst of a dinner party at his home. As this officer was vital to the operation of the institution, Boudinot had no choice except to shut down the operations once more and order that Cox's accounts be brought up to date while a successor was being sought. All of this took time and it was not until December 12 that Joseph Richardson, Jr. took his oath of office as assayer; he was to serve the Mint faithfully for more than 30 years.³

At the same time as Cox's death, Boudinot faced another problem: bullion deposits, especially of silver, were beginning to decline. With this falling off, creating smaller amounts of coinage, public criticism once more began to rise. The average person simply did not understand that the amount of silver or gold coinage depended solely on the amount of

¹ Walter H. Breen uses the deliveries of October 17 and October 24, totaling 42,738, for the total of Draped Bust coinage, a figure which is also used by *A Guide Book of U.S. Coins*. However, as indicated, one guess is as good as another, and few Mint figures or later interpolations from this era are precise. In general, the coinage figures used in the individual descriptions of early 1794-1804 varieties in the present book are, if yearly, taken from Mint records and, if within a year (such as Flowing Hair and Draped Bust within the year 1795) are from Walter H. Breen.

² QDB and Mark Borckardt note: Analysis of individual 1795 die varieties to determine their specific silver fineness may be a way to determine which were coined before Boudinot's arrival. Similarly, the presence or absence of trace elements could link certain varieties (of any year) with each other via a common silver deposit source. It would not be surprising if such technology became available on a widespread basis in numismatics within the next decade or two. In other series (such as colonial copper coins and territorial gold), such analysis could indicate specific mine sources.

³ Joseph Richardson is perhaps better known to numismatists as one of the men who hand-engraved the large oval Indian Peace medals during the Washington administration. Some of these are hallmarked, proving his work.

bullion brought to the Mint. There was no government bullion fund, due in part to the dispute over whether the Treasury should be over the Mint.

Coinage of 1796

The low deposits of bullion, coupled with Boudinot's desire to strike minor silver coins in 1796, led to a greatly decreased coinage of silver dollars in that calendar year (1795: 200,000+ vs. 1796: 72,920). Half dimes, dimes, and quarter dollars were also struck in 1796. The famous half dollars of 1796, however, were actually struck in 1797. It is generally believed that dollar dies of 1795 were used in 1796, though for how long is uncertain. Just under 5,000 dollars were struck in January and February 1796, and this just might cover the final coinage with the old dies.

While the varieties for the 1795 Draped Bust dollar are best described as minor (placement of the head on the obverse), the dollars of 1796 are somewhat more interesting in this regard. There are both large and small dates while the reverse lettering also has large and small varieties. There does not seem to be any chronological significance to these varieties.

There is speculation that John Smith Gardner, the assistant engraver, may have been responsible for some of the reverse dies, and the change of lettering may signal this fact. Gardner left Mint employ in the spring of 1796 but returned in the late summer for a few weeks while Scot was working on the quarter eagle dies.

Coinage of 1797

The minting of all silver coins fell to a very low level in 1797, well under that of the low production of 1796. Only 7,776 silver dollars were delivered by Chief Coiner Voight during the entire year, with nearly all of these coming during the months from May through August. All of the other silver denominations were coined, but mostly in small quantities as well. (The 252 quarter dollars struck in 1797 used dies of 1796 while half dollars dated 1796 and 1797 were struck in 1797.)

So little silver bullion was being deposited in 1797 that Mint officers, especially Assayer Joseph Richardson, went to great lengths to encourage depositors as well as bringing in silver themselves. In June 1797 even Secretary of State Thomas Jefferson brought 300 Spanish dollars to the Mint for re-

coinage.¹ Criticism was again building up over the low coinages. (The silver famine at the Mint began to end toward the end of 1797 and by early in 1798 there was a sufficient supply.)

There are some interesting varieties of the 1797 dollar, mostly concerned with the number of stars on the obverse (either 9+7 or 10+6). All dies have 16 stars, proving that the dies (unlike the 1798 obverse with 15 stars) were made after June 1, 1796 when Tennessee became the sixteenth state to be admitted to the Union. It may be that as few as 2,493 dollars of 1797 actually bore that date; this is the coinage executed in August, when the last silver coins for the year were delivered.

It is probable that many of the known 1797 dollars were actually coined and delivered on January 5, 1798, when the chief coiner brought 30,372 dollars to the treasurer. The maximum coinage from one press, per day, at this time was about 13,000 pieces (the figure is for cents and may be somewhat lower for larger coins such as the dollar), meaning that many 1797-dated coins may have been struck in 1797 but not delivered until the beginning of the new year. Struck coins were sometimes held for several weeks before delivery if there was not enough on hand to pay off the oldest unpaid bullion deposit.

As if the silver famine of 1797 was not enough of a problem, two other disasters struck the Mint during that year. The first of these was in the person of an important Philadelphia merchant and importer named John Vaughn, who had been a heavy depositor of silver in 1795. During 1796 he learned of the illegal standard in effect until October 1795 and calculated that he had been shorted about \$2,300 on the payment in coin from his bullion deposits. This was a considerable sum of money in those days, and Vaughn demanded that the government pay him what was his legal and moral due. The Treasury refused to comply.

Mint Director Boudinot played a key role in this refusal to pay Vaughn the money he was owed. The director produced the novel argument that no crime against Vaughn had actually been committed because the 1792 law did not provide penalties for putting *too much* silver in the coinage. Boudinot noted that Vaughn had received all his silver back in the form of coins, it was just that there should have been more coins. Vaughn did not accept this bizarre argument and applied directly to Congress for re-

¹ Philadelphia was capital of the United States at that time (until Washington, D.C. became the capital in 1800), and federal officials, who were nearby, paid more attention to the Mint than anytime since.

lief. It was not until 1800, along with a great deal of heated debate and delay, that he was paid.

The second major problem during 1797 was the return of the yellow fever epidemic, the first serious attack of the disease since 1793. The Mint closed late in August and did not reopen until nearly the end of November. Some coins of the precious metals were apparently struck in 1797, but not delivered until early in 1798, as noted above. There was a considerable coinage of copper cents in December 1797, however.

Director Boudinot was so concerned about the shortage of silver bullion in particular that he searched for a reliable source and, at length, was to succeed. In April 1797 a formal agreement was signed with the Bank of the United States, a semi-official institution, to supply foreign gold and silver coins for recoinage by the Philadelphia Mint. It was also agreed that these deposits of foreign coins would not include the Spanish dollar because of heavy domestic use; however, this prohibition was only temporary and was later abandoned.

The problem with the Bank of the United States was that during 1797 that institution had almost no foreign silver coins to send to the Mint. In November 1797, however, the Bank of North America delivered nearly \$30,000 worth of French silver, mostly in crowns of the old regime. It was not totally a blessing because this bank wanted their bullion returned only as silver dollars, as would most of the depositors during 1798 and 1799. This in turn meant that very little in the way of minor silver would be struck for the benefit of the general public.

Dollars of 1798 and 1799

Even though few of the smaller silver coins were to be made in 1798 or 1799, it was a mixed bag of complaints and benefits. The Mint could stay open because it was receiving deposits, but complaints also came its way. Yet the minor silver coinage was not always a problem because there was a great deal of Spanish silver coinage in daily use in the United States, mostly in reales (12-1/2 cents) and two reales (25 cents). The situation was complex and without a ready solution.

Despite the large November deposit, others were urgently needed, and Director Boudinot decided to put his own money into use by depositing slightly more than 9,000 French crowns (worth \$1.10 each). His \$10,000 worth of silver was paid off in dollars, but by this time other deposits were arriving and the

director used his money in other ways. In 1800, when fresh problems arose with insufficient deposits, Boudinot was to return with his \$10,000 again.

The Boudinot silver, coupled with increased deposits, especially from the Bank of the United States (which now had a surplus of foreign silver coins), signaled the end of the famine. Coinage of dollars was very heavy in 1798 and 1799 (327,536 and 423,515 pieces, respectively). In 1799 the only silver coinage was of dollars.

As noted above, part of the January 5, 1798, delivery of dollars was probably dated 1797, but there is no certain way of determining the actual number included in this delivery. It is entirely possible that the entire 30,000+ coins of January 5 were dated 1797. Dollars of this date are simply much too common, in a relative sense, for only 7,776 to have been made, the amount reported for the calendar year.

It is not clear precisely when the scarce 1798 Draped Bust dollars with small eagle reverse were struck. They may well have made up a small part of the January 5 delivery noted above, or perhaps they were struck in the latter part of January. The mintage was certainly small, whenever the time of striking. Oddly enough, even for this coinage, there are two obverse dies, one with 13 stars and one with 15. The latter is the scarcer of the two.

The Heraldic Eagle Reverse Design

In 1796, as part of a general redesign of American coinage, the government ordered that the new quarter eagles, first issued in the latter part of the year, have the heraldic eagle reverse rather than the small eagle prepared a year earlier. (John Smith Gardner returned for a few weeks in the fall of 1796 while Scot was engaged on the new dies for the quarter eagle.) Over a period of time all of the gold and silver coin denominations had their reverses changed to include the heraldic eagle.

The change to the heraldic eagle may seem arbitrary, but almost certainly was done to be in line with standard European practice. Nearly all of those countries used their coat of arms on the reverse of their coins. The U.S. gold and silver coins followed Scot's design for the Great Seal of the U.S., in which the national arms were affixed to the displayed eagle's breast.

This decision was misunderstood within a few years. In 1807 when the silver was redesigned by John Reich (as dictated by Mint Director Robert Patterson), a new type of eagle was put on the re-

verse but the motto "E Pluribus Unum" was kept in the mistaken belief that the new eagle was merely a variation of the official one on the national seal. In the 1830s the 1807 error was rectified by removing the motto but it was gradually returned to the coinage beginning with the 1873 trade dollar.

The turn of the silver dollar to get the heraldic eagle reverse came in the early weeks of 1798, probably late January or early February. Once more Scot cut a new hub for the eagle (the eagle was separate from the clouds and the stars were punched in by hand) and prepared the necessary working dies.

Dollars Used for Export

The heavy coinage of silver dollars in 1798 and 1799 had an unexpected side effect. It had been normal practice for importers of foreign goods to send Spanish dollars in exchange, but the availability of the American version made it easier to use the domestic product. Many American dollars were now sent to the treaty port of Canton in China to pay for Oriental luxury goods. These dollars rarely returned and were thus lost to the nation as coins.

American dollars also went to the West Indies where they were exchanged for Spanish dollars. It has long been an article of faith among numismatists that the trade was done for a profit, but this seems unlikely, especially in view of the fact that freshly-issued United States dollars were roughly equal in pure silver to the average circulating Spanish coin of eight reales (dollar). It is more likely that American silver went to the West Indies simply because that is where the Spanish dollars were to be obtained.

Some of the silver dollars that went to the West Indies would return, though of course more worn than they had left. This left the Orient as the real area that drained American coined silver from our shores, never to return. In 1804 the continuing loss would force the government to stop coining dollars.

In 1798 and again in 1799 the dreaded yellow fever epidemic struck the Philadelphia area in all its fury. People fled for their lives but, even though the Mint was closed for several months in each of these years, coinage resumed soon after reopening with a minimum of trouble. Sometimes dies were used almost at random, thus confusing the order of striking for some issues, but in general the reopenings were more orderly than in 1793 and 1797. After 1799 the Mint was to close but once more (1803) for the terrifying disease.

Varieties of 1798 and 1799 Dollars

There are several varieties of the Draped Bust dollar (heraldic eagle reverse) for 1798 and 1799. For 1798 the differences are rather minor for the obverses, primarily consisting of wide or close dates and knobbed or pointed 9s. For the reverse we find the so-called *arc* and *diamond-shaped* star patterns, but these probably do not reflect policy but rather differing individuals in the engraving department helping Scot prepare the dies. One reverse die even has 10 arrows instead of the standard 13. Many of the minor details in the die—such as berries, stars, and arrows—were added by hand after the main design hubs were punched into a blank die. It appears that there was one or more people seconded to the engraving department from other areas of the institution as the need arose.

For 1799 we find the first overdate (1799/8) in the dollar series as well as similar varieties to those of 1798. One that does stand out, however, is a blunder consisting of 15 stars (instead of the regular 13) above the eagle on the reverse; the extra two stars were partially hidden by extra clouds, but not all that successfully.

Silver Dollars of 1800

For 1800 the silver deposits were at first heavy but as the year progressed the quantity of bullion brought to the Mint underwent a serious decline and the amount of coinage, mostly in dollars, went down accordingly. Despite the fall in bullion deposits, the number of dollars struck in 1800 was still substantial: 220,920. The early American economy, increasingly subject to the whims of European politics and wars, often showed sharp swings up and down in the early decades of our independence. During 1800 we were on a downward trend.

Perhaps the most interesting varieties for 1800 are the coins bearing what may be a stray punch mark at the end of "AMERICA." The remaining effect looks like the letter "I," and the word seems to be spelled "AMERICAI."

Dollars of 1801-1803

Despite the virtual dollars-only policy for silver from 1798 to 1800, there was not all that much public outcry over the failure of the Mint to supply sufficient small silver coins to the economy. With the downturn of the economic activity in the latter part of 1800 and perhaps some loss of small Spanish silver to the export trade, however, public criticism

once more was on the rise. In fact, through 1803 the Mint was under severe attack in Congress over a number of matters, most of which the Mint could not control, such as the amount of bullion deposited for gold or silver coinage.

Even though most of the depositors wanted silver dollars in exchange for bullion brought to the Mint, Director Boudinot was able to persuade some of them into taking an increasing amount of smaller silver coins. Mintage of the dollar dropped to under 55,000 pieces in 1801. A few thousand dollars' worth of dimes and half dimes were struck in this year but the principal non-dollar coinage in silver was the 30,000+ half dollars struck mostly in December. This was the first coinage of that denomination since May 1797.

For 1802 the situation was even more depressing for silver than in 1801, with only about 42,000 dollars delivered by the coiner. Boudinot continued to twist bankers' arms to get them to take the smaller silver coins they simply did not want. Their main customers wanted dollars, which Boudinot did not wish to strike any more than necessary.

Interestingly, the dies for dollars show a distinct improvement in quality with differences mostly very minor for 1800 through 1803. An overdate, 1802/1, appears on several different obverse dies, the last such event in the silver dollar series until 1880!

During 1801 came one of those semi-comic interludes which livened up Mint affairs for a few days. An inventor named Leslie had developed a variation of the old European roller die system (in which coins are struck by being squeezed between cylindrical dies rotated on their axes) and announced to the government that he had solved the problems of the Mint. Even President Jefferson, who seems not to have understood why the Mint did not strike more silver and gold coins, thought the invention a good one and sent him to the Mint for a practical trial.

What Leslie got, instead of a practical test, was a mock trial where the assembled officers very pointedly told him that his invention was useless, which was a fair statement. Leslie claimed that his method would speed up production, which was not true because the striking of the coins was only a small part of the overall operation to produce coinage. The inventor was told to bring in bullion, not dies, the next time he wanted to improve the institution.

There was a second affair which was not quite so funny. Benjamin Rush, signer of the Declaration of Independence and famous physician of Philadelphia,

became treasurer of the Mint in 1797 after the yellow fever death of his predecessor, Nicholas Way. Rush and Director Boudinot had a mutual relative that died and whose original will left a considerable sum of money to Boudinot's side of the family. There was an all-night death-bed session with physician Rush, however, in which the will was changed to Rush's favor.

By 1800 the two men were barely speaking and Rush even went to the trouble of making formal charges against Boudinot, including theft of Mint property. The "property" in question was horse dung, which Boudinot had arranged to have hauled from the Mint for nothing. The result of the charges was an unpleasant inquiry, but nothing came of the hearings.

In 1805 Boudinot resigned and Rush applied for the post but was told by President Thomas Jefferson that another man, Robert Patterson, had already been chosen. The irony of this was that Rush had been offered the director's post in 1795 (after the resignation of David Rittenhouse) and had declined it at the time because of his lucrative medical practice. To add insult to injury, Rush loaned Boudinot some chemical textbooks to study when the latter became director in October of the same year!

After 1801 the silver dollar started on a roller coaster ride that lasted until suspension of coinage at the end of March 1804. Fewer than 42,000 silver dollars were struck in all of 1802 because of severe problems with the declining bullion deposits.

Beginning in 1803 there was some improvement in the amount of silver being brought to the Mint, but in the fall Boudinot attempted to stop the coinage of dollars and replace them with half dollars. No dollars were delivered from June 30 through December 12, although it is true that yellow fever interfered with production for several weeks. (1803 was the last year in which this disease forced the closing of the Philadelphia Mint.) The only silver coinage in this period consisted of half dollars, which Boudinot wanted the depositors to take instead of dollars, and a small quantity of dimes consisting of 1,660 pieces delivered in the third quarter of 1803.

Apparently there was enough pressure brought to bear on Director Boudinot that dollar coinage resumed in December 1803 and continued at a strong pace until March 27, 1804, when the last of the Draped Bust dollars was delivered. All of those struck in 1804 bore 1803 or earlier dates. (The 1804 and "1805" dollars, as well as the Proofs of 1801-1803, are covered in chapters 5 and 6.)

CHAPTER 4

Guide to Collecting and Investing

EARLY SILVER DOLLARS 1794-1803

by Q. David Bowers

Opportunities With Early Dollars

Made in three distinct design types and well over 100 die varieties, early silver dollars of the 1794-1803 years are fascinating to study and collect. (Dollars dated 1804 are treated in the following chapter.) The largest diameter of all United States coins, these “dollars of our daddies,” as they have been called, offer an especially large surface on which to study die characteristics, a situation of which the collector of tiny half dimes must surely be envious!

Walter H. Breen had this to say about the opportunities awaiting collectors in the early dollar series:¹

Only in recent years have early silver dollars begun to attract collector attention as intense as the smaller denominations—despite the shortcomings of available reference books. Were some future researcher to produce a book on this series in a class with Sheldon on 1793-1814 cents, doubtless early dollars would eventually rival the cents’ popularity.

Russell J. Logan, an astute observer of the market and collecting scene, commented similarly:²

Bust dollars used to be king for collectors interested in early U.S. silver coins by die variety. I can remember thinking during the mid-1950s how wonderful it would be if half dollars were as organized as dollars were by Bolender. But the bottom line was a Bust dollar cost five times what a comparable Bust half dollar would demand. The world was full of Bust dollar variety collectors. . . . Today it is a totally different story. There seem to be only a few collectors pursuing the early dollars seriously. . . . With only half a dozen variety collectors pursuing these lovable cartwheels, there is an opportunity to initiate a collection not only challenging to complete but also financially rewarding.

As early as 1927, B. Max Mehl noted in the first reprint of the Haseltine *Type-Table* catalogue: “While practically every series of the American coinage has been covered by works of various kinds, the series of our early silver coinage have remained more or less unexplored.”

While the followers of Morgan silver dollars are legion, and while Liberty Seated issues also have a large coterie of enthusiasts, only a few have signed up to follow the early Flowing Hair and Draped Bust coins. I attribute this to several causes:

1. First, unlike large cents and Capped Bust half dollars of the late 1790s and early 1800s, silver dollars of that era are apt to cost several hundred dollars just for a specimen in Very Good or Fine grade. In higher grades such as EF and AU, the values of large cents and early dollars draw closer together, except that prices of rare varieties of cents far outdistance those of dollars in any and all grades. As low-grade cents and half dollars are inexpensive, the price of entry to those series is low; it costs little to break the ice, to get acquainted. In contrast, it would cost several thousand dollars to make a beginning with an early dollar set.

2. There is a great camaraderie and fellowship among enthusiasts in the cent series, who belong to the Early American Coppers (EAC) club and read its interesting, authoritative, and informative newsletter, *Penny-Wise*. At intervals, including at the annual convention of the American Numismatic Association, EAC members gather and swap ideas and coins, and share their enthusiasm. Ditto with collectors of early Flowing Hair, Draped Bust, and Capped Bust half dollars 1794-1836; many belong to the Bust Half Nut Club (BHNC). The John Reich Collectors Society (JRCS) embraces all collectors of early silver, of the general era pre-1837, but articles about early silver dollars in the *John Reich Journal* have been relatively few over the years. Needed: more camaraderie and inter-relationships among

¹ Walter Breen’s *Complete Encyclopedia of U.S. and Colonial Coins*, p. 428.

² “Condition Census: Pre-Turban Bust Dollars.” Article in the *JRCS Journal*, October 1990.

collectors, plus lively, interesting, and thought-provoking articles.

3. The classifying of early dollars by die varieties is easy and quite enjoyable for the years 1794 through early 1798, but dollars of 1798-1803, in particular those of 1798, 1799, and 1800, can be tedious. A solution to this is to collect the Flowing Hair and Draped Bust/Small Eagle dollars from 1794 through early 1798 by specialized die varieties, and to collect the Draped Bust/Heraldic Eagle dollars of 1798-1803 by dates only.

4. Few dealers have made a specialty of stocking early dollars by varieties. Part of the reason is that early dollars are very rare in comparison to early cents and halves. A new collector in the dollar series, who wants to buy quickly, has to be patient, as quality offerings are few and far between, and are mainly in auctions.

Today, in the early 1990s, early dollars are akin to the old "acres of diamonds" speech given to high school graduation classes; potentially valuable rarities exist, are often not identified, and await only an alert observer to find them. Curiously, the two leading certification companies—Professional Coin Grading Service (PCGS) and Numismatic Guaranty Corporation of America (NGC)—do not identify the die varieties of the coins they encapsulate. Therein lies an opportunity—one of many in the silver dollar field.

Early dollars—representing as they do the largest silver denomination of the fledgling Philadelphia Mint—America's contribution to the crown-sized or dollar-sized coins of the world—are historical in their context, numismatically interesting in their diverse die varieties, aesthetically appealing in their design, and, if another reason to collect them is needed, they are relatively inexpensive *in relation to their rarity*.

It seems apparent that here, indeed, is a fertile field for the alert, astute numismatist—an area of collector endeavor that has been largely overlooked in recent times. Market recognition has yet to come.

Haseltine's *Type-Table*

Detailed descriptions of early silver dollar die varieties were first published in November 1881 in Capt. John W. Haseltine's *Type-Table of United States Dollars, Half Dollars, and Quarter Dollars*. Around 1876, Haseltine first contemplated writing an extensively illustrated book on die varieties of higher denomination silver coins, and he set about building a

reference collection for this purpose. In 1881, he decided to sell his holdings, with the result being an auction sale catalogue with the *Type-Table* title.

Of all nineteenth-century dealers, Haseltine was the one most closely identified with silver dollars. Living in Philadelphia, he had close connections to the Mint, directly and also through his father-in-law and fellow dealer, William Idler. Apparently, both were able secretly to buy numismatic delicacies directly from Mint employees. Over a period of time they handled such fancy pieces as 1801-2-3 novodel "restrrike" silver dollars, 1804 dollars, Gobrecht dollars, and 1884 and 1885 trade dollars. A case is made in Chapter 6 for Haseltine being the main "distributor" in the mid-1870s of 1801-2-3 Proof novodels and 1804 Class III dollars. During the first decade of the twentieth century, Haseltine was a partner with Stephen K. Nagy (also of Philadelphia) in the sale of rarities, many of which came from the Idler estate (Idler died in 1901) or from Haseltine's private holdings.

For many years, Haseltine numbers were used by some numismatists to identify varieties of early silver dollars, although the vast majority of auction catalogues and price lists omitted Haseltine's specific die variety attributions. Other catalogues—certain of those issued by B. Max Mehl serve as examples—used Haseltine numbers sporadically. As a latter-day observer of the early twentieth-century numismatic scene, I have concluded that if *the consignor* attributed his or her early dollars to H numbers, Mehl used them. Otherwise, Mehl did not have the inclination to look them up on his own. In general, no matter who issued an auction catalogue, it was more apt to omit Haseltine numbers than to include them. Although this is partly because it took work to classify early dollars by varieties, perhaps a more important reason is that few collectors cared about different dollar dies, and rarities were likely to bring little more than common issues. In a word, it was not *worthwhile* for a dealer to classify them. This apathy continued for decades.

With regard to the original publication in 1881 of the *Type-Table*, it seems that Capt. John W. Haseltine should have at least given a fellow numismatist, J. Colvin Randall, a credit line in the finished work. In his auction catalogue for his June 29-July 1, 1885 sale, W. Elliot Woodward, who was always quite free with his opinions, noted this:

In the collection of American silver coins following there are no duplicates; each piece is distinctly different, and the differences are very briefly noted. . . . In a private letter Mr.

Randail writes me: "The idea of a correct work on types and varieties of United States silver dollars, halves and quarters, originated with me. H. and myself were to publish the work together, but without any consultation whatever with me, he issued for his own benefit what he styles the Type-Table Catalogue."

M.H. Bolender's Study

In 1950, Milferd H. Bolender, who by that time had been a full-time professional dealer for nearly 20 years, published *The United States Early Silver Dollars from 1794 to 1803*, an expansion and updating of the 1881 Haseltine work. In the introduction to his book, Bolender noted that he was able to find 114 distinct die varieties covering the 1794-1803 span.

Bolender, born in 1894, started in numismatics as follows, per his own account:

My first silver dollar, a 1795 with a hole, was acquired by me in 1906 from my grandfather, who gave me a bag of old coins, his collection, because I made the best grades in school of the seven grandchildren. That started me collecting.

At the age of 15, Bolender became a part-time coin dealer. Later, he worked in construction, and in the World War served with the United States Army. In 1919, he began teaching school, a vocation he followed for the next 13 years, until his coin business grew to the point at which he could enter it on a full-time basis. Totally, he spent 57 years as a rare coin dealer, a tenure equaled by few others in the trade, and conducted 197 auction sales. He lived in Illinois, later (upon retirement) moving to California.

In telling of his life, Bolender went on to say that he became interested in early silver dollars by die varieties, but found that specimens described according to Haseltine numbers were very often attributed incorrectly. "In one large shipment of early dollars to me, *every* Haseltine number was incorrect!"¹ Dealers were often too busy to attribute early dollars by die variety, Bolender continued. Therefore, he took matters into his own hands, and using the Haseltine work as a foundation, prepared an easy-to-use reference complete with illustrations. By his own account, his data were based upon observing 5,000 coins over a period of 40 years. Actually, this amounts to only 125 coins per year, certainly a paltry figure. If the 5,000-coin figure is true, this explains why certain coins that Bolender considered to be very rare are rather plentiful today.

I saw Mr. Bolender at several conventions in the 1950s, before his retirement in 1960. He was a quiet man, but was always willing to reminisce about the "good old days." From 1961 to 1964 he conducted a column, "M.H. Bolender Writes," for *Numismatic News*. His death occurred on November 15, 1977, at the age of 83, in Spring Valley, California.

In the era of Bolender's predecessor, J.W. Haseltine, there were only a few coin dealers, and most lived on the East Coast within a day's journey of each other. Groups of rare coins tended to be clustered among a small group of dealers and collectors. M.H. Bolender lamented that things changed radically between the 1870s and his own research efforts in the 1940s. By the latter time the supply of early dollars had become widespread among thousands of different collectors and hundreds of different dealers, and examining a significant quantity of pieces was a greater problem.

Where applicable, M.H. Bolender preserved in his book the numerical listings of Haseltine, simply converting H numbers to B numbers. Hence, 1795 H-1 in the Haseltine *Type-Table* is equivalent to 1795 B-1 in the Bolender book. In instances in which numbers assigned by Haseltine were proved by Bolender to be incorrect (in several instances, Bolender found that Haseltine had acted upon incorrect information or had mis-identified as a new discovery an already known die), Bolender eliminated the old Haseltine number from his new B-number sequence. Hence, while among 1800 dollars, Haseltine had H-1, H-2, H-3, H-4, H-5, H-6, H-7, H-8, H-9, etc., through H-19, Bolender concluded that H-6 and H-7 were misattributions by Haseltine, as was H-9. Accordingly, the Bolender sequence omits these three numbers, and reads B-1, B-2, B-3, B-4, B-5, B-8, B-10, B-11, B-12, etc. This makes it easy to compare an old-time listing by H numbers, such as the 1945 sale of the F.C.C. Boyd Collection, with Bolender numbers.

In many instances, Bolender was conservative in his rarity estimates. He observed that "in some cases only one or two specimens are known to me, but I have declined to imagine that no other such coins exist." Bolender used an eight-point rarity scale, Rarity-1 through Rarity-8, but did not state what the numbers meant, other than Rarity-1 coins were considered common, and Rarity-8 ones very rare. It is

¹ QDB note: For this reason, Haseltine attributions appearing in pre-1950 catalogues must be considered with caution, especially when compiling population data of rare varieties.

possible that he borrowed Dr. William H. Sheldon's rarity scale, which also culminates with Rarity-8, but if he did, he made no mention of it.

In numismatics, too many writers fall into the trap of making precise statements such as "only eight examples are known." It might be better to say that "only eight specimens are known to me," or to give a range such as "probably eight to 12 specimens are known." As Dr. William H. Sheldon said in his *Early American Cents* book (1949), if Jones was seen, then he was there. If Jones was not seen, then he also might have been there. To the credit of Bolender, he did not deal with absolutes. He simply reported what was known to him, based upon his rather limited observations.

Rarity ratings, including these I give in this book, should always be taken with a grain of salt. There are always new discoveries to be made.

Bowers-Borckardt (BB) Numbers

In the descriptions of individual varieties of 1794-1804 dollars in this book, the BB number (for Bowers-Borckardt) represents the numerical designation of the variety. The numbering system, new to this book, is arranged in approximate order of the manufacturing of the dies and/or the striking of the coins. The system is not precise—nor could it ever be—for often dies were used in a different order from their order of production. However, the system is more chronological than any heretofore utilized for the series. Collectors and dealers are invited to use it, if desired, in connection with attributing these early dollars.

There are a number of other "B people" who are closely connected with this book, and with early dollars, including Walter H. Breen and Kenneth E. Bressett, not to overlook the historical contributions of M.H. Bolender. Thus, in your own mind, the BB can represent more than just two people, if you wish.

At first it was thought to use the system devised by Capt. John W. Haseltine in 1881 for use in his *Type-Table of United States Dollars, Half Dollars, and Quarter Dollars*. However, by 1950, when Milferd H. Bolender used it for his book, *The United States Early Silver Dollars from 1794 to 1803*, he immediately ran into trouble when he found that certain Haseltine (H) numbers represented varieties that did not exist or were erroneously described. Thus, Bolender had gaps in his numbering to omit the listings.

As the Haseltine and Bolender numbering system was closed, when a new variety was discovered, it

had to be appended to the end of the numbers already designated for the year. Thus, in Haseltine's listing, 1795 Flowing Hair dollars went from H-1 to H-13, after which were found the two known varieties of 1795 Draped Bust dollars, H-14 and H-15. Bolender translated these numbers to B-1 through B-13 for the Flowing Hair, and B-14 and B-15 for the Draped Bust issues. New Flowing Hair varieties were tacked on to the end of the series, after Draped Bust numbers, to become B-16, B-17, etc. As noted above, among 1800 silver dollars, there are no B-5 and B-7 varieties, as Bolender felt that the Haseltine descriptions were erroneous; ditto for B-9, which does not exist. Hence, a listing of varieties of 1800 dollars by Bolender numbers has the sequence B-1, B-2, B-3, B-4, B-5, B-8, B-10, B-11, etc.

Under the BB numbers, the numerical listings are open. If and when new die combinations are discovered, they can be numbered adjacent to related known varieties. Credit is due to Harry Salyards, M.D., who upon reviewing an early draft of the silver dollar section, suggested that it might be about time for a new classification system.

The structure is as follows:

- 1794: BB-1.
- 1795 Flowing Hair: Begins with BB-11.
- 1795 Draped Bust: Begins with BB-51.
- 1796: Begins with BB-61.
- 1797: Begins with BB-71.
- 1798 Small Eagle reverse: Begins with BB-81.
- 1798 Heraldic Eagle reverse, Knob 9: Begins with BB-91.
- 1798 Heraldic Eagle reverse, Pointed 9: Begins with BB-101.
- 1799/8: Begins with BB-141.
- 1799: Begins with BB-151.
- 1800: Begins with BB-181.
- 1801: Begins with BB-211.
- 1802/1: Begins with BB-231.
- 1802: Begins with BB-241.
- 1803: Begins with BB-251.
- 1801-4 Novodels: Begins with BB-301.

Ways to Collect

Silver dollars from 1794 through 1803 (or 1804) can be collected in at least three different ways:

Collecting by Types

A set of early dollars by design type consists of just three coins: one each of the 1794-1795 Flowing Hair type, the 1795-1798 type with Draped Bust obverse and Small Eagle reverse, and the 1798-1803 style with Draped Bust obverse and Heraldic Eagle

reverse. Such a set is easy to put together, and although it will not afford a great deal of stimulation so far as identifying varieties or becoming deeply involved in the series are concerned, it still can make a nice introduction to the series. Such a trio of dollars can be expanded to form one of the specialized sets described below. Of course, such a set of three can also be acquired as part of an overall type set of United States coins from half cents to double eagles.

Collecting by Major Varieties

A popular pursuit 10 to 30 years ago, less so today (because of the overall higher prices of all early U.S. coins), is the acquisition of one each of the major varieties from 1794 through 1803. Such a listing begins with 1794 and continues with 1795 Flowing Hair, 1795 Draped Bust, etc., through 1803. Often, the varieties listed in the *Guide Book of United States Coins* are used as a basis for forming a want list. The rarest major variety within the series is the 1797 with stars arranged 9x7, Small Letters reverse, followed by the considerably more expensive and more famous 1794.

Once the cost of a 1794 is absorbed, the rest of the set can be obtained relatively inexpensively, although a budget into low four figures is required to acquire certain of the earlier issues in VF-20 grade. I suggest VF-20 to EF-40 as a goal. Such coins, especially EF-40, are sharp enough to show interesting characteristics, and yet cost much less than AU specimens. For all practical purposes, an MS-60 set cannot be collected, for certain varieties, including the aforementioned 1797 9x7 stars, Small Letters dollar, are not obtainable at that level.

An alternative is to collect the 43 varieties listed in Walter Breen's *Complete Encyclopedia of U.S. and Colonial Coins*.

Collecting by Specialized Die Varieties

The third way is to collect by specific specialized die varieties as listed by Bolender in *The United States Early Silver Dollars from 1794 to 1803* and as described in the present book. A number of these varieties have been given names, such as 1800 "Dotted Date," and are listed in the *Guide Book of U.S. Coins*. Apparently, Richard S. Yeoman, author of that familiar red-covered annual volume, wanted to expand the listing of early silver dollars and used the Bolender book as a guide. As a result, more technical die varieties are listed for early silver dollars than

are, for example, early half dollars of the same era. However, the *Guide Book* lists only a fraction of the over 100 different die varieties known to exist.

VF-20 to EF-40 is a good objective, for the grade permits study of minute die differences. Probably, no set will ever consist of evenly matched grades. Typically, commoner varieties are more readily available in higher grades than are rarer ones.

A few words about die progressions are in order. Bolender observed the die states of dollars that passed through his hands, and noted bulges, cracks, and other defects, which typically grew more severe as the die remained in use over time. The earliest "die state," as it is called, was given a basic number such as B-5. A later die state would be designated as B-5a, and a still later one as B-5b. Since Bolender's studies, which ended in the late 1940s, many new die states have been discovered. Some are *earlier* than the earliest state known to Bolender. This has caused a problem if our hypothetical variety B-5 was described as having a die crack, and now one is known with the same crack but in an earlier and smaller form, or with no die crack. What to call it? Some collectors have opted for B-5c, but that implies that it not only has a die crack, but the crack is of a later state and more extensive than that on B-5b—obviously a confusing situation if the coin has no die crack at all! The method I use in this book to list die states is more logical and easier to understand, in my opinion.

In general, under the Bowers-Borckardt numbers, various states are listed as Die State I, Die State II, etc. If there is a reasonable chance that a perfect-dies specimen may have been struck, it is listed as Die State I. If no example has been seen, the notation "May not exist" is given. If at a later date a specimen comes to light, there will be a listing to accommodate it; no need to rearrange numbers or use them out of sequence.

Much more study remains to be done in the field of die states and also of die progressions, the latter referring to the sequence in which different dies were used. Research styles and procedures have been highly refined in the early large cent series 1793-1814, and the methodology can just as easily be extended to dollars. As collecting early dollars by die varieties has been relatively overlooked in recent decades, often, in fact, *usually*, rare die varieties can be obtained for scarcely more than common ones. I have more to say on the subject of die states and progressions later.

An Overview of the Series

1794-1795 Flowing Hair Dollars

In 1794 the first silver dollars were struck. The mintage has been widely published as 1,758 specimens, a figure taken from the official Mint report. The design is of the Flowing Hair motif with Small Eagle reverse, similar to that used on the half dimes and half dollars dated the same year. The edge of this and other early silver dollars bearing dates through 1804 are lettered: HUNDRED CENTS ONE DOLLAR OR UNIT with ornaments between the words.

According to Jack Collins, who has studied the 1794 dollar in detail, examples of this date exist to the extent of somewhere between 120 and 130 coins. Most survivors show considerable signs of wear, and all show at least some signs of light striking, particularly at the lower left obverse and corresponding part of the reverse.

In American numismatics, the ownership of a 1794 dollar has always been a badge of distinction. Over the years the frequent auction appearances of this date have furnished occasions for numerous tributes to the coin's rarity and desirability.

The attractive Flowing Hair design was continued in use throughout most of the year 1795. Two main varieties of 1795 Flowing Hair dollars are listed in popular catalogues: the style with two leaves under each wing on the reverse, and that with three leaves, although other characteristics are readily discernible. Seventeen different die varieties are known of 1795 Flowing Hair dollars. However, most demand today comes from collectors desiring but a single specimen for inclusion in a type set. Those acquiring dollars by die varieties are few and far between, due to the basic high cost for even common issues.

Flowing Hair silver dollars of 1795 exist today in all grades. Most often seen on the market are coins in lesser conditions, Good through Very Fine, with Fine to Very Fine being average. Extremely Fine specimens are elusive, AU pieces with original lustre are quite rare, and Uncirculated examples are few and far between. Only a few MS-63 or finer pieces are known.

In keeping with other early silver (and gold) denominations, early silver dollars often show mint-caused adjustment marks, due to filing of the planchets to remove excess silver prior to coining, to bring the piece down to the weight required by law. Adjustment marks usually take the form of parallel

or criss-cross grooves or scratches *recessed* in the surface of a coin, and are most visible near the rims and at the center. (By contrast, a scratch on a die used to strike a silver dollar will appear as a *raised* line on the finished coin.)

Striking quality varies from die variety to die variety. Some are more sharply impressed than others. One often-seen variety (1795 BB-27) has weakly defined details in Miss Liberty's hair. Some especially intriguing specimens of the 1795 date have a Mint-inserted silver plug in the center of the coin.

Attributing 1795 Flowing Hair die varieties is easy to do. On the obverse, the positions of the bust, hair curls, stars, letters in LIBERTY, and date numerals in relation to each other are determinants. On the reverse, such variables as the number of berries in the wreath and their positions, the letters of UNITED STATES OF AMERICA in relation to the leaves and berries, the number of leaves below each wing of the eagle, and other features provide keys to attribution.

After a short perusal of the Easy-Finding Guide and examination of the illustrations, each variety will come to life in your eyes and will be easy to identify.

1795-1798 Draped Bust Dollars Small Eagle Reverse

Late in the year 1795 the Draped Bust obverse with Small Eagle reverse was adopted for silver dollar coinage. Artist Gilbert Stuart, contemplating the Flowing Hair motif, remarked in 1795 that "Liberty on the other coins had run mad. We will bind it up and thus render her a steady matron." Accordingly, Stuart created what we know today as the Draped Bust obverse motif.

The new design depicted the draped bosom of Miss Liberty facing right, the word LIBERTY above, the date below, and stars to left and right, on the obverse. The reverse showed an eagle perched on a cloud within a wreath composed of an olive branch to the left and palm leaves to the right, tied with a bow at the bottom. The inscription UNITED STATES OF AMERICA surrounds, with particularly wide spacing between the words. Just two die varieties are known for the 1795 year: BB-51 and BB-52. Each is easy to find.

This style was continued through early 1798 and is similar to that used on half dimes and dimes of 1796 and 1797, quarters of 1796, and half dollars of 1796 and 1797.

Counting Board Used at the Mint

Counting board, used to keep track of silver coins and certain gold issues, as employed in the Philadelphia Mint during the early 19th century. In *Illustrated History of the United States Mint*, George C. Evans described the device: "The boards are a simple flat surface of wood, with copper partitions the height and size of the coin to be counted, rising from the surface at regular intervals, and running parallel with each other from top to bottom. They somewhat resemble a common household washing board, with the grooves running parallel with the sides but much larger. The boards are worked by hand, over a box, and as the pieces are counted they slide into a drawer prepared to receive them. They are then put into bags and are ready for shipment.

Particularly interesting is the 1795 BB-51 variety with small letters on the reverse. This identical reverse die was used with six different obverses dated 1795, 1796, 1797, and 1798!

All dollars of 1796 and 1797 are of the Draped Bust obverse and Small Eagle reverse type. Silver dollars of both dates exist in several varieties. A rarity is the 1797 issue with the Small Letters reverse, BB-72, struck from the durable reverse die just discussed, first used to coin 1795 BB-51. Nearly all specimens of the 1797 BB-72 dollar are weakly defined on the reverse, due to the shallow relief of the die after it had been resurfaced (relapped). No specimens of 1797 BB-72 exist above the AU level, to my knowledge, and the best grade usually seen is VF.

During the first part of 1798, two varieties of silver dollars of the Draped Bust type with Small Eagle reverse were produced, 1798 BB-81 and BB-82. Coinage was quite limited, as can be estimated from the fact that there are over 30 different die varieties of 1798 silver dollars, of which just *two* have the Small Eagle reverse style. 1798 Small Eagle dollars are scarce in all grades.

1798-1804 Draped Bust Dollars Heraldic Eagle Reverse

The most often seen early silver dollars are those of the 1798-1803 years with Draped Bust obverse and Heraldic Eagle reverse. The new reverse motif, by Robert Scot, was first employed on the 1796 \$2.50 gold quarter eagle, and is an adaptation of the Great Seal of the United States. The Heraldic Eagle coin motif differs in that the eagle holds arrows in its dexter claw (observer's left on the coin) and an olive branch in its sinister claw (observer's right)—the opposite of the placement on the Great Seal.

Various adaptations of the Great Seal motif appear elsewhere on American and related coinage, including the Peter Getz' 1792 Washington cents and half dollars, half dimes 1800-1805, dimes 1798-1807, quarters 1804-1807, half dollars 1801-1807, \$2.50 1796-1807, \$5 1795-1807 (although the 1795-dated \$5 coins were minted later, in 1798), \$10 1797-1804, Barber quarters and half dollars beginning in 1892, Kennedy half dollars beginning in 1964, the one-ounce silver "eagles" beginning in 1986, etc.

The year 1799 saw the first overdate in the silver dollar series, 1799/8. Apparently an unhardened, unused 1798 obverse die was on hand in 1799, and

rather than waste the die (or harden it and then use it with the 1798 die date—this was also an early Mint practice), the timely digit 9 was punched over the earlier 8, thus producing the overdate. Including the overdate (which occurs in three die varieties, from mating the obverse die with three different reverse dies), there are 22 distinct 1799 dollar issues. This year and 1798 seem to be the most common of all early dollars, and nearly half of all known silver dollars within the 1794-1804 range known today are dated either 1798 or 1799.

The Heraldic Eagle design was continued in 1800. Popular references list several different variations within the year, including the curious AMERICA I variety which is not a diecutting error but, instead, has the terminal "I" in the form of a stray mark in that position. 1801-dated dollars include Proof novodels, popularly called "restrikes," although no originals from the dies were ever made. Comments on these and the related 1802 and 1803 "restrikes" are discussed in chapters 5 and 6.

Among 1802 dollars the overdate 1802/1, known from five different obverse dies, is especially interesting. On many examples the undertype 1 is almost as bold as the 2.

Dollars of the year 1803 include those with small 3 in the date and one variety with large 3.

The very rare 1804-dated silver dollar, the most famous of all United States coins, was first minted for presentation and numismatic purposes circa 1831-1834 and was not intended as a regular circulating issue. This issue is discussed in detail in chapters 5 and 6.

Rarity of Early Dollars

Estimating Rarity

How rare is a given early silver dollar variety? In the present book I attempt to give rarity ratings for individual die varieties as well as for major dates and types (such as 1795 Flowing Hair dollars as a class). My estimates are based upon estimates of rarity given by Bolender, and cataloguers who have attributed coins in their publications; data compiled by Mark Borckardt and Bowers and Merena Galleries staff members by using hundreds of auction catalogues, advertisements, and price lists (especially since about 1950, for as Bolender mentioned in his book, in earlier times dealers' attributions to Haseltine numbers were often incorrect); consulta-

tions with specialists; and my own observations. In addition, I present what I consider to be good reasons why previously published Mint report figures and/or coinage figures in numismatic reference books for certain years, types, and varieties (e.g., 1797 BB-72 with Small Letters reverse) probably are not correct.

Unfortunately, the great coin market innovation of the decade of the 1980s—certification of coins, beginning with the Professional Coin Grading Service (PCGS) in 1986—did not include attribution of early dollars by die varieties. As a result, many outstanding early dollars have been examined by PCGS, Numismatic Guaranty Corporation of America (NGC), and ANACS (American Numismatic Association Certification Service), but the plastic “slabs” in which the coins are placed do not include information about die varieties (except for ANACS). Perhaps in the future this oversight will be remedied.

It is to be regretted that requests for inventories of collections of dollars owned by members of the John Reich Collectors Society (JRCS), published in the *John Reich Journal*, have drawn only a limited response. Part of this is because collecting early dollars by die varieties is not a popular specialty today. Another reason is that it takes a lot of effort to compile a listing of one’s holdings, and few are willing to devote the necessary time to the task. Another consideration is that of security: many numismatists want to maintain privacy concerning their holdings. I recall that in one of our auction sales, an enthusiastic bidder on a rare 1794 dollar hastily made up a pseudonym when he was interviewed by a member of the numismatic press.

The Borckardt Population Survey

In 1992, Mark Borckardt and several staff members of Bowers and Merena Galleries surveyed selected auction sales (and a selected advertisement) in which silver dollars were attributed by Haseltine or Bolender numbers, and tallied their findings. The total number of coins considered—over 8,530—was greater than the quantity (5,000) M.H. Bolender stated he viewed in his lifetime.

Catalogues from 1970 to date were emphasized, a total of 701 auction sales, although selected earlier sales were represented as well. Catalogues *not* surveyed fell into several categories:

1. Although much time was spent surveying nineteenth and early twentieth-century catalogues of the Chapman brothers, Ed. Frossard, William Hesslein, Lyman H. Low, W. Elliot Woodward, and others, and although a number of these are represented in this book in the section on historical prices, most of these have been omitted from the survey. The reason is that most sales were not attributed by die varieties. Most were not illustrated. Those few that were illustrated, usually depicted only the key issues such as 1794. If plated coins (which could be attributed by the photographs) had been included, this would have skewed the data toward rarities and high-grade coins, and would have included no common issues (1795 BB-21, for example) in low grades. Similarly, the vast majority of B. Max Mehl catalogues did not attribute the early dollars. Even worse, Mehl used “stock” illustrations in some catalogues; the coin being sold was not the one illustrated.

2. Catalogues that were not readily accessible to Mark Borckardt when the research was conducted were not surveyed.

3. Numerous minor offerings of silver dollars, including just a few coins, were not surveyed. (It is anticipated that some of these will be included in any future edition of this book.)

The following catalogues *were* included in the Borckardt survey:

Apostrophe Auctions (annual summer sales held by Paramount (later, David Akers), Rarcoa, Stack’s, and Superior combined). All auctions 1979-1990. (12 catalogues)

Bebee’s May 1953 advertisement in *The Numismatist*. (1)

Bolender Sale #183, his own collection, 1952. (1)

Bowers and Merena Galleries. All auctions 1983 to September 1992. (67)

Bowers and Ruddy Galleries. All auctions 1972-1982. (63)

Chapman brothers. Haines Collection, October 1888. (1)

Frossard, Ed. Sale of March 1898. (1)

Heritage Numismatic Auctions. 1986 Midwinter Sale; 1988 sales numbered 2, 3, 4, and 5; 1989 sales 2, 4, and 5; 1990 sales 1 and 2. (10)

Ivy, Steve. All public auctions except October 1977, February 1979, May 1979, and August 1983. (24)

Kagin’s Numismatic Auction. All sales 1970-1988 except February 1988. (60)

Kelly, James F. DeCoppet Collection, April 1955. (1)

McIntire Auctions. Gengerke nos.:¹ 9, 10, 12, 16, 17, 19, 20, 21, 22, 23, and 24. (11)

Mehl, B. Max. Sales of March 1925, April 1929, June 1947. Most other Mehl sales did not attribute the dollars. (3)

¹ The only McIntire catalogue listings used were those in which silver dollars were attributed by Bolender numbers.

Merkin, Lester. All sales except March 1967 (Green catalogue), April 1972, September 1973, December 1973, and August 1976. (26)

Mid-American Rare Coin Auctions. All through 1992 except May 1984, September 1984, May 1985, and January 1986. (19)

New Netherlands Coin Company. All numbered sales from 34 through 66 except 36, 37, and 62. (30)

Numismatic Gallery. World's Greatest Collection, 1945; sale of June 1950. (2)

Pine Tree Auctions. Nos.:¹ 3, 6, 7, 9, 10, 12, 15, 16, 19, 21, 27, 32. (12)

Schulman, Hans M.F. Herdegen Collection, December 1973. (1)

Stack's. All sales 1960 to October 1992 except April 1989, October 16, 1989, October 17, 1990, December 1990, January 1991, April 1991, June 1991, October 1991, and June 1992. (273)

Superior Stamp & Coin Co. All sales through August 1992. (83)

Total catalogues surveyed: 701.

The Borckardt Survey: Analysis

Composed nearly entirely of auction data (with the sole exception of a 1953 retail advertisement by Bebee's), the Borckardt population survey includes only coins that were deemed sufficiently important to their owners and/or various professional firms to be included in an auction sale and to be attributed to Haseltine or Bolender numbers.

Many common varieties in lower grades were never consigned to auctions, or were consigned but not deemed sufficiently valuable to warrant attribution. Thus, the results are skewed in favor of dates or varieties considered to be rare and valuable, especially 1794 dollars (which are valuable in *any* grade) and 1797 dollars (considered by many to be the second most valuable date after 1794). Such pieces are over-represented in the survey, while commoner issues as 1795 Flowing Hair, 1798, 1799, and 1800 are under-represented. Indeed, 1794 is by far the most over-represented coin among early dollar auction listings.

High-grade dollars of any and all dates are valuable. Thus, higher grade coins, especially those in categories of AU and Mint State, are over-represented, while coins graded Fair, Abt. Good, Good, and Very Good are severely under-represented.

In addition to the foregoing, common die varieties are under-represented and rare ones are over-

represented, as, for example, every specialist collector has aspired to own just one example of the common 1795 BB-21 and also just one of the rare 1797 BB-72. Because of this, large numbers of unsold 1795 BB-21 dollars resting in dealers' stocks or among collectors' duplicates are not represented.

In general, dollars of earlier dates are attributed in auctions and in dealers' stocks more often than are later dollars. In the past, numerous auction sales have had specimens of 1796 and 1797 listed by varieties, but the harder-to-attribute 1798, 1799, 1800, and later dollars were simply listed by date. This has caused an additional under-representation for dates after 1797.

Further, catalogue listings are not always what they appear to be. In one of my own firm's catalogues, Mark Borckardt discovered that a dollar described as a rare 1796 Bolender-3 (BB-62) was actually of another, commoner variety. In looking at the offerings of the same variety in catalogues of other firms, he found that *all but one* (the Straus-Spies specimen sold by Stack's) were misattributed. Bolender mentioned in his 1950 book that he had purchased a dozen or more of this same Bolender-3 (BB-62) variety over the years, and that *every one of them* had been misattributed.

In checking 10 listings of another variety, 1795 BB-15 (Bolender-8), illustrated in modern auction catalogues, Mark Borckardt found that four were wrongly identified. Because of this, certain rare varieties—especially ones which differ from another variety only by some minor or hard-to-determine difference—are apt to be over-represented in catalogues. When such a piece is not illustrated, there is no way of telling today if it was attributed correctly.

Still further, it was and is often the practice to "recycle" unsold auction coins into a future sale. Because of this, two or three listings may represent just one actual coin. In the same vein, if a coin was sold in a 1970 sale, then consigned to a 1973 sale and sold, then consigned by its new owner to a 1980 sale and sold, etc., several different catalogue listings over a span of years can represent the same coin. If the pedigree is given, as "from our Gilhousen Sale," then the duplication has been eliminated in the "Auction Population Survey" listings given under the variety descriptions (however, duplications have not been extracted from the "Borckardt Population Survey Totals" summarized below).

¹ Numbers are those assigned by Martin Gengerke in his study, *American Numismatic Auctions*.

BORCKARDT AUCTION POPULATION SURVEY
(1992)

1794: 102 = 1.2% of the total coins surveyed

1795 Flowing Hair: 1,154 = 13.6%

1795 Draped Bust: 447 = 5.3%

1796: 490 = 5.8%

1797: 552 = 6.5%

1798 Small Eagle: 246 = 2.9%

1798 Large Eagle: 1,323 = 15.6%

1799/8: 265 = 3.1%

1799: 1,650 = 19.4%

1800: 940 = 11.1%

1801: 330 = 3.9%

1802/1: 239 = 2.8%

1802: 329 = 3.9%

1803: 438 = 5.1%

Total: 8,505 pieces = 100%¹

Data from the preceding, with duplicates deleted (in instances in which pedigree listings were given), are given under the individual entries.

Of the early silver dollars surveyed, very few were certified by ANACS, NGC, or PCGS. None of the coins in the major collections was thus "slabbed." Instead, grading was mostly adjectival, with some numerical evaluations as well. In order to compare the data, all descriptions were reduced to numbers. In instances of split grades, such as VF-EF, the lower grade was used, in this instance VF. In instances in which a cataloguer used a number, such as EF-40, these numbers were preserved.

In the Uncirculated category, all coins are listed as "MS-60 or finer," even though original catalogue descriptions ranged from a simple "Uncirculated," to "superb gem Uncirculated." The reason for this is that in the course of handling in modern times many "gem Uncirculated" coins from years ago, I have found that only a few qualify as gems today. Many coins that were listed as Uncirculated years ago, today are AU at best. Sample "Auction Population Survey" listings follow:

1794 BB-1: Good: 3, Very Good: 13, Fine: 21, Very Fine 34, Extremely Fine: 15, About Uncirculated: 4, MS-60 or better: 12. Total: 102.

1795 Flowing Hair, BB-21: Good: 6, Very Good: 45, Fine: 57, Very Fine: 88, Extremely Fine: 41, About Uncirculated: 23, MS-60 or better: 11. Total: 271.

The preceding illustrates the frequent appearances in auctions of the rare 1794, a coin of which Jack Collins, who has studied dollars of this year and

who is preparing a book on them, 1794: *The History and Genealogy of the First United States Dollar*, believes that about 120 to 130 different coins exist. When a coin comes on the market, chances are good that it will be sold via the auction route. As noted, the auction data over-represent the 1794 BB-1 dollar.

On the other hand, 1795 BB-21 is one of the most common of all dollars of its era. Most specimens change hands privately, not across the auction block. I have had a half dozen pieces in stock at once, and I have seen a couple of dozen or more at a single coin show. It is obvious that the auction data under-represent the 1795 BB-21.

The Value of Detailed Explanations

It may be that in the explanation of data gathering and evaluation, and rarity determination, I am going into too much detail. However, I feel that readers truly interested in the subject will appreciate knowing how the figures were derived, and what their reliability is. (Those who are not should just skip this section of the book!)

In the course of working with many numismatic reference books in many different series over a long period of years, I have always found it frustrating when an author stated, for example, that a variety is common, when in my own experience I have seen very few; or, if someone wrote that a coin is one of two known, and I have bought and sold five different. Accordingly, by explaining in detail the derivation of an estimate, readers will know as much as I do, and can more clearly evaluate the rarity aspect of a given coin.

It is dramatically evident that much information presently in print concerning mintages and rarity ratings is patently incorrect. Much of the rarity information in the present book represents new information based upon methods and a depth of research not hitherto employed in the early dollar series.

However, due credit is given to the excellent studies conducted by others in the past, as we all build on the efforts of our predecessors. When Bolender published his first rarity ratings in 1950, he was a committee of one. From this beginning, much has developed. It would be hard to envision a world of early dollars without the work of Milferd H. Bolender looming large over it. Likewise, the ghost of Capt. John W. Haseltine still lurks in the shadows.

¹ In addition, just before this book went to press, 26 early dollars from the Heritage sale of February 1986, including 25 from the Frank M. Stirling Collection, were surveyed, and the results incorporated into the various listings.

Similarly, the present work will be a jumping-off spot for additional research. If interest in early dollars expands, then doubtless many presently unattributed coins will be classified, and rarity ratings will have to be revised once again. If NGC and PCGS start attributing the early dollars that pass through their hands, this will be very helpful to those who study the subject in the future. The study of die states will undoubtedly necessitate some revisions of die linkages and minting periods.

Revised Mintage Figures

It is popular with numismatists to use published mintage figures as a guide to rarity. However, I suggest that in the field of early silver dollars, official figures are of relatively little use in this regard.

Each year the Mint kept production records of coins minted, and each year the Treasury Department made the numbers available in annual reports to the public. According to these figures, the following quantities of silver dollars were struck during the calendar years indicated:

1794: 1,758
1795: 203,033
1796: 72,290
1797: 7,776
1798: 327,536
1799: 423,515
1800: 220,920
1801: 54,454
1802: 41,650
1803: 85,634 ¹
Total: 1,438,566

These are the figures that are published in the *Guide Book* and other standard references. I have no quarrel at all with the total of these numbers, and believe that during the time span in question, silver dollars totaling 1,438,566 coins were struck. Further, I am sure that 1,758 silver dollars must have been struck in calendar year 1794, 203,033 in calendar year 1795, and so on. However, I do have a problem with the assumption that the calendar year mintage figures equate to the dates actually struck on the coins.

For example, on the market today, the 1797 dollar is only *slightly* scarcer than the 1796 dollar. There

is little difference in market prices between the two dates. Thus, it is not reasonable to assume that the mintage of 1797-dated dollars was only 7,776. It must have been more (or else the mintage of 1796-dated dollars must have been less than the government number). It seems to me that the original mintage of 1796-dated dollars and 1797-dated dollars must have been about the same.

As Dr. Robert Stark has suggested,² it is possible—in view of the belief that large quantities of dollars were exported—that as the Mint struck silver dollars to order for bullion depositors, an exporter may have deposited a quantity of foreign coins or bullion, and received new dollars. The freshly coined dollars, perhaps consisting of much or most of the production of a given die variety, could have been exported, never to enter domestic circulation, and to be lost to present-day numismatists.

In the early years it was Mint practice to keep using dies until they wore out or broke.³ Thus, if the Mint had made up a quantity of 1797-dated dies in anticipation of a large coinage that year, but if silver deposits were insufficient, or there were other problems, and if only a few coins were minted, the serviceable dies still on hand at the end of the year would be used the following year. I believe that this happened in the majority of instances.

Of course, the Mint never stated that its production figures for early silver dollars referred to the dates actually on the coins. Numismatists have just assumed that they did. In Appendix II the situation is explored in depth. The Economite hoard (1878) and data from NGC and PCGS population reports are used to suggest revisions to the Mint figures.

This ground has been covered before, but not to such an extent. Examples include these:

In *The Fantastic 1804 Dollar*, p. 50, Eric P. Newman and Kenneth E. Bressett said the following: "Obverse dies were used until they failed, and good dies were not withdrawn when the year of their dating had passed." In his *Encyclopedia*, p. 428, Walter H. Breen stated this: "Mintage reported for 1801 consisted largely of coins dated 1800; similar backdating was the rule through 1804."

In summary, here are the official Mint figures for

¹ 85,634 includes 19,570 struck in calendar year 1804 from earlier dated dies.

² Letter to the author, January 1, 1993.

³ This policy was followed for a long time. For example, in 1827 an obverse die for the quarter dollar was made by overpunching an 1823-dated die still on hand but not used earlier. Circa 1798, the Mint used a 1795 half eagle obverse to strike coins with the Heraldic Eagle reverse (which had not been devised by 1795, thus creating a design oddity).

calendar year coinage (again) and, in parentheses, my estimates of the approximate actual mintage of coins bearing those dates.

1794 Mint figure: 1,758 (delivered); Author's estimate: No change

1795 Mint figure: 203,033; Author's estimate: 390,000

1796 Mint figure: 72,290; Author's estimate: 75,000

1797 Mint figure: 7,776; Author's estimate: 60,000

1798 Mint figure: 327,536; Author's estimate: 235,000

1799 Mint figure: 423,515; Author's estimate: 395,000

1800 Mint figure: 220,920; Author's estimate: 100,000

1801 Mint figure: 54,454; Author's estimate: 35,000

1802 Mint figure: 41,650; Author's estimate: 80,000

1803 Mint figure: 85,634; Author's estimate: 60,000

The years 1797, 1798, and 1800 in particular are interesting relative to the use of dies in year(s) other than indicated on the dies.

Actual Rarity vs. Auction Records

While estimating the number of coins originally minted and/or distributed by the government is an interesting exercise, the figures obtained tell only part of the story concerning the availability of various early dollar dates today. The numismatic market has its own history, and is a valuable source of information.

Gathering useful data concerning the rarity of coins within the coin collecting fraternity is a task more difficult than it might seem at first. In each of the succeeding sections of the book, I give information pertaining to data gathering, which for each series shares a common philosophy, but there are individual differences. However, nowhere is the task more uncertain and difficult than with early silver dollars. The main dilemma concerns die varieties. It would have been easy had the object been to evaluate the rarity of early dollars by dates or by major types.

Over the years, early silver dollars 1794-1803 have been offered in numerous dealers' advertisements and price lists. However, for the vast majority of such offerings no attributions have been given to either Haseltine or Bolender numbers. Rather, most are listed by date and basic description, such as "1795 Flowing Hair" or "1798 Small Eagle reverse," or "1802/1 overdate." While a compilation of such offerings is useful to determine the relative rarity of a given major variety or type, it is of little use in making finer distinctions.

As I have noted, sometimes a listing can be repeated over and over. If a dealer offers an attributed

coin such as a 1795 Flowing Hair dollar, Bolender-1 [BB-21], in EF grade, in five successive catalogues or five successive retail advertisements, does this mean that he has just one coin and has not been able to sell it, or has he had five different? The answer is unknown. The presumption is that he had just one piece, but for a common issue he may have had several.

Auction data are useful to an extent. Probably the best advantage to be secured from auction information is the relative rarity of a given issue at different grade levels. If 20 VF-20 specimens of a specific die variety are offered over a five-year span of time, even if some of the auction appearances represent duplication, it is still reasonable to assume that in VF-20 grade that particular variety is not too difficult to acquire. If over a span of decades, the highest specimen of a given variety auctioned is VF-30, then it is reasonable to assume that should an EF-40 coin appear, it definitely would be a Condition Census (in the top six known specimens) item. More about the Condition Census later.

The main flaw with auction data is that the numbers tend to make rarer coins seem more available than they really are, and to make common varieties seem less plentiful than their true proportion in the real population.

The reason for this is that numismatists building collections have sought just one example of each date, date and major type, or variety, as the case may be. They have not wanted duplicates. Thus, going far back into history, a representative collection by dates and major varieties would typically contain a 1794 dollar, 1795 Flowing Hair dollar, 1795 Draped Bust dollar, and so on. In actuality, among 1795 silver dollars, the Draped Bust variety is many times more elusive than the Flowing Hair type. If relative rarity were to be shown, a collection that has one 1795 Draped Bust dollar should have several of the Flowing Hair style. However, no collector, unless he or she is acquiring coins by minute varieties, wants more than just one of each. Because of this, Flowing Hair dollars and Draped Bust dollars dated 1795 seem, per the auction records, to be closer together in availability than they actually are.

To expand the illustration, consider the Lincoln cent series minted from 1909 to date. Over the years, just about every collection of Lincoln cents ever offered has had a 1909-S V.D.B., one of the lowest mintage issues in the series. The typical collection has also included a 1959 Philadelphia Lincoln cent, a coin made to the extent of over 610 million

pieces. Today, for every Uncirculated 1909-S V.D.B. cent in existence there are many thousands of 1959 Lincoln cents. However, if you were to compile auction data, you would find that this great difference in availability would not be reflected. Many other examples could likewise be given.

The ideal way to determine the rarity of silver dollars dated 1794-1803 would be to have had access to the stocks and auction consignments of J.W. Haseltine, the Chapman brothers, Edward Cogan, W. Elliot Woodward, Ed. Frossard, S.K. Harzfeld, and other nineteenth-century dealers, and to have kept track of the die varieties they handled, making careful notes about scratches, toning, edge bumps, etc., so that the reappearance of a given specimen could be identified. In the present century, the stocks of B. Max Mehl, Thomas L. Elder, John Zug, Numismatic Gallery (Abner Kreisberg and Abe Kosoff), Stack's, New Netherlands, Heritage, Superior, and many others could also be audited.

However, this is not possible. If it had been, perhaps part of the fun of collecting and studying early dollars would be lost. After all, there is something fascinating about the unknown, the quintessential, the mysterious.

In most numismatic series, among the best sources for information today are the population reports published by the various grading services, with NGC and PCGS being the most widely known. While resubmitting the same coins has caused some inaccuracies, particularly among pieces that are more expensive and/or in higher grades, in general the proportions remain correct, in my opinion.

In the analyses of specific dollar die varieties to follow I make limited use of NGC and PCGS data. Unfortunately—*very* unfortunately—these two fine grading services do not attribute coins by die varieties, so we have no idea what particular varieties have been certified. That information must be obtained elsewhere, such as from a dealer or auctioneer who has attributed a group of dollars earlier certified by these services.

Bolender: The Basic Source

Over the years various specialists have given their opinions concerning rarity, and updatings have been published of the ratings given by M.H. Bolender in 1950. This information has been of great value to me in compiling rarity information concerning early dollars. In many instances, Bolender was conservative, and allowed for the fu-

ture discovery of additional pieces. In other instances, he was optimistic. In any event, the Bolender estimates are history now, for two generations of numismatists have had the opportunity to build upon and refine his ideas.

All research efforts in numismatics build upon the efforts of others. In 1950, M.H. Bolender took under advisement the comments made by Capt. J.W. Haseltine in his 1881 *Type-Table*, and if that old-time Philadelphia dealer called a variety "excessively rare" (one of Haseltine's favorite ways to describe an ultra-rare piece), surely Bolender factored this into his own ratings. For dollar enthusiasts, the Bolender text with its subsequent updatings serves as a jumping-off spot, a home base to which one constantly returns for information and numismatic nurturing.

However, the Bolender work has its inconsistencies. In one instance, he mentioned that he had seen just one specimen of a sub-variety, and yet he called it Rarity-6, meaning that dozens are known, if he meant R-6 on the Sheldon Scale. In other instances, he described one or two die cracks on a coin, and ignored others, sometimes almost as obvious.

Apparently, Bolender knew little about the die-making and coin striking processes. This was not unusual; most other numismatic writers didn't know much on these subjects either. In 1950, Walter H. Breen was a relative beginner in numismatics, Don Taxay was completely unknown to the collecting fraternity, and R.W. Julian hadn't been heard from yet. Today, in the 1990s, a lot of what we consider "common knowledge" concerning Mint history can be credited to the research efforts of these three researchers, plus notable efforts by Walter Thompson, Raymond Williamson, Eric P. Newman, and others.

Years ago, clash marks caused by dies coming together without an intervening planchet were not fully understood. The resultant die damage traces were curiously called "suction marks" by Bolender, as if some sort of vacuum process was responsible. The "suction marks" misnomer dates back at least to 1908 in Lyman H. Low's catalogue of the Dudley R. Child Collection. Nor, apparently, did Bolender know much about die lapping and resurfacing, die alignment and spacing, or other technical considerations. With today's fund of information on Mint processes, it becomes easier to understand early silver dollars and their idiosyncrasies.

As strange as it may seem today, Bolender was not concerned with grading. For his own collection he endeavored to acquire one of each variety, and a

VF or EF would do nicely. Had he wanted to, he could have acquired AU and Mint State specimens for certain varieties at relatively little cost. While the guidelines for building his own collection were properly his own business, it is to be regretted that he did not keep notes on the grade levels of the 5,000 specimens he observed over a period of 40 years, in the manner that Dr. William H. Sheldon did for his *Early American Cents* book, which was published in 1949, the year before Bolender's opus.

Grading as a Factor of Rarity

Today, the sophisticated collector of early dollars is interested in more than a basic rarity rating. If I were to write that 200 specimens existed of 1795 Bolender-50 (to create a hypothetical variety), this would not be a fraction as useful as information stating that 100 are known, including one MS-65 coin, one MS-63, two to four MS-60 pieces, a dozen AUs, 25 to 50 EF coins, and 100 or so in VF grade, etc.

As noted, grading information is close at hand with the population reports issued by NGC and PCGS, but it is largely useless unless the coins are seen in person or reliably reported, for published data of these two certification services do not identify the die varieties.

Auction catalogues, price lists, and dealers' advertisements present another grading problem. Is a coin advertised in 1935 as Uncirculated, in a grade we would call Uncirculated today? Often not. After examining many coins from old-time collections over a long period of years in conjunction with my rare coin business, I have come to these general conclusions for *most* listings prior to about 1986 (to which there are many exceptions, of course):

1. If a coin was called *choice* back then, it may or may not be what we would designate as Uncirculated (Mint State) now. If it was called *gem*, the chances improve greatly. If it was simply called Uncirculated (or brilliant Uncirculated), chances are great that if NGC or PCGS would grade it today, the coin would be AU.

2. Rare coins such as 1794 dollars tended to be graded more liberally (at all condition levels) than common ones.

3. Among nineteenth and *early* twentieth-century listings, pieces described as Fair or Good were undergraded by today's standards. Further, AU was not commonly used, and many pieces graded as EF back then are what we would call AU today. Of course, this conservative grading seems a bit strange

in view of the overgrading of pieces at the Uncirculated level.

4. If a coin was cleaned, this wasn't mentioned, unless it was horribly cleaned or rubbed. Nicks and edge bumps were usually overlooked.

5. Catalogue illustrations, particularly of the photographic variety, can be useful in determining grade. However, it was a common practice to use "stock" photos instead of the coins actually being sold. Certain catalogues of B. Max Mehl, Numismatic Gallery, and Hollinbeck Coin Company are notable in this regard.

How, then, did I determine grading as part of the rarity equation for the present book? The answer is that I usually employed printed catalogue grades such as Good, VG, Fine, VF, and EF as they were given, unless examination of catalogue illustrations suggested otherwise. Fortunately, some of the most extensive and best modern offerings of early dollars appeared in the catalogues of New Netherlands, Stack's, Lester Merkin, Superior, my own firm, and others I consider to be reliable (with some scattered exceptions for individual coins).

The matter of Mint State vs. AU is another consideration, and no collector, dealer, museum, or anyone else who graded Uncirculated coins years ago could have known that in 1986 and later, grading interpretations would tighten considerably. For example, in the 1950s it was perfectly acceptable for a coin described as Uncirculated to have some light rubbing. Indeed, it might be called something like "Uncirculated with light rubbing on the high points," or something similar. Today, the same coin would probably be graded AU. For this reason, I suggest that more "Uncirculated" coins appear in the historical record of auction sales than actually exist by today's standards.

On the other hand, auction appearances represent only a tiny fraction of the total population of early dollars in various grades. Nowhere is this more evident than to point to certain varieties or die states of which Bolender was not aware, but yet are now known to exist in multiple numbers. 1798 BB-91 (Bolender-32) is an example of an issue discovered after the 1950 publication of the Bolender book. Several generations of numismatists—in the nearly three-quarters of a century from the publication of Haseltine's *Type-Table* in 1881, to Bolender's 1950 book—studied early dollars but were not aware of what we today call 1798 BB-91. The fascinating part is that now a dozen or more specimens have been

identified, and one cataloguer estimated the population to be in the range of 20 to 30!

Population Estimates

Drawing from the sources just mentioned, and others, I have derived estimates of the population of each variety in several different grade ranges. A typical variety is accompanied by an estimate summary similar to the following:

Approximate population MS-65 or better: 0 (URS-0)
Approximate population MS-64: 0 (URS-0)
Approximate population MS-63: 1 to 2 (URS-1)
Approximate population MS-60 to 62: 2 to 5 (URS-2)
Approximate population AU-50 to 58: 10 to 20 (URS-5)
Approximate population VF-20 to EF-45: 250 to 450 (URS-10)
Approximate population G-4 to F-15: 100 to 200 (URS-8)
Approximate population for all grades combined: 350 to 675 (URS-10)

CONDITION CENSUS: 63-60-60-55-55-55

The lower of the two figures, for example, 10 in the AU-50 to 58 range, represents the number of pieces I feel certain exist, based upon auction appearances, catalogues, the rarity ratings published earlier by others, consultations with specialists, my own experience, etc. The second figure, 20, represents an estimate of how many might exist, but which are not known or accounted for at present.

As was demonstrated by the earlier example of the previously unknown 1798 BB-91 variety, once specialists start looking in earnest, often many additional specimens come to light. It is likely as time goes on, that specimens in various grades will become more plentiful than we now realize.

The URS designation represents the Universal Rarity Scale estimate based upon the lower figure in the range, in this case upon an estimated population of 10 coins in the AU-50 to 58 range.

The approximate population for all grades combined is obtained by adding together the lower figures and higher figures in each range, and rounding them off for final figures. In this instance, the total of the lower figures is 363 and the higher, 676. This has been rounded off to 350 to 675, as giving the range as 363 to 676 would imply a precision that does not exist. Even a range such as 350 to 675 simply represents the total of my estimates (or, less kindly, guesses). If one could see and know all things, perhaps precisely 483 exist, or 1,382, or whatever.

As is true of the ratings given by other writers who have gone before me, my rarity ratings given in

the present book will be a target for specialists and others to consider, and undoubtedly after they have been in print for a time, numerous changes will be suggested, possibly some of them dramatic.

Condition Census

A Condition Census rating has been given for each silver dollar variety. The rating consists of listing the numerical grading of the top six specimens known, reliably reported to me, or reasonably estimated to exist in private hands. Early dollars in institutional collections (the American Numismatic Association, American Numismatic Society, Smithsonian Institution, etc.) are not included.

In some instances the Condition Census will include more than six, if the lowest number in the range has multiple coins. I will give illustrations of each instance:

1. In this hypothetical instance, it is believed that the finest known specimens of a given variety grade AU-55, AU-50, AU-50, EF-45, EF-45, EF-45, EF-40, EF-40, VF-30, and so on downward. The Condition Census would be expressed as follows: 55-50-50-45-45-45, which lists the grades of the top six coins.

2. In this next hypothetical instance the finest known examples of a given variety are AU-55, AU-50, AU-50, AU-50, AU-50, followed by 22 grading EF-45, followed by 30 in EF-40 grade, and so on downward. In this instance the Condition Census would be expressed as follows: 55-50-50-50-50-45 (multiples).

The Condition Census has the advantage that the collector can determine at a glance the range and availability of the finest known pieces. It has the disadvantage that grading interpretations vary, and what one cataloguer or expert might call MS-60, another might call AU-55 or even MS-63. Because of this, the grades, including those given by the certification services, must not be considered as absolute. Time and time again I have seen coins of the same grade and certified by the same grading service, put side by side, and to my eyes one would be materially nicer than the other.

As noted, the Condition Censuses and the various rarity ratings represent examples reported to or known to me. Each year, estates come on the market, old-time collections are broken up, and coins otherwise sho up that have not been available for years. Even more relevant, coins that have never been attributed will come under the scrutiny of

someone familiar with die varieties, and will be identified.

Because of these, over a period of time the Condition Census numbers will rise, as more high-grade pieces are found. If EF-40 represents the lowest grade in a Condition Census today, perhaps a decade from now the lowest grade will be EF-45 or AU-50. The same is true of rarity ratings. If more coins are discovered, the rarity ratings will become more generous. Certain coins described today as having two or three known may be properly described as having four to six known later.

In other words, take my numbers with a degree of skepticism.

Die States and Characteristics

Die States

The term *die state* refers to the condition of the dies when a particular piece was struck. Specific considerations for certain die states include these:

1. The presence of pitting or rust, which on a coin appears *raised*, sometimes as a rough or grainy patch. In the humid Philadelphia summer, a die not protected by grease could rust in a matter of days.

2. Die finishing marks, which include file marks and polishing marks, are often visible as *raised* lines near the denticles. As a die was used, these marks wore away gradually.

3. Repunching marks made when a design element such as a date numeral, star, or inscription letter was punched more than once, with the second punch being slightly misaligned, showing a doubling on the finished coin. Sometimes, repunching was done to correct an error. Often such repunching traces wore away as the die was used, or dwindled or vanished after the die was relapped. An example of a die-punching error is furnished by 1798 BB-118, which has the N in UNITED over a previous erroneous I. And on 1795 BB-21, 22, and 23, the 7 is punched over an erroneous 1.

4. Die cracks. Cracks in a die—ranging from tiny hairline cracks extending for a short distance, to massive cracks bisecting a coin, to rim breaks—usually start small, and increase in length and prominence. Often (as in the case of 1800 BB-194, the so-called *Dotted Date*), a die crack would begin as one or a series of dots or small lumps. A die with a crack just beginning indicates an earlier state than one with the same crack more advanced, or with additional cracks. Dies broke for several reasons, including being used extensively. If a die was improperly

hardened during the die preparation process, it might crack after only a few coins were struck from it, thus creating a rare die variety. Theoretically, a die could acquire cracks during the preparation process, including by improper hardening; in such an instance, all coins struck from the die, from the first piece onward, would show the crack(s). A famous example of this is the 1793 Liberty Cap cent, Sheldon-14, always found with vertical crack bisecting the obverse. Caveat: If a die with one or more cracks is relapped, these cracks may be removed, or may be diminished in their prominence.

5. Die clashing. Often during the course of striking silver dollars—in fact, beginning with the initial issue in the series, 1794—the obverse and reverse dies would come together without an intervening planchet. If the impact was severe enough, the harder of the two dies (no two steel dies had exactly the same hardness) would be impressed into the softer die, and lettering, designs, etc., usually in fragmentary form, would be impressed into it. Thus, a die state of 1800 BB-192 has the incuse letters MERIC visible on the right of the obverse between the stars and the border, clashed impressions from these letters as part of AMERICA on the reverse. The letters MERIC were incuse in the reverse die; thus, in clashed form, they were in relief on the obverse die. As they were in relief on the obverse die, they were impressed into the coin incuse (intaglio, or recessed), as noted. If a feature was incuse on a die to begin with, such as the crevices or folds in the drapery on Miss Liberty's bust, then in clashed form they would appear in relief on a coin. This happened on 1800 BB-193, Die State III, which exhibits raised traces of the drapery, now on the reverse of the coin at F in OF. (Bolender called these marks a "die break like a spray.") Perhaps the most spectacular instance of die clashing among early dollars is 1795 BB-13, late state, with much of wing and part of wreath behind the head. Numerous other examples could be cited. Die clashing was a prime reason to relap or resurface a die.

6. Die sinking. As a die was used (especially if imperfectly hardened), it tended to compress the crystalline lattices. The shallower the hardening, the more likely the centers of the die would compress under stress and thus sink the die face. This had the opposite effect on coins struck from the die: the surface of the coins appeared to bulge outward. Die cracks, especially large ones, often contributed to a die sinking in a particular area, causing mounds or bulges on coins struck from that die.

7. Die faces not parallel (axially misaligned). If a pair of dies was put into the coining press, with the faces not parallel, then the upper and lower dies would be closer together on one side and farther apart on the other. Coins struck from such misaligned dies would be sharper and with more prominent border denticles (toothlike rim projections) where the dies were closer together, and lightly struck and indistinct where the dies were more widely separated. This is most often noticed on early cents; die breakage often occurs where the dies come closest together. This situation occurs several times among early dollars, the most famous instance being that of all silver dollars dated 1794. The very rare 1798 BB-91 is another example.

8. Resurfacing or relapping. Sometimes to extend its use (most often to remove clash marks), a die was resurfaced. The reverse die used to coin 1798 BB-101 shows just 10 arrows, but earlier, when used to coin 1798 BB-96, the same die had 10 arrows and two "sticks" (arrows without heads). The die was ground down (called "relapping"), and certain shallow features were removed, including the two sticks. Relapping also caused the denticles to be smaller (and the rims of resultant coins to be lower, thus causing the coins to wear faster), and stars to be irregular or "spidery." Perhaps the most famous instance is the reverse of 1799 BB 158-161, which after two relappings, showed no berries.

9. Strengthening and altering. In some instances, die features were strengthened or augmented. For example, the obverse die used to strike 1795 BB-25 had the tail of the R in LIBERTY strengthened with an engraving tool after relapping had removed some of what was already a defective R (struck from a broken punch).

10. Miscellaneous flaws. Often, early dollar dies had small flaws in certain areas, often around the borders. These were caused by improper finishing of the die, imperfections in the die steel, stray marks from an engraving tool or piece of metal (believed to be the cause for the extra I in the inscription AMERICA I on an 1800 dollar die), or in other ways. Such flaws, indented in the die, appear raised on the coins struck from such a die. Often, such flaws wore away as the die was used. In other instances, flaws indicated die weakness and furnished the genesis for a die crack. Perhaps the outstanding instance of such a stray mark is the diagonal one behind the top curl on 1795 BB-27. On the latest state, relapping weakens this mark.

About Bifurcation

The term *bifurcated* was used extensively by Bolender, and refers to letters and numerals around the periphery of an early dollar which seem to be split at their bases. Thus, the letter I, if bifurcated, will have the bottom of the vertical shaft split or forked.

During the striking process for a coin in an open collar, the metal that starts to fill up the vertical shaft of the I will continue to expand outward (toward the rim) along that shaft, leaving the base of the upright unfilled. If the dies come no closer together after this happens, the letter I (in this example) will appear bifurcated. The bases of other letters will remain incomplete as well, the degree of bifurcation depending upon the depth of the strike and the shapes of the letters. Those letters with long, vertical uprights will be affected the most, and the effect will be more noticeable if there are serifs struck up at their bases.

On the other hand, if the strike is adequate and the dies continue to come closer together, the base of the shaft will ultimately fill up with the silver alloy metal, and the planchet will mold itself to the design in the dies, and outward expansion will be inhibited.

A variant type of bifurcation was caused by metal flow, when a planchet with an insufficiently upset rim (a too-flat slope up to the rim raised during the lettering of the edge on the blank planchet), or too loosely fit within the collar, was struck, and the metal in the planchet flowed outward toward the collar, especially if the strike was not deep enough to fully bring up all aspects of the design, and to fill all the die recesses. Any characters in the die near the border—and this usually meant stars, letters (especially letters with long, vertical shafts), or date numerals—would then sustain flow marks, or bifurcations, at the inner edges of the characters. Sometimes, the bifurcation process made the letters around the border appear ornate or fancy, as in examples of 1799 B-8 [BB-165] examined by Bolender and found to have the letters of the word LIBERTY with extensive bifurcations. As one of many coins that could be cited, an example of 1795 BB-18 studied by the author had beveled, flattened innermost star rays, and bifurcated tops to the 1 and 9 in the date. Often, stars appear lopsided, with the rays toward the center shortened, due to the bifurcation process.

Apparently, Bolender had no clue as to what bifurcation marks really were. He must have considered them to be a product of die deterioration or perhaps repunching, for in some instances he assigned a separate sub-variety number to coins with

bifurcation marks. An example is provided by Bolender's 1799 B-10 (BB-163), which has no bifurcation marks, and his Bolender-10b, from the same dies, "and with the letters much bifurcated."

Similarly, 1800 Bolender-16a (BB-187) was described as follows: "From the same dies as Bolender-16, but with most letters bifurcated." Other examples could be cited. As noted earlier, Bolender was not alone in knowing little about minting processes. The excellent findings of Breen, Julian, Taxay, and others were yet to be discovered and disseminated.

As we understand the minting process today, a planchet which had a properly upset rim and/or was tightly fit into the collar would have minimal metal flow near the rims, and no bifurcation marks would result. If a planchet had an insufficient upset rim and was significantly smaller in diameter than the collar, then it was a candidate for bifurcation marks, as metal flow occurred in an outward direction from the center. If such a planchet was loosely placed in the dies, close to the collar on one side and distant from it on the other side, then bifurcation marks would occur on the side most distant from the collar—as the metal flow to the collar was greatest there.

Stack's catalogue of the sale of the W. Earl Spies Collection, 1974, offered a specialized cabinet of early dollars described very carefully. Among the 1801-dated dollars were these three coins:

1801 [BB-211] B-1. Wide date. Small dot next to center dot. Most of the letters not bifurcated. VF, delicate toning.

1801 [BB-211] B-1a. Dies as above. The letters are lightly but mostly bifurcated. VG.

1801 [BB-211] B-1b. Letters not bifurcated (per Bolender, in reference to his observations), but there is now a crack from the wing tip through "STA" through the clouds to first "A" of AMERICA. "Waves" through "ERICA." Fine, with some scratches across the obverse.

Per the preceding, it is apparent that a particular variety of 1801 dollar was struck with most letters *not* bifurcated. Then, a specimen was struck from the same dies, with most letters bifurcated. Then, the reverse die cracked, and in this *later* use, the coin struck from the dies was *not bifurcated*. In other words, bifurcation had nothing to do with the life or wear of the dies.

Sometimes a die pair would be used to strike many loose-fitting planchets, with many coins with bifurcated features resulting. Other times, a die pair would be utilized to strike closely-fitting planchets, with no resultant bifurcation. Contrary to what Bo-

lender stated, *the absence or presence of bifurcation does not constitute a separate die variety, or even a die state.*

Accordingly, in the specialized descriptions of individual die varieties in this book, in instances in which Bolender used bifurcated letters as an attribution guide, I have deleted these references or have modified them to state, for example, "often seen with bifurcated letters," "Bolender reported specimens with bifurcated letters," etc. There is the strong possibility that *any* variety that Bolender saw with bifurcated letters or other features may also exist without bifurcations. In the present work, bifurcation is not a determinant of die varieties or states.¹

The same process that caused bifurcation in the vertically-oriented elements, border letters, stars and numerals sometimes affected horizontal parts of letters and numerals as well. If at the border, the metal flow was "sliding" outward from the center, it might skim over a thin horizontal element in the die, such as the thin line at the bottom or top of the letter E or D, and fill in the serifs, but not the thin line. Thus, for example, certain specimens of 1798 BB-94 appear as if the tops of E and D in UNITED are broken; it is logical, and is a fact, that the vertical elements of these same letters are heavily bifurcated.

With regard to stars, the bifurcation process sometimes makes the point facing toward the center of the coin seem smaller or shortened. On some strikings of the Heraldic Eagle reverse, the bottom rays of the stars thus appear smaller or even defective, an idiosyncrasy of the striking of the particular coin involved—and a situation not related to die preparation or a die state.

Changing Die States

As a die was used, it became worn. Typically, over a period of time, several things would happen:

1. Minute features of a die's surface—tiny flaws, file marks, light repunchings, etc.—would wear away.
2. Stress marks would appear, most commonly in the form of die cracks, small at first, and usually starting at the border denticles and, over time, extending inward, perhaps joining other cracks.
3. As a die began to fail, the cracks would become larger, and certain areas of the die would begin to sink, often at the centers, resulting in mounds, lumps, or bulges (although sinking could occur at an earlier stage). About this time, the die would be discarded.

¹ The author acknowledges the assistance of Thomas K. DeLorey (letter dated November 18, 1992), Bill Fivaz (letter dated November 16, 1992), and Harry E. Salyards, M.D. (letter dated December 4, 1992) concerning the commentary on bifurcation.

For a hypothetical variety of early dollar, a sequence of die states might have a history as this:

DIE STATES:

Die State I: Perfect obverse and reverse dies. No cracks.

Die State II: Perfect obverse die. Reverse develops small crack at rim above I of AMERICA.

Die State III: Perfect obverse die. Rim crack at I extends through adjacent R in AMERICA, and continues to touch eagle's wing.

Die State IV: Obverse die crack from rim through the middle of the 2nd star (stars are counted clockwise, beginning at the left of the date), continuing to edge of Miss Liberty's hair. Reverse die as III.

Die State V: Obverse die as IV. Reverse die is cracked across.

Die State VI: Obverse die as IV. Reverse with bulging at center, die cracked across, and several other cracks developing. Latest state of the dies.

When a coin of this variety is found, it may be examined to determine its die state.

Die State I represents the obverse and reverse in the condition when the first coins of the variety were struck. Unless one or both dies were broken before the first coin was struck, Die State I shows no cracks or other breaks. Die flaws, such as file marks, repunchings, etc., will be sharper in Die State I than in later states.

Die States II, III, IV, etc., represent examples of coins seen in various later stages of the life of the obverse and reverse dies.

While die state information furnishes a handy guide to various steps leading to a die's destruction or abandonment, in practice, dies did not deteriorate in finite steps, but on a continuum. Thus, one might find a coin which has, for example, the reverse die cracked across, plus one tiny die crack developing below the eagle's tail. A check with the listing will reveal that this is between Die State V and Die State VI. You have your choice of simply calling it Die State V, or being more precise, such as "an intermediate die state between V and VI, showing a small additional crack developing below the eagle's tail." In practice, few cataloguers are this sophisticated. In fact, for expediency's sake, most cataloguers list just the variety and omit the die state. If *all* minute die states were listed, especially for a variety known to have many cracks in its later states, the listing might well run from Die State I to Die State XX or higher! In practice, only a few intervals are listed.

Die States Revised

The die states catalogued by Bolender are often illogical. In general, he endeavored to list as a regu-

lar variety the earliest die state *he had seen*, and then to list significant later states with suffix letters. For example, the earliest state known might be listed as B-10, and a variety with an advanced die crack would be listed as B-10a. Often, B-10 itself would have a die crack. Problems arose when, later, someone discovered a *still earlier* state of the die, perhaps with a smaller crack than B-10 or with no crack at all. What to call it? Some have suggested B-10c or B-10d, which destroys the logical sequence.

Because of this, I have found it practical to list as Die State I a pair of perfect dies. Then, if such are ever found for our hypothetical B-10, it will be B-10 Die State I. In the meantime, all "regular" B-10 varieties of the type known to Bolender, with a crack, would be called Die State II. If later states are found, they could be called III, IV, etc. Of course, in the actual listings, BB numbers are given in place of Bolender numbers.

Die Combinations

Die combinations, called matings or marriages, are the pairing of an obverse die with one or more reverses, or vice versa. If a die was particularly durable, it might outlive two, three, or more mates. One particularly robust reverse die was mated with obverse dies dated 1795, 1796, 1797, and 1798!

In some instances, a die—a hypothetical obverse, for example—was mated with a reverse die, coins were struck, and then it was removed from the die and put in the die vault; let's call these the BB-1 variety. Later, it was mated with another reverse die, and more coins were struck; BB-2. Still later, it was mated with the first reverse die, and additional BB-1 pieces were made. For starters, it is known that varieties BB-1 and BB-2 exist. However, examination revealed that the reverse of certain BB-1 coins were in Die State I, and others were in a much later die state, while BB-2 coins, using the same reverse die, were in an intermediate die state. The only conclusion is that given: BB-1 coins were struck, then BB-2 coins, then more BB-1s.

Research concerning die progression and die states of early dollars is in its infancy. As interest in the series increases, and detailed notes and observations are kept concerning minute die differences, it will be possible to determine in what order many early varieties were struck. There is ample precedent for this in the series of U.S. large cents of the years 1793-1814, which have been analyzed in detail by many specialists over a long period of years.

Coin and Striking Defects

Defective planchets and/or problems in striking (except for misalignment of dies) do not constitute die states. If a coin is weakly struck at the centers, due to inadequate die spacing, this is considered to be a weak or light strike, not a specific die state.

If a planchet was filed during the preparation process, to remove excess metal to bring the disc down to the proper weight, the resultant parallel grooves indented in the surface of a finished coin do not constitute a die state. Nor are they post-striking damage, though they may affect eye appeal and therefore price. No two coins have the same adjustment marks. Similarly, planchet cracks, carbon marks and streaks (black marks and streaks from an incomplete alloy mix), laminations, etc. are not die states.

The "Four Year Reverse" Die

Among dies made for early dollars, certainly none is more interesting than the "Four Year Reverse" die combined with six different obverses, and used to create coins of four different dates: 1795, 1796, 1797, and 1798. The die varieties are these: 1795 BB-51, 1796 BB-62, BB-63, and BB-66; 1797 BB-72, and 1798 BB-81.

The reverse is of the Small Eagle type—the motif first used in the silver dollar series in 1795 and continued through early 1798. Early in the 1798 calendar year, this general type was replaced by the Heraldic Eagle motif, which was used for the balance of the series.

I believe that the durable reverse die under discussion was first used in calendar year 1795, again in 1796, temporarily retired in 1797 (I believe coins bearing this date were struck in 1798), and used for the last time in early 1798 (to strike coins dated 1797 and 1798).

Envision this scenario:

1. FIRST USE OF THE REVERSE DIE: In the late autumn of 1795, Gilbert Stuart's new Draped Bust motif was introduced. The first pair of dollar dies made was employed to strike the variety known as BB-51. The obverse depicted Miss Liberty in Draped Bust form, with the motif *too far to the left*. On all subsequent obverse dies, Miss Liberty was more central. Hence, it seems reasonable to assume that the die with the portrait too far to the left represented a first effort, later corrected. The reverse was of a new style, with a small eagle perched on a cloud, with an olive branch to the left and a palm branch to the right. The words UNITED STATES OF AMERICA

were placed around the periphery, widely spaced, and in small letters; what numismatists call the "Small Eagle, Small Letters reverse."

To create a souvenir of the occasion of issuing the first specimens, from the first dies, of the new design, prooflike presentation coins, perhaps even qualifying as full Proofs, were struck. In 1980 I catalogued the Garrett Collection specimen for the Johns Hopkins University. Described as a Proof, this piece is similar to that general style enumerated by Walter H. Breen in his *Encyclopedia of United States and Colonial Proof Coins*, p. 33, as having:

mirrorlike fields, frosty heads and devices, exceptional sharpness including eagle's claws and breast feathers, good centering, etc. The occasion for manufacture of presentation pieces of this design was, of course, Henry William DeSaussure's achieving his ambition for having United States coins made from designs by the famous American portraitist Gilbert Stuart.

While cataloguing the Garrett coin I noted that "while it could be argued that the Philadelphia Mint did not have special apparatus for striking Proof coins on hand until 1817, certainly the specimen offered here is a *de facto* Proof by virtue of its appearance; it may be more conservative to describe it as a 'presentation piece.'" However, in 1992 Michael Hodder presented evidence that equipment for making Proofs was on hand before 1817.

Following the striking of presentation pieces, thousands of additional specimens were made of the 1795 BB-51 variety, perhaps until the obverse die broke or was otherwise rendered unfit for further use.

2. SECOND USE OF THE REVERSE DIE: In 1796, the Small Eagle, Small Letters reverse die used to coin 1795 BB-51 was mated with three different 1796-dated obverses, and used to coin 1796 BB-62 and a very few specimens of 1796 BB-63.

3. FINAL USE OF THE REVERSE DIE: Although a 1797-dated dollar, BB-72, has this reverse die, I do not believe it was actually struck in 1797. Early in 1798 it was decided to adopt the new Heraldic Eagle reverse, a design which was also used on the dimes of the year (no half dimes, quarters, or half dollars were struck in 1798; the last year the Small Eagle reverse was used on these denominations was 1797).

On hand at the Mint were these silver dollar dies:

Obverse 1: 1796 die never used in 1796 (the 1796 BB-66 obverse).

Obverse 2: 1797 9x7 stars obverse die never used in 1797.

Obverse 3: Unused die, without date added yet, with 15 obverse stars. This die may have been prepared, without date, in late 1795 or 1796 (but before June 1796, when Tennessee was admitted to the Union as the 16th state) when 15 stars

were the standard on silver dollars. The date was added in 1798. It is illogical to assume that this die was first made in 1798, as by then the standard obverse star count had been changed to 13, and no 15-star dies had been made since 1796 (alternatively, it could have been a blunder, as in the 1817 15-star Newcomb-16 cent).

Obverse 4: 1798 die with 13 obverse stars; one of the first regular obverses of the 1798 year.

Reverse A: Small Eagle, Small Letters. The die earlier used to coin 1795 BB-51 and 1796 BB-61 and BB-62.

Reverse B: Small Eagle, Large Letters. Die made in 1797, but not used during that calendar year.

In early 1798, it was realized that the two remaining reverse dies with the Small Eagle design were obsolete, as they were of a motif that was to be replaced by the Heraldic Eagle type. Accordingly, the two Small Eagle reverses and the three obverse dies were put into the press, and dollars were coined of the following combinations:

1-A. 1796 obverse, with Small Eagle, Small Letters reverse, now relapped. (1796 BB-66)

2-A. 1797 obverse, with Small Eagle, Small Letters reverse. Obverse die perfect (without cracks). (1797 BB-72)

2-B. 1797 obverse as preceding, with Small Eagle, Large Letters reverse. The obverse die is cracked, indicating this was made later than 2-A. (1797 BB-73)

Sometime early in 1798, reverses A and B were mated with new 1798 dies and used to create these combinations:

3-A. 1798 15 obverse stars; Small Eagle, Small Letters reverse. (1798 BB-81)

4-B. 1798 13 obverse stars; Small Eagle, Large Letters reverse. Die cracks show that some specimens of 1798 4-B were made prior to some specimens of 1797 2-B. (1798 BB-82)

Obverse 1 of 1796 and reverse A (Small Letters die first used in 1795), *now relapped* to permit further use, produced the variety known today as 1796 BB-66. Obverse 1 of 1796 is known in no other combination.

Obverse 2 of 1797 and reverse B of 1797 are known in no other combinations than those given above; that is, they do not appear to have been used with other dies before the 1798 calendar year. I believe that early 1798 represents their first use.

Reverse B, the Small Eagle type with Large Letters, was first combined with a 1797 die to strike 1797 BB-73 dollars. This die, which by now had developed some cracks, was removed from the presses and was used to strike 1798-dated coins (1798 BB-82). The reverse die, with the cracks slightly more advanced, was then re-mated with the 1797 obverse and used to strike additional 1797 BB-73 dollars. It seems reasonable to me that *all* 1797 BB-73 dollars

were made in 1798.

If we assume that 1797 BB-73 and 1798 BB-82, both sharing the same Large Letters reverse die "B," were both struck in 1798, this leaves only one remaining of the three 1797-dated varieties, BB-71, as a candidate for having actually been struck in 1797. 1797 BB-71 may have been a part of the 7,776 mint-age reported by the government for that calendar year. I do not believe that the paltry coinage of 7,776 dollars coined during the 1797 calendar year was sufficient to create three die varieties and produce the large number of coins still surviving today.

For the Small Eagle, Small Letters reverse, a summary of its activity follows:

1. It was used in 1795 to strike specimens of BB-51, including some presentation pieces with prooflike surfaces.

2. It was next used in 1796 to produce a generous coinage of 1796 BB-62 and a small number of BB-63.

3. The die was not used in 1797.

4. In 1798, the reverse die was mated with a hitherto unused 1796 obverse to create 1796 BB-66, an unused 1797 obverse to create 1797 BB-72, and a 1798 15-stars obverse to create 1798 BB-81.

5. Its useful life began in 1795 and ended in early 1798, by which time it had been mated to six different obverses bearing four different dates!

Overdates

Two overdates occur among early silver dollars: 1799/8, of which one obverse die is known; and 1802/1, of which five obverse dies are known. On the other hand, it seems to be a certainty that various other (non-overdated) dies were sometimes used in years later than the dates on them. The most obvious example is 1797, during which calendar year only 7,776 silver dollars were made—equal only to a tiny fraction of dollars made bearing the 1797 date; *i.e.*, 1797-dated dollars were made in one or more later years. No dies are known, such as 1798/7, with 1797 being the under-date. Accordingly, dollars were struck in later years from earlier-dated, non-overdate dies.

When dies were made, they were hardened (by heating them red hot, then quenching them suddenly in cold water) to strengthen the die faces and to prolong their life. Once a dated die was hardened during the normal die-making process, it could only be overdated effectively if it was annealed (softened

by slow heating), after which it would have to be rehardened. Accordingly, it was easier to utilize already-hardened dies no matter what date they bore.

On the other hand, if a die had been punched with a date, say 1801, but had not yet been hardened, and if it remained on hand until 1802, it was a simple matter in 1802 to punch a 2 over the last digit of the date, and then harden the die for use.

Rarity vs. Price

Factors Affecting Pricing

Early silver dollars exist in varying degrees of rarity. The pricing of a given early dollar is affected by several factors. Among those are the following:

1. **Rarity as a date:** If a coin is basically rare as a date—and dollars dated 1794 and 1804 are prime examples—pieces will bring strong prices as there is a great demand from date collectors.

2. **Major varieties:** In addition to collecting dollars by dates, many numismatists also aspire to own *major* varieties. Thus, for the 1795 coins they desire to own two examples, one of the Flowing Hair design and one of the Draped Bust type. They are not particularly concerned with subdivisions within those varieties, or whether a 1795 Flowing Hair is, for example, a BB-15 or a BB-21. All they want is a Flowing Hair coin. Such collectors often employ the *Guide Book of United States Coins* to formulate a want list as to what major varieties to acquire. Accordingly, any variety listed in the *Guide Book* draws a larger following than one that is not.

An excellent example of this is provided by the year 1797. In this instance there are three varieties known, BB-71, BB-72 and BB-73. Coincidentally, the *Guide Book* also lists three varieties as being major. These match up with the three Bolender varieties. Accordingly, all three varieties of the 1797 date are in strong demand.

On the other hand, just two varieties are listed of 1795 Flowing Hair dollars, the style with two leaves beneath each wing of the eagle and the style with three leaves. Further subdivisions are not considered, even though 17 different die varieties of 1795 Flowing Hair dollars are known.

3. **Die varieties:** The dedicated specialist in early silver dollars seeks to acquire one of each Bolender die variety. This may or may not include individual die state subdivisions within a variety, but certainly includes one of each Bolender number. Accordingly, a variety which is unique or of which just a few are known, say up to a dozen or so, will bring a strong

price based upon the demand by variety collectors.

Fortunately for specialists today, the number of numismatists seeking die varieties of 1794-1803 dollars is relatively small, just a fraction of the number of adherents who hope to acquire early American large cents of the same period. While the number of truly dedicated early dollar die variety collectors is not known with certainty, it is probably fewer than two dozen.

The smallness of this group makes it possible to acquire coins of medium rarity without paying much more than “type” prices for them. For example, if only two or three specimens of a coin are known, it may bring several thousand dollars even in well-worn condition, as there are up to a couple dozen people seeking it. However, if 50 to 100 pieces are known, while the variety is still rare in absolute terms, in the early dollar series it would not bring much of a premium, as there are more than enough coins to satisfy the demand of the two dozen or so enthusiasts desiring them.

Should demand for die varieties of early silver dollars grow, prices will increase. This is especially so for rare varieties of which the population ranges from, say, 25 to 100 pieces.

4. **Other considerations:** Notoriety enters the pricing structure of several early silver dollar varieties. In addition to being rare as a date, 1794 dollars are of the first year of issue. Over the years the 1794 dollar has received much publicity, thereby enhancing its desirability. Indeed, as the present book goes to press, Jack Collins is completing his book-length study, *1794: The History and Genealogy of the First United States Dollar*.

The 1795 Draped Bust dollar with small eagle Reverse has a special demand attached to it as it is the first of its design type, a motif continued through early 1798. Similarly, the 1798 Draped Bust obverse with Heraldic Eagle reverse is more popular than would otherwise be the case as it is the first of its design type. The 1800 AMERICA! variety, with the extra “I” being caused by a stray mark from a punch, has always been in exceptional demand as it seems to be curious and interesting to many observers. The 1801-2-3 “restrikes” (actually novodels) have drawn an enthusiastic but limited following, and have brought high prices, because they represent an unusual opportunity to acquire an early-dated dollar with a high-grade Proof finish.

The 1804 dollar is in a category all by itself. Fame has propelled it to the front rank of American rari-

ties. More words, paragraphs, columns, and pages of print have been expended on the 1804 silver dollar than on any other United States coin rarity in any series. Indeed, an entire book was written about this coin! Over the years, numerous collectors and dealers who do not specialize in early dollars by dates or die varieties have sought to acquire an example of the prize 1804 just to have it for enjoyment and display. As an example of this, Texas collector Reed Hawn acquired an 1804 dollar and has exhibited it over the years. In 1993, the American Numismatic Association announced that at its Early Spring Convention there would be not one, not two, but three 1804 dollars on exhibit—two from the ANA Museum and the third on loan from Reed Hawn. Chapters 5 and 6 discuss the 1804 dollar and its cousins, the Proof dollars of 1801, 1802, and 1803.

Looking to the Future

Today in the early 1990s, interest in collecting 1794-1803 dollars by die varieties is minimal. As noted, probably no more than two dozen collectors are seriously pursuing the completion of a set. Of such situations, opportunities are made.

What will affect prices in the future? The main answer is one word: *popularity*. If early dollar die varieties become more popular with collectors, prices will rise. If demand lessens, prices will fall.

I see a number of factors that *may* lead to increased prices in the future. It is not the objective of this book to predict prices, for no one has ever been able to do this with accuracy. Nevertheless, some observations are worth making:

1. By default, early dollars are cheap. A silver dollar dated in the 1790s, of a die variety of which just five coins are known, will sell for a tiny fraction of the price a similarly dated large cent of comparable rarity will bring. Eventually, bargain prices attract new buyers.

2. Early dollars are interesting. The large surfaces make die varieties easy to study. Most coins exist in grades such as Fine, VF, and EF, in which die characteristics are readily visible.

3. Dissemination of this book will introduce a new group of readers to the series. Perhaps, some will become specialists.

4. The John Reich Collectors Society (JRCS) is devoted to the study of early silver coins, including dollars. As this relatively young organization grows, it will help engender interest in 1794-1803 dollar

varieties. The Silver Dollar Collectors Club (SDCC) may also lend interest; at present this organization is primarily devoted to Morgan and Peace dollars.

5. In the marketplace most early dollars are not yet attributed. The strong possibility exists for paying a "common coin price" for a major rarity. It has happened many times.

6. There are *many* discoveries waiting to be made concerning die states (in particular), Condition Census data, and other numismatic and market aspects.

Historical Prices

Historical Market Prices for Early Dollars

The following survey of prices realized at selected auction sales and offerings in fixed price lists and advertisements shows the changes in descriptions for varieties and the advance of values over a long period of years from the 1850s to modern times. This is not a comprehensive listing. Rather, it illustrates early silver dollars that have been part of various American cabinets over the years. An effort has been made to include numerous "average" or "typical" collections rather than only important ones. The list of important sales could be expanded considerably to include Parmelee, Winsor, and others, but to be truly all-encompassing such a list would be a book in itself. Under the specific listings of silver dollar varieties later in the book, the category "Notable Specimens" includes memorable examples of certain die varieties, a listing drawn from many sources, including many not represented in the present "Historical Prices" section.

In each instance, coins are listed in order by date and variety. In the actual auction catalogues the order may have been different. There were no grading standards in effect during the nineteenth century, and one cataloguer's Extremely Fine (EF) might be equal to another's Uncirculated (Unc.). In general, coins listed as Poor, Fair, or Good would be designated higher grades today. However, at the other end of the scale the opposite is true for coins listed as Unc.; today, many would be called EF or AU.

As is readily apparent from the auction, fixed-price, and advertising listings, there was no such thing as a standard price for a given early silver dollar sold during a particular time. Prices varied, often greatly. Valuations given later in the book in the charts under individual dates and major varieties 1794-1803 represent averages and what I believe to be educated guesses; as noted, actual sale prices may

The First United States Mint

An interior room of the first United States Mint photographed when Frank H. Stewart owned it during the early 20th century, by which time it had been used for numerous other purposes in the intervening years. (From *History of the First United States Mint* by Frank H. Stewart.

Photograph of one of the buildings used as part of the first United States Mint, as shown in a photograph taken in the early 20th century. (From *History of the First United States Mint* by Frank H. Stewart.

have been higher or lower. Some data in these charts are from the auction data below.

Even a casual perusal of the early dollars in collections auctioned during the nineteenth and early twentieth century will demonstrate that few cabinets contained coins of uniformly high quality, and that Uncirculated pieces were represented only occasionally. I mention this as sometimes there is the misconception that old-time collections were laden with nothing but sparkling Uncirculated and Proof gems.

The first sophisticated cataloguing of an important offering of early dollars was that in Milferd H. Bolender's descriptions of his own coins sold in his sale of February 23, 1952. New Netherlands Coin Company's American Numismatic Association Convention sale followed a few months later, in August, and featured detailed cataloguing by John J. Ford, Jr. The year 1952 represents the jumping-off spot for truly knowledgeable, authoritative cataloguing of early dollars and other early series, although many later sales by various firms were catalogued hastily.

The Coin Collectors' Manual, 1860, by George F. Jones, published by Edward Cogan in Philadelphia, gave auction price records for silver dollars and other coins. Among the silver dollars listed were items sold in Moses Thomas' sale of the A.C. Kline Collection, June 12, 1855; Edward Cogan's sale of the Joseph N.T. Levick Collection, December 19, 1859; multiple New York sales of 1859; and a Cogan sale of 1860. Cogan, who began his business as a coin dealer in 1856, was America's first full-time professional numismatist. He conducted 70 auction sales from 1858 until 1870, when his son George assumed management of the business.

The late 1850s and early 1860s were the cradle days of numismatics, and information concerning rarity and price was sparse. The 1860 Jones study, brief as it is, must have filled an important need at the time. The introduction to the manual is reprinted herewith:

PREFACE: The want of a concise coin manual, or guide book, has long been felt by collectors, and those beginning to arrange collections of coins. It seems hardly necessary to mention a fact so well known, but it has not been generally appreciated until the present time. The various works on coins that have been published, are too elaborate, and consequently too costly, to come within general reach, and many do not contain the information most important to the student in numismatics, or the young collector; such, for instance, as the market value of coins. This is of daily use, to those who are endeavoring to improve their collections; and although it

is at once conceded that the value is somewhat variable, and dependent on the condition of the coin, and perhaps other causes, still it is desirable to have this information at hand, and in a concise, intelligible form. Added to this, the years of coinage, a short description of each coin, the principal varieties of each date, and the actual sales, together with other relevant matter, must make this record a valuable reference and guide.

Believing this want exists, and that the veteran numismatist, as well as the young collector, will gladly welcome a book containing such information, the undersigned has been persuaded to publish the following, which he had compiled and transcribed only for his own private use. The only coins referred to, are those of our own country, and those relating to its history before we became a free and independent nation. The arrangement is made as simple as possible, and the condition of the coins sold, is such as described by the sellers, at various sales within five years past. All varieties of dates and dies are not given, but only those generally met with in cabinets, or daily private and public sales. If this book becomes an aid or guide to but a few, the object of its publication is attained, and the undersigned fully repaid.

GEORGE F. JONES, No. 1119 Girard Street: 1860.

The following early silver dollars were included:

A.C. Kline Collection (1855):

- 1795 Flowing Hair, Fine. \$1.70.
- 1795 Flowing Hair, Fine. \$1.70.
- 1796 VF. \$1.50.
- 1797 VF. \$1.63.
- 1798 Thirteen Stars—Small Eagle, scarce, VF. \$1.05.
- 1798 Fifteen Stars, Small Eagle, scarce, VF. \$1.05.
- 1799 Six Stars Facing, scarce, VF. \$1.05.
- 1800 Six Stars Facing, scarce, VF. \$1.25
- 1801 Six Stars Facing, scarce, VF. \$1.25.
- 1802 Six Stars Facing, scarce, VF. \$1.05.
- 1803 Straight 3 [Large 3], VF. \$1.05.

Joseph N.T. Levick Collection (Edward Cogan, December 1859):

- 1794 Very rare, Poor. \$5.50.
- 1795 Flowing Hair, Fine. \$1.25.
- 1795 Flowing Hair, Fine. \$1.25.
- 1795 Fillet Head [Draped Bust], Fine. \$1.38.
- 1796 Fine. \$1.25.
- 1797 [No grade given]. \$1.38.
- 1798 Thirteen Stars, Small Eagle, scarce, Fine. \$1.87.
- 1798 Fifteen Stars, Small Eagle, scarce, Fine. \$2.00.
- 1798 Reverse of 1799, Large Eagle, Fine. \$1.10.
- 1799 Five Stars Facing, scarce, Fine. \$2.25.
- 1799 Six Stars Facing, Fine. \$1.15.
- 1800 VG. \$1.25.
- 1801 Fine. \$1.30.
- 1802 Fine. \$1.30.
- 1803 Straight 3, Fine. \$1.30.

New York Sales (1859):

- 1794 Very rare, Fair. \$7.25.

- 1795 Flowing Hair, Fine. \$1.15.
1795 Flowing Hair, VF. \$2.40.
1795 Fillet Head, [no grade given] \$1.20.
1796 VF. \$1.63.
1797 [no grade given] \$1.12.
1798 Thirteen Stars, Small Eagle, scarce [no grade given] \$1.50.
1798 Fifteen Stars, Small Eagle, scarce [no grade given] \$1.50.
1798 Reverse of 1799, Large Eagle [no grade given] \$1.25.
1799 Five Stars Facing, scarce, Good. \$2.10.
1799 Five Stars Facing, scarce [no grade given] \$1.12.
1799 Six Stars Facing, scarce [no grade given] \$1.62.
1800 VF. \$5.00.
1801 VF. \$1.25.
1802 VF. \$1.75.
1803 Straight 3, Good. \$1.70.
1803 Crooked 3, Good. \$1.75.

Cogan Sale (1860):

- 1794 Very rare, Poor. \$9.50.
1795 Flowing Hair, VF. \$5.00.
1795 Flowing Hair, Fine. \$1.05.
1795 Fillet Head, Fine. \$1.10.
1796 VG. \$1.30.
1797 [no grade given] \$1.80.
1798 Thirteen Stars, Small Eagle, scarce [no grade given] \$2.00.
1798 Fifteen Stars, Small Eagle, scarce [no grade given] \$2.00.
1798 Reverse of 1799, Large Eagle, Fine. \$1.40.
1799 Five Stars Facing, scarce, VF. \$2.87.
1799 Six Stars Facing. \$1.20.
1800 Fine. \$1.10.
1801 Good. \$1.55.
1802 VF. \$1.40.
1803 Straight 3 [Small 3], VF. \$1.50.

Bangs, Merwin & Co. sale of the John W. Kline Collection, June 8-9, 1876. Offered were several early dollars. The description "Fine for date," sometimes expressed as "Fine for coin," was common in this era and reflected the option of grading a coin slightly more loosely if it was considered rare; otherwise, if the 1801 dollar had been of a commoner date such as 1799, it might have been graded VG. Similarly, such terms as "VF for coin, EF for coin," etc., were often employed.

With regard to the copy (fake) of the 1804 silver dollar, at the time it was considered proper to include electrotypes (forgeries made by electro-

deposition of metal into molds impressed from genuine coins) of various rare coins as fillers. Indeed, such august institutions as the British Museum and the American Numismatic Society would oblige collectors by making electrotypes of specimens in their collections; this practice continued until well into the twentieth century.

The New York auction firm of Bangs, Merwin & Co., also known as Bangs & Co. at one time, sold household goods, art, and many other items at auction; coins were only a small part of their business.¹ Additional Kline material was sold by the Chapman brothers in 1893 (coins) and 1896 (coins).

- 1795 VG. \$1.50.
1796 Fair. \$1.50.
1798 Very Fair. \$1.25.
1799 VG. \$1.25.
1800 VG. \$1.25.
1801 Fine for date; scarce. \$1.75.
1802 Fine; slightly scratched; scarce. \$1.50.
1803 Quite Unc.; scarce. \$1.25.
1804 Fine copy. \$0.50.

A.S. Jenks Collection catalogued by Edward D. Cogan, sold by Bangs & Co., April 12-13, 1877, offered a nice run of authentic dollars 1794-1803 plus a phony 1804. Jenks, a prominent nineteenth-century collector, is not to be confused with William J. Jenks or John Story Jenks, whose collection was auctioned nearly a half century later.

1794 Fine impression. Head Fine, stars on the left flattened, those on the right much better; Liberty and date very distinct. \$60.00.

1795 Flowing Hair. Unusually fine impression, barely circulated. \$11.00.

1795 Flowing Hair. Head somewhat rubbed, but Fine. \$6.25.

1795 Flowing Hair. About same condition (Fine). \$5.50.

1795 Flowing Hair. Much more circulated. \$2.50.

1795 Fillet Head. Fine bold Unc. specimen.² \$8.00.

1795 Fillet Head. Head a good deal rubbed. \$2.25.

1796 Large Date. VF. Barely circulated. \$3.00.

1797 Six Stars Facing. Head rubbed. \$3.50.

1798 Large Eagle. Barely circulated. \$4.00.

1798 Large Eagle. Barely circulated. \$3.25.

1798 Barely circulated. \$2.50.

1798 Fair. \$4.00.

1799 VF. Barely circulated. \$4.00.

¹ John W. Adams, *United States Numismatic Literature*, v. 1, pp. 147 ff., gives an interesting account of the firm's activities, noting that some sales were catalogued by experts such as Augustus B. Sage, and others by "nameless ignorami."

² The word "fine" here is used adjectivally, as "nice" or "selected." The same applies to the word "good" in connection with the second 1801 dollar in the sale.

- 1799 VF. \$3.13.
- 1799 Fine. \$2.50.
- 1800 VF. \$3.55.
- 1800 Nearly VF. \$2.75.
- 1801 Fine Bold impression. Little circulated. \$6.50.
- 1801 A good impression, but weaker struck. \$3.00.
- 1802 Very little circulated. \$4.50.
- 1802/1 A beautiful impression, but barely circulated. \$10.00.
- 1802 Another. About as fine in condition. \$5.50.
- 1803 Very strong impression. In VG condition for date. \$4.50.
- 1804 Electrotpe copy of this dollar. VG. \$4.50.

The Ferguson Haines Collection sold by Bangs & Co., May 28-29, 1877, offered a modest selection of early dollars. Haines catalogued the sale himself.

- 1795 Flowing Hair. VF. \$1.70.
- 1795 Fillet Head. VF. \$2.
- 1796 Unusually Fine. \$2.03.
- 1797 7 Stars Facing. EF. \$3.75.
- 1798 Wide Date. But little circulated. \$1.30.
- 1798 Fair. \$1.05.
- 1798 VG. \$1.40.
- 1798 Good. \$1.25.
- 1799 Nearly Unc. \$1.50.
- 1799 Fair. \$1.10.
- 1799 Fine. \$1.20.
- 1799 Equally Fine, but slightly nicked. \$1.20.
- 1800 VF. \$1.10.
- 1800 Good. \$1.30.
- 1800 Fine. \$1.35.
- 1800 Slightly scratched. \$1.30.

S.K. Harzfeld's sale of December 7, 1878 included the following early silver dollars. In Philadelphia, Harzfeld conducted an active but brief numismatic trade in the late 1870s and early 1880s. He knew *too much* about the nearby Mint, and was one of the most outspoken numismatists on the subject of the corruption of officials within the walls of that establishment. The inequitable distribution of patterns, the 1879-1880 \$4 gold stellas being examples, came under his purview, and to silence his criticisms, the Mint made some minor concessions and policy changes.

1795 Flowing Hair, date close. Wreath has two leaves under each wing of eagle. 16 berries. Good. \$1.75. [Buyer: Ferguson Haines]

1795 Flowing Hair, date wide. Three leaves under each wing. 13 berries. Very Fine, but somewhat rubbed on hair. \$1.87. [Buyer: Haines]

1795 Flowing Hair, wide date. Two leaves under wings. 19 berries. Fine. \$2.75. [Buyer: J.W. Scott]

1795 Fillet Head, large date. 7 berries on wreath. Fine impression, but letters J.H. scratched on field of obverse. \$2.10. [Buyer: Haines]

1795 Fillet Head, small date, 6 berries. Very Good. \$1.85. [Buyer: Haines]

1796 Large Date, small letters on rev. Barely circulated. \$3.25. [Buyer: Haines]

1796 Small Date, large letters on rev. Fine. \$2.37. [Buyer: Haines]

1797 Six Stars Facing. Uncirculated impression, but L.B.D. 1820 neatly engraved on field of obverse. Beautiful and rare. \$3.50. [Buyer: S.K. Harzfeld]

1797 Seven Stars, close date. Very Good impression. \$2.30. [Buyer: J.W. Scott]

1798 Small Planchet, pointed 9, close date. \$1.50.

1798 Large Planchet, pointed 9, wide date. Very good. \$1.50. [Buyer: J.W. Haseltine]

1798 Large Planchet, blunt 9. Fine. \$1.50. [Buyer: Edward Cogan]

1799/8. Barely circulated. 15 stars on reverse, the rays of two just emerging from clouds. \$2.50. [Buyer: Charles Durand]

1799 over 1798. 13 stars on reverse. Very Good. \$1.80. [Buyer: Charles Durand]

1799 VF, sharp impression. \$1.85. [Buyer: J.W. Scott]

1799 Crack on reverse, dividing the piece in two equal parts. Good. \$1.15. [Buyer: Haines]

1800 Barely circulated, wide date. \$3.25. [Buyer: Edward Cogan]

1800 Close date. Barely circulated, tarnished, little nick in field. \$1.75. [Buyer: S.K. Harzfeld]

1801 VG, scarce. \$2.90. [Buyer: Brown]

1802/1. VG. \$3.10. [Buyer: Brown]

1802 VF, tarnished. \$3.75. [Buyer: Edward Cogan]

1803 Uncirculated impression, hair slightly rubbed. \$3.25. [Buyer: Brown]

1804 Beautiful electrotpe. Silver-plated. \$3.75. [Buyer: J.W. Scott]

J.W. Haseltine's sale of January 15-17, 1879 marked the auction debut of the curious Proof novodel 1801-2-3 dollars later called "restrikes" by numismatists.

In the 1870s, Capt. John W. Haseltine was one of the best known professional numismatists in Philadelphia, indeed, in all of America. Not only did he handle many rarities and important collections, he also served as an unofficial sales depot for patterns, restrikes, and other special pieces made by or for Mint officials. Haseltine knew much but told little about the origin and number minted of such delicacies as 1801-2-3 "restrike" silver dollars, 1804 dollars, 1884-1885 trade dollars, and 1877 \$50 gold pieces, to mention just a few of the coins he handled. Important to the present book, he was the person who

introduced the 1801-2-3 Proof novodel dollars to the collecting fraternity. In 1881 his *Type-Table*, actually an auction catalogue, was the first detailed description of early silver dollar die varieties.

Lot 282. 1801 Brilliant Proof; sharp bold impression; exceedingly rare in this condition. \$25.00.

Lot 283. 1802 Brilliant Proof; very sharp impression; equally rare as the preceding. \$25.00.

Lot 284. 1803 Brilliant Proof; sharply struck; also an exceedingly rare dollar. \$25.00.

(The preceding dollars have never before been offered at auction in Proof condition, and are the finest I have ever seen.¹)

J.W. Haseltine's sale of his own collection, June 24-25, 1880, included these two Proof dollars, not described as "restrikes." George Cogan was the buyer of each. Obviously, Haseltine was engaging in a marketing program for these early-dated Proofs.

Lot 982. 1802 Brilliant Proof; everything sharp and boldly struck; no scratches in field; in fact, a perfect dollar of this date; excessively rare in this condition, only two others known. \$16.00.

Lot 983. 1803 Brilliant Proof; sharp and beautiful; a companion piece to the preceding and equally rare; only two others known. \$18.00.

H.G. Sampson's sale of July 25-26, 1883. Offered were early silver dollars from 1795 to 1803. The catalogue copy in the American Numismatic Society Library was annotated by someone who had viewed the coins at the sale, and who crossed out in black ink certain adjectives that he felt didn't apply. For example, the first 1795 dollar was catalogued as "Very Fine," but our long-ago numismatist crossed out "Very."

H.G. Sampson entered the coin trade in the early 1870s, and in the 1880s conducted a series of over two dozen auction sales, the first four being as part of a short-lived partnership with noted numismatist Harlan Page Smith (who went on to create *his* own series of sales).

1795 Flowing Hair. The hair and stars on obv. and the eagle on rev. somewhat rubbed, and two or three nicks on edge; otherwise Very [crossed out in black pen] Fine. \$1.75.

1795 Fillet Head. Fine. [crossed out] \$2.05.

1796 Large Date. A crack in the rev. die between the I and C of AMERICA. Fine. \$2.05.

1796 Small Close Date. Extremely [crossed out] Fine; scarce. \$2.05.

1796 Small Spread Date. Very [crossed out] Fine. \$2.05.

1797 Six Stars Facing. Extremely Fine; barely circulated. Rare. \$2.05.

1797 Seven Stars Facing. Very Fine; scarce. \$2.10.

1798 Thirteen Stars. Rev. Small eagle and large letters. Fine for variety. Rare. \$3.65.

1798 Fifteen Stars. Rev. Small eagle and small letters. Very [crossed out] Good; rare. \$3.40.

1798 Large eagle. The 8 in date high. Extremely Fine, barely touched by friction. \$2.30.

1799 Six Stars facing. Fine. \$1.25.

1799 Six Stars facing. A variety. \$1.15.

1799 Five Stars facing. Fine. Scarce. \$1.75.

1799 Five Stars facing. Good. Scarce. \$1.60.

1800 Break in obv. die through first 0 in date. Fine. \$1.80.

1801 Very Good. \$1.75.

1802 Perfect die. Very Fine; scarce. \$2.05.

1802/1. Good. \$1.40.

1803 Uncirculated. Italic 3 ["Italic 3" crossed out] in date. \$2.85.

1804 Electrototype. Very Fine. \$3.45.

Charles Enders, Jr., New York City, offered these silver dollars for sale in the *American Journal of Numismatics*, 1886:

Set of U.S. dollars, 1795, 1796, 1797, 1798, 1799, 1800, 1801, 1802, 1803, and 1836, "complete set, VG to Fine," \$20.00.

S.H. and Henry Chapman's sale of the Ferguson Haines Collection, October 17-18, 1888. Haines, of Biddeford, Maine, consigned to several sales in the late nineteenth century, and his name appears on various catalogues.

Interestingly, the Haines Collection contained a 1794 obtained from the Mint Cabinet, possibly in trade. The Chapman brothers attributed the dollars by Haseltine numbers, being one of the relatively few dealers to do so at the time (but as numerous coins in other Chapman catalogues were not attributed, I surmise the attribution in the present sale was done by the consignor). The brothers had an affinity with Capt. John W. Haseltine, having worked in his Philadelphia shop from 1876 until they started their own business in June 1878. In later reminiscences, Haseltine spoke kindly of the Chapmans and was proud of having launched their numismatic careers.

1794 VG; light dents on cheek and a few in other places. Well struck; the date bold, as also the rest of the coin, the fine feathers in eagle's wings showing. Letters in UNITED STATES weak on top as usual. An excellent specimen of this rarity. \$44.00.

¹ The implication seems to be that although these are the first to be auctioned, Haseltine had seen additional specimens.

- 1794 Good. Formerly in the United States Mint Cabinet at Philadelphia. Extremely rare. \$38.50.
- 1795 Head [Flowing Hair type]. VG. H-1. \$1.50.

S.H. and H. Chapman's sale (owner not named) of June 17-18, 1889. Offered were miscellaneous early dollars, mostly in lower grades, with the notable exception of a "VF for date" 1794.

To tell much about the Chapman brothers would be tantamount to writing a large book, so varied were their activities and so long were their duration. However, a few remarks are appropriate here. Samuel Hudson Chapman (born 1857) and Henry Chapman, Jr. (born 1859) entered the employ of Capt. John W. Haseltine as numismatists in 1876. In June 1878, they hung out their own shingle as S.H. and H. Chapman, Numismatists and Antiquaries, in their home town of Philadelphia. Modesty was not among the virtues of the Chapman brothers, as they became known. In 1882, they succeeded in acquiring for auction the legendary collection formed over a long period of years by Charles I. Bushnell, one of America's most knowledgeable numismatists in the 1850s and 1860s (later, his interest faded). They showcased their accomplishment by publishing a lavish catalogue, the fanciest edition of which was priced at \$5, and offering lots described in exacting detail, and illustrated with photographic plates. This aroused the jealousy of others in the coin trade, who responded by finding fault with every aspect of the catalogue and sale. From the Bushnell sale, the Chapmans went on to handle many other important collections and to issue numerous further catalogues. In 1906, the brothers dissolved their partnership and went their own separate ways as dealers and auctioneers. S.H. Chapman continued until he retired in 1929, and Henry remained active in numismatics until his death in 1935. In the early 1930s, Henry Chapman worked with Burdette G. Johnson (of St. Louis) in the inventorying of the immense collection of Virgil M. Brand, who upon his death in 1926 left 350,000 coins behind.

1794 VF for date. An unusually strong even impression, every part equal. The hair, profile, eagle's head and wings fine, in fact, every part is. One of the finest dollars of this year that has been offered. Originally from the Britton sale, Jan. 1883, at \$160.00. Excessively rare. Fit for any cabinet. \$100.00.

1795 Head. EF. Mint lustre. Desirable specimen. \$4.00.

1795 Head. VG. \$2.25.

1795 Head. Good. (Total: 3 pieces). \$1.50 each.

1795 Bust. VF. \$3.50.

1796 Small Date, large letters. VG. Scarce. \$2.50.

1796 Small Date, large letters. VG. Scarce. \$2.60.

1797 Six Stars Facing. EF. Very rare in this condition. \$4.50.

1797 Six Stars Facing. VG. Scarce. \$3.00.

1797 Six Stars Facing. Good. Light scratch on obverse. \$1.55.

1797 Seven Stars facing. Fair. \$1.50.

1798 13 Stars. Rev. Small eagle. Good. Planchet scratched on reverse. Rare. \$2.87.

1798 Wide Date. 13 stars. Rev. Large eagle. VG. \$1.35.

1798 Close Date. Good. \$1.30.

1799 Five Stars Facing. VG. Rare. \$2.12.

1799/8 Six Stars Facing. Good. \$1.30.

1799 Perfect date. VF. Cost \$3 in Europe three years ago. \$2.00.

1799 VG. \$1.30.

1799 Good. \$1.25.

1800 VG. \$2.10.

1801 Good. \$2.11.

1802/1 VG. \$1.60.

1802 Perfect Date. VG. \$2.00.

1803 Small 3. Good. \$2.10.

1803 Large 3. Good. \$1.70.

1803 Large 3. Good. \$1.50.

The Robert Coulton Davis Collection sold by the New York Coin & Stamp Co., January 20-24, 1890.

The sale offered a nice run of dollars from 1794 through 1803, plus a fake 1804. Like many 1794 dollars offered in auctions over the years, the Davis coin had problems.

The New York Coin & Stamp Co. began in 1888 as a partnership between two capable numismatists, Harlan Page Smith and David Proskey. Although Smith died in 1902, the firm continued in the auction business through 1908. Along the way, many important collections were handled, including the cabinets of Lorin G. Parmelee (whose 1890 sale contained the most complete collection of U.S. coins ever to be auctioned), Francis Doughty (collector of large cents and other issues by die varieties; years later, a scenario writer for films), and R. Coulton Davis (Philadelphia druggist).

1794 Stars flat as usual; but a much finer and stronger impression than usually offered; has been neatly plugged at lower point of bust, but barely perceptible; hair only worn on highest portions; Fine for date. \$52.00.

1795 Naked Bust [Flowing Hair]; strong, sharp and beautiful Unc. specimen; very rare in this condition. \$16.75.

1795 Naked Bust; Unc. strong and sharp; but milling not so well struck up as on preceding. \$11.00.

1795 Naked Bust; few light nicks; Fine impression. \$2.75.

1795 Draped Bust; strong and sharp impression; barely if any circulated. \$9.75.

1796 Small Date; Unc., sharp and brilliant impression; a beauty in every respect; very rare. \$42.00.

1796 Small Date; Fine; not much circulated. \$3.60.

1796 Large Date; VF; barely touched by circulation, stars, etc.; sharp, the finest specimen we have seen. \$16.50.

1797 Six Stars on Right; Brilliant Unc.; sharp in every particular; as it dropped from the die. \$40.00.

1797 Seven Stars on right; sharp Brilliant impression; as handsome as when it left the die; very rare in this condition. \$36.00.

1798 Small Eagle, 15 Stars; we believe this to be the finest known specimen; a splendid Unc. piece. \$52.00.

1798 Small Eagle, 13 Stars; VF and sharp impression; barely touched by circulation; rare in this condition. \$10.00.

1798 Heraldic Eagle; sharp impression; nearly Unc. \$2.50.

1798 VG. \$1.25.

1799 Five Stars on Right; VF and sharp; a splendid impression; barely if any circulated. \$17.25.

1799/8 VF and sharp; almost Unc. \$3.00.

1799 VF and sharp; nearly equal to an Unc. piece. \$3.50.

1799 VF and sharp; barely circulated. \$1.75.

1800 So-called "Comet" variety; a strong, sharp and beautiful Unc. piece. \$6.50.

1800 Perfect die; sharp bold impression; a light nick in field; otherwise a Brilliant Unc. impression. \$3.60.

1800 Cracked die; sharp, Unc. and brilliant. \$3.00.

1801 Unc. and sharp; rare in this condition. \$5.25.

1802/1 Stars sharp; VF. \$3.25.

1802 Few minute nicks; otherwise sharp, Unc. and brilliant. \$4.10.

1802 Duplicate; equally fine. \$3.60.

1803 Large 3; sharp and barely circulated; rare. \$3.25.

1804 An altered date and poor; this probably is nearer to being an original than those usually offered as genuine.¹ \$4.25.

Charles Steigerwalt's fixed price list, October 1890. "Catalogue of an \$8,000 Collection." Lancaster (Pennsylvania) dealer Steigerwalt was a proponent of fixed priced catalogues, and during this era he issued more than anyone else did. His critics said that his auction catalogues were also, in actuality, fixed price lists, inasmuch as many were simply offerings of his own inventory at high reserve prices. Unquestioned is the fact that from the 1870s through the end of the first decade of the twentieth century, he handled many important rarities and collections.

1794 Unc. Sharp bold impression. When shown at the Parmelee sale it was pronounced by all to be much superior to the Parmelee specimen which sold for \$225.² \$200.00.

1794 Fine. An usually even impression: stars, head and date well struck, as is also the reverse. \$85.00.

1795 Flowing Hair. Unc., Brilliant mint lustre. Beautiful specimen. \$25.00.

1795 Flowing Hair. A beautiful specimen. Barely touched. Mint lustre. \$15.00.

1795 Fillet Head. Unc., Proof surface. \$75.00.

1795 Fillet Head. Shows scarcely a trace of circulation. Sharp and with considerable mint lustre. \$30.00.

1795 Fillet Head. Almost equal to last. \$20.00.

1796 Large Date. Quite Fine. \$5.00.

1796 Small Date. VF. \$7.50.

1797 Seven Stars Facing, VF. \$7.50.

1797 Six Stars Facing. Unc., Brilliant mint lustre. \$35.00.

1798 Fifteen Stars. Small Eagle. Fine. \$10.00.

1798 Thirteen Stars. Small Eagle. VF. \$7.50.

1799 Five Stars Facing. Fine. \$5.00.

1799/8 But little worn. \$3.00.

1800 Barely circulated. Considerable lustre. \$3.50.

1801 VF, considerable lustre. \$7.50.

1802/1 Barely touched on most prominent parts. Mint lustre. \$10.00.

1803 Could be called Unc. Sharp, handsome, with semi-proof surface. A beauty. \$15.00.

Charles Steigerwalt's fixed price list, April 1892, offered these early dollars. Leading off was a specimen of the highly prized 1794.

1794 VG specimen of this rare date. \$65.00.

1795 Flowing Hair. Fine and bold. \$2.50; Very Fair. \$1.50.

1795 Fillet Head. VF. \$3.50.

1796 Large Date. Fine. \$3.50.

1796 Small Date. Large letters on reverse. VG. \$3.00.

1796 Small Date. Small letters on reverse. Quite fine. \$4.50.

1797 Seven Stars Facing. VG. \$3.00.

1797 Six Stars Facing. Quite Fine. \$4.00.

1798 Fifteen Stars. Small Eagle. VG and bold. \$7.50.

1798 Thirteen Stars. Small Eagle. Quite Fine and bold. \$6.00.

1799 Five Stars Facing. Fine. \$4.00; Good \$3.00.

1799 Six Stars Facing. Quite Fine. \$2.00.

1800 EF. But little circulated. \$3.50.

1801 VF and bold. Some mint bloom on reverse. \$5.00.

1802/1 EF. \$4.00.

1803 EF, but little circulated. \$4.00.

Scott's Catalogue of Gold and Silver Coins, 1893, remained in use for many years thereafter and was considered to be a standard guide to coin values, although very little research or effort went into the book.

John Walter Scott, better known as J.W. Scott, was a pioneer in the American *stamp* business, held the first stamp auction in the United States, and published many reference books. Today, stamps are still catalogued by Scott attributions, which are periodically updated. However, in the coin business as well, Scott was a formidable presence in the nineteenth century. The Scott Stamp & Coin Co. conducted many numismatic sales. After he sold out to the Calman brothers, Scott formed a new and unre-

¹ Convoluted thinking here!

² For Steigerwalt to show his coin at a sale conducted by a competitor (New York Stamp & Coin Co.) seems to have been a breach of numismatic etiquette.

lated firm, J.W. Scott Co., Ltd., dealers in coins and stamps, an action which precipitated litigation with the Calmans.

In nineteenth-century numismatics, the Scott name is remembered more for its mass advertising and promotions—including displays at the 1876 Centennial Exhibition and the 1893 World's Columbian Exposition—than for anything else, although the firm's restriking in 1879 of 500 Confederate States of America half dollars is worthy of note, as are many of its auction catalogue descriptions (early descriptions by David Proskey, later ones by Lyman H. Low, both of whom were very knowledgeable).

As noted, Scott's 1893 catalogue of coin prices was a poor job, with virtually no market research involved. The following prices were given for early silver dollars:

1794 dollar (unpriced, indicating great rarity).

1795 With two leaves below each wing, Fair \$2.50, Good \$3.50.

1795 With three leaves below each wing, Fair \$2.50, Good \$3.50.

1795 Draped Bust, Fair \$2.75, Good \$3.75.

1796 Small Date, Fair \$3.00, Good \$4.00.

1796 Large Date, Fair \$3.00, Good \$4.00.

1797 16 Stars (6 facing) Fair \$3.00, Good \$4.00.

1797 16 Stars (7 facing), Fair \$3.00, Good \$4.00.

1798 15 Stars (7 facing), Fair \$6.50, Good \$10.00.

1798 13 Stars (6 facing), Fair \$5.00, Good \$8.50.

1798 Without knob to 9, Fair \$2.25, Good \$3.00.

1798 Knob to 9, Fair \$2.25, Good \$3.50.

1799/8, Fair \$2.25, Good \$3.00.

1799 13 Stars (5 facing), Fair \$4.00; Good \$6.50.

1799 13 Stars (6 facing), Fair \$2.00, Good \$2.75.

1800 Fair \$2.75, Good \$3.50.

1801 Fair \$3.00, Good \$4.00.

1802/1, Fair \$2.75, Good \$3.50.

1802 Fair \$2.85, Good \$3.75.

1803 Small 3, Fair \$3.00, Good \$4.00.

1803 Large 3, Fair \$3.00, Good \$4.00.

1804 "The dies for this coin are known to have existed, and from them it is believed about 20 impressions have been taken, but we do not think that any were struck in the year the coins are dated, hence we class them as restriks. The dies were destroyed in 1869."

Ed. Frossard's sale of the W.M. Friesner Collection, June 7-8, 1894 (Frossard's 125th sale). Offered was a cabinet of major early dollar die varieties from 1794 to 1803.

Édouard (usually in print as Ed., with a period) Frossard was born in Switzerland in 1837, and came to America in 1858. He became interested in numismatics in the early 1870s, and in 1876 became edi-

tor of J.W. Scott's *Coin Collector's Journal*. The next year he went into business on his own, and over the next two decades or so—until his passing in 1899—published numerous articles, the *Numisma* house organ and price list, and 160 auction catalogues. Frossard was highly opinionated and was ever ready to comment on anything that came to his attention, often doing his writing first and his research afterward—which during the course of his career led to several embarrassing situations. Above all, Frossard's words were highly readable and, in the whole, imparted a great deal of worthwhile information.

1794 VG impression, the head almost bold, stars to left better than usually found; rev., of corresponding quality. Rare; desirable specimen. \$77.50.

1795 Flowing Hair. Line break in die behind head, stars sharp. Fine. \$3.00.

1795 Fillet Head. Bust too far left, lower star touching hair; reverse; seven berries to branch. Sharp, beautiful impression; EF, rare. \$8.00.

1795 Fillet Head. Point of lower right star touches bust; reverse, 6 berries to branch. Fine. \$2.60.

1796 Large, wide date; reverse, Eight berries to branch. Fine. \$3.30.

1796 Large, close date; rev., Seven berries to branch. VF. \$5.00.

1797 Six Stars Facing. Fine; scarce. \$2.50.

1797 Seven Stars Facing. VF; rare. \$5.90.

1798 15 Stars; rev., small eagle in wreath. Fine; rare. \$7.80.

1798 13 Stars; rev., small eagle in wreath. VF; rare. \$7.00.

1798 Heraldic Eagle reverse. VF. \$3.00.

1798 Good. \$1.40.

1799 Six Stars Facing. Good. \$1.30.

1799 Five Stars Facing. Fair, scarce. \$1.65.

1799 EF. \$2.20.

1799 Five Stars Facing. Fine, scarce. \$5.00.

1800 Stars sharp; Extra Fine. \$2.50.

1801 Stars sharp; Fine. \$4.10.

1802 A beautiful impression; almost Unc. \$7.00.

1803 Small 3 in date high. VF. \$3.90.

1803 Large 3 in date low. VG. \$2.20.

Scott Stamp & Coin Company's 130th Sale, December 12-13, 1894, included these early dollars.

1795 Flowing Hair. Fine \$3.50.

1795 Draped Bust. VF \$2.50.

1796 Large Date. VF \$4.50.

1798 13 Stars, small eagle. Very Fair \$3.50.

1798 15 Stars About Good \$4.60.

1798 Large Eagle, Knob to 9. Fine. \$2.50.

1798 Knobless 9. VF \$2.60.

1799 Five Stars Facing. Fine \$4.25.

1799 Six Stars Facing. VF \$2.75.

1800 Fine \$4.10.

- 1801 Fine \$2.60.
- 1802/1 VG \$2.20.
- 1802 VG \$2.90.
- 1803 Large 3. VG \$2.90.

S.H. and H. Chapman's sale of the M.A. Brown Collection, April 16-17, 1897. Offered was a nice quality selection of early dollars, including several obtained from the Winsor Collection sale conducted earlier by the Chapman brothers.

1797 Six stars before the bust. Large letters on reverse. Uncirculated. Beautiful mint lustre. Almost invisible, very light scratches on reverse. From the Winsor Collection, No. 400. \$30.00.

1797 Seven stars before bust. Rev. Large letters. VF. From Winsor Collection, No. 399. \$5.00.

1797 Seven Stars before bust. Rev. Small letters. VG. Very rare. \$3.50.

1798 12.00 13 Stars. Rev. Small eagle. VF. Splendid, bold, sharp impression. Superior to those usually obtainable. From Winsor Collection, No. 402. \$15.00.

1798 15 Stars. Rev. Small eagle. Small pin head hole on ribbon on rev. VF. Very rare, From Winsor Collection, No. 401. \$10.50.

1799 Six Stars before bust. Even 99 the 7 high. Uncirculated. Sharp impression. Slight file marks in planchet on eagle's neck on rev. Mint lustre. From Bispham Sale, 1880. \$18.00.

1800 Die cracked in date and up the sides. Uncirculated. Splendid, sharp impression, with Mint lustre. Rarely seen in this condition. From Winsor Sale, No. 410. \$15.00.

1801 Uncirculated, only the faintest touch of cabinet friction obv. Reverse semi-proof. Superb specimen, sharp impression. \$20.00.

1802/1 EF. Mint lustre. \$5.00.

1802 Perfect Date. Uncirculated. Sharp, even, superb impression with mint lustre. From Winsor Sale, No. 413. \$18.00.

1803. Large Date. Uncirculated. Magnificent, sharp, even impression with Mint lustre. The finest specimen of this date we know of. A superb coin and extremely rare in this condition. \$23.50.

Ed. Frossard's sale of the John F. Bateman Collection, December 16-17, 1897. Included in the sale was a representative assortment of early dollars.

1795 Flowing Hair. Lower curl touches point of star; rev., three leaves under left wing. VG. \$1.90.

1795 Flowing Hair. Lower curl distant from star; rev. as in last. VG. \$1.70.

1795 Flowing Hair. Broken lower curl passes at each side of point of star; rev. two leaves under left wing. Fine. \$2.50.

1795 Fillet Head. VG. \$1.80.

1796 Large Date. Nearly Fine. \$2.85.

1796 Small Date. VF. Rare in this condition. \$3.20.

1800 Dotted Date. EF. \$4.50.
1801 VF. \$7.50.
1802 EF. \$6.00.
1802/1 EF. \$6.00.
1803 Large 3. EF, slight Proof surface. \$7.00.
1803 Small 3. VF. \$6.00.

S.H. and H. Chapman's sale of the Ralph Barker Collection, July 7-8, 1904, offered dollars from 1794 onward. Reminiscing in later years, the Chapman brothers stated that of all significant United States coin rarities, the 1794 dollar was the only issue that they never bought over the counter from the public in the normal course of business.

The dollars in the Barker sale were catalogued hastily, and the basic types of 1795 were not given.

1794 Fine for this coin. Well and evenly struck. A few almost invisible scratches in field before head. Slight edge dent. \$75.00.

1795 Fine. \$2.60.
1795 VG. \$2.50.
1795 VF. \$3.25.
1795 Fine. \$2.00.
1795 Fine. Nick on end of nose and in field. \$2.00.
1796 VG. \$7.25.
1796 Fine. Light nicks on bust. \$3.25.
1796 VF. \$7.25.
1797 Fine. \$4.00.
1797 VG. \$2.20.
1798 VF. Strong impression. \$3.00.
1798 Fine. Slight edge dent. \$5.00.
1798 VF. Slight drift mark [carbon streak] on obverse. Sharp, even impression. \$2.25.
1799/8 Unc. Sharp impression. Mint lustre. \$3.25.
1799 Fine. \$3.00.
1799 EF. Sharp, beautiful impression; shows very light hairline file marks in center of reverse. Mint lustre. \$2.75.
1800 VF. Sharp, even impression. \$4.10.
1801 EF. Sharp, even impression. Mint lustre. \$6.75.
1801 VF. \$3.70.
1802/1 VG. \$1.75.
1802 Unc. Stars not centered. Slight nick on neck. Mint lustre. Even impression. \$4.50.
1803 VF. \$2.00.

Lyman H. Low's sale of the H.G. Brown Collection, Part I, October 11, 1904. This offering is representative of several similar situations in American numismatics over the years, in which a collector added a prime rarity (in this case an 1804 dollar) to a collection of otherwise mediocre quality. The 1794 was a real dog.

Presumably, the first several 1795 dollars were of the Flowing Hair type, inasmuch as a later one is called the Bust style. However, the reader hadn't a clue about varieties of 1796 and 1797. Low omitted the same information in the Hoch Collection described subsequently.

Lyman Haines Low, born in Boston in 1844, was an important figure on the American numismatic scene from the early 1880s to the mid-1920s. During that time he left an indelible mark on the hobby, not only as co-editor of the *American Journal of Numismatics* from 1891 to 1907, but also for his research findings and, especially, the excellent auction catalogues he published under his own name, and for those he prepared for Scott.

1794 Good impression, date strong, somewhat worn and nicked; plugged through E in LIBERTY; letter restored. Very rare. \$25.00.

1795 About Fine. \$2.60.

1795 Equally as good as last. \$2.50.

1797 Nearly Fine. \$3.10.

1797 VG. \$2.75.

1798 VG. \$3.30.

1798 VG. \$1.80.

1798 VG. \$2.05.

1799 VG. \$2.75.

1799 Good. \$2.10.

1800 Good. \$2.15.

1801 Very Fair. \$3.20.

1802 Good. \$2.20.

1803 Fair. \$2.10.

1804 [Lengthy description shortened] EF, with a brilliant prooflike surface, and unimpaired since its last public appearance at an auction sale in Philadelphia in May 1885, when it was purchased on an order from J.B. Dexter, for \$1,000. . . . \$1,100.00.

The Waldo C. Moore Collection sold by Ben G. Green, May 13, 1905, contained a below-average quality offering of early silver dollars. Moore, of Lewisburg, Ohio, later served as president of the American Numismatic Association. Green was a seller of medical equipment, including prostheses, in Chicago, was prominent on the local numismatic scene (but less well known nationally), and was an early supplier to super-collector Virgil M. Brand.

1795 Flowing Hair. Two leaves under each wing. Scratched both sides. Good. \$2.25.

1795 as last. Three leaves under wings. VG. \$2.75.

1795 Fillet Head. VG. \$3.05.

- 1803 VG. \$2.55.

The George Rice Collection, sold by St. Louis Stamp & Coin Company, April 13, 14, 1906. The cabinet consisted of a set of major varieties from 1794 through 1803. The St. Louis Stamp & Coin Company was managed for a long time, and later owned, by Burdette G. Johnson. B.G. Johnson had the knack of being in the right place at the right time, and later in his career handled much of the numismatic estates of Virgil M. Brand and Col. E.H.R. Green, including all five of the 1913 Liberty Head nickels owned by the latter.

1794 Strong, even impression of this always weakly struck coin. All portions of the design show plainly except top half of first S of STATES. One of the finest specimens known of this extremely rare coin. Cost owner \$225. VF. \$180.00.

1795 Point of bust far from first star, very strong impression, Unc. Very rare. \$8.00.

1795 Long bust points to second star. Good. \$3.00.

1795 Rev. Three leaves below eagle's wing. Unc., strong, sharp, even impression. Very rare. \$5.10.

1795 Same, different dies. VG. \$3.00.

1795 Fillet Head. About Fine. \$3.00.

1796 Large Date, Rev., small letters. VG. \$4.00.

1796 Small Date, Rev., small letters. VF. \$4.00.

1796 Small Date, Rev., large letters, About VG. \$3.00.

1797 Six Stars Facing. VG. \$3.25.

1797 Seven Stars Facing. VG. \$3.25.

1798 Obv. 15 Stars, Rev., small eagle, About Fine. Very rare. \$6.00.

1798 Obv. 13 Stars, Rev., small eagle, About Fine. Rare. \$3.30.

1798 Obv., no knob to 9, Rev., Heraldic eagle. Unc. \$6.00.

1798 Knob to 9. Good. \$1.90.

1799/8 VG. \$2.10.

1799 Six Stars Facing. EF. \$3.20.

1799 Six Stars Facing. VG. \$2.10.

1799 Close 17, faint cracks on bust. VG. \$2.00.

1799 Five Stars Facing. EF. Rare. \$3.90.

1800 Obv. Fine, Rev. VF. \$3.10.

1800 VG. \$2.50.

1801 About Fine. \$3.00.

1802/1 EF. \$2.95.

1802 Perfect Date. EF. \$6.10.

1803 Small 3, Unc., some mint bloom, fine, sharp impression. \$8.20.

1803 Large 3, Unc., fine, sharp impression, some Proof surface. \$7.75.

1804 Electrotpe. VG. \$6.10.

Ben G. Green's 23rd Sale, May 25, 1906, featured sparse descriptions of the varieties therein. While a few cataloguers—very few—attributed early

dollars by Haseltine numbers, the vast majority did not. Descriptions were inconsistent. Were the first two 1795 dollars of the Flowing Hair type? Possibly they were, by implication, as the third is listed as Fillet Head (Draped Bust in today's terminology), but we may never know.

In view of inconsistencies in grading and wide differences in cataloguing styles, mail bidders were often wary of such sales. As a result, most coins sold to floor bidders, including dealers representing clients. In the instance of complete mail bid sales (such as those conducted by B. Max Mehl, who never had a floor bid sale), descriptions were often more elaborate, to create a mental image of the coin for the prospective buyer.

1794 VG. \$82.00

1795 VF. \$3.85.

1795 Obverse Fine, reverse EF and sharp; shows mint lustre. A few trifling scratches. \$4.00.

1795 VF, strong impression. \$4.25.

1795 Fillet Head. Practically Unc., almost Proof surface. Sharply and evenly struck. \$8.00.

1796 VF. \$3.85.

1796 VG. \$3.55.

1797 VG. \$3.40.

1798 VG. \$5.50.

1798 Fine. Sharp. \$3.85.

1798 VF. Shows mint bloom. \$2.95.

1798 EF, almost Unc. Splendid, strong impression. Faint drift marks [carbon streaks]. \$3.85.

1799/8 Sharp dent below 1 of date. VF. \$2.95.

1799 VG. \$3.65.

1799 VF. \$2.70.

1799 VF. \$2.75.

1800 Fine. \$2.90.

1801 VG. \$2.95.

1801 Fine. \$3.00.

1802/1 EF. Reverse shows mint lustre. \$5.00.

1802 Fine. \$2.80.

1803 EF. reverse shows lustre. Drift marks on obverse. \$4.00.

Henry Chapman's sale of the Matthew Adams Stickney Collection, June 25-29, 1907. This magnificent cabinet, begun in the first half of the nineteenth century, contained many outstanding pieces, and many mediocre coins as well. The Chapmans went to some length to describe the varieties but for some reason did not elect to use Haseltine numbers, which would have simplified the process.

1794 Fine. Extremely rare. \$190.00.

1795 Head resembling that on the 1794. Three leaves under each wing of eagle; attempted hole near edge on reverse. Good. \$2.50.

1795 Head with intent expression on face, curl between

points of first star. Rev. Three leaves under each wing of eagle. EF, only the slightest cabinet friction. Mint lustre. \$12.00.

1795 Large head, curl high in field between stars. The variety with short bar in die behind head. Rev. as last. VF. \$4.30.

1795 Large head, curl passes through star; die cracked from edge through 7 of date up into the head. Rev. As last. Good. Rare die. \$2.50.

1795 Large head, curl passes through star and curls up toward bust; similar but different from last. Rev. Two leaves under each wing of eagle. VG. \$3.10.

1795 Large head, curl touches and stops at point of star. Rev. As last. VG. \$2.75.

1795 Small head far from LIBERTY, curl touches two points of star, and point of bust almost touches star. Rev. Two leaves under each wing, different die from preceding. EF. Mint lustre. \$9.50.

1795 Type with bust in left of the field. VF. \$8.50.

1796 Large Date. Rev. small letters in legend. VF. Rare. \$9.50.

1796 Small Date. Rev. small letters in legend. VG. Slight scratch on obverse. \$3.25.

1796 Small Date. Rev. large letters in legend. VG. Rare. \$3.50.

1797 Six stars before bust, ten behind it. Rev. large letters in legend. EF. Sharp stars, and a very superior example in every way. Mint lustre. \$13.00.

1797 9x7 stars. Rev. large letters. VG. \$3.60.

1798 7x6 stars. Rev. small eagle. VF. \$6.25.

1798 8x7. 15 Stars. Die broken from between bust and last star to chin. Rev. small eagle as above, but legend in small letters. VF. \$11.50.

1798 Close date, high 8; 7x6 stars. Heraldic eagle. Unc. Sharp, even impression with brilliant mint lustre. \$18.00.

1798 Same dies as last. VF. \$2.40.

1798 Close date, high 8; curious break in die begins under the 9 and extends to first star on left, thence to ribbon in hair, and on right side to field before face. Rev. three stars before eagle's head in almost straight line. VF. \$2.25.

1798 Close, even date. Rev. different die. Good. \$2.50.

1798 Wide date, the 8 touches bust. Rev. Stars grouped three, line of five, and line of six far from clouds. EF. \$6.25.

1799 8x5 stars. EF. Sharp impression. Mint lustre. \$20.00.

1799 7x6 stars. Rev. each star of upper row of stars touches a cloud. Unc. Mint lustre. Sharp impression. \$4.50.

1799 Die cracked around date and over bust in several directions. Star at Y close at L farther than last die. Rev. Same die. EF. \$2.75.

1799 Erratic uneven date. Rev. 14 stars! One just emerging from first cloud. Good. \$2.00.

1799 Even date. Rev. no berries on laurel branch. Unc. Only the slightest cabinet wear on bust. Mint lustre. \$4.50.

1799 Even date, though last 9 is slightly higher; star before and after LIBERTY evenly spaced—wide. Rev. same as last—no berries on laurel. EF; a magnificent dollar. \$6.00.

1799 Same as last. VF. \$2.50.

1800 Stars at side of LIBERTY evenly spaced, and first star far from lower hair. Rev. first star in upper row near wing. Deep milling. EF. \$9.50.

1800 Same dies as last. VG. \$2.10.

1800 Wide Date. Star far from L. Different dies to last. VF. \$2.75.

1800 Even closer date. Different dies to last. Fine. \$2.90.

1800 Star far from L. Break on reverse makes it appear AMERICAN. VF. Very rare dies. \$3.00.

1800 Dotted O in date, due to small flakes out of the die. EF. Mint lustre. \$5.25.

1801 Reverse leaf touches I. VF. Sharp impression. Rare in this superior condition. \$12.00.

1801 Reverse leaf points to left of I. VF. Sharp impression. Rare in this preservation. \$8.50.

1801 Reverse leaf under center of I; lower arrow head under middle of U. VG. \$3.00.

1802/1 Star distant from Y. Rev. First leaf points to C. VG. \$2.75.

1802/1 Star close to Y and points at right hand upper corner of that letter. Rev. First leaf points to I. VG. \$2.20.

1802 Perfect Date. Unc. Sharp, even impression. Mint lustre. Perfection, and while I have seen several superb dollars of this year, yet I feel this is the finest specimen. A gem. \$15.50.

1802 Same dies as last. EF. Sharp, beautiful impression. Mint lustre. \$6.50.

1802 Same dies as last. Fine. \$3.00.

1803 Large 3. Not perfectly centered. VF. \$4.00.

1803 Same dies. VG. \$2.25.

1803 Small 3. VF. \$4.25.

1804 Original. . . 1 The present piece which Mr. Stickney received May 9, 1843 from the U.S. Mint at Philadelphia, it being a duplicate, in exchange for other coins one of which was an impression in *gold* of the 1785 Immune Columbia and which coin has remained to this day as the *only* example known. This 1804 dollar has never been out of Mr. Stickney's possession and so carefully guarded by him that few persons were ever even allowed to see it. He always considered the 1787 New York Brasher doubloon and this coin his greatest numismatic treasures. I compared it with the one in the Mint and it is exactly the same; the edges correspond even to the impression on the letters. Weight 415 grs., 307/1000, correct as the legal standard was 416 grains. A statement by Mr. T.L. Comparette, curator of the U.S. Mint Collection, that this dollar is exactly the same as the one in the Mint Cabinet accompanies it. As to its state of preservation it surpasses the one in the Mint, as it is a trifle finer impression, and the Mint specimen has several minute nicks above the head. At some time it has been wiped or kept possibly in a chamois bag and shows very faint hair marks, otherwise it is EF, brilliant and with a slight Proof surface. No other example of this great coin has such a clear pedigree as this—here it is obtained of the U.S. government in 1843 and never changed hands until this year 1907—64 years! The first publication of the 1804 dollar was 1842 when it was published by Messrs. Eckfeldt and DuBois, assayers at the Mint; in their *Manual of Coins*, and on one of the plates in that pioneer book on American coins,

they placed the 1804 dollar; without any comment as to its rarity and evidently there shown as the finest specimen of the dollar in the Mint Collection, this was 15 years before the first counterfeit die¹ was made and its rarity was established. The illustration in that publication was made by the ruling engine and so it is exact, being made right from the coin. As to what it will sell for at this sale, no one knows but unlimited bids had better not be sent—place at least an approximate sum on your bid so your agent will know your wishes; suffice it to say that from all I have heard the past eight weeks, I feel confident it will pass any previous record for a U.S. coin! Every other 1804 dollar is out of the market—three alone being in museums and Mr. Dunham and Mr. Manning are not sellers and here is your last chance! In fine white morocco case. \$3,600.00.

Lyman H. Low's sale of the Dudley R. Child Collection, February 25, 1908. As is the case with many silver dollar collections, even those of medium size and quality, it began with a specimen of the rare 1794.

1794 VG, with date strong; five light obverse edge nicks, with two on reverse. \$80.00.

1795 Flowing Hair; two leaves below eagle's wings. Nearly Fine, slight suction marks of reverse design. \$3.40.

1795 as last; three leaves. EF, rarely equaled. \$6.50.

1795 Bust type. Fine; edge dent opposite second star l. \$2.90.

1796 Small Date. VG. \$3.10.

1796 Large Date. About Fine. \$3.80.

1797 Six Stars Facing. Fine. \$4.10.

1797 Seven Stars Facing. VG. \$3.80.

1798 Small Eagle, 13 Stars on obverse. VG. \$3.80.

1798 Large Eagle, Eight high and near bust. VF. \$2.60.

1799/8 Good. \$2.05.

1799 Five Stars Facing. VG. \$3.00.

1799 Six Stars Facing, stars widely spaced. EF, might fairly be graded Unc., with lightest nicks. \$3.50.

1800 Without breaks through date. Fine. \$2.75.

1800 Dies differing from last. VG. \$2.50.

1801 VG. \$2.00.

1802/1 About Fine. \$2.60.

1802 Perfect Date. EF. \$4.30.

1803 Small 3. VG. \$2.50.

1803 Large 3. Fine. \$2.80.

The Bristol, Church, and Bishop Collections sold by Thomas L. Elder, January 16, 1909. Elder's 23rd public sale, this event included a sparse offering of early dollars. Elder, located in Pittsburgh, Pennsylvania, then for many years in New York City, was the successor to Ed. Frossard, in that he had a ready opinion on just about every subject brought to his attention. He fought a heated battle with numismatic entrepreneur and American Numismatic As-

sociation president Farran Zerbe, whom he considered to be a scoundrel of the lowest order; he railed against Henry Ford, William J. Bryan, and other pacifists who sought to keep America from involvement in the world war; and had a hundred and one other causes. It is said that at his auction sales, he would not hesitate to castigate a bidder publicly if an earlier bill had not been paid, or if he recalled a difference of opinion or problem.

However, Elder left a rich legacy of auction catalogues, which included many important rarities and collections. Further, he was one of the relatively few leading dealers who devoted a generous amount of time to educating new collectors and sharing his knowledge for the benefit of others, particularly in the field of tokens and medals.

1795 Flowing Hair. Three leaves under each wing. Curl touches top of star. AU. Rare. \$7.50.

1795 As last. VG. \$3.10.

1796 Small letters in legend. Extremely Fine. \$10.00.

1798 13 Stars. Small eagle on clouds. Fine. Rare. \$4.25.

1798 13 Stars. Heraldic eagle. VG. \$2.20.

1799 Six Stars. The stars small. VG. \$2.10.

1799 Six Stars. The stars large. Nearly Unc. \$3.10.

1800 Dotted Date. VG. \$2.40.

1800 Perfect Date. VG. \$2.70.

1802 Perfect Date. Unc. Rare. \$8.50.

1803 Lower part of 3 double-cut. VF. \$3.70.

Lyman H. Low's sale of the R.T. Rose Collection, September 9-10, 1909, offered a selection of ho-hum quality early dollars.

1795 Head type. Slight cross scratch on head. Otherwise nearly Fine. \$2.70.

1795 Head type. Fine; slight file marks in planchet. \$3.25.

1795 As last. VG. \$2.70.

1795 Bust type. VG. \$2.65.

- 1802 Perfect Date. VF. \$3.50.
- 1803 VF. Scarce. \$3.25.

B. Max Mehl's sale of the P.H. Griffith Collection, March 20, 1912, featured unusually detailed

descriptions for the era, undoubtedly made necessary by the fact that all bidders participated by mail, and no one attended the sale in person to inspect the lots.

Mehl, in business since 1903, was just beginning to hit his stride in the major league of dealers, and by 1912 he had handled several important collections. He would go on to become the most famous rare coin dealer of all time. For a period of years, he had his own nationwide radio program as part of an ongoing effort to sell the *Star Rare Coin Encyclopedia*, which suggested that a great fortune awaited anyone fortunate enough to find a 1913 Liberty Head nickel, 1804 dollar, or other rarity in pocket change. Of course, few such coins were ever found, but Mehl made a fortune selling his books.

Mehl conducted business on two fronts: with the public and his premium catalogues, and in a more serious vein with established numismatists. In the latter category, he published *Mehl's Numismatic Monthly*, which for a number of years after 1908 was, arguably, America's most interesting numismatic periodical, and an illustrious series of auction (actually, mail bid) catalogues featuring the Ten Eyck, Dunham, Roe, Neil, Olsen, Atwater, and other notable collections.

1794 Fine for coin. Left part of coin weakly struck, but every letter, star and figure is plain. A very light immaterial dent on obverse edge and a pin-point nick in field before liberty head. Much better than usually found. \$122.00.

1795 Head of '94. Very light scratches in field before head. Fine, with strong impression. Rare variety, seldom found so choice. \$3.50.

1795 Variety with two leaves under wings. Last curl between points of star. Good. Scarce. \$3.80.

1795 So-called Large Head variety, last curl in field between stars. The point of bust between first and second star. Reverse two leaves below wing. A small dent on either side. Well centered and VF. \$3.50.

1795 New type with Liberty facing right. 15 stars. EF, near Unc., with beautiful semi-proof surface. \$5.40.

1796 Small Date. Rev. Large letters in legend. Light, long dent on obverse field. Reverse, two small cracks on edge due to break in die. VG. \$3.50.

1796 Large Date. Rev. Small letters in legend. Variety with small die break between I C in AMERICA. EF, bold impression, with some mint lustre. \$7.35.

1797 10x6 stars. VF. \$8.90.

1797 9x7 stars. Rev. Light scratches, otherwise Good to VG. \$2.75.

1798 Small Eagle variety. 13 Stars. Most skillfully plugged at top and letters re-engraved. EF, some mint lustre. \$2.35.

1798 Small Eagle, but with 15 Stars, and small letters in legend on reverse. VG. \$4.40.

1798 Heraldic eagle. Even date, large 8, very near but does not touch bust, knobless 9. About Unc., original mint lustre. \$3.50.

1798 High straight 8 but not touching bust, knobless 9. VF, strong impression. Very choice specimen. \$2.35.

1798 High straight date, 8 touching bust, knob to 9. Fine. \$2.50.

1798 Curved date, 8 distant from bust, knob to 9. EF, well centered, and very bold impression, but unfortunately several initials scratched on obverse. \$1.85.

1799 Five Stars Facing. VG. \$2.35.

1799/8 Six Stars to right of Liberty, small stars on obverse. VG. \$2.25.

1799 Perfect Date. Large stars. EF, some mint lustre. \$3.00.

1800 Perfect Die. Large berries in olive branch. VG, near Fine. \$3.50.

1800 Break in reverse die, making it read AMERICA, large berries in olive branch. EF, some mint lustre. \$3.00.

1801 Reverse leaf touches I. EF. \$5.25.

1802/1 The overdate is the most marked that I ever saw. Strictly Fine, sharp impression and well centered. \$3.30.

1802 Perfect Date. About Unc. with bright semi-proof surface. Only the highest portions showing slight wear which is undoubtedly due to cabinet friction.¹ Perfectly centered and good strong impression. Extremely rare and valuable so choice. \$4.80.

1803 Small 3. EF, semi-proof surface, perfectly centered. \$5.25.

1803 Large 3. Near Unc., unusually strong impression, considerable mint lustre. \$3.50.

Henry Chapman's sale of the George H. Earle Collection, June 25-29, 1912. Note that four specimens of the 1794 dollar are offered; most sales were doing well to have just one!

1794 EF. Sharp, bold, even impression. Stars before head sharp; those behind bold, but not centered. Slight hairmarks or abrasion in field. Light charcoal drift mark [carbon impurity] in planchet from edge at first star in a circle embracing the first and second stars to the edge. \$620.00.

1794 Fine. Bold impression, though stars behind head are flat, the first one weak. Date well struck up. Slight drift mark in planchet from head to right. Two slight dents on obverse edge and a larger one on reverse. \$140.00.

1794 Good. Stars behind head weak, as usual, as also UNITED STATES on reverse. Slight defect in planchet between first and second stars. \$80.00.

1794 Good. Stars behind head very weak, but rest of the obverse well struck. Field behind head has been rubbed down. Some scratches and edge dents. Rev. STATES very weak. Pin-point nicks on eagle's legs. \$87.00.

1795 Head resembling that used on the 1794. Rev. Two leaves under each wing of the eagle. VF. Many small nicks on obverse, and around edge of reverse may be seen many of the file marks in the planchet. \$10.50.

1795 Tall head, similar to last. Rev. Two leaves under each wing. Shows considerable planchet file marks on head. Body of eagle not up. EF. Mint lustre. \$18.50.

1795 EF. Rev. Bad scratch from left leg of eagle to point of second leaf. \$4.75.

1795 Small, low head, curl touches two points of first star. Rev. Two leaves under each wing. Unc. Mint lustre. Die frosted around head. Rev. Pin scratches across eagle. \$45.00.

1795 Short Head. Rev. Two leaves under each wing. Surface around head frosted. Small nick on chin. EF. \$6.00.

1795 Beautiful head, showing center dot under ear; lower curl passes through first star. Rev. Two leaves under each wing. Proof, showing very slight abrasion. Sharp, even impression. \$43.00.

1795 Curl just touches first star. Rev. Two leaves under each wing. Weak impression on eagle. Fine. \$5.00.

1795 Head in center of field. Curl free of stars. Small cut in the die back of the head. Small scratch before eagle. Three leaves under each wing of eagle. Unc. Br. mint lustre. Milling around edge not struck up on half of the circumference; also shows some of the planchet file marks. \$22.00.

1795 As last. Unc. The very slightest abrasion. Sharp, even impression. \$10.50.

1795 Same dies as last. VF. Light scratches. \$4.50.

1795 Small Head. Lower curl between two points of first star. Rev. Three leaves under each wing. Not struck up on milling. Fine. \$3.75.

1795 Curl just touches tip of star. Rev. Two leaves under each wing. Unc., the faintest hairmarks. Mint lustre. Sharp, with broad milling. \$29.00.

1795 Draped Bust of Liberty in left of field, the hair tied by a fillet. Rev. Eagle in wreath on clouds. Uncirculated, brilliant. The faintest abrasion. Mint lustre. \$62.50.

1795 Bust in left of field. Fine. \$3.50.

1795 Bust in left of field. VF. \$4.75.

1795 Draped Bust of Liberty, with the hair bound by a fillet. The die with a small break like a horn on side of the head. Bust in center of field. Rev. Small eagle on clouds. VF. \$5.25.

1795 Same dies. Fine. Fields burnished. \$5.75.

1796 Large Date. Small letters in legend on reverse, die broken between I C. EF, only showing the slightest abrasion. Sharp, even impression. \$15.00.

1796 Large Date. Same reverse as last. VF. \$6.50.

1796 Large Date. Same as last. VF. \$10.50.

1796 Small Date. Rev. Large letters. Fine. \$4.20.

1796 Small Date. Rev. Small letters. VG. \$4.10.

1796 Small Date. Rev. Large letters. Fine. Pin-head dent on bust. \$5.00.

1797 Stars 10x6. Rev. Large letters in legend. Unc. Minute nick on throat. Sharp for this date, even impression. Mint lustre. \$17.00.

1797 As last. Very slightest planchet file marks on head. \$5.50.

1798 15 Stars. Rev. Small eagle on clouds, small letters in

¹ "Cabinet friction," a term in use by nearly all dealers in the nineteenth and early twentieth centuries, referred to slight rubbing on an otherwise Uncirculated specimen, or on a Proof coin. The implication was that the rubbing was acquired by the coin's having been kept in a drawer in a cabinet; somehow, this type of rubbing was supposed to be better than similar-appearing rubbing acquired from a coin having been in general circulation for a very short time. With cabinet friction one could expect much, or even full, lustre in field, and rubbing only on one side; with light circulation, lustre would be partly gone, and both sides would be rubbed.

legend. EF. Minute nicks. Slight dent on reverse edge. Eagle's breast not up. \$14.00.

1798 15 Stars. Rev. Small eagle. As last. Fine. Light nicks. Pin-head dent on reverse. \$5.00.

1798 15 Stars. Rev. Small eagle. As last. Fine. Slight dent on reverse edge. \$5.25.

1798 13 stars. Rev. Small eagle on clouds, large letters in legend. EF. Bold impression. \$11.00.

1798 High 8 in date. Rev. Heraldic eagle, as are all following. EF. Sharp, even impression. Abraded on bust—minute nicks and scratches. \$2.75.

1798 Same dies. EF. Sharp impression. \$3.00.

1798 Same obverse, die cracked below date. Rev. Variety from last. VF, but weak on bust and stars over eagle. \$2.75.

1798 High Date, 1 almost touches hair and 8 the bust. Rev. Large stars over eagle. EF. Sharp. Planchet file marks on head. \$3.50.

1799/8 Rev. 13 large stars over eagle's head. Die broken around I of AMERICA. EF. Mint lustre. Slightly chafed. \$13.00.

1799/8 Rev. 13 small stars [*sic.* the text says 13 but this is clearly 15-Star reverse], first one just emerging from cloud. EF. Mint lustre. Planchet shows fine drift marks. \$6.50.

1799/8 VF. \$4.00.

1799 Five stars before bust, 8 behind it. EF, but has been cleaned in acid and wiped with a gritty cloth, hairmarking it. \$6.25.

1799 Five Stars Facing. Fine. \$4.50.

1799 EF, Br. Sharp, small stars. \$9.50.

1799 Similar dies. Claw touches A. EF, brilliant. Sharp, small stars. \$12.00.

1799 Six Stars. Unc. Stars sharp. \$8.00.

1799 Six Stars. Unc. Two minute nicks on obverse. \$6.00.

1799 Large Stars. Reverse shows planchet file marks in center. Unc. Sharp. Mint lustre. \$5.50.

1799 Close Date. Obverse die shattered. Unc. Sharp. Mint lustre. \$12.00.

1800 Perfect Date. Unc. Three stars not up, two behind and one before bust, owing to sinking of the die, which also shows around right edge of reverse. Mint lustre. \$16.00.

1800 Perfect Date. Small nick behind head, slight drift mark on reverse. VF. \$4.00.

1800 Die broken around date, making second O look like Q. EF. Mint lustre. \$6.00.

1801 Unc. Sharp, even impression. Mint lustre. A magnificent example and extremely rare in this preservation. \$45.00.

1802/1 EF, though somewhat chafed. Small pieces broken out of edge on reverse, owing to defect in the planchet. \$5.50.

1802 Perfect Date. Unc. A few microscopic nicks. Mint lustre. Sharp, even impression. \$7.75.

1802 As last and in almost same condition, the mint lustre slightly chafed. \$7.50.

1803 Large Date. Unc., a few microscopic nicks on bust. Sharp, even impression, with broad milling. Remarkable specimen and very rare in such beautiful preservation. \$30.00.

1803 Large Date. EF. Not quite evenly centered, but sharp. \$5.00.

1803 Small 3. VF. \$5.00.

1803 Small 3. VG. \$3.00.

B. Max Mehl's sale of the H.O. Granberg Collection, July 14, 1913, was an offering of second-string pieces, perhaps duplicates, owned by this well-known Oshkosh, Wisconsin numismatist, who reserved many of his finer coins for later sale. Granberg was president of the American Numismatic Association 1915-1917.

1794 Good to VG. As usual, the left part of the coin is weakly struck, but practically every letter and figure shows plainly. Free from nicks or dents, the date unusually good. \$51.00.

1795 Type of 1794. Three leaves under each wing. Long dent on cheek, otherwise Fine. \$3.90.

1795 Type with bust of Liberty facing right; 15 stars. VG. \$3.50.

1796 Small Date. Reverse, large letters and legend. VG. \$4.20.

1796 Large Date. Reverse, small letters and legend. Die break at I of AMERICA. About Fine. \$4.00.

1797 Stars 10x6. VG. \$3.60.

1797 Stars 9x7. With the exception of very light, hardly noticeable hairline scratches on reverse it is almost Unc. Perfectly centered and well struck, with some mint lustre. \$6.00.

1797 Stars 9x7. Reverse, large letters. VG, nearly Fine. \$3.10.

1798 Small Eagle variety. 15 stars. VG. \$5.00.

1798 Obverse VG; reverse Very Fair. \$3.00.

1798 VF, every star filled. \$4.20.

1798 Date distant from bust. Good. \$2.60.

1799 Stars 8x5. VG. \$2.25.

1799 Practically Unc., with some mint bloom. \$3.50.

1799 VG, near Fine. \$2.25.

1799/8 VG. \$2.25.

1799 Perfect Date. VG. \$2.30.

1799 Perfect Date. VG. \$2.25.

1800 Perfect Die. Fine. \$2.25.

1801 Fine. \$4.20.

1802/1 VG. \$2.60.

1802 Perfect Date. VG. \$3.00.

1803 Large 3. Unc., mint lustre. Only highest portions are very slightly rubbed from cabinet friction only. Very strong impression; every letter, star and figure bold. Perfectly centered.

1804 [See "What Others Have Said About the 1804 \$1" in the 1804 dollar section of this book.]

The Henry Rogers Collection sold by Thomas L. Elder, July 18, 1913. Elder's 82nd public sale, this offering included two Mint State early dollars among several lower grade coins.

1797 Six stars before bust, 10 behind it. Rev. Small eagle. VF; rare. \$7.00.

1798 Break over figure 9. EF. \$2.25.

1798 Wide, even Date. Unc.; some lustre; rare. \$3.80.

1799 Six stars before bust. Unc., partly bright. \$2.40.

1799 VF. \$2.00.

1802 Perfect date. VF. \$2.25.

1802/1 EF; scarce. \$2.50.
1803 VF. \$3.05.

B. Max Mehl's sale of the Charles H. Conover Collection, May 6, 1914. The coins appear to be carefully described, as an aid to bidding by mail.

1794 Good to VG for coin; everything showing and plain. The piece has evidently seen considerable circulation and with the exception of what seems to be a small corrosion spot on reverse, it is free from any serious nicks or dents. \$39.00.

1795 Type as last, three leaves below eagle's wing. EF and sharp, every star filled; perfectly centered and an unusually bold impression. \$5.40.

1796 New type with bust of Liberty draped, facing to right. Seven stars before and eight behind bust. Rev. Small eagle with outstretched wings on clouds within wreath. Small date, large letters. Fine. \$3.60.

1797 Seven stars before and nine behind bust. VG, nearly Fine. \$3.65.

1798 Obverse as last. Rev. heraldic eagle with shield on breast; 13 stars about its head. VF, with some mint lustre. \$3.55.

1799 Perfect Date. Unc. Brilliant mint bloom. Perfectly centered and well struck. Every star filled. \$12.50.

1800 Perfect Die. Unc. Mint lustre. Every star filled and well struck. Broad milled border. \$13.75.

1801 EF, with considerable mint lustre. Very nearly Unc. \$7.80.

1802 Perfect Date. Fine. \$2.80.

1803 Large Date. EF with semiproof surface. Well centered and sharp. \$5.75.

The Arthur C. Nygren Collection sold by B. Max Mehl, November 30, 1914. The Nygren pieces were described in detail, per the standard B. Max Mehl policy, which was quite unusual for an era in which rarities such as 1794 often merited just two or three words, or a sentence, in the typical auction offerings of his competitors.

1794 Strictly Fine; VF for coin. While left portion is not struck up as bold as the balance yet it is one of the best impressions of this excessively rare dollar that has passed through my hands. Far above average, and excessively rare in this condition. \$132.00.

1795 Type as 1794; two leaves under wings. Last curl touches point of star. VF, sharp and well struck. Very scarce so choice. \$4.25.

1795 Type as last. Practically Unc.; considerable mint lustre. Very bold impression. Only the highest portions show some traces of wear. \$5.75.

1795 Unc. Tiny, immaterial, hardly noticeable nicks. An unusually sharp and perfectly centered specimen, with considerable brilliant mint lustre. Extremely rare. \$6.75.

1796 Small Date. A faint hairline scratch in field before face. Fine. \$4.00

1796 Large Date. EF, nearly Unc., with considerable mint lustre. Sharp, nearly every star filled. \$8.00.

1797 VF. \$6.00.

1797 Strictly Fine; perfectly centered. \$4.25.

1798 Fine, strong impression and well centered. \$3.35.

1798 VG. \$3.10.

1798 Practically Unc., with considerable mint lustre. Every star sharp. \$3.50.

1799/8 Only faintest touch of circulation. Sharp, with mint lustre. \$3.60.

1799 A pin-point prick at neck. EF. Sharp and with considerable mint bloom. \$3.00.

1799 EF, sharp. Broad milled border; considerable mint lustre. \$4.00.

1799 Strictly Fine. \$3.10.

1800 Unc. Brilliant frosty mint surface. Sharp and well struck. Every star filled. \$8.25.

1801 EF, considerable mint lustre. \$4.60.

1802/1 VF. \$3.00.

1802 EF, sharp; some mint lustre. \$4.00.

1803 Unc. Brilliant mint bloom. The highest portions and field very slightly rubbed. A sharp and perfectly centered specimen. \$7.00.

The United States Coin Co., Inc. sale of the John Brooks Collection, December 10, 1914. The auction offered a basic date and major variety set of early dollars 1794-1803.

1794 VG for this rare piece, weakly struck as usual. \$41.00.

1795 Three leaves under eagle's wings. Fine. \$2.90.

1795 Two leaves under eagle's wings. VF. \$2.85.

1795 Bar behind head. VF. \$3.00.

1795 Fillet Head. Fine. \$3.10.

1796 Small Date, large letters on reverse. Fine. \$3.20.

1796 Small Date, small letters on reverse. Good, rare. \$2.15.

1797 Seven Stars Facing. Fine. \$3.60.

1798 15 Stars, Small Eagle. Good. \$3.00.

1798 Heraldic Eagle, small close date. Fine. \$2.20.

1798 Large Date. 8 touches bust. VG. \$2.00.

1798 Large Date, free from bust. VG. \$2.00.

1799/8 Good. \$1.85.

1799 Six Stars Facing. VF, sharp impression. \$2.20.

1800 VG. \$2.10.

1801 VG. \$2.50.

1802 Perfect Date. VG. \$2.20.

1803 Large 3. Good. \$2.10.

1803 Small 3. Good but holed. \$1.00.

Henry Chapman's sale of the William F. Brown Collection, January 16, 1915, offered a modest selection of early dollars, including a Mint State 1795 and a notably fine 1802.

1795 Head of Liberty low, far from LIBERTY; lower curl touches two upper points of first star. Rev. Two leaves under each wing. Unc. Mint lustre. Die frosted around head. \$47.00.

1796 Large Date. Rev. Small letters, die broken between IC. VG. \$3.10.

1796 Small Date. Rev. Large letters. About Fine. \$3.80.

1797 Six stars before bust. VF. Light scratches across bust where impression was not strong enough to take them out of the planchet. \$4.50.

1798 13 Stars. Rev. Small eagle on clouds in wreath. EF. Sharp, even impression. \$17.00.

1798 Close erratic date. 13 stars. Rev. Large heraldic eagle. Fine. \$2.50.

1799 Six stars before bust. Berries on stem. EF. \$2.50.

1799 Five stars before bust. VG. \$3.00.

1800 VG. Even, sharp impression. \$2.50.

1801 VF. Sharp impression. \$4.35.

1802 Perfect Date. Unc., only the slightest abrasion on bust. Sharp, even impression. Mint lustre. \$4.80.

1803 Small 3. Fine. \$3.00.

United States Coin Co., Inc. sale of the George M. Andrus Collection, January 20, 1915. Offered were several early dollars.

1795 Curl high over star. Bar behind head; three leaves under each wing of eagle. AU, sharp, beautiful impression with Proof surface. \$5.00.

1795 Fillet Head. Head in center of planchet. EF and sharp, but two initials lightly scratched in obverse field. \$2.75.

1798 Heraldic Eagle. High 8 in date through which runs a die crack. VF. \$2.65.

1799/8. EF. \$3.85.

1800 Fine. \$2.25.

1801 VF. \$3.00.

1803 Large 3. VF. \$2.60.

1803 Small 3. AU, mint lustre with Proof surface. \$6.00.

United States Coin Co., Inc. sale of a "Collection of U.S. Coins Belonging to a Prominent American," May 19-21, 1915. The sale offered a nice set of early dollars 1794-1803.

1794 Fine. All stars on left and entire reverse legend are struck up. \$100.00.

1795 Curl just touches point of first star, wide date, 19 berries in wreath, 9 on l. branch and 10 on right. Unc., sharp impression with mint lustre. \$10.00.

1795 Curl cuts point of first star, wide date, 19 berries in wreath, 9 on l. branch and 10 on right. Unc., sharp impression with mint lustre. A magnificent piece, extremely rare in this beautiful condition. \$2.50.

1795 Curl touches two points of first star, close date, 17 berries in wreath, 9 on l. branch and 8 on right. Fine. \$2.60.

1795 Curl high over star, small die break in field behind head, 13 berries in wreath, 7 on l. branch and 6 on right. EF, sharp impression with mint lustre. \$6.00.

1795 Same dies as preceding. VF. \$4.25.

1795 Fillet Head. Head of Liberty not in center of obverse, 7 berries in laurel branch on wreath. EF. \$4.00.

1795 Same dies. VG. \$2.25.

1795 Fillet Head. Head in center of obverse, 6 berries on laurel branch. VF. \$4.00.

1796 Small close date, highest curl on head under upright of E in LIBERTY, small letters on reverse. EF. \$5.00.

1796 Small wide date, highest curl under space between B and E. VF. \$3.25.

1796 Small medium spaced date. Curl under upright of E. Large letters on reverse. VF, rare. \$4.00.

1796 Same dies as preceding. VF. \$3.20.

1796 Large Date, small letters on reverse. Fine. \$3.00.

1797 Seven Stars Facing. AU, only faintest marks show. Sharp, beautiful impression with mint lustre. \$13.00.

1797 Same dies as preceding. VF, mint lustre. \$5.00.

1797 Seven Stars Facing. Additional curl on top of head. VG. \$3.00.

1797 Same dies as preceding. Good. \$2.25.

1797 Six Stars Facing. EF. \$5.25.

1797 Same dies as preceding. VG. \$2.80.

1798 13 Stars. Small Eagle. EF, only faintest marks of circulation, mint lustre. \$7.25.

1798 VG. \$2.80.

1798 15 Stars. Small Eagle. Fine. \$3.75.

1798 Same dies as preceding. Good. \$2.40.

1798 Heraldic Eagle, very close date near bust. Fine. \$2.00.

1798 Close, uneven date. EF, mint lustre. \$3.50.

1798 Close Date, evenly spaced. Fine. \$2.20.

1798 VF. \$2.25.

1798 Wide Date, 8 touches bust. VF. \$2.25.

1798 Wide Date placed low. Fine. \$2.10.

1799/8 13 stars and portion of two other stars show over eagle on reverse. Unc., mint lustre. \$4.00.

1799/8 Good. \$2.00.

1799 Five Stars Facing. EF. \$4.00.

1799 Date placed high, light die breaks through obverse, very broad planchet. AU, mint lustre. \$3.10.

1799 Even date, light die breaks through reverse. AU, mint lustre. \$2.50.

1799 Last 9 low. EF, mint lustre. \$2.50.

1799 Last 9 high, light die cracks through obverse. EF, mint lustre. \$2.50.

1800 Small curl at top of head, die break resembling an I after word AMERICA. AU, mint lustre with Proof surface. \$3.00.

1800 Similar dies without break after AMERICA. VG. \$2.00.

1800 00 in date high. VG. \$2.00.

1800 Dotted Date. Good. \$2.00.

1801 Lower point of eagle's beak touches star. EF, mint lustre. \$4.25.

1801 Outside part of eagle's beak touches star. VF. \$4.25.

1802/1 Wide Date, 8 distant from 0. VG. \$2.00.

1802 Perfect Date. T in LIBERTY defective. EF, mint lustre. \$3.05.

1802 Same dies as preceding. EF, mint lustre. \$3.25.

1803 Wide Date, small 3, star very close to Y in LIBERTY. VF. \$2.90.

1803 Close Date, small 3, very close to bust. VF. \$3.00.

1803 Wide Date, large 3. EF, only faintest marks of circulation, mint lustre with Proof surface. \$6.00.

1803 EF. \$4.00.

In the **August 1915** issue of *The Numismatist*, **S. Hudson Chapman** advertised the following early silver dollars. By this time (since 1906) he and his brother Henry were operating their own businesses independently.

- 1794 VG, nicks on edge \$75.00.
- 1794 Fine \$95.00.
- 1795 Flowing Hair, Good \$1.50, VG \$2.00.
- 1795 Flowing Hair, VF \$5.00, Unc. \$20.00.
- 1795 Bust Right, EF \$8.00, VF \$5.00, VF with lustre \$8.00.
- 1796 Small Date, Large Letters, VF \$5.00.
- 1797 Six Stars Facing, Fine \$4.00, EF \$10.00.
- 1797 Seven Stars Facing, Fine \$4.00, VF \$6.00.
- 1798 13 Stars. Reverse with Small Eagle. Fine \$6.00.
- 1798 Fair \$1.50, VG \$2.00.
- 1799 VG \$1.50.
- 1799 Small Stars, EF \$4.00.
- 1799 Five Stars Facing, VG \$3.00.
- 1800 VG \$2.00, Fine \$2.50.
- 1801 VF \$3.50.
- 1802/1 Unc. \$10.00.
- 1802 Fine \$2.50, Unc. \$8.00.
- 1803 Large 3. EF, mint lustre \$7.00.
- 1803 Small 3. Fine \$2.50, VF \$7.75.

B. Max Mehl's sale of the Moore and Quade Collections, November 23, 1915, offered a selection of early dollars, skimpily described as to major types.

- 1794 Strictly Good for the coin. \$65.00.
- 1795 VF and sharp. \$4.10.
- 1795 VG, nearly Fine. \$3.00.
- 1795 VG. \$2.50.
- 1795 VG. \$2.95.
- 1795 Nearly Fine. \$3.05.
- 1796 Nearly Fine. \$3.15.
- 1796 Two nicks on obverse, otherwise VG. \$3.00.
- 1796 VG. \$2.75.
- 1797 VG, nearly Fine. \$2.80.
- 1797 VG. \$3.65.
- 1798 Fine. \$3.50.
- 1798 VG. \$2.20.
- 1798 VG. \$3.75.
- 1798 VG. \$2.75.
- 1798 Good, nick on edge. \$2.20.
- 1798 Good, but considerably nicked on reverse. \$2.00.
- 1799/8 VG, nearly Fine. \$2.20.
- 1799 VF, sharp. \$3.00.
- 1799 Nearly Fine. \$2.20.
- 1799 VG. \$2.20.
- 1799 VG, but lightly scratched on obverse. \$3.00.
- 1800 Almost Unc., sharp with considerable mint bloom. \$3.00.
- 1800 Fine. \$2.20.
- 1800 VG. \$2.20.

- 1801 VG. \$3.60.
- 1800 VG, light scratches on obverse. \$2.50.
- 1800 AMERICA! VF, some mint lustre. \$2.60.
- 1801 Strictly Fine. sharp. \$2.75.
- 1801 VG, light scratch on neck. \$2.75.
- 1802 VF. \$2.80.
- 1802 VG. \$2.75.
- 1803 About Fine. \$4.00.
- 1803 VG. \$3.00.
- 1803 VG. \$2.25.
- 1803 VG. \$2.25.
- 1803 About Fine. \$4.20.

B. Max Mehl's Sale of the Griffith Collection, February 29, 1916, included a rare 1794, an Uncirculated 1795 of unknown design type, a 1796 in AU grade (also not described as to variety), and several other high-grade pieces.

1794 Liberty Head. Left portion not struck up, which is as usual for this coin, but otherwise strictly Fine for the piece. Extremely rare; far above the average. \$120.00.

1795 Type of 1794. On reverse, a few light file marks. Nearly Unc., sharp with mint lustre. \$8.50.

1795 Unc., brilliant mint lustre. \$17.50.

1795 VG. \$3.50.

1795 VG. \$3.00.

1795 VG. \$3.50.

1796 Practically Unc., sharp and showing only the slightest abrasion. Perfectly centered. \$13.00.

1796 VG. \$3.50.

1797 Unc., even impression and for this date unusually bold. \$15.50.

1798 About Fine. \$4.00.

1798 Planchet file marks on reverse, and small dent on obverse edge. \$4.00.

1798 Unc., bold impression, and considerable mint lustre. \$4.15.

1798 VG. \$2.50.

1799/8 Practically Unc., milling a trifle off. \$5.50.

1799 Perfect date and perfectly centered. VG, rather bold impression. \$3.50.

1800 Perfect die. Fine, bold stars. \$3.40.

1801 VG. \$4.50.

1802/1 Practically Unc. with bright mint lustre. An unusually bold and perfectly centered specimen. \$9.50.

1802 Perfect Date. VG. \$3.00.

1803 Small 3. About Fine. \$3.00.

1803 Large 3. Fine. \$3.50.

Henry Chapman's sale of the Clarence S. Bement Collection, May 29, 1916. Bement, best known for his large cents (sold in 1923), consigned the following early silver dollars to the present Chapman sale.

1795 Head in center, lower curl cuts through first star, small bar just inside fourth star. Rev. Two leaves under each wing; 9 berries and 22 leaves on left branch; 10 berries and 22 leaves on right branch. Unc. Mint lustre. Perfect, even, sharp impression. \$67.00.

1795 Draped Bust of Liberty in left of field. Rev. Small eagle on clouds in wreath. Unc., the slightest microscopic abrasion. Mint lustre. Sharp, even brilliant impression. \$65.00.

1797 Six stars before bust, 10 behind it. Unc. Beautiful specimen with mint lustre. Very faint hair mark in field. Minute dent on reverse edge. \$20.00.

1798 15 stars. Rev. Small eagle on clouds. VF. \$33.00.

1799 Six stars before bust, low 99. Unc., the slightest abrasion in field. Very slight depression in milling over BE. Small stars. \$5.50.

1799 Six stars before bust, high 99. EF. Sharp, even impression. \$3.75.

1802 Perfect Date. Unc., the slightest abrasion. Sharp, even impression. Mint lustre. \$8.10.

Henry Chapman's sale of the Daniel Houpt, Van Buskirk & Bruce Collections, March 14-15, 1917, offered a selection of early dollars, mostly in lower grades.

1795 Head of Liberty. Rev., two leaves under wing. VG. \$3.00.

1795 Tall Head. Rev., two leaves under each wing. Fine. Slight edge dents. \$3.75.

1795 Head in center, curl touches first star. Rev., as last. VG. \$2.60.

1795 Head low, curl above space between points first star. Rev., three leaves. VG. \$3.00.

1795 Bust, draped, hair tied by a fillet. VF. \$5.25.

1795 Bust as last. VG. \$2.75.

1796 Large Date. Rev., small letters, die broken at I. Fine. \$4.50.

1796 Small Date. Rev., large letters. VG. \$3.00.

1796 Large Date. Rev., small letters. Good. \$2.50.

1797 Seven stars before bust. Rev., large letters. VG. \$3.20.

1797 Seven Stars before bust. Rev., large letters. VG. \$3.50.

1797 Six Stars Facing. Pin scratch on throat. VG. \$2.60.

1798 13 stars. Rev., small eagle in wreath. VG. \$2.50.

1798 13 stars. Rev., large eagle, stars above head. Good. \$2.00.

1798 15 stars. Rev., small eagle in wreath. VG. \$3.50.

1799 Five Stars Facing. VG. \$2.70.

1799 Six Stars Facing. VG. Berries on stem. \$1.95.

1800 Die broken or rusted at 0 in date. VF. \$2.50.

1800 VG and Good (nick on edge). (Total: 2 pieces). \$1.85 each.

1800 VG. Half inch filed on reverse edge. \$1.60.

1801 VG. \$2.60.

1801 VG. \$2.60.

1802/1 VG. \$2.20.

1802/1 Good. Bad nicks on edge. \$2.10.

1802/1 VG. \$2.10.

1802 Perfect Date. VG. \$2.00.

1802 Perfect Date. Good. Name pin-scratched in field of obverse. \$1.25.

1803 Large 3. VG. Edge nicks, one in field. \$3.10.

1803 Large 3. VG. \$2.30.

1803 Small 3. VG. \$3.10.

Thomas L. Elder's sale of April 13-14, 1917, contained these early dollars.

1795 Fillet. Unc., Proof surfaces. \$5.00.

1796 EF and sharp. \$14.00.

1797 VF. \$8.50.

1799/8 Choice About Unc. \$11.00.

1799 Sharp, Unc., with brilliant Proof surface. \$15.00.

1799 Almost Unc. \$4.50.

1799 VF. \$3.70.

1800 Fine. \$3.25.

1800 Almost Unc. \$6.75.

1801 Sharp impression. Unc., bright. \$18.00.

1802 Fine. \$2.75.

1802 EF, strong impression. \$4.00.

1803 Unc., some Proof surface. \$12.00.

Thomas L. Elder's sale of January 25-26, 1918 included the following early silver dollars. Elder was a man of quick decisions and speed. It is said that on occasion he could catalogue 1,000 auction lots in a single day! (Of course, the descriptions would not win any literary awards.)

1794 VG. \$60.00.

1795 Head of '94. Two leaves below wing, 19 berries [no grade given] \$3.50.

1795 EF. Some lustre. \$5.25.

1795 Fillet, in center of flan. EF. Proof surface. \$4.50.

1795 Flowing Hair. Slightly scratched on head, otherwise about Unc. Still very choice. \$4.

1795 Fillet. EF, choice. \$3.25.

1796 Fine. \$3.25.

1796 VF. \$3.60.

1797 Unc., bright mint lustre. \$12.00.

1797 Fine. \$3.25.

1798 VG, approaching Fine. \$3.10.

1798 Fine to VF. \$2.75.

1799 Almost Unc. \$3.10.

1799 AU. Reverse entirely so. \$4.50.

1799 Fine. \$2.25.

1800 Almost Unc. \$3.50.

1800 VG. \$1.90.

1801 Brilliant mint lustre. \$13.00.

1802/1 EF. \$2.90.

1802 VG, about Fine. \$2.50.

1803 Almost Unc. \$3.50.

1803 Fine. \$2.50.

The H.O. Granberg Collection sold by B. Max Mehl July 16, 1919, included an outstanding collection of early silver dollars, many of which were in higher grades. Particularly notable is a complete set of 1801-2-3 Proof novodel "restrikes."

1794 Weakly struck on left hand side, as usual. Good to VG. \$41.00.

1795 EF, nearly Unc., sharp with mint lustre. \$7.35.

1795 Beautiful semi-proof, almost equal to a brilliant Proof. \$16.00.

1795 Slightest touch of circulation, sharp with mint lustre. \$5.00.

1795 EF, considerable mint lustre. \$7.00.

1795 Proof. A pinpoint nick on reverse edge. \$21.00.

1795 Fillet Head. Unc., sharp, with brilliant mint bloom, slight purple surface. A magnificent coin. \$16.00.

1795 VG. (Total: 2 pieces) \$2.60 each.

1796 VF, considerable mint lustre. \$4.25.

1797 AU, with bright mint lustre. \$4.65.

1798 Unc., bright mint lustre. \$8.40.

1798 Unc., mint lustre. \$8.40.

1798 Beautiful sharp Unc. specimen. \$9.25.

1798 EF, nearly Unc., mint lustre. \$3.60.

1798 VF, sharp. \$3.60.

1799/8 VF, sharp. \$4.20.

1799 EF, sharp, with considerable mint lustre. \$11.50.

1799 Unc., broad milled borders on reverse. \$10.25.

1799 Unc. Sharp with brilliant mint lustre. \$10.25.

1800 Unc., perfectly centered. Sharp. Bright mint lustre. \$8.40.

1800 EF, nearly Unc. with bright mint lustre. \$4.00.

1800 EF, a trifle off center on obverse. \$3.60.

1801 Practically Unc., sharp. Fine, hardly noticeable pinpoint nicks on obverse. \$5.00.

1801 Restrike. Perfect brilliant Proof. \$42.00.

1802/1 EF, bold impression. Considerable mint lustre. \$4.35.

1802 Unc., frosty mint surface, perfectly centered. \$6.25.

1802 Restrike. Beautiful brilliant Proof. \$42.00.

1803 Small 3 in date. AU, some mint lustre, fine impression. \$4.00.

1803 EF, sharp, stars on left just a trifle flat. \$3.75.

1803 Restrike. Beautiful perfect brilliant Proof. \$38.25.

B. Max Mehl's sale of the Hon. James H. Manning Collection, May 17, 1921, included many coins, the most famous of which was the 1804 silver dollar described below. In general, all 1804 dollars auctioned during the twentieth century were accompanied by lengthy catalogue descriptions, most of which are abbreviated in the present book.

This particular 1804 dollar consigned by the widow of Judge Manning later got Mehl in trouble with the United States Post Office. In his nationwide

advertising he showed a sketch of a movie theatre teller in a ticket booth, with a caption stating that he had paid Mrs. Manning an enormous sum of money for a rare dollar, with the implication that she had found it in change! This the Post Office considered to be misleading advertising, and for good reason.

Despite Mehl's hopes, neither this nor the Ten Eyck 1804 dollar he sold in the following year brought prices up to expectations. America was in the midst of an economic downturn, and the prices of rarities felt the effect.

1804 King of American coins. . . . The condition of this specimen is VG to About Fine. There are few light nicks as are usually found on coins having been in circulation. This is the only genuine 1804 dollar that shows evidence of having actually been in circulation. Weight 410-1/4 grains. I absolutely guarantee it to be genuine and original.

The history and record of the previous owners of this specimen is as follows:

The first owner of record of this dollar was Colonel M.I. Cohen of Baltimore, Md. . . . In October 1875, Colonel Cohen sold his collection at auction through the famous dealer, Edward Cogan, who catalogued this dollar as follows:

"1804 This extremely rare dollar was procured from Richmond, Virginia, where it was known to Colonel Cohen to exist for many years before it came into his possession. It has been more circulated than either of the two previously sold at auction, and has every appearance of having been struck in the year of its date, and is guaranteed to be original."

It was purchased at this sale by Mr. H.S. Adams, whose collection was sold at auction in New York in October of the following year, 1876. In the catalogue of that sale the dollar was described as follows:

"This exceedingly rare dollar was purchased by Mr. Adams at the sale of Colonel Cohen's collection in October last. The impression is not so fine as of the two that have been sold some years previous, but warranted original."

The purchaser this time was Mr. Parmelee, the famous collector of Boston.

Two years later, in 1878, Mr. Parmelee sold the specimen at private sale to Major W.B. Wetmore, who retained the coin for 28 years—till 1906, when, in June of that year his collection was sold at auction by S.H. & H. Chapman, and this dollar was bought in by the cataloguers. The present owner, Mr. James H. Manning, obtained it soon after.

After obtaining this famous coin, Mr. Manning wrote direct to its immediate former owner, Major Wetmore, for additional information regarding the history, etc., of this dollar. Major Wetmore replied with the following most interesting letter:

Allenhurst, N.Y., Aug. 9, 1906.

Mr. James H. Manning,
Albany, N.Y.

Dear Sir:

I have been delayed in answering your letter of July 17, as I have been away and besides the Chapmans had my own

memorandums and catalog to make up theirs and have only just received them back. You state that you have every reason to believe that your 1804 dollar "is one of the original six." I believe it is the only original and the others are restrikes. Of course the persons who have restrikes like to think they all are; to let no one have any advantage.

When my set of double eagles was complete except 1849, of which there is only one, a Proof, in the Philadelphia Mint and none were struck until 1850, and this 1804 never being out of the mint or struck for circulation, it was a great pleasure to me to persuade myself that this piece was a pattern or only struck to show what the issue was to be. Without this persuasion my set would be incomplete. Mr. Parmelee, from whom I bought the 1804, had a beautiful restrike. . . . His pieces were superb. Naturally this 1804 having been in circulation marred somewhat his set. He did not want both and hesitated sometime which he would part with, but finally beauty prevailed and I got your piece. I learned afterwards that he much regretted its loss, as if there is one original, this one is the only one. This remark has been made to me by numerous collectors and dealers. From my own catalogue made by myself when I bought this piece I copy the following.

1804—"The rarest piece of the American series, only four or five originals known. (This was written in 1878 with my knowledge at the time.) This piece is considered by all collectors as having the finest history of any of this date and of undoubted originality, having been once in circulation and afterwards known to Col. Cohen long before the rarity of this date was known or there was any demand for them."

Now, there are a number of theories of why there are no 1804s. One is that 20,000 were struck to pay the Navy in the Mediterranean and the vessels sunk, etc. The Mint reports a coinage, yet none or only one may have been struck, as can be seen, as the fiscal year relating to coinage being different by six months from the calendar year. For instance take two consecutive years and see what may happen. We start with the fiscal year June 1, 1903. From June 1, 1903, to Jan. 1, 1904, are struck 100,000 pieces. They bear the date of calendar year, 1903. From Jan. 1, 1904, to June 1, 1904, none are struck, yet for calendar year June 1, 1903, to June 1, 1904, 100,000 pieces were struck, yet none would bear date of 1904. Now for the next fiscal year commencing June 1, 1904, from June 1, 1904, to January 1, 1905, no pieces are struck. The latter part of the fiscal year, viz: Jan. 1 to June 1, 1905, will record 100,000 pieces struck. Here we have two consecutive fiscal years reported as struck by the Mint 200,000 pieces and not one having the date of 1904.¹ Now could not some accident like this have happened to the 1804 dollars, and one, possibly only a few were struck with that date, and as you see from the above there could be no record of them, as the fiscal year reports do not give the dates of the pieces.

(Signed) W.B. Wetmore

Mr. Manning, in commenting on the above letter from Major Wetmore, writes me as follows:

"The subject of the 1804 dollar is naturally very dear to my heart and mind, and I have studied it with considerable care

for a long period. When I was with the United States Assay Commission I endeavored to find some record in the Mint at Philadelphia concerning the 'king dollar' but was unable to glean any material which I did not possess.

"While I have been willing to accept the general theory that there are six original specimens of the dollar, I am also strongly of the opinion that the Cohen dollar, which was in circulation before being purchased by Col. Cohen, is the only original specimen. My views are substantially backed by those of Major W.B. Wetmore, who was justly considered an authority on coins and his selection of specimens in his collection showed good judgment and rare knowledge in a line of endeavor that was very dear to him."

It is interesting to note, according to the mint report as published in the Dickeson *Numismatic Manual*, there were 321 silver dollars coined in the year 1805. The same report also mentions that over 150,000 half dollars were coined in 1804, whereas we all know that no dollars of 1805 are known nor half dollars of 1804. So much for the mint reports as regards their relations to the dates on the coins.

The first published mention of the 1804 dollar was made by Eckfeldt & DuBois, Assayers of the U.S. Mint at Philadelphia, in their *Manual of Coins*, in 1842.

In 1843, Matthew A. Stickney, famous collector of Boston, obtained a specimen of this dollar and his opinion regarding it, there is a paragraph which is of great interest and importance in establishing beyond a doubt not only that the dollar of 1804 is contemporaneous but what is most important in this case, that he mentions the fact that Messrs. Eckfeldt & DuBois did not know of Col. Cohen and his 1804 dollar at the time they published their book, in 1842.

Here is the paragraph from the Stickney letter of 1867 as published in the sale catalog of his collection:

"As regards the authenticity of other specimens of the U.S. dollar of 1804, I have no knowledge. Those having dollars of that date (Cohen and Mickley) were not then known at the Mint as collectors, as appears by the list of which I send you a copy, then obtained, 1843, from Mr. DuBois, which remains, in his handwriting, in my possession. . . ."

From Major Wetmore's letter, expressing as he does his mature opinion based on the careful study of the facts and history of the 1804 dollar extending over a period of more than a quarter of a century, and the information gleaned from the letter written by Mr. Stickney more than 50 years ago, places this specimen, to my mind, as the most authenticated and historical specimen of his famous coin.

Have received a number of inquiries as to what I thought this 1804 dollar would now bring. Of course, it is a difficult matter to say just what any coin may bring at auction, but judging from past records, the last specimen of the 1804 dollar offered in this country brought \$3,600.00. This was some 15 years ago. Considering the trend of prices for all rarities, and especially so in this case, considering the history and value of this specimen, it is my opinion that it should by far exceed its highest record. \$2,500.00.

¹ Q.D.B. note: This explanation of fiscal years vs. calendar years is not valid for 1804, for at the time, and continuing until the changeover in 1857, the Mint's fiscal and calendar years were concurrent.

B. Max Mehl's sale of the Langfelder & Jaedicke Collections, November 22, 1921. Offered was a selection of early silver dollars.

1795 Head type. Point of bust and curl distant from stars. Reverse, three leaves under wings. VF, sharp, with some lustre. Scarce and in demand. \$5.50.

1795 Bust type. Fine to VF. \$5.50.

1796 Large Date. Reverse, small letters. VF, but light nicks on obverse. \$6.00.

1796 Small Date and small letters. Rare combination. Strictly Fine. \$5.10.

1796 Small Date and large letters. Good to VG. \$6.00.

1797 16 Stars. Nearly Fine, well struck. \$4.75.

1797 16 Stars, but with six stars on right and 10 on left. Good. \$5.75.

1798 Rare variety with small eagle on reverse, 15 stars. VG obverse and Good reverse. \$7.00.

1798 Obverse as last but with 13 stars. Reverse, heraldic eagle. VG. \$3.50.

1799/8 About Fine. \$3.75.

1799 Six Stars Facing. EF, with some lustre. \$4.00.

1799 High Date, die break on reverse connecting olive branch with edge. VF, sharp. \$4.20.

1800 Perfect Die. VG. \$2.90.

1801 About Fine, sharp. \$4.90.

1802/1 EF, with considerable bright mint lustre. Only highest portions show slight wear. \$5.00.

1802 Perfect Date. Strictly Fine. \$3.30.

1803 Large 3 in date. EF, with some lustre. A fine strong impression. \$5.00.

1803 Large 3. Obverse Good, reverse Very Fair. \$2.50.

B. Max Mehl's sale of the James Ten Eyck Collection, May 2, 1922, included many notable early dollars highlighted by an 1804.

1794 Fine to VF for coin. Three small nicks on reverse edge. While the coin, as usual, is not struck very bold but on this specimen every star and date is well struck and nearly perfectly centered. By far above the average of this extremely rare coin. \$94.50.

1795 Obverse similar to last, reverse three leaves under eagle's wing. Variety with stars distant from point of bust and last curl. Unc., with beautiful mint lustre. \$26.00.

1795 Type as last, head as on 1794, two leaves under wings. VG. Scarce. \$6.30.

1796 Draped bust of Liberty to right, . . . Reverse, small eagle on clouds within wreath. . . . Variety with large date and small letters. EF, with some mint lustre. Rare and valuable so choice. \$10.50.

1797 Six stars on right, ten stars on left. Reverse, large letters. About Fine. \$6.00.

1797 Seven stars on right, nine stars on left. Reverse, large letters. Fine, sharp. Very scarce. \$6.50.

1798 Type as last, with small eagle. Obverse, with seven stars to right and eight to left. Reverse, small letters in legend. Date small and widely spaced. About Fine. Rare. \$6.75.

1798 Obverse, six stars to right and seven to left, date large

and close. Reverse, small eagle, large letters in legend. Strictly Fine. \$8.00.

1798 Obverse as last. Reverse, heraldic eagle. . . . Edge lettered as last. Variety with 8 of date high. Fine. \$4.50.

1799/8 The so-called 15 Stars variety on reverse, the clouds touching wings are much larger than the others on the dollars of this type, parts of stars showing from beneath. EF, sharp, frosty mint lustre. Rare so choice. \$5.70.

1799 Perfect Date. Variety with five stars on right and eight on left. Fine. Very scarce. \$4.50.

1800 Perfect Die on obverse; reverse, die break making the legend read AMERICA. VF. Scarce. \$5.00.

1801 Small planchet defect on obverse edge. VF. Very scarce. \$5.25.

1802/1 Practically Unc., with mint lustre, reverse, almost brilliant. Rare so choice. \$10.50.

1803 Small 3 in date, uneven stars on reverse, some large and some small. EF, nearly Unc., with mint lustre. Rare so choice. \$6.30.

1804 Dollar. . . . Proof; nearly full brilliancy. Excessively rare and valuable. At one time it was claimed that twelve or thirteen original 1804 dollars were known. In the list of these coins, published some twenty years ago, in *American Journal of Numismatics*, the Ten Eyck specimen was listed among them. However, after careful comparisons and study of these famous coins, we find that while they are all of the same obverse die, there are two distinct different reverse dies. On the original specimens, or those claimed to be original and struck in 1804, the words STATES OF on reverse are evenly spaced between the eagle's wings, while on the second variety, the spacing is uneven, there being quite a bit more space between the last S in STATES and O in OF. This last variety is what is now known or termed as the Restrike—struck at the United States Mint in Philadelphia, from the original 1804 obverse die, but at a later date than 1804. The specimen here offered is of the second variety, but its rarity, considering the number known, is very high, as only three or four of this variety are known outside of museums.

The specimen here offered appears to be of the identical die as the Lyman, Rosenberg [*sic*; Rosenthal intended] and Idler specimens. The Lyman specimen was sold in 1913, (bringing \$340.00), but the Ten Eyck specimen is of an earlier impression and is much stronger, with all stars on obverse and reverse well struck up, perfectly centered and in Proof condition. Besides the Lyman specimen, I can find no record of another having been offered at auction.

Mr. Ten Eyck purchased this coin about forty years ago. It was formerly owned by Dr. Henry R. Linderman, who was director of the Mints and Assay Offices of the United States from 1873 to 1875, and a great authority on coinage and assay.

With this coin is an affidavit executed by Emily Linderman, which reads as follows:

"State of Pennsylvania

"Monroe County. SS.

"Personally appeared before me a Justice of the Peace in and for said County of Monroe, Emily Linderman, widow of the late Dr. Henry R. Linderman, director of the Mint, who being duly sworn according to law deposes and says, 'that the

said Dr. Linderman told deponent that he had obtained the 1804 Dollar in his collection, that it was an original, that it was of great rarity, there only having been twelve or fourteen struck, that it was one of the finest, if not the finest specimen in existence, that he had paid for it in installments, not feeling able to pay for it all at one time.' He then showed the specimen to deponent afterward locking it in his office safe with his collection.

"(Signed) Emily Linderman.

"Sworn and subscribed before me this first day of July A.D. 1887.

"Charles W. Holbrook,

"Justice of the Peace"

An interesting episode in regard to the question of rarity of this variety of the 1804 dollar, is the fact that the Idler specimen, which is of the identical variety as this specimen, is claimed by Mr. Haseltine, the veteran numismatist, to be an absolutely genuine specimen struck in 1804. However, with all the facts before me and a careful comparison of the different dies, I am of the opinion that the specimen here offered is of the so-called Restrike—from the original 1804 obverse die, the same as the Lyman, Idler, and Rosenberg specimens. As there are only but five or six known in all, and of these, I believe, this is the only remaining one that is "purchasable," I consider it of great rarity and high value; worthy of a home in the most extensive and prominent collections of American coins. \$840.00.

B. Max Mehl's sale of the E.E. Wright Collection, March 10, 1925. This cabinet offered a particularly extensive group of early dollars, most of which were attributed to Haseltine numbers.

1795 Head type. Haseltine No. 1. VF. \$10.00.

1795 Type as last, H-2. About Fine. Scarce variety. \$7.00.

1795 Head type. H-3. Fine. Rare variety. \$5.75.

1795 Head type. H-4. VG. \$7.00.

1795 Type as last. H-5. VF and sharp. \$5.25.

1795 Head type. H-6. Fine to VF, sharp; pin-point nick at third star on left. Very scarce. \$5.00.

1795 Head type. H-12. Obv., VG, slightly chafed. Rev., VG to Fine. Haseltine classifies this variety as an "excessively rare variety." Seldom offered. \$5.00.

1795 Head type. Three leaves under wings. Fine obverse with VF reverse. Scarce and in demand. \$6.00.

1795 Bust type. H-14. Fine. \$5.00.

1795 Bust type. H-15. Fine. \$6.10.

1795 As last, but reverse double struck. Fine. Rare. I do not recollect of ever having offered another. \$5.25.

1795 Bust type. VF, but lightly nicked. Scarce. \$6.50.

1796 H-1. VG. Rare variety. \$8.40.

1796 H-2. Same as last. Strictly Fine; sharp. Rare, especially so choice. \$10.50.

1796 H-4. Fine. \$9.00.

1796 Small Date and large letters. VG. Getting rare. \$7.00.

1796 H-5. VF; sharp, especially the reverse, traces of original lustre. A difficult and rare date to find choice and as such, quite rare and valuable. Said to have cost over \$15.00. \$9.50.

1797 H-1. VG. Rare, more so than is generally known. \$7.75.

1797 H-2. Obv. VG; rev., Good. Weakly struck as are all of this variety. Haseltine described this variety, over 45 years ago, as a "very rare variety." \$6.50.

1798 H-1. Small Eagle reverse; 13 stars; close date. Fine to VF. An unusually choice specimen for this variety. Seldom equaled. Rare. (Cost \$15.00.) \$8.00.

1798 H-2. Small Eagle reverse; 15 stars; cracked die, from chin to edge. Obv., VF; rev., Fine for coin. Seldom equaled. Rare and valuable. \$12.75.

1798 As last but with perfect die obverse. About Fine for coin. \$11.00.

1798 Heraldic Eagle, as are all of the following. H-3. VG, nearly Fine. Rare variety. \$12.50.

1798 H-8. Good, nearly Fine. Rare. \$4.00.

1798 H-9. VG, Good impression. Rare variety. \$5.25.

1798 H-11. VG, nearly Fine. Rare die variety. \$5.25.

1798 H-12. Stars on reverse, on left, are weakly struck. Otherwise Fine. Very scarce variety. \$5.00.

1798 H-25. Fine to VF. Very scarce. \$5.00.

1798 The rare type with small eagle on reverse; 13 Stars. VF. Quite a rarity in this choice condition. Valued at \$15.00 to \$20.00. \$16.25.

1798 Heraldic Eagle; close date. Fine; struck off center, giving it a very wide border on left. \$5.00.

1799/8 Fine, sharp; stars on reverse small and evenly spaced; clouds nearly covering stars on either side. Fine. Scarce variety. \$5.00.

1799 Five Stars to right. VG; reverse, about Fine. Scarce, more so than is generally recognized by collectors. \$5.00.

1799 Six Stars to right, no berries on olive branch. Small planchet defect at third star on right. Fine. Very scarce. \$3.60.

1799 Six stars. Rev., 5 berries. VG. \$4.00.

1799 Perfect Date. Six stars facing; variety with die break on reverse. Nearly Fine. \$4.50.

1800 H-11. Fine to VF. Scarce. \$3.80.

1800 H-18. Barely circulated, only highest portion shows slight evidence of circulation. A frosty mint lustre. A similar specimen in Haseltine brought over \$7.00 over 40 years ago. Comparing the condition and scarcity with equal specimens of large cents, this dollar should bring a correspondingly good price. \$8.80.

1800 Date high, stars close. Rev., die break making the legend read AMERICA. VG. Scarce. \$5.00.

1801 H-1. Fine. Scarce. \$5.00.

1801 H-2. VF, sharp. Rare. \$5.50.

1801 H-3. VG. Scarce. \$5.50.

1801 H-4. VG. Scarce. \$5.25.

1802/1 H-3. Very plain overdate. About Fine. Scarce. \$5.00.

1802/1 H-4. VG. \$3.25.

1802/1 Small dent above Liberty head. VG. \$3.50.

1802 Perfect Date. H-5. VF, sharp. Rare variety, especially so choice. \$5.25.

1802 Perfect Close Date. H-6. Good to VG. \$3.65.

1803 H-1. Small 3 in date. VG. Rare. \$4.00.

1803 H-5. Obv., About Fine. Rev., VG. Rare variety. \$4.60.

1803 Large 3. H-6. Fine. Scarce. \$5.00.

1803 Large 3 in date. VG. \$3.50.

In the **September 1928** issue of *The Numismatist*, **John Zug**, of Bowie, Maryland, advertised these early dollars. Zug, relatively unknown to current numismatic historians—for he did not memorialize his trade by issuing catalogues—maintained one of the largest inventories of silver dollars of any professional.

- 1795 Flowing Hair, 2 leaves. VF \$10.00, Fine \$7.50.
- 1795 Flowing Hair, 3 leaves, Fine \$7.50, VF \$10.00.
- 1795 Fillet Head, EF \$12.50; VF \$10.00.
- 1796 Small Date, large letters, EF \$15.00; Fine \$10.00.
- 1796 Large Date, small letters, Fine \$10.00.
- 1796 Small Date, small letters, Fine \$15.00.
- 1797 Six Stars Facing, Fine \$8.50.
- 1797 Seven Stars Facing, EF \$17.50; VF \$12.50.
- 1798 Small Eagle, 13 Stars, VF \$15.00.
- 1798 Large Eagle, knobbed 9, EF \$10.00; Fine \$5.00.
- 1798 Large Eagle, plain 9, EF \$10.00; Fine \$5.00.
- 1798 Large Eagle, wide date, EF \$10.00; Fine \$5.00.
- 1799/8 Six Stars Facing, EF \$12.50; VF \$8.50.
- 1799 Five Stars Facing, Fine \$10.00.
- 1799 Six Stars Facing, five berries, EF \$6.50; Fine \$4.50.
- 1799 Six Stars Facing, no berries, VF \$7.50; Fine \$6.00.
- 1800 Unc. \$15.00; EF \$7.50; VF \$6.00, Fine \$5.00.
- 1800 Dotted Date, Fine \$6.50.
- 1801 VF \$10.00; Fine \$7.50.
- 1802/1 VF \$8.50; Fine \$7.50.
- 1802 Unc. \$15.00; VF \$7.50; Fine \$5.50.
- 1803 Small 3. EF \$12.50; Fine \$7.50.
- 1803 Large 3. Unc. \$15; VF \$7.50; Fine \$5.00.

B. Max Mehl's sale of the Alex J. Rosborough Collection, April 9, 1929. This listing includes a selection of early dollars beginning with the rare 1794.

1794 Obverse, Good to VG; Reverse, VG, and considering the coin, it has some claims to being classed as almost Fine. The left lower portion of the obverse weakly struck as usual, but every star and the date is very plain. A few minor, hardly noticeable light scratches but free from any serious nicks or dents. A most acceptable specimen of this very rare dollar. One of the rarest of the entire series and far more rare than is generally recognized. \$135.00.

1795 Head type; variety with two leaves under eagle's wing on reverse. VG. \$6.00.

1795 Head type, so-called small head; three leaves under wings. Haseltine No. 5. EF, sharp, and with considerable lustre. Very scarce so choice. \$10.00.

1795 Another as last but with slight die break back of head. Small nick on reverse edge. VG. \$6.50.

1795 Head type; curl touches one point of star. H-7. VG. Rare die. \$6.00.

1795 Bust type, H-15. Light nicks on obverse, otherwise about Fine. Scarce. \$5.25.

1796 Large Date, small letters on reverse; die break at IC. Nearly Fine. \$5.75.

1796 Small Date and large letters. Good. Scarce. \$5.50.

1797 Six stars to right of bust. VG. \$5.50.

1797 Seven stars to right of bust. Good. Scarce. \$7.00.

1798 Heraldic Eagle. H-13; knobless 9. Only 10 arrows in eagle's claw. VF, with some lustre. \$7.35.

1798 Heraldic Eagle; wide date, 8 touching bust. Good. \$4.25.

1798 Small Eagle reverse, 13 stars on obverse. Good to VG. Scarce variety. \$7.50.

1798 Small Eagle; 15 stars. VG. Rare. Seldom found better. \$7.75.

1799/8 Fine. \$5.25.

1799 Perfect Date. Without berries on olive branch. EF, with mint lustre. Nearly Unc. Very scarce so choice. \$13.25.

1799 Similar to H-2. Good to VG. \$3.80.

1800 Perfect Die. VF, but nick on obverse. \$4.80.

1801 H-2. 12 arrows in eagle's claw. About Fine. Scarce. \$5.25.

1802/1 VF, sharp; bold impression. Scarce. \$7.35.

1803 Small 3 in date. H-1. About Fine. Very scarce. \$5.00.

1803 Small 3 high. H-5. VG. Rare. \$4.00.

1803 Large 3 in date. EF; sharp, with considerable lustre. Very scarce. \$7.35.

B. Max Mehl's sale of the Foster Lardner and H.N. Walton Collections, June 24, 1930. This collection begins with a genuine 1794 and ends with a fake 1804. In between is a mostly average selection of early dollars, a particularly nice 1795 being an exception.

1794 First year of issue. One of the rarest dollars. A strictly VG specimen, and considering this coin, has considerable claims to being Fine. As usual, the lower left portion of obverse and corresponding side of reverse not struck up as bold as the other portions of the coin. Very light scratches back of head, hardly noticeable, and the letter D very faintly scratched below chin. These defects are hardly noticeable, but only mentioned due to the important rarity of the coin. Worthy of a home in any collection. Extremely rare and valuable. \$136.00.

1795 Head type. Variety with die break back of head. Practically Unc., sharp, with mint lustre. Minute nick below right wing of eagle. Variety with three leaves under wing. Rare so choice. \$15.50.

1795 Another just as last. About Fine. \$6.50.

1795 Bust type. About Good. \$3.50.

1796 Small date and large letters on reverse. Good. \$3.00.

1797 Six stars to right of bust. VG; nearly Fine. \$4.00.

1798 Large Eagle. Wide date, with top of 8 touching bust. VG. \$4.20.

1799 Six stars to right of bust. VG. \$3.00.

1800 So-called Dotted Date variety. About Fine. \$4.50.

1801 Scarce date. Fine. \$6.00.

1802 Perfect Date. Nearly Fine. \$5.25.

1803 Large 3 in date. VF obverse with Fine reverse. Scarce. \$6.00.

1804 (?) A cleverly-altered date. One of the best I have ever seen. VG. \$13.25.

B. Max Mehl's sale of the F.H. Knoop collection, December 8, 1931. This offering is strictly average in quality and includes a damaged 1794.

1794 First year of issue. The usual average specimen, struck weakly on the left obverse and corresponding side of reverse, but all letters and stars visible. Light hairline scratches on obverse and three minor nicks on edge. Unfortunately, the coin is plugged at lower left edge. But the date, the most important feature, is plain, and the coin as a whole can be classed as VG, especially for this rarity. Far more rare than is generally known. While this is not a perfect specimen, it is nevertheless a worthy specimen for the average collector, especially for the collector who does not care to invest \$150.00 to \$200.00 for a single coin. \$41.00.

1795 Head type; variety with three leaves under wings. About Fine, sharp. \$6.30.

1796 Small Date; large letters. VG. Scarce. \$5.00.

1797 Seven stars to right of bust. VG. Scarce date. \$5.00.

1798 The rare variety with small eagle on reverse; 15 stars on obverse. VG. Rare. \$7.40.

1798 Second issue, heraldic eagle on reverse. Good to VG. \$4.20.

1799 Five stars to right of bust. Fine, but slightly rubbed on obverse. Scarce. \$5.80.

1799 Six stars to right of bust. About Fine. \$3.50.

1800 Perfect Die. Obverse lightly scratched, otherwise, Fine. \$4.60.

1800 Perfect Die. Tiny nick on obverse edge. VG. \$4.25.

1801 VG. Scarce date. \$5.00.

1802/1 Good to VG. \$3.70.

1802/1 Good to VG. \$4.75.

1803 Large 3 in date. VG. Scarce. \$3.50.

John Zug advertised these early silver dollars in the **August 1933** issue of *The Numismatist*.

1795 Flowing Hair, 2 leaves, EF \$15.00; VF \$10.00; Fine \$7.50.

1795 Flowing Hair, 3 leaves, EF \$15.00; VF \$10.00; Fine \$7.50.

1795 Fillet Head, Unc. \$25.00; EF \$12.50; VF \$10.00.

1796 Large Date, small letters, VF \$12.50; Fine \$8.50.

1796 Small Date, large letters. EF \$12.50; VF \$10.00.

1796 Small Date, small letters, EF \$22.50; Fine \$10.00.

1797 Six Stars Facing, EF \$15.00; VF \$12.50; Fine \$8.50.

1797 Seven Stars Facing, Unc. \$50.00; EF \$17.50; VF \$12.50.

1798 Small Eagle, 15 Stars, VF \$15.00; Fine \$10.00.

1798 Small Eagle, 13 Stars, Unc. \$50.00; VF \$17.50; Fine \$12.50.

1798 Large Eagle, EF \$8.00; VF \$6.00; Fine \$4.00.

1799/8 EF \$10.00; VF \$8.00; Fine \$6.00.

1799 Five Stars Facing, EF \$12.50; VF \$10.00; Fine \$7.50.

1799 Six Stars Facing, no berries, VF \$7.50; Fine \$5.00.

1799 Six Stars Facing, five berries, Unc. \$15.00; EF \$7.50; Fine \$4.50.

1800 Unc. \$15.00; EF \$10.00; VF \$7.50; Fine \$6.00.

1800 Dotted Date variety, Fine \$7.50.

1800 AMERICA variety, Unc. \$20.00; Fine \$7.50.

1801 Unc. \$35.00; EF \$17.50; VF \$12.50; Fine \$7.50.

1802/1, EF \$10.00; VF \$7.50; Fine \$6.00.

1802 Perfect Date, EF \$10.00; VF \$7.50; Fine \$6.00.

1803 Small 3. EF \$12.50; VF \$8.50; Fine \$6.50.

1803 Large 3. Unc. \$15.00; VF \$7.50; Fine \$6.00.

B. Max Mehl's sale of the Mose Marcuson Collection, October 20, 1935. Despite the national economic depression, the 1794 in this sale, apparently an especially nice strike, brought a strong price. In general, the other coins were in lower grades.

1794 Fine. This rare dollar is seldom found well struck. Every letter and figure is very plain on this coin. It shows the usual evidence of circulation but is free from any serious nicks or dents. Considering the general condition in which this dollar is usually found, it can easily be classed as VF. Very rare. Seldom equaled. \$165.00.

1795 Type similar to last. Variety with curl ending between stars. Reverse, three leaves under wings. VF. Scarce. \$5.50.

1795 Head type. Reverse, two leaves under wings. Fine. \$5.35.

1795 Head type, two leaves under wings. VG; long light scratch on obverse. Scarce. \$5.40.

1795 Type as last. Just Fair. \$1.75.

1795 Bust type. VG. \$5.00.

1795 Another as last. Good. \$3.15.

1795 Bust type. Fine. Scarce. \$4.75.

1796 Small Date. Fine. Scarce. \$7.25.

1796 Large Date; reverse, small letters. Fine. Scarce. \$6.90.

1796 Large Date, small letters. Good, but initials scratched on reverse. Scarce date. \$2.00.

1797 Six stars to right of bust. Fine. Very scarce. \$6.90.

1797 Six stars to right and nine to left of bust. Fine. Scarce. \$4.50.

1797 Seven stars to right of bust. Fine. Scarce. \$6.75.

1797 Another as last and equally as fine. \$4.60.

1797 Another just as last. Strictly Fine. \$5.25.

1797 Variety with seven stars to right and nine to left. Reverse, large letters. Strictly Fine. Scarce. \$4.75.

1797 Another just as last. About Fine. \$4.50.

1797 Obverse as last; reverse, small letters. VG. Very scarce. \$4.10.

1797 Another just as last. Good. Very scarce. \$3.00.

1798 Small Eagle, 15 stars. About Fine. Rare. \$6.25.

1798 Small Eagle variety; 13 stars. Good. Rare type. \$6.00.

1798 Heraldic Eagle. Wide Date. Fine. \$3.80.

1798 Type as last; date close. About Fine. \$3.15.

1798 Heraldic Eagle, wide date, large stars. VG. \$3.00.

1798 Heraldic Eagle variety, close high date. Fine. \$3.50.

1798 Variety with die break at date. Good. \$3.00.

1799/8 About Fine. \$3.00.

1799 Five stars to right of bust. VG. Scarce. \$4.50.

1799 Five Stars Facing. Good. Scarce variety. \$3.75.

1799 Six Stars Facing. Perfect Date. Fine. \$3.05.

1800 Perfect Die. VG. Scarce date. \$3.50.

1800 Perfect Die. About Fine. \$2.75.

1800 So-called Dotted Date. VG. \$2.60.

1800 Die break on reverse, making the legend read AMERICA. VG, but name stamped in small letters back of head. \$2.40.

1800 Perfect Die. About Fine. \$2.75.

1801 Good. Scarce date. \$3.40.

1801 VG. Scarce. \$3.90.

1802/1 VG. \$3.05.

1802/1 VG. \$4.00.

1803 Small 3 in date. Fine. Scarce. \$4.00.

1803 Small 3 in date. VG. Scarce. \$3.60.

1803 Large 3 in date. Fine. \$4.10.

1803 Large 3 in date. VG. \$2.50.

1803 Small and large 3, the latter slight nicks on obverse edge. VG. Scarce pair. (Total: 2 pieces). \$2.75 each.

J.C. Morgenthau & Co.'s sale of the J.C. Lighthouse Collection, February 18-19, 1936. Catalogued by Wayte Raymond and James Macallister, this auction began with the 1794, an obligatory coin for any silver dollar set claiming to be comprehensive. Lighthouse, whose interest in numismatics began in the nineteenth century, formed one of the finest cabinets ever of U.S. coins, a holding particularly rich in gold, including Proofs. His early silver dollars were not particularly memorable, however.

1794 Good. Usual weakness in striking, but all of date shows. Several light dents on obverse and several edge nicks on reverse, but still a better specimen than often obtainable. Very rare. \$86.00.

1795 Head type. EF, only slight evidence of circulation. Three leaves under eagle's wing. \$25.00.

1795 Same type but from different dies. Two leaves on reverse. VF. \$16.00.

1795 Bust type. Head to left of center. Unc. except for a few immaterial edge dents. \$21.00.

1795 Bust type. Bust in center of obverse. EF. \$22.00.

1796 Large Date. VF. \$9.00.

1796 Small Date. EF. \$20.00.

1798 Small Eagle reverse, 15 star variety. VF. \$15.00.

1798 Small Eagle reverse, 13 star variety. Fine. \$9.50.

1798 Large Eagle reverse. Knobby 9. EF. \$12.50.

1798 Large Eagle reverse. Plain 9. EF. \$9.00.

1799/8 Unc. \$21.00.

1799/8 Unc. \$18.50.

1799 Five stars before. VF. \$11.00.

1800 EF. \$11.00.

1801 VF. \$13.00.

1802/1 Unc., beautiful dollar. \$23.00.

1802 Perfect Date. VF. \$7.50.

1803 Large and small dates. VF. (Total: 2 pieces). \$14.50 the pair.

J.C. Morgenthau & Co.'s sale of December 21, 1937. This auction, beginning with a specimen of

the rare 1794, contains some coins in especially high grades.

1794 VF, an unusually good specimen of this rare date. Very rare. \$250.00.

1795 Head similar to 1794. Three Leaf variety on reverse. Unc., superb piece with mint lustre. Rare. \$41.00.

1795 Another type of the Three Leaf variety. Superb Mint State, almost a Proof. Very rare. \$55.00.

1795 Two Leaf variety. Brilliant Mint State. Superb. \$41.00.

1795 Bust type. Sharp Unc. with Br. Proof surface. One of the most beautiful early dollars we have seen. \$60.00.

1796 Large Date. Unc., mint lustre. Very rare condition. \$30.00.

1796 Small Date and letters. Fine. Rare. \$15.00.

1796 Small Date, large letters. EF and sharp. Rare. \$16.00.

1797 Stars 10x6. VF. Scarce. \$15.25.

1797 Stars 9x7. EF and sharp. Scarce. \$17.00.

1798 Small Eagle, 15 Stars. VF. Rare. \$17.50.

1798 Small Eagle, 13 Stars. EF, mint lustre. Very rare condition. \$21.00.

1798 Large Eagle. Unc., very choice. \$10.50.

1799/8 EF. Practically Unc. Rare. \$15.00.

1799 Stars 7x6. Unc. \$12.00.

1799 Stars 8x5. AU, handsome Proof surface. Very rare. \$20.00.

1801 Unc., sharp with mint lustre. Rare. \$26.00.

1802 Unc., very sharp. \$16.00.

1803 Large 3. Unc., prooflike. \$22.50.

1803 Small 3. AU, Proof surface. \$15.50.

1804 Clever alteration. Fine and a good space filler. \$26.50.

James Kelly, October 1940, advertised at fixed prices in *The Numismatist* the following silver dollars under the timely title of "Blitzkrieg of Rarities" (this was when Hitler was devastating much of Europe; a rather tenuous numismatic connection here, however).

1795 Flowing Hair, AU \$25.00.

1795 Bust, Unc. \$35.00.

1796 8x7, Unc. \$35.00.

1797 9x7, Unc. \$40.00.

1798 Unc., Large Eagle \$20.00.

B. Max Mehl's sale of the William Forrester Dunham Collection, June 3, 1941. The collection of W.F. Dunham, a Chicago druggist (who later in life moved to California), was purchased intact by Mehl in 1939. Many coins were sold privately from the collection before the mail bid closing date of June 3, 1941; thus, in all instances the "prices realized" for this event must be taken with a degree of skepticism. Dunham was active for many decades, hitting his stride in the early twentieth century, when he gave

prizes (Proof gold coins) to the person signing up the most new ANA members. The Dunham catalogue was an elaborate production and today ranks as the most desired single piece of generally available Mehl-iana.

1794 There is only one type and variety of this, the first issue of our dollar. Fine to VF. A planchet depression from about the middle of neck to edge. The stars on left not as bold as those on right; the legend on reverse also not as boldly struck on left. Without the planchet mark, the coin would have been at least a \$350.00 specimen. A most acceptable specimen of this rare dollar. Far above the average. Cost \$190.00 about 30 years ago. \$217.50.

1795 Small Head type; star touching bust. Reverse, two leaves under wings. EF with considerable mint lustre. Very rare: The rarest 1795 dollar, and extremely rare in this choice condition [Mehl likes the word "rare" here!]. Originally purchased from Henry Chapman at \$50.00. \$30.00.

1795 Head type. Reverse, three leaves under wings. Magnificent Unc. specimen; sharp and perfect in every respect. A gem, and as such, very rare and valuable. Just about as perfect as the day it dropped from the press. \$67.50.

1795 Second type, bust. Reverse, eagle on clouds. Just a shade from Unc.; highest portions show slight cabinet friction, but with brilliant mint lustre. Said to have cost \$50.00. \$30.00.

1795 Bust type. Variety with bust closer to left; star on right does not touch bust, and star on left has two points touching curl. EF, with considerable lustre; perfectly centered. Very scarce. \$13.50.

1796 Small Date. Reverse, large letters. About Fine. Scarce. \$7.65.

1796 The extremely rare variety with small date and small letters. VF, with considerable mint lustre. Catalogues at \$35.00, but difficult to obtain at this price, especially so choice. \$27.00.

1796 Large Date and small letters. Variety with die break at IC. Fine to VF. \$12.75.

1797 9x7 stars. VF, with some lustre. Very scarce. \$10.00.

1797 10x6 stars. VF, with frosty mint surface. \$15.75.

1798 Variety as last; small eagle on reverse; 13 stars on obverse. Variety with die break through second T in STATES. Strictly VG. Very scarce. \$10.50.

1798 Heraldic Eagle. Small stars on obverse. Date and stars distant and evenly spaced. Reverse, struck off center to left. The edge reads UNI instead of UNIT. Nearly Unc. with mint lustre. A common date but scarce variety and rare condition. \$7.85.

1798 Heraldic Eagle. Date high; star on right close to date. Obverse struck slightly off center to right with raised borders on left. \$7.75.

1799/8 VF, with frosty mint surface. \$8.40.

1799 Perfect Date. VF; sharp, with considerable lustre. Only slight touch of circulation. \$8.50.

1799 The rare variety with five stars to right of bust. VF. Rare, listed at \$15.00. \$9.00.

1799 Perfect Date, six stars to right. Counterstamped with EB in rectangular punchmark in top center of head. The letters, EB are of the identical type as found on the Brasher dou-

bloon. We know that it was the custom of Brasher to stamp all gold coins that passed through his hands. I do not at this moment recall ever having seen a silver coin with his counterstamp. This is the first I have ever seen. After a very careful examination I unhesitatingly say that the counterstamp is contemporaneous. At any rate, it is a most interesting item. The coin is in strictly VG condition. \$10.00.

1800 Perfect Die. Just a shade from Unc. with considerable mint lustre. Rare so choice. Cost \$20.00 over 20 years ago. \$9.60.

1800 Variety with die break on reverse, making the legend read AMERICA. Strictly Fine. \$4.70.

1800 Perfect Die. Variety with stars close to bust and curl. Reverse, legend close to clouds. Just a shade from Unc., with frosty mint surface. Quite rare so choice; in fact far more so than is generally recognized. \$11.10.

1801 Unc., frosty mint surface. Perfectly centered and struck, with every star filled. A rarity in this remarkable condition. Certainly far more rare than an Unc. cent of this year which is worth at least \$50.00. \$21.00.

1802 Perfect Date. VF with some lustre. \$6.25.

1802/1 Very plain overdate. EF, with considerable lustre. Cost over \$10.00 many years ago. \$9.30.

1802 Perfect Date. Struck from the dies of the 1804 dollar, but at a later date. It is the same dies as the "King of American coins." The 2 in the date is entirely different than that of any other 2 of this date dollar. Raised borders. Perfect Brilliant Proof. Just as rare as the second issue or so-called re-strikes of the 1804 dollar of this variety [which sold for] \$840.00 about 19 years ago. Since then a specimen sold at private sale for \$1,500.00. While this date, 1802, is not as desirable as the 1804, but as mentioned before, it is just as rare and should bring well into the three-figure mark. A gem, and of highest interest. \$127.50.

1803 Small 3 in date. Highest portions show slight cabinet friction, otherwise Unc. with semiproof surface. A beautiful specimen of this rare variety. Listed at \$15.00 in VF condition. This one should be worth a great deal more. \$15.75.

1803 Large 3 in date. VF, with some lustre. Very scarce so choice. \$7.75.

The Famous Dexter 1804 dollar, one of only six originals known or ever discovered. This great coin was first discovered, as were many other choice and great American rarities, in Europe, in 1884, by one of the Chapman brothers, who acquired it from the famous Berlin numismatist, Adolph Weil. The Chapmans offered it in their sale of May 14th and 15th, 1885. Description of the 1804 dollar as it appeared in the Chapman catalogue of 1885:

"1804. . . Weight correct, 415.8 grs., the legal standard being 416 from 1794 to 1837. In superb, EF condition, with beautiful Proof surface, as fine as, if not the finest of the seven known. We guarantee it genuine." . . .

In my opinion, which is concurred in by all who have had the privilege of seeing this rarity, the coin is really and truly a brilliant semiproof, with an even, beautiful, iridescent medium purple surface. The Chapmans stated that it was superior to the Stickney specimen which later brought \$3,600.00 in the sale of the Stickney Collection, in 1907. . . .

Fortunately, Mr. Dunham preserved the original "Certificates of Genuineness" which S.H. & H. Chapman furnished

Mr. Dexter in 1885 and 1887, all of which are herewith reproduced. It is most interesting and important to note that these certificates were prepared and signed by the most important personages connected with the early American numismatics.

This is only the second original 1804 dollar that I have had the great pleasure of handling in my 40 years of numismatic business. The other specimen was in my sale of the James H. Manning Collection, in 1921, where the 1804 dollar, which was the least choice in condition of the six originals known, brought \$2,500.00 plus 5%. It was purchased by a dealer for whom, about two years later, I sold it for \$3,200.00, to a private collector. About three years after I made this sale, I was commissioned by a prominent collector to endeavor to secure for him an original 1804 dollar. I offered the purchaser of the Manning dollar \$5,000.00 for his coin, but my offer was declined. . . .

Such great collections as the Col. E.H.R. Green, which is at least a two million dollar collection; the Waldo Newcomer Collection, a million dollar collection; the Virgil M. Brand Collection, which was appraised at three and one half million dollars, and many other great collections, did not possess an original 1804 dollar. The Harlan P. Smith Collection, which contained all the rare gold half eagles, including the 1815 and 1822; the Earle Collection, which brought over \$50,000.00 in 1912, did not have an 1804 dollar. Colonel Green and Mr. Newcomer were willing to pay almost any price to obtain a specimen, but none were available.

As has always been truly said that—"ownership and pride of possession contribute a large part of the pleasure of collecting"—surely, then, the joy and pride of ownership of this famous coin, "the King of American Coins," can never be measured in dollars and cents. Its acquisition will provide a thrill which only a true collector can appreciate and enjoy—its ownership, a treasure to be valued and enjoyed an entire lifetime, and which will always be the source of untold dividends in pride and happiness. [Then followed eight pages of letters and certificates.] \$4,250.00.

The "World's Greatest Collection" (F.C.C. Boyd Collection) sold by Numismatic Gallery, May 11-12, 1945, included an important group of early silver dollars, among which were an Uncirculated 1794 and a complete set of 1801-2-3 novodel "restrikes." Boyd was one of the most prominent numismatists on the New York City scene, and was a connoisseur who truly appreciated his coins. By 1945, his interests turned toward colonial coins, tokens, and medals, and he considered his federal series to be superfluous to his needs. The Boyd silver coins were auctioned by the Numismatic Gallery (Abe Kosoff and Abner Kreisberg) in 1945, and the gold coins crossed the block in 1946.

Unfortunately for today's readers, the catalogue descriptions were bare-bones, no historical information or pedigrees were given, and readers were left with little beyond variety and grade. Further, when

a variety was unlisted by Haseltine—as several were—the cataloguers did not describe the new dies or combinations in detail.

As if this were not enough to digest, the researcher today does not know how many coins were attributed correctly. Plates in the catalogue indicate that what was described as a 1797 H-2 was actually an H-3, and what was described as an H-3 was really an H-2, perhaps a simple case of transposition. 1798 H-16 was illustrated with what appears to be an H-15. A new variety described as 1796 H-6 was in actuality a die state of H-5.

1794 Unc. \$2,000.00.

1795 H-1. Unc. \$145.00.

1795 H-2. VF. Light pinpricks on face. All lettering sharp. \$24.00.

1795 H-3. VF. \$43.00.

1795 H-4. VF. \$35.00.

1795 H-5. EF, much mint lustre. \$85.00.

1795 H-6. About EF. \$50.00.

1795 H-7. VF. Two light scratches near temple. A sharp, boldly struck example. \$37.50.

1795 H-8. VF. Wear on high spots of head and eagle; sharp stars and lettering. \$75.00.

1795 H-9. Slight edge dents. Fine. \$20.00.

1795 H-9a. Unlisted by Haseltine. VF. \$75.00.

1795 H-10. Unc. \$150.00.

1795 H-11. VF. \$35.00.

1795 H-12. Fine. \$27.50.

1795 H-14. Unc. \$110.00.

1795 H-15. VF. \$27.50.

1795 H-15a. Well centered, barely circulated. \$60.00.

1796 H-1. VF. \$55.00.

1796 H-2. VF; well centered. \$60.00.

1796 H-3. VF. \$65.00. [unknown if correctly attributed]

1796 H-4. VF or better. Nice lustre. \$55.00.

1796 H-5. An EF example with much lustre. Slightest wear on high spots. \$100.00.

1796 H-6. Unlisted in Haseltine. VF. \$50.00. [Actually a late state of H-5]

1797 H-1a. Fine. \$35.00.

1797 H-2. Fine to VF. \$37.50. [Illustrated with an H-3]

1797 H-3. VF. \$40.00. [Illustrated with an H-2]

1798 H-1. VF. \$55.00.

1798 H-2. Fine to VF. \$67.50.

1798 H-2A. Not in Haseltine. VF. \$65.00.

1798 H-3. Fine. \$35.00.

1798 H-6. EF. \$40.00.

1798 H-6a. Not listed in Haseltine. Fine. \$20.00.

1798 H-7. Fine. \$30.00.

1798 H-8. VF. \$35.00.

1798 H-10. Slight wear on reverse. Unc. \$35.00.

1798 H-11. EF, nice lustre. \$35.00.

1798 H-12. VF. \$30.00.

1798 H-13. VF. \$25.00.

- 1798 H-14. VF. \$20.00.
 1798 H-15. Barely circulated with nice lustre. \$45.00.
 1798 H-16. Unc. \$120.00. [The plate in the catalogue is not an H-16, and appears to be an H-15. Because of the possibility for error, this coin was not surveyed for use in this book, under either H-16 or H-15.]
 1798 H-17. Fine. \$25.00.
 1798 H-18. VF with slight edge dent. \$30.00.
 1798 H-19. VF. \$22.50.
 1798 H-20. Barely circulated. Cabinet friction on high spots. \$20.00.
 1798 H-21. VF. \$50.00.
 1798 H-22. VF. \$17.50.
 1798 H-23. VF. \$25.00.
 1798 H-24. VF. \$25.00.
 1798 H-25. Fine. \$20.00.
 1798 H-26. VF. \$20.00.
 1798 H-26a. Fine. \$30.00.
 1798 H-27. Barely circulated. \$60.00.
 1798 H-28. Unc. \$60.00.
 1798 H-28a. About Fine. \$20.00.
 1798 H-29. EF. \$30.00.
 1798 H-30. EF. \$50.00.
 1798 H-31. VF. Light obverse scratch. \$20.00. [Probably not as described.]
 1798 H-32. VF. \$35.00. [Probably not as described.]
 1798 H-33. Fine. \$25.00. [Probably not as described.]
 1798 H-34. VF. \$35.00. [Probably not as described.]
 1799 H-1. Unc. \$75.00.
 1799 H-3. Unc. \$75.00.
 1799 H-4. VF. \$15.00.
 1799 H-5. VF. \$20.00.
 1799 Slight cabinet friction on head. Choice. \$50.00.
 1799 H-7. Fine. \$17.50.
 1799 H-8. Unc. \$45.00.
 1799 H-9. Unc. \$70.00.
 1799 H-9a. [Described as obverse of H-9, reverse of H-5.]
 Light scratches across head. VF. \$17.50.
 1799 H-10. Fine. \$15.00.
 1799 H-11. VF. \$17.50.
 1799 H-11a. Unc. \$70.00.
 1799 H-12. VF. \$15.00.
 1799 H-12a. EF. \$30.00.
 1799 H-13. VF. \$22.50.
 1799 H-14. VF. \$17.50.
 1799 H-14a. EF. \$30.00.
 1799 H-15. VF. \$20.00.
 1799 H-16. VF. \$22.50.
 1799 H-17a. VF. \$20.00.
 1799 H-18. EF. \$25.00.
 1799 H-19. Fine. \$17.50.
 1799 H-21. Fine. \$12.50.
 1799 H-2/a. VF. \$30.00.
 1799 H-22. VG to Fine. \$12.50.
 1799 H-23. Barely circulated. \$70.00.
 1800 H-1. VF. \$40.00.

- 1800 H-2. Fine. \$45.00.
 1800 H-3. EF, with some wear on high spots. \$35.00.
 1800 H-4. VF. \$25.00.
 1800 H-4a. VF. \$25.00.
 1800 H-5. VF. \$45.00.
 1800 H-7. VF. \$45.00. [Purchased by M.H. Bolender, who found it to be a late state of H-5.]
 1800 H-8. Unc., slightest edge nick. \$45.00.
 1800 H-10. VF. \$25.00.
 1800 H-11. EF. \$45.00.
 1800 H-11a. VF. \$17.50.
 1800 H-12. EF, with much lustre. \$40.00.
 1800 H-14. Unc., brilliant of original mint lustre. Nick on chin. \$70.00.
 1800 H-15. VF. \$27.50.
 1800 H-16. Unc. \$55.00.
 1800 H-17. Barely circulated. \$45.00.
 1800 H-18. VF. \$30.00.
 1800 H-18a. Unc. \$55.00.
 1800 H-19. Fine to VF. \$20.00.
 1800 H-19a. VF. \$12.50.
 1800 H-20. VF. \$45.00. [unknown if correctly attributed]
 1801 H-1. Not quite EF. \$60.00.
 1801 H-2. Unc. with cabinet friction on high spots. Brilliant. \$85.00.
 1801 H-3. Fine. \$25.00.
 1801 Brilliant Proof restrike. \$225.00.
 1802 H-1. VF. \$40.00.
 1802 H-2. Almost EF. \$35.00.
 1802 H-3. VG to Fine. \$15.00.
 1802 H-4. VF. \$30.00.
 1802 H-5. Fine. \$32.50.
 1802 H-6. Barely circulated. \$47.50.
 1802 Brilliant Proof restrike. \$210.00.
 1803 H-1. Fine to VF. \$35.00.
 1803 H-2. VF. \$37.50. [unknown if correctly attributed]
 1803 H-3. VF with some lustre. \$60.00.
 1803 H-4. VF. \$45.00.
 1803 H-6. VF. \$45.00.
 1803 Brilliant Proof restrike. \$210.00.

The William Cutler Atwater Collection sold by B. Max Mehl, June 11, 1946. This holding was one of the great American cabinets dispersed in the middle of the twentieth century. Among early dollars there were many outstanding pieces. Both varieties of 1804 dollars were included.

1794 Unc., just the barest touch of cabinet friction, with frosty mint lustre. Perfectly centered; an unusually bold impression. \$1,575.00.

1794 Strictly VG, Fine; lower stars on left not as bold as the other stars and the corresponding side on reverse is also not boldly struck, but all the lettering is plain. \$380.00.

1795 Brilliant semi-proof; almost a brilliant Proof. Sharp and perfect in every respect with full brilliant Proof surface. Just the slightest die hairlines on head and a faint, very light,

mark between 5 and first star on right. \$152.50.

1795 Perfect Unc. Sharp and well centered, full mint lustre. \$137.50.

1795 Unc. with frosty mint lustre. Stars are sharp and bold, with deep milled border. \$132.50.

1795 Unc., frosty mint surface. Just the barest touch of cabinet friction. \$85.00.

1795 AU, with frosty mint lustre. Two planchet defects. \$45.00.

1795 EF, well struck and perfectly centered. \$52.50.

1795 EF, sharp; just a shade from Unc. \$48.00.

1795 A beautiful perfect Unc. specimen with magnificent mint lustre. Well struck, sharp and perfect in every respect. \$157.50.

1795 Strictly Unc. with full brilliant mint lustre. \$51.35.

1796 EF with mint lustre; just a shade from Unc. Two of the lower stars on left are not as bold as the others which are sharp. \$40.35.

1796 Strictly Fine to VF. Well struck and well centered. \$38.50.

1797 Practically Unc. with frosty mint surface. Stars are sharp. \$85.00.

1797 Just a shade from Unc., with frosty mint lustre. Well centered and struck. \$85.00.

1798 EF with bold impression. \$51.25.

1798 Strictly Fine, the obverse nearly VF. \$36.00.

1798 EF with frosty mint surface; just a shade from Unc. Light die file marks on reverse, not affecting the appearance or value. \$32.50.

1799/8 Unc. with frosty mint surface. Well struck and centered. \$67.50.

1799 Practically Unc. with frosty mint surface. Unusually bold impression. \$33.50.

1799 Unc. with full mint lustre. \$70.00.

1799 Strictly Fine. A pinpoint nick on right obverse field. \$22.50.

1800 VF obverse with nearly Unc. reverse. Considerable frosty mint lustre. \$20.00.

1801 Strictly Fine to VF. \$21.00.

1802/1 VF, strictly so. Considerable mint lustre. \$31.00.

1802 VF, nicely struck and centered; free from any nicks or dents. \$16.25.

1803 Unc., with beautiful semi-proof surface. Reverse almost equal to a brilliant Proof. Highest points of obverse show just the slightest touch of cabinet friction. There is also what appears to be a very light hairline on cheek to upper part of bust. \$85.00.

1803 Unc. with beautiful full brilliant mint lustre. \$147.50.

1804 Stickney coin. Original. [Lengthy description omitted here.] Shows very faint hair marks, otherwise EF brilliant and with slight Proof surface. \$10,500.00.

1804 Second type. Idler specimen. [Lengthy description omitted here. No grade listed.] \$2,875.00.

The Will W. Neil Collection sold by B. Max Mehl, June 17, 1947. This was another of the great cabinets sold by Mehl. The offering of early dollars

began with an Uncirculated 1794 and ended with a set of 1801-2-3 Proof "restrikes" and an 1804!

Although Neil, a Wichita, Kansas druggist, collected many series, his favorite denomination was silver dollars. Mehl's use of Haseltine attributions during this period of his career is puzzling. Some collections used them, some did not, and some (such as the Neil Collection) were partially attributed. I suspect that if the consignor attributed the coins to Haseltine, Mehl copied the numbers; otherwise, Mehl did not include them.

1794 Probably the finest known specimen! . . . Beautiful Unc. specimen. Some short file marks in the die on upper obverse right edge. Usually, as is well known, the 1794 dollar comes with the stars on left and corresponding side on reverse weakly struck. This specimen is undoubtedly a very early impression of the die, as the stars on left are just about as bold as those on right, and the legend on reverse is perfect and well struck. Hardly the slightest touch of cabinet friction. The feathers on eagle's breast all show. Full iridescent mint lustre. Far superior to the specimen in my sale of the great Atwater Collection where the coin brought \$1,575.00. And comparing it with the reproduction of the specimen offered and sold in January of 1946 for \$2,000.00, this coin seems to be far superior. I cannot say that this is the finest specimen known. I can and do make the statement that it is by far the most beautiful specimen of this rare dollar that I have ever seen or that has ever passed through my hands. And according to the records of somewhat inferior specimens, that of \$2,000.00, this coin should bring a correspondingly higher price. In fact a rarity of this caliber in this remarkable choice condition is practically priceless. Valued by Mr. Neil at \$2,500.00, which value I consider conservative. It is difficult to resist the temptation to get enthusiastic about a gem of this sort. Regardless of what the lucky buyer may pay for the coin it will pay him great dividends in the pleasure and pride of ownership. \$1,250.00.

1795 Head type. VF. \$27.60.

1795 Type as last. H-5. Strictly VF, can easily be classed as EF with iridescent purple surface. \$45.50.

1795 Head of '94. Obverse H-3; reverse H-4. Fine, strictly so. \$41.

1795 Bust type. H-14. Strictly Fine. \$22.50.

1796 VF. \$51.50.

1796 VF. \$22.75.

1796 H-4. VF; free from any nicks or dents. \$42.50.

1797 About Fine. \$26.00.

1797 EF with bold impression. \$40.00.

1798 H-1. VF, especially for this coin. \$44.50.

1798 VF. Unusually bold impression. \$40.00.

1798 Just a shade from Unc. Only highest portions show slight cabinet friction. Iridescent mint surface. The stars on right are not as boldly struck as those on left. \$31.00.

1799/8 Very plain overdate. EF. Fairly broad milled borders. \$31.00.

1799 H-8. VF. \$18.00.

1799 Perfect Date. H-11. Obverse H-7. EF, nice even impression; perfectly centered. \$26.00.

1799 H-12. Obverse as H-9. reverse as H-11. Tiny planchet defect on right edge. VF, more so EF. \$5.75.

1799 Tiny nick on obverse left field. Strictly Fine. \$25.00.

1800 Perfect die in legend with exception of light breaks through STATES. H-4. Broad milled borders. EF with some lustre. \$36.00.

1800 H-11. VF. \$19.00.

1800 H-19. Raised milled borders. EF. \$23.00.

1801 H-2. Strictly Fine. \$18.75.

1801 H-4. VF, strong impression. Mr. Neil purchased this coin as EF. \$21.00.

1801 [Proof restrike] Perfect brilliant Proof. Raised borders and instead of milling, borders are of small dots. \$300.00.

1802 [Proof restrike] Perfect brilliant Proof gem. \$300.00.

1802/1 Very plain overdate. VF with bold impression, but few hairline scratches on left obverse. \$17.65.

1802 Perfect Date. H-7. Obverse as H-6; reverse as H-4. Strictly VF; almost EF. Well struck and centered. \$26.00.

1803 Strictly VF. Well struck and centered. \$27.00.

1803 Sharply struck. Doubt if this coin has ever been in circulation, as only the highest portions show slight cabinet friction and the coin retains much of its original mint lustre, iridescent surface. \$67.50.

1803 [Proof restrike] Perfect brilliant Proof. \$300.00.

1804 King of American coins. [Lengthy description abbreviated here.] Idler specimen. Lettering, especially the words STATES OF, slightly uneven, there being a bit more space between the last S in STATES and O in OF. Lettering on edge is far more pronounced than that on first type. Most famous and best known of six or seven specimens in existence. [No grade given] \$3,125.00.

The Dr. Christian A. Allenburger Collection, sold by B. Max Mehl, March 23, 1948, included these early dollars, not attributed to Haseltine numbers.

1794 As is usual with our first dollars, the left obverse and corresponding side of the reverse is not struck up as bold as the other portions of the coin, but on this specimen, while it has the characteristic features of this coin, the stars on the left are very plain and the same is true of the corresponding side of reverse. A tiny nick or dent on lower obverse edge. Few light hairlines, but the coin as a whole can easily be classed as strictly Fine or VF for this coin. It is far above the average of specimens of this rare dollar usually found. Catalogues \$600.00 and has record for that amount and higher. In much demand. \$455.00.

1795 Head type. Point of star equal with point of bust. Star on left cuts through curl. Reverse, two leaves under wings. Beautiful sharp Unc. specimen. A very tiny die break at fourth star at left. Full mint lustre. Raised milled borders. Very rare so choice. A similar specimen in my Atwater Sale brought \$137.50 and the buyer was willing to go up to \$160.00. It is really remarkable that a dollar over 150 years old can be found in such perfect mint condition. \$86.00.

1795 Type similar to last but trifle smaller head. Star at right below point of bust and last curl touches two points of

first star at left. Reverse, two leaves under wings. EF with considerable frosty mint surface. Rare variety in very rare condition. \$40.00.

1795 Type of 1794, small head. Variety with star at right just barely under point of bust. Star at left, one point barely touches small curl. Reverse, three leaves under wings. A beautiful semiproof. Just the slightest touch of cabinet friction. Very rare and valuable so choice. Record over \$150.00. \$65.00.

1795 Type similar to last. Small head. Stars distant from point of bust and curl. Three leaves under wings on reverse. Perfect Unc. specimen. Sharp with full brilliant mint lustre. Every star filled. Variety with tiny die break back of head. Light short hairline on cheek, hardly noticeable. A beautiful coin. Very rare and valuable. Record \$137.50 for an equal specimen. \$75.00.

1795 Second or bust type. Variety with curl touching two points of star. Reverse, seven berries in wreath. Beautiful brilliant semi-proof. The obverse shows just the slightest touch of cabinet friction. As near a Proof of this early dollar as I have ever seen. Every star is sharp and fully struck. Superior to the Unc. specimen in my sale of the great Atwater Collection where the coin brought \$157.50. \$167.50.

1796 Large date and small letters on reverse. Dot die break at IC in AMERICA. EF with considerable mint lustre. Well centered and struck. Record up to \$50.00 for equal specimens. \$48.50.

1796 Small Date and small letters. The coin shows very light nicks on obverse, probably due to having been handled with other coins, otherwise the coin shows but the slightest cabinet friction. At first glance the coin looks like a Proof. I classify it here as EF with semiproof surface. It is next in beauty to the specimen I sold in my sale of the Roe Collection where the coin brought \$175.00. \$36.00.

1796 Small Date and large letters. Strictly very good; can be classed as fine for coin. Catalogues \$17.50 and retails for more. \$17.00.

1797 Variety with six stars to right of bust and 10 to left. Reverse, large letters in legend. Beautiful Unc. specimen. Sharp with bold impression and every star filled. Die suction marks on obverse and very light, hardly noticeable, file marks on reverse. A tiny light nick at eagle's beak, probably due to another coin falling on it. With full bright mint lustre. Just about as perfect as the day it was minted. Rare and valuable so choice. A similar specimen in my sale of the Roe Collection brought \$112.50. \$105.00.

1797 Same type as last, six stars to right and ten to left of bust. Strictly VF. Catalogues \$27.50 but has an auction record for much more. \$22.50.

1797 Variety with seven stars to right of bust and nine to left. Reverse, large letters. EF, nearly Unc. Unusually bold impression with every star sharp, fairly broad milled borders. Rare so choice. Said to have cost \$75.00. \$55.00.

1797 Another just as last. Strictly Fine. Scarce and in much demand. Record about \$30.00 for equal specimen. \$24.50.

1797 The extremely rare variety with small letters in legend of reverse. Strictly Fine. Can easily be classed as VF for this coin. Free from any nicks or dents. A similar specimen in my Roe Sale but in Unc. condition brought \$172.50. \$41.00.

1798 Type of 1796, small eagle on reverse. Variety with 15

stars. VF obverse with fine reverse. Very scarce and in much demand. Catalogues up to \$60.00 in VF. \$51.00.

1798 Heraldic Eagle. Date fairly close. Broad milled borders. EF with considerable mint lustre. Every star filled. Variety with light die break from border through 17 to bust. Very scarce so choice. \$42.50.

1798 Heraldic Eagle. Type as last but of an entirely different die. Most of the stars on reverse distant from clouds and star distant from beak. VF. \$20.00.

1798 Figure 8 close to bust. Reverse, top stars touch clouds; star close to beak. Fine. \$9.00.

1799/8 Date high. Fine, strictly so. Scarce. Catalogues at \$20.00 and retails for more. \$16.00.

1799 The rare variety with five stars to right of bust and eight stars to left. Practically Unc. Almost full mint lustre. Unusually sharp impression with every star filled. Just the very barest touch of cabinet friction and tiny nicks on cheek, hardly noticeable. The reverse is perfect. Undoubtedly one of the finest specimens known of this rare variety. Even such great collections of dollars as the Atwater and Roe only possessed Fine specimens. I doubt if more than half a dozen specimens exist in this beautiful condition. This is only the second or third choice specimen I have ever seen. Said to have cost well over \$100.00 many years ago. \$97.50.

1799 Six Stars to right and seven to left. The date is over '98. Very plain overdate. Practically Unc. with frosty mint surface. Variety with light die breaks through legend on reverse, with almost full mint lustre. Not a rare date, but extremely rare so choice. Catalogues \$30.00 in only VF. In this gem condition it is worth several times that amount. \$30.00.

1799 Perfect Date. Star on reverse touches lower part of beak. Faint die breaks on obverse. Nearly Unc., iridescent surface. Quite rare so choice. \$12.50.

1799 Six stars to right. Variety with stars trifle smaller and sharply cut. Stars on reverse smaller. Unc. with raised milled borders. The obverse shows slight cabinet friction. Almost brilliant mint lustre. The reverse is as perfect as the day it was minted. Quite rare so choice. (Said to have cost \$100.00). \$36.50.

1799 Perfect Date, struck low. Light die breaks through date. Nearly Unc. with frosty mint lustre. A beautiful specimen, and as such, rare and valuable. \$40.00.

1799 Six Stars Facing. Perfect Date. The rare variety with diagonal die break across entire center of reverse. Small stars. Strictly VF. Rare. \$15.65.

1799 Six Stars Facing. Light die breaks through date. Perfect die on reverse. Large stars about eagle's head. Fine. \$12.50.

1799 Six Stars Facing. Variety with very short ends to 9's in date. Perfect dies. VF. Scarce variety. \$12.55.

1799 Six Stars Facing. Light die breaks through date. Small stars on reverse. Die breaks in legend. About Fine. \$8.50.

1799 Six Stars Facing. Perfect Date. VG. \$7.50.

1800 Variety with top lock of hair in single curl with few thin hairs above. Practically Unc. with mint lustre. Unusually bold impression with wide milled raised borders; considerable mint lustre. Just the slightest touch of cabinet friction. Rare so choice. Record for similar specimen \$90.00. \$58.50.

1800 Variety with light die breaks through date. Strictly VF. \$10.00.

1800 Die break on reverse making the legend read AMERICA. Strictly Fine. \$10.00.

1800 Variety with die break at neck and above bust and light die breaks on reverse. VF. Very scarce variety. \$18.75.

1801 Variety with large stars on reverse. VF but light scratch on obverse. Scarce date. Catalogues \$25.00 in VF. \$25.00.

1801 Perfect Dies. EF, sharp; well centered and struck with some mint lustre. Just the faintest die break from top star to scroll on reverse. Very scarce so choice. \$27.50.

1801 Small stars on reverse. Variety with first 1 of date almost touching curl. Strictly Fine. \$18.00.

1801 Type similar to last. Variety with short stem to olive branch. Fine. \$17.50.

1801 Variety with long stem to olive branch. Figure 1 somewhat distant from curl. Fine. \$18.00.

1801 Faint die break on reverse. A in STATES connected with cloud. VG. \$16.00.

1801 First 1 of date very close to curl. VG. \$17.00.

1802/1 Wide Date. Unusually bold overdate. Practically Unc., sharp with full mint lustre. Slight evidence of cabinet friction. Raised milled borders. Very scarce variety in rare condition. The Atwater specimen was only VF. This specimen is about equal to the specimen in my Roe Sale where it brought \$40.00. In my opinion this coin is worth considerably more today. I cannot help but repeat that the values of our early silver dollars in choice condition have not and are not being appreciated. \$31.00.

1802/1 Close Date. Fine, strictly so. Record for similar specimen over \$30.00. \$12.50.

1802 Perfect Date. Beautiful brilliant Unc. specimen. Just about as perfect as the day it was minted. Well centered with bold impression. Very rare so choice. Record \$138.50. \$115.00.

1802 Perfect Date. VF. \$25.00.

1802 Perfect Date. Another as last. Fine, strictly so. \$23.00.

1802 Perfect Date and Dies. About Fine. \$18.00.

1803 Large 3 in date. EF with mint lustre. Very scarce so choice. The coin is not far from Unc. \$22.50.

1803 Small 3 in date. VF. Very scarce, more so than the large 3 variety. Catalogues \$25.00 in VF. \$26.00.

1803 Small 3 in date. Duplicate. About Fine. Catalogues \$17.50. \$18.00.

B. Max Mehl's sale of the Dr. Charles W. Green Collection, April 16, 1949. This cabinet was better known for its gold coins than for its silver dollars, which were of just average quality, with one or two exceptions.

1795 EF with considerable mint lustre. \$41.00.

1795 Good. \$13.25.

1796 VF. \$42.50.

1797 Good to VG, but initials lightly scratched on right obverse and on reverse. \$12.25.

1798 Fine to VF. \$30.00.

1798 Strictly VF. Only slightest touch of circulation. \$21.70.

1798 Fine, short scratch on reverse. \$11.00.

1799/8 Strictly Fine. \$18.00.

1800 Nearly Fine. \$12.75.

1800 Unc. with frosty mint surface; sharp with raised borders. Just the slight cabinet friction. \$45.00.

1801 Strictly Fine to VF; bold impression. \$26.50.

1802/1 EF with mint lustre. \$31.00.

1802 Unc. with iridescent mint lustre. Slight cabinet friction. \$110.00.

1803 VG. \$11.00.

1803 Fine. \$12.50.

The Adolphe Menjou Collection sold by Numismatic Gallery, June 15-17, 1950. Menjou was a movie star who was interested in coins. Although his name appeared on a catalogue cover, it is believed that many of the coins were actually the property of Charles Williams, of Cincinnati. Included in the Menjou sale were the following early dollars.

1794 VF. \$510.00.

1795 H-1. Faint obverse scratch, edge dent. VF and a scarce variety. \$27.00.

1795 H-2. Eagle is rather weakly struck. Fine and scarce. \$19.00.

1795 H-5. Fine. \$25.00.

1795 H-14. Fine. \$20.50.

1796 H-5. Fine. \$21.00.

1797 H-1. Small dent on reverse edge. VF, sharp. \$45.00.

1797 H-3. Fine. \$25.00.

1798 H-2. VG. \$27.00.

1798 H-3. About Fine. \$16.00.

1798 Fine to VF. \$16.00.

1798 VF. \$15.00.

1799/8 H-1. Fine-VF. \$20.00.

1799 H-4. First 9 is out of place. Fine. \$17.00.

1799 H-5. EF. \$31.00.

1799 VF. \$18.00.

1799 Fine. \$23.00.

1800 Fine. \$13.50.

1801 H-3. VF-EF. \$27.50.

1802/1 EF. \$29.00.

1802/1 VF. \$15.00.

1802. About EF. \$23.00.

1803. VF. \$16.50.

1803 VF. \$18.00.

1803 Brilliant Proof restrike. \$280.00.

The Bolender Collection of early dollars, M.H. Bolender's 183rd Sale, February 23, 1952. This sale featured Bolender's reference collection used to describe and illustrate his book on early dollars, and

thus is one of the most important in the annals of the series. Nearly all of the Bolender Collection coins were acquired by K.P. Austin, of Salisbury, Maryland, who in turn later sold them with the balance of his collection to Alfred J. Ostheimer, 3rd.¹ In due course, most of the Ostheimer coins were sold either in Lester Merkin's 1968 sale of the Ostheimer Collection or the 1973 Gilhousen Sale conducted by Superior.

Bolender's descriptions of the dies are omitted in the listing below, as they duplicate those in his book and the technical descriptions given later in the present volume. However, his pedigrees and interesting, chatty comments are retained, as are the references to the plates in his book. The Bolender Collection catalogue represents the most detailed published up to this date.

1794 [BB-1] VG. Lower stars on left are weak as usual. Rare. \$425.00.

1795 [BB-11] B-3. Flowing Hair. Strictly VF, sharp even impressions. Plate. (Both obverse and reverse of this very coin used in book for illustrations on plate I.) Geo. M. Parsons Coll'n. \$70.00.

1795 [BB-12] B-11. Flowing Hair. VF. Excessively rare variety, and the only one I have found. Haseltine's specimen was only "Good" and scratched in field, the only one he could find. A specimen listed in an important sale a few years ago as H-11 was purchased by me, but turned out to be H-2, and there was no H-11 in the sale. From the Earle sale, and later in the Schuyler Coll'n. Plate. (Reverse illustrated on plate II in the book on dollars.) \$150.00.

1795 [BB-13] B-9. EF, even impressions. Frosty surface around head. Very rare variety. From the Parsons sale by H. Chapman 1914. Plate. (Reverse used for illustration in my book.) \$90.00.

1795 [BB-13] B-9a. VF. Very rare. From Col. Green Collection, later in the Gettys Collection. \$72.50.

1795 [BB-14] B-4. Flowing Hair. EF, bold and sharp, with some prooflike surface. The edge below date and corresponding edge on reverse show a very slight planchet defect. A splendid example for this scarce variety, from the Col. Green Coll'n., later in the [Lloyd B.] Gettys Collection. This piece superior to the one shown on plate in my book, as it was recently purchased to improve my collection. \$70.00.

1795 [BB-15] B-8. Flowing Hair type. A little wear on the high parts of hair and eagle, but VF and well-centered even impressions. Excessively rare. From the "World's Greatest Collection" sale. In my 45 years as a collector and dealer, I have seen only two specimens! However I handled one of these four times. Haseltine had seen but one, and it was not in his *Type-Table* sale catalogue of 1881, having been withdrawn from the sale and sold privately. Plate. \$165.00.

1795 [BB-20] B-2. Slight wear on high portions of hair, and some adjusting marks on high part of eagle, done at mint in correcting planchet weight. EF, sharp stars. Plate. (This coin

¹ Per author's conversation with Jules Reiver, December 2, 1992.

illustrated on plate I in the book.) From the Newcomer Collection. \$85.00.

1795 [BB-21] B-1. Flowing Hair. EF, considerable lustre, sharp even impression. Plate (refers to the Bolender book on silver dollars, where this identical coin was used for both obverse and reverse plates). From the great Stickney Coll'n. later in Schwab Collection. \$70.00.

1795 [BB-22] B-10. Flowing Hair. Fine. Purchased from Gutttag Bros., New York dealers many years ago. Plate. (Reverse shown on plate II.) \$85.00.

1795 [BB-23] B-16. Unc., with Proof surface, a few trivial nicks under a glass. Beautifully toned, and a magnificent example, and one of the rarest of all dollars. Rarity-8, the only specimen known, and I believe it to be unique! Purchased by me at an Elder sale in New York 20 years ago. A prominent collector who was also in attendance bid against me, and it brought seven times the starting bid, and a new record for a 1795 dollar. The competition was the sensation of the entire auction sale. It is certainly worth more than any other dollar of this date. Plate. (Reverse of this coin was used for plate II in book.) \$440.00.

1795 [BB-24] B-13. Flowing Hair. Several file marks on reverse done at mint to reduce planchet weight, but strictly VF and without doubt it is the finest of the three known specimens. Haseltine had met with only a single specimen, and called it "probably unique." This piece is probably the Haseltine specimen, as its condition would indicate, and was later in the Col. Green Collection. Plate. (Obverse shown on plate I.) \$190.00.

1795 [BB-25] B-6. Flowing Hair. Some faint file marks appear on eagle's breast, done at mint to reduce planchet weight. EF. From the Lighthouse Collection. Plate. (Both obverse and reverse of this coin shown on plate I in the Bolender book on dollars.) \$60.00.

1795 [BB-26] B-12. Flowing Hair. EF, mint lustre close to letters, stars, and wreath. Extremely rare, Rarity-6. From Elder sale, New York 1924. Finest of the few known specimens. Plate. (Obverse shown on plate I.) \$110.00.

1795 [BB-26] B-12a. Fine. This piece was lot 807 in the great Stickney sale held by Henry Chapman in 1907, and Mr. Chapman there described the break. Mr. Stickney was the first great collector in America. The only specimen I have ever seen. \$110.00.

1795 [BB-27] B-5. Flowing Hair. VF, slightly scratched in right obverse field. A.M. Smith Collection. \$44.00.

1795 [BB-51] B-14. Draped Bust. This piece was purchased as "Unc." but with magnifying glass you can see a pinpoint nick before nose, and slight rubbing on highest point of eagle's breast. It is a beautiful example, with considerable mint lustre. From the Lighthouse Collection. Plate. (Both obverse and reverse plates in my dollar book are from this very coin.) \$70.00.

1795 [BB-52] B-15. Draped Bust. EF, very nearly Unc. A beautiful dollar, sharply struck, splendid impressions. Bought from Henry Chapman, Philadelphia dealer, many years ago. Plate. (This coin used for both obverse and reverse in my book on early dollars. \$72.50.

1796 [BB-61] B-4. EF, splendid impressions. From the Treadway Collection in 1924. Plate. (This coin used for both obverse and reverse in book.) \$60.00.

1796 [BB-61] B-4a. VF. Ex. rare. The only specimen I have found. Formerly in the Gable Collection sold by Chapman, bought by John T. Reeder whose grand collection I purchased in 1940. Plate. (Obverse shown on plate II.) \$70.00.

1796 [BB-63] B-2. VF, sharp impressions. From Geo. M. Parsons Collection. 1914. Plate. (This coin used for both obverse and reverse illustrations on plate II in my book on dollars.) \$55.00.

1796 [BB-64] B-5. Strictly VF. Formerly in the great Stickney Collection sold by H. Chapman in 1907, then going to the Schwab Collection where I obtained it. Plate. (This coin used for both obverse and reverse illustrations on plate II in my book on dollars.) A specimen only slightly better sold for \$100 in the "World's Greatest Collection" sale in 1945. \$77.50.

1796 [BB-65] B-5a. Curious overstrike. The date and several stars and features of obverse appear on the reverse. VF. From the Col. Green Collection, later in the Gettys Collection, from whom I purchased it a few years ago for \$50. \$42.00.

1796 [BB-65] B-5a. EF, bold even impressions. From the John G. Mills Collection sold by the Chapman brothers in 1904. \$56.00.

1796 [BB-65] B-5b. The die lump is very small, does not touch C in AMERICA, and touches only the right top of letter I. Early impressions from the dies. EF, choice and beautiful dollar, with considerable mint lustre. Very rare state of the die break, and only recently acquired by me, since the book's publication.¹ \$52.50.

1796 [BB-66] B-1. VF. P.C. Clark Collection. Plate. (Obverse shown on plate II.) \$60.00.

1797 [BB-71] B-3. Large planchet. EF, strong sharp impressions. The Stickney piece, later in the Schwab Collection. \$55.00.

1797 [BB-71] B-3a. Smallest planchet. EF, beautiful even impressions, well-centered, even border milling all round both sides, barely Unc. Newcomer Collection. \$62.50.

1797 [BB-71] B-3b. Letters only slightly bifurcated. VF. From Gettys Collection. \$45.00.

1797 [BB-72] B-2. Fine. Very rare. Plate. (Reverse shown on plate III.) \$80.00.

1797 [BB-73] B-1. Perfect Dies. EF, strong impressions, but a little off center. From Treadway Collection sold in 1935 by Elder. (Both obverse and reverse shown on plate III.) \$61.00.

1797 [BB-73] B-1a. EF, splendid impressions, considerable lustre. From the Newcomer Collection. \$56.00.

1797 [BB-73] B-1b. EF, and as choice as the last. From the Col. Green Collection. \$56.00.

1797 [BB-73] B-1c. Advanced states of the die breaks, with numerous additional cracks, from 9th star down to ribbon, neck through chin, right field to 12th star, and others. EF, a beautiful piece. Jewett Collection. \$57.50.

1798 [BB-81] B-2. VF. Very rare, Rarity-5. Plate. (Both obverse and reverse shown in book.) A.M. Smith Collection. \$65.00.

¹ Q.D.B. note: Actually, this die state is very common. Apparently, Bolender did not pay much attention to this variety.

1798 [BB-81] B-2a. Fine and very rare. From Gettys Collection, formerly in Col. Green Collection. \$47.50.

1798 [BB-82] B-1. EF. Reverse struck off center to the right. Bought from Henry Chapman. Rare and in demand for type sets. \$65.00.

1798 [BB-82] B-1a. Very rare. Rarity-5. EF. From Col. Green Collection. Plate. (This coin was used for illustrations of both obverse and reverse in plate III.) \$77.50.

1798 [BB-92] B-4. EF. Reverse shows adjustment marks done at Mint. From Lighthouse Collection. Plate. (This coin used for reverse of Plate IV.) \$110.00.

1798 [BB-93] B-5. Fine. Excessively rare, Rarity-7. This is the better of the two known specimens. Haseltine's piece was only Fair. Plate. (Reverse of this coin illustrated on plate IV.) \$65.00.

1798 [BB-94] B-3. Unc., except for a few tiny spots, and minute nicks visible under a glass, and the reverse die was worn making UNUM weak in motto. Beautiful sharp impressions, mint lustre on obverse, and full Proof surface on reverse. Recently obtained from same collection as last. [Ex Gettys, Col. Green] Very rare so choice. \$50.00.

1798 [BB-95] B-7. Obverse VF, Rev. Fine. Col. Green Collection. \$29.50.

1798 [BB-96] B-6. VF. Strictly VF. From Treadway Collection, sale by Elder in 1935. Plate. (This coin was used for both obverse and reverse plates in the dollar book.) \$32.00.

1798 [BB-96] B-6a. Obverse VF. Reverse Fine. Very rare. Schuyler Collection. \$25.00.

1798 [BB-96] B-6b. Curiously double-struck on both sides. Obverse VF. Rev. Fine. \$30.00.

1798 [BB-101] B-17. VF. Excessively rare, Rarity-7. Haseltine's specimen was only Good, the only one he ever found. The piece in this sale is the finest of the three known. From the Gable and Schuyler collections. Plate. (Both obverse and reverse shown in book on plates IV and V.) \$31.00.

1798 [BB-102] B-20. Obverse VF. Rev. Fine. From Lyman H. Low in 1916. Plate (Obverse). Rare variety. \$21.00.

1798 [BB-104] B-22. Obverse VF, Rev. Fine. Rare variety. From Col. Green Collection and bought of B.G. Johnson. Plate. (Reverse of this coin used for plate V.) \$28.00.

1798 [BB-105] B-23. EF, strong even impressions. Well-centered with complete border millings. P.C. Clark Collection. Plate. (Both obverse and reverse shown on plates IV and V.) \$36.00.

1798 [BB-105] B-23a. EF. Elder sale 1925. Plate. (Obverse and reverse used for plates in book.) \$34.00.

1798 [BB-106] B-19. VF. From Col. Green Collection. Plate. (Obverse plate IV.) \$35.00.

1798 [BB-107] B-21. EF; file marks on obverse done at mint to reduce planchet weight. Some mint lustre. Rare variety. Elder sale 1923. Plate (Obverse). \$30.00.

1798 [BB-108] B-13. VF, nicely toned piece. From Gettys Collection, formerly in Col. Green Collection. Plate. (Reverse shown on plate V.) \$22.50.

1798 [BB-109] B-10. Obverse practically Unc., beautiful impression. Rev. EF. Rare variety. From Earle sale, later in Col. Green Collection. Plate. (This coin used for both obverse and reverse in book.) \$37.50.

1798 [BB-110] B-16. EF. Purchased from the Numismatic

Gallery in 1950. Plate. (Obverse shown on plate IX.) \$65.00.

1798 [BB-111] B-11. VF. Plate. From Col. Green Collection. \$36.00.

1798 [BB-111] B-11 a. EF. Scarce. Lighthouse Collection. \$31.00.

1798 [BB-111] B-11 b. Fine. From the Gable and John T. Reeder Collections. \$26.00.

1798 [BB-112] B-15. Reverse EF, usual weakness at upper part of eagle in this variety. Gettys Collection. Plate. (Obverse shown on plate IV.) \$39.00.

1798 [BB-112] B-15 a. EF. Ex. rare. Cost \$60 four years ago. \$37.50.

1798 [BB-113] B-27. EF, only slight signs of circulation, considerable mint lustre. Sold in same condition at World's Greatest Collection sale in 1945 at \$60. Plate. (Obverse.) \$36.00.

1798 [BB-113] B-27a. Unc., sharp impressions. From Earle sale, then in the Schuyler Collection. \$52.00.

1798 [BB-114] B-26. VF. Col. Green Collection. Plate. (Both obverse and reverse.) \$32.50.

1798 [BB-115] B-31. VF, well-toned. Plate (Reverse). From Col. Green Collection. \$39.00.

1798 [BB-115] B-31a. VF. St. Louis Stamp & Coin Co. Plate (Reverse). Excessively rare, Rarity-7. \$37.50.

1798 [BB-116] B-30. EF, magnificent sharp and even impressions. Formerly in the Stickney and Schwab collections. Plate. (Reverse.) \$46.00.

1798 [BB-116] B-30a. VG. I don't know where I found this one, but it's the only one I have seen. \$16.50.

1798 [BB-116] B-30b. Fine. From Col. Green and Gettys collections. Cost \$35. \$26.00.

1798 [BB-118] B-28. Obverse VF, Rev. Fine. Elder sale 1924. Plate. (Both obverse and reverse of this coin on plates IV and V in book.) \$22.00.

1798 [BB-119] B-29. VF. From Elder sale 1929. Plate. (Both obverse and reverse of this coin used for plates IV and V.) \$27.50.

1798 [BB-120] B-12. EF, but a few stars on reverse are always weakly struck in this rare variety, because of high relief of bust. A.M. Smith Collection. 1935. Plate. (This coin used for obverse and reverse illustrations in the book on silver dollars.) \$36.00.

1798 [BB-120] B-12a. Fine; slight edge dent on obverse near first star, and some stars hardly show on reverse, peculiar to this variety. Rare. \$12.50.

1798 [BB-121] B-9. EF. Plate. (Both obverse and reverse of this coin shown on plates III and V in the book.) \$34.00.

1798 [BB-122] B-14. EF, struck a little off center to right. From P.C. Clark Collection. Plate. (This coin used for both obverse and reverse plates in book.) \$27.00.

1798 [BB-122] B-14a. VF. Ex. rare, Rarity-6. Col. Green Collection. \$31.00.

1798 [BB-122] B-14b. VF and very rare. This is Lot 61 of "World's Greatest Collection" sold by Numismatic Gallery in 1945. \$26.00.

1798 [BB-123] B-8. VF. Plate. (This coin illustrated on plate III, obverse, and plate V, reverse, in my book.) The specimen in World's Greatest Collection was in same condition, and sold in 1945 for \$35. \$26.50.

1798 [BB-123] B-8. VG, two edge dents. Very rare. \$17.50.

1798 [BB-124] B-25. Fine. A rare variety. From St. Louis Coin & Stamp Co. Plate. (Obverse). \$24.00.

1798 [BB-124] B-25a. Fine. A.M. Smith Collection. \$24.00.

1798 [BB-124] B-25b. EF, choice piece. Lighthouse Collection. Plate. (Obverse). Rare. \$46.00.

1798 [BB-125] B-24. EF, reverse struck off center to right. Mint lustre near letters, stars, etc. From Col. Green and Gettys collections. Plate. (Both obverse and reverse of this coin shown on plates IV and V.) \$32.50.

1798 [BB-125] B-24a. VF. Bought from Henry Chapman. \$24.00.

1799/8 [BB-141] B-3. EF, sharp even impressions. From the great Earle sale, later in the Schuyler Collection. Plate. (Both obverse and reverse of this coin used for plates VI and VII in my book on dollars.) Extremely rare, Rarity-5. Value \$90. \$52.50.

1799/8 [BB-142] B-1. EF. Very rare, Rarity-5. From Lighthouse Collection. Plate (Reverse). \$37.50.

1799/8 [BB-142] B-1a. Unc., sharp and beautiful impressions, except for on high part of eagle and around some stars on reverse. Frosty surfaces. From Col. Green Collection. \$60.00.

1799/8 [BB-143] B-2. VF; dent on left wing of eagle. Lacking in "World's Greatest Collection Sale." From Treadway sale by Elder 1935. Plate (reverse). \$27.50.

1799 [BB-151] B-13. Nearly Unc., just slight friction on highest portions of hair and eagle. Finely toned, considerable mint lustre. Perfect dies. From Harlan P. Smith and Schuyler collections. Plate. (Reverse shown on plate VII.) \$37.00.

1799 [BB-152] B-15. EF, the obverse practically Unc., with mint lustre. Both sides are struck a little off center. A very rare variety, Rarity-5. Just slight die crack through first 4 stars toward date. Bought from [Burdette G.] Johnson, St. Louis [Stamp & Coin Co.]. Plate. (Reverse). \$42.50.

1799 [BB-152] B-15a. VG. Rare. \$16.00.

1799 [BB-153] B-4. EF, nicely toned piece, with considerable mint lustre. Rare variety. From Col. Green Collection, later in Gettys Collection. Plate. (Obverse used for plate VI.) \$43.00.

1799 [BB-154] B-18. VF, weakness on upper part of eagle. From Col. Green Collection. Plate. (Both obverse and reverse of this identical coin shown on plates VI and VII in book.) \$38.00.

1799 [BB-155] B-19. EF, struck a little off center, but sharp and very rare variety. Also came from Col. Green Collection. \$32.50.

1799 [BB-156] B-7. EF, some lustre. A.M. Smith Collection. Plate (Reverse). \$38.00.

1799 [BB-156] B-7a. VF. From Loyd Gettys Collection. \$32.50.

1799 [BB-157] B-5. EF, sharp even impressions, beautifully toned, with considerable lustre. From the Harlan P. Smith sale by Chapman brothers in 1906, later in the Schuyler Collection. Plate. (Reverse shown on plate VII.) \$27.00.

1799 [BB-157] B-5a. EF. Col. Green Collection. \$30.00.

1799 [BB-158] B-16. EF, slightly rubbed on highest parts. Considerable mint lustre. A.M. Smith Collection. Plate. (Both

obverse and reverse shown on plates VI and VII.) \$32.00.

1799 [BB-158] B-16a. Same condition as last. A nice choice coin. Col. Green Collection, later in Gettys Collection. \$30.00.

1799 [BB-158] B-16b. EF, slight wear on highest parts. Extremely rare in this most advanced state of die breaks. From Elder sale 1924. \$30.00.

1799 [BB-158] B-16c. EF, some mint lustre, nice impressions. Gettys Collection. \$55.00.

1799 [BB-158] B-16d. EF, some mint lustre. Sharp impressions. Col. Green Collection. \$32.50.

1799 [BB-159] B-23. EF, nearly Unc., with sharp even impressions. From the Col. Green Collection. Very rare. Plate. (Both obverse and reverse on plates VI and VII.) \$55.00.

1799 [BB-160] B-12. VF. Col. Green Collection. Plate. (Obverse) \$26.00.

1799 [BB-160] B-12a. See plate for obverse of this identical coin on plate VI in book. EF, magnificent impressions. \$72.50.

1799 [BB-160] B-12b. EF. Rare. P.C. Clark Collection. Plate. (Obverse of this very coin shown on plate VI.) \$75.00.

1799 [BB-161] B-11. VF. Reeder Collection. Plate. (Reverse.) \$29.00.

1799 [BB-161] B-11a. EF, sharp even impressions. Considerable mint lustre. Rare. From Parsons and Schuyler Collections. \$27.50.

1799 [BB-161] B-11b. VF. Bought from B.G. Johnson. Rare. \$22.00.

1799 [BB-162] B-6. Unc., but a few file marks on reverse done at the Mint to adjust weight of planchet before striking, and usual weakness at UNUM on ribbon. Attractive color and mint lustre. Lyman H. Low sale 1918. Plate. (Both obverse and reverse used for plates VI and VII in book.) Very rare variety. \$57.50.

1799 [BB-162] B-6a. Unc., magnificent sharp even impressions. Highest portions of eagle on reverse are very slightly rubbed. Nearly full mint lustre. This coin came from the convention sale of the California State Numismatic Association held last spring in Santa Cruz, where it was knocked off at \$85. \$90.00.

1799 [BB-163] B-10c. VF. Elder sale 1936. Strong even impressions. \$22.00.

1799 [BB-163] B-10. VF. Elder sale 1936. Plate. (Both obverse and reverse of this coin shown on plates VI and VII.) \$24.50.

1799 [BB-163] B-10a. VF, bold even impressions. \$25.50.

1799 [BB-163] B-10b. Fine. From Lighthouse Collection. \$20.00.

1799 [BB-164] B-17. EF, nearly Unc., considerable mint lustre, prooflike surface on reverse. Schuyler Collection. Plate. \$34.00.

1799 [BB-164] B-17a. EF, mint lustre. From Gettys Collection. \$34.00.

1799 [BB-164] B-17b. VF. Col. Green Collection. \$25.00.

1799 [BB-165] B-8. EF, considerable mint lustre. P.C. Clark Collection. Plate. (Both obverse and reverse shown on plates VI and VII in book.) \$31.00.

1799 [BB-165] B-8a counterstamped by Ephraim

Brasher, New York City merchant, famous for his Brasher gold doubloons. With counterstamp EB in depressed rectangle, on top part of head. VG, and the only one known. Ex. rare. From the celebrated Dunham Collection. \$42.50.

1799 [BB-165] B-8a. VF, possibly better, as there is some lustre close to stars and letters. Bought from Gutttag Bros. many years ago. \$26.00.

1799 [BB-165] B-8b. Obverse Fine, reverse VG. Very rare state. \$18.25.

1799 [BB-166] B-9. Unc., beautiful impressions, except for slight friction on reverse center. Finely toned, mint lustre. Early impressions. From Elder sale in 1924. Plate. (Plate VI and VII show both obverse and reverse of this identical coin.) \$41.50.

1799 [BB-166] B-9a. EF, sharp even impressions, nearly Unc., mint lustre. From the Gable Collection, later in the Reeder Collection. \$38.50.

1799 [BB-166] B-9b. VF. Col. Green Collection. \$22.00.

1799 [BB-166] B-9c. Some file marks on reverse done at Mint to reduce planchet weight. Sharply struck, Unc., with mint lustre. Schuyler Collection. \$51.00.

1799 [BB-167] B-14. Unc., strong impressions, reverse struck somewhat off center to right as usual with this variety. Mint lustre. Bought from Henry Chapman over 30 years ago. Plate. (See plates VI and VII for both obverse and reverse illustrations of this very coin.) \$45.00.

1799 [BB-168] B-22. Obverse Fine, reverse VF. Ex. rare variety, Rarity-6. From the Schwab Collection. Plate. (Reverse). \$28.50.

1799 [BB-169] B-21. EF, only slightly touched by wear on highest parts. Bought from Henry Chapman 30 years ago. Plate. (Obverse). \$45.00.

1800 [BB-181] B-1. Fine. Very rare. Plate. (Obverse). \$21.00.

1800 [BB-182] B-2. Fine. Excessively rare, Rarity-7. From the "World's Greatest Collection" sale by Numismatic Gallery in New York in 1945 at \$45. Probably the Haseltine specimen, and the only one I have ever seen. \$38.75.

1800 [BB-183] B-3. Excessively rare, the finest known, and not found by me until 1949. Formerly in "World's Greatest Collection." VF, obverse edge nick at top. Plate. (Reverse). \$42.50.

1800 [BB-184] B-12. Unc., Proof surface on reverse. Col. Green Collection. \$51.00.

1800 [BB-184] B-12a. VF. From Lyman H. Low sale 1916. Plate. (Obverse) \$22.50.

1800 [BB-185] B-20. Obverse new, not known to Haseltine. The upper right star is in a position similar to the obverse of the 1804 dollars, with two points almost touching Y. This variety of the 1800 dollar is just as rare as a genuine 1804 dollar, and just as hard to find, which prevents its being used in idle fabrication of an "1804" by altering the date, but it has been done at least twice. EF, sharp even impressions, well toned. Rarity-7. Plate. (Obverse). The only piece known to me. \$175.00.

1800 [BB-186] B-4. VF, strong impressions, some lustre. From same collection as last. Plate. (Obverse). \$32.50.

1800 [BB-186] B-4a. VF, and from same collection as two preceding. W.G.C. sale in New York, 1945. Very rare. Plate. (Obverse). \$26.00.

1800 [BB-186] B-4b. Recently obtained, it was formerly in Col. Green Collection. VF, except weak on upper right part of eagle, ribbon, and a few stars on right on reverse. V. rare. \$27.50.

1800 [BB-187] B-16. EF, sharp even impressions. From Earle sale, later in Schuyler Collection. Plate. (Both obverse and reverse seen on plate VIII.). \$31.00.

1800 [BB-187] B-16a. EF, sharp even impressions. From Gettys Collection. \$28.50.

1800 [BB-187] B-16b. VF. From H. Chapman in 1930. \$24.00.

1800 [BB-188] B-8. EF, sharp even impressions. H.P. Smith and Schuyler collections. Plate. (Both obverse and reverse of this very coin shown on plate VIII). \$35.00.

1800 [BB-189] B-5. EF, some lustre. Rare. Bought from B.G. Johnson. \$36.00.

1800 [BB-189] B-5a. VF, and very rare variety. Plate. (Reverse) \$26.00.

1800 [BB-189] B-5b. VF, nicely toned, some mint lustre. Col. Green Collection. Ex. rare. \$31.00.

1800 [BB-189] B-5c. VF. Newcomer Collection. \$24.00.

1800 [BB-190] B-10. VF and sharp. From Col. Green Collection. (One of biggest collections of U.S. coins ever assembled). \$23.50.

1800 [BB-190] B-10a. EF. Col. Green Collection. \$31.00.

1800 [BB-191] B-11. VF. Purchased from Ben's Stamp & Coin Co. in Chicago. Plate. (Both obverse and reverse shown on plate VIII.) \$32.50.

1800 [BB-192] B-19. VF, sharp, and well-centered. Plate (obverse), bought from Johnson, St. Louis. \$25.00.

1800 [BB-192] B-19a. VF, nice even impressions. Schwab Collection. \$24.00.

1800 [BB-192] B-19b. EF, sharp even impressions. The AMERICA variety. From Elder sale in 1927. \$32.50.

1800 [BB-193] B-18. EF, some lustre near stars and letters. A.M. Smith Collection. Plate. (Plate VIII shows both obverse and reverse.) \$39.00.

1800 [BB-193] B-18a. EF, finely toned piece. From the Fox Collection. \$31.00.

1800 [BB-194] B-14. VF, nicely toned piece, some mint lustre. Treadway Collection. Plate. (See plate VIII in my book on dollars for both obverse and reverse of this identical coin.) \$26.00.

1800 [BB-194] B-14a. VF. Lighthouse Collection. \$29.00.

1800 [BB-195] B-15. VF, sharp and bold impressions. From Elder sale 1924. Plate. (Both obverse and reverse shown on plate VIII.) \$25.00.

1800 [BB-196] B-17. EF. Formerly in Stickney Collection, then in Schwab Collection. Plate. (See plate VIII for both obverse and reverse of this coin.) \$47.50.

1800 [BB-196] B-17a. VF, strong sharp impressions. \$23.00.

1800 [BB-196] B-17b. EF. Col. Green Collection. \$32.00.

1801 [BB-211] B-1. Only slight signs of circulation, strong impressions, mint lustre. From Howe Collection. Plate. (Obverse and reverse of this coin shown on plate IX in book on dollars.) \$42.50.

1801 [BB-211] B-1a. EF, edge very slightly nicked on reverse. From Col. Green Collection. \$41.00.

1801 [BB-212] B-2. EF, a little wear on high parts of hair. Some mint lustre. From Lighthouse Collection. Rare. \$45.00.

1801 [BB-213] B-3. EF, sharp even impressions, nearly Unc. From Col. Green and Gettys collections. \$42.00.

1801 [BB-214] B-4. EF, sharp even impressions. Superb example of this very rare variety, Rarity-5. From the Treadway Collection sale by Elder in 1935. Plate. (Obverse on plate IX.) \$80.00.

1801 [BB-214] B-4a. EF. V. rare. From Col. Green Collection. \$41.00.

1802/1 [BB-231] B-1. EF, sharp even impressions. Well-toned piece. From Newcomer Collection. Plate. (Obverse) \$37.50.

1802/1 [BB-232] B-4. EF, struck a little off center to left. Very rare variety. From Gable and Reeder collections. Plate. (Obverse) \$39.00.

1802/1 [BB-233] B-2. EF, nearly Unc., considerable lustre, sharp impressions. From Earle sale, then in Schuyler Collection. Plate. (Obverse of this very coin shown on plate IX.) \$41.00.

1802/1 [BB-234] B-3. EF, magnificent impressions. From the Brand Collection. \$42.50.

1802/1 [BB-235] B-9. A new variety which I discovered in 1950 when I purchased the Marmaduke Fox collection of United States coins. Unknown to Haseltine, and to me also until 1950. See my book for description. The plates for the book had already been completed when this coin was found, hence not shown on plate. Strictly Fine. May be unique. \$155.00.

1802 Bolender-8. The Proof restrike. Brilliant and sharp perfect Proof. From the "World's Greatest Collection" sale by the Numismatic Gallery in New York in Jan. 1945. Plate. Just as rare as the 1804 dollar, but not as valuable because of the date. In very few of the great collections of the past, there was none in the great Stickney sale, although there was the 1804. \$275.00.

1802 [BB-241] B-6. Unc., except for light cabinet friction. From the Brand Collection. Plate. (Obverse and reverse of this very coin illustrated on plate IX in book.) \$65.00.

1802 [BB-242] B-5. EF, sharp even impressions, some Proof surface. From Howe Collection. Plate. (Both obverse and reverse of this piece used for plate IX in book.) Extremely rare variety, Rarity-6. Worth \$85. \$37.50.

1803 [BB-251] B-1. VF, nicely toned, and well centered. Very rare. Newcomer Collection. Plate. (Obverse) \$40.00.

1803 [BB-252] B-5. EF, nearly Unc., some lustre. Sharp even impressions. Very rare variety. From the Brand Collection. Plate. (Obverse) \$40.00.

1803 [BB-252] B-5a. VF. Treadway Collection. Very rare. \$37.50.

1803 [BB-254] B-4. VF, sharp even impressions, nicely toned coin. From Gable Collection, then in Reeder Collection. Plate. (Obverse) \$40.00.

1803 [BB-255] B-6. Sharp Unc., beautiful mint lustre, and some Proof surface. Strong sharp impressions. From the Brand Collection. \$105.00.

1803 [BB-255] B-6a. EF, beautifully toned. Col. Green Collection. \$65.00.

1803 [BB-255] B-6b. Unc., with Proof surface. Very rare. From Gable Collection. Plate. (Obverse on plate IX.) \$80.00.

The 1952 ANA Convention Sale, August 16-21, 1952, New Netherlands Coin Co. Many early dollars were included, mainly from the cabinets of O.K. Rumbel and Ralph J. Lathrop. The descriptions by John Jay Ford, Jr. included attributions and detailed grading commentaries.

1795 [BB-13] B-9. Almost VF. A choice and lustrous coin with magnificent iridescent toning. There is a minute obverse edge nick, but this is one of the finest known specimens. Rarity-5. \$42.50.

1795 [BB-13] B-9. Fine. Has an odd planchet defect through Y of LIBERTY. Rarity-5. \$22.00.

1795 [BB-20] B-2. Obverse VG and comparatively sharp; reverse is Good to VG. Usual minor handling defects. \$16.00.

1795 [BB-20] B-2. Strictly VG; nicely centered and struck, with two slight defects in the reverse field. \$24.00.

1795 [BB-21] B-1. AU, bold and sharp, with considerable original lustre. Only the highest parts of the reverse show signs of rubbing. \$125.00.

1795 [BB-21] B-1. Slightly better than Fine. Has a reverse edge bruise. \$27.00.

1795 [BB-21] B-1. Strictly Fine. Beautifully centered and evenly worn. \$25.00.

1795 [BB-21] B-1. VG. Minor defect in left obverse field. Nice even wear. \$17.50.

1795 [BB-25] B-6. VF to EF. A beautifully toned coin with traces of reverse mint lustre. There is a slight imperfection upon the reverse edge, and the obverse shows the slightest signs of file marks. \$47.00.

1795 [BB-26] B-12a. Fine to VF. \$67.50.

1795 [BB-27] B-5. About EF. Not quite as sharp as preceding, but considerable mint lustre. Boldly struck with well defined borders. Minute nick in upper part of obverse field. \$37.50.

1795 [BB-27] B-5. About Fine. \$22.00.

1795 [BB-27] B-5. Claims to EF. Well centered with a partly toned, lustrous surface. Has a few infinitesimal imperfections, many of which are manufacturing defects. \$35.00.

1795 [BB-27] B-5. EF. Left side of obverse, in particular, shows file marks done at mint to correct planchet weight. Minute reverse edge nick. \$45.00.

1795 [BB-27] B-5. Fine, though bought as VF. Few minute defects. \$25.00.

1795 [BB-27] B-5. VF. Nicely toned and highly desirable coin. \$38.00.

1795 [BB-51] B-14. About VF. File marks on obverse together with one or two unimportant defects which include a few minute scratches under L of LIBERTY. \$26.00.

1795 [BB-51] B-14. EF. Only the high spots, particularly on the reverse, show signs of rubbing. The obverse shows several file or adjustment marks, done at the mint in correcting planchet weight. Originally purchased as Unc. \$42.50.

1795 [BB-51] B-14. Strictly Fine. Usual minor defects together with a serious, attempted puncture in the O of OF upon reverse. \$15.00.

1795 [BB-52] B-15. Fine to VF. Nice, clean coin with nominal amount of commonly found picayune defects. \$26.00.

1795 [BB-52] B-15. Strictly VF with traces of mint lustre. There are one or two microscopic edge defects. \$43.00.

1795 [BB-52] B-15. Strictly VG. Small gouge in left obverse field, as well as a few other defects, including a reverse edge bruise. \$15.00.

1796 [BB-61] B-4. Almost Fine. \$26.00.

1796 [BB-61] B-4. VF. A lightly toned and lustrous coin with a minute rim bruise or so, opposite C in AMERICA, upon the reverse. \$36.00.

1796 [BB-61] B-4a. Good to VG with two small punch marks upon reverse. \$13.00.

1796 [BB-61] B-4a. Strictly Good with a minute reverse edge bruise. \$21.00.

1796 [BB-61] B-4b. Identical obverse to the last, but curl on top of head incomplete or defective, as on B-3. VF. There are faint file marks on the obverse, most discernible on center of the bust. Also, a pinpoint gouge in the left obverse field. \$46.00.

1796 [BB-63] B-2. About VF. \$34.00.

1796 [BB-65] B-5. About Fine. Weakly struck, as sometimes found, on lower left side of obverse and at STA of STATES upon reverse. Lightly toned. \$23.00.

1796 [BB-65] B-5. Almost EF; slight rubbing on the high spots. This coin has a beautifully toned surface with considerable mint lustre. A few, hardly noticeable scratches between UNITED and STATES upon reverse. \$42.50.

1796 [BB-65] B-5. Fine or better. Nicely toned. \$25.00.

1796 [BB-65] B-5. Strictly Fine. Few defects, including an obverse edge bruise. Appears to have been cleaned. \$22.00.

1796 [BB-66] B-1. Fine to VF. \$38.00.

1797 [BB-71] B-3. Obverse strictly VG. Reverse About Good. Obverse shows a few handling marks and has three initials lightly scratched in right field. \$18.00.

1797 [BB-71] B-3. Obverse VG or better. Reverse Almost Good. Outside of a minor obverse edge bruise, this is a nice, evenly worn coin. \$13.00.

1797 [BB-71] B-3. Strictly VF with traces of lustre. One or two old minor defects, but above average. \$26.00.

1797 [BB-71] B-3. VF. Very lightly toned with traces of tarnish and of golden lustre. Reverse edge has a small planchet defect which looks like a minor bruise. \$44.00.

1797 [BB-72] B-2. Fine, with some claims to VF. Obverse is particularly sharp and well struck. Several signs of mishandling, mostly on the edges, including a very small cut in the right obverse field. \$77.50.

1797 [BB-73] B-1. VF with a nicely toned iridescent surface. There is a minute edge nick upon the lower part of the obverse which does not affect the appearance of this coin. We also note an odd planchet defect, of little consequence, in right obverse field. \$57.00.

1797 [BB-73] B-1. VF. Beautifully centered with considerable mint lustre. \$41.00.

1797 [BB-73] B-1a. About EF. The eagle, upon the reverse, is not struck up as always, but the various high spots only show slight rubbing. \$57.50.

1797 [BB-73] B-1a. Fine to VF. Few unimportant defects including an obverse edge bruise. Lightly tarnished. \$30.00.

1798 [BB-81] B-2. Obverse VG. Has a few granulation streaks together with several tarnish spots and other minor

defects. Reverse Very Fair to Good. \$21.00.

1798 [BB-81] B-2. VF. A well centered, evenly struck and attractively toned coin. \$54.00.

1798 [BB-82] B-1. Fine or better. Usual minor defects and several rim bruises, including a serious one that is apparent on both sides. \$31.00.

1798 [BB-82] B-1. Good to VG. Minute rim defect on obverse. Tarnished and evenly worn. \$21.00.

1798 [BB-92] B-4. VF and sharp. \$37.00.

1798 [BB-92] B-4. VF to EF. Sharp and bold, the obverse particularly so. \$39.00.

1798 [BB-95] B-6. Strictly Fine or better. A number of edge bruises and several minute nicks. \$8.50.

1798 [BB-95] B-6. VG with some claims to Fine. Few defects and well toned. \$10.50.

1798 [BB-95] B-7. About VF. Attractively toned with faint traces of lustre. A choice and desirable coin with the slightest reverse defects. Rarity-4. \$29.00.

1798 [BB-101] B-17. About EF. A beautifully toned coin with considerable lustre. \$67.50.

1798 [BB-102] B-20. Almost VF. Two unimportant obverse edge bruises. \$20.00.

1798 [BB-102] B-20. Fine or better. Has a minute reverse edge bruise. \$20.00.

1798 [BB-102] B-20. Strictly Fine and has a few minor defects, including several light digs on the obverse. \$16.00.

1798 [BB-104] B-22. Good or slightly better. Also slightly mishandled, including a reverse scratch and two minute digs to the right of E in STATES. \$11.00.

1798 [BB-104] B-22. VG. A number of edge bruises, one of which, on the obverse, is rather serious. \$10.50.

1798 [BB-105] B-23. Strictly Fine. Nicely toned. \$18.00.

1798 [BB-105] B-23a. About VF. Usual slight signs of handling. \$20.00.

1798 [BB-105] B-23a. VF or better, originally purchased as EF. A bright, lustrous bold coin with infinitesimal indications of handling. \$27.00.

1798 [BB-106] B-19. VF. \$25.00.

1798 [BB-108] B-13. Almost Fine. Bought as VF. \$11.00.

1798 [BB-111] B-11. Fine to VF. Obverse edge bruise and small punch mark upon breast. \$29.00.

1798 [BB-111] B-11. Fine. Few light handling defects. Rarity-6. \$30.00.

1798 [BB-112] B-15. Strictly VF. Bold and generally well struck, but somewhat weak in the center. \$21.00.

1798 [BB-112] B-15. VG to Fine. There is a slight edge bruise upon the obverse and two upon the reverse. \$13.00.

1798 [BB-112] B-15a. Almost VF. Weakly struck on the upper left part of the obverse and the corresponding part of the reverse. Two minute reverse edge bruises. \$21.00.

1798 [BB-112] B-15a. Fine to VF. A nice, clean example. \$21.00.

1798 [BB-113] B-27. Almost Unc. A highly lustrous coin, struck on a wide full planchet. There are a few, almost invisible scratches to the right of S in STATES. \$30.00.

1798 [BB-113] B-27. Fine to VF. Above average, but with one or two unimportant reverse defects. \$16.00.

1798 [BB-113] B-27. Strictly Fine or better. The obverse

has its share of minor defects. \$12.50.

1798 [BB-115] B-31. Fine or better for this poorly struck piece. Both sides show a few old signs of handling. Rarity-7. \$39.00.

1798 [BB-116] B-30. Strictly Fine. Slight defects. \$19.00.

1798 [BB-122] B-14. VG. Has an odd shaped cut at mouth and one or two other defects. \$10.00.

1798 [BB-123] B-8. Somewhat weakly struck in the center of the reverse, but strictly VF. A well struck and lustrous coin with two infinitesimal reverse nicks. \$27.00.

1798 [BB-123] B-8. VF, has been roughly handled. \$18.00.

1798 [BB-123] B-8a (Should be 8b.) VG or better with a number of minor defects, including a pinpoint nick in center of shield. \$11.50.

1798 [BB-123] B-8a. (Should be B-8b.) Almost Fine and showing the full effect of broken dies. \$16.50.

1798 [BB-124] B-25. VG, originally bought as Fine. Usual signs of handling, this time obvious in two obverse edge bruises and a slight dig in left obverse field. \$14.00.

1798 [BB-125] B-24. VF. A sharp, well struck example. \$17.00.

1798 [BB-125] B-24a. AU. A lustrous and comparatively bold coin, considering the condition of the dies. \$28.00.

1798 [BB-125] B-24a. Fine or better. Minute bruise upon shield on reverse. \$12.50.

1799/8 [BB-141] B-3. EF. A boldly struck and lustrous coin with sharp, even impressions. Rarity-5. \$41.00.

1799/8 [BB-141] B-3. Fine or better. \$15.00.

1799/8 [BB-141] B-3. Fine or better. \$22.00.

1799/8 [BB-143] B-2. About VF. Not strongly struck, but a nice example of a popular coin. \$22.00.

1799/8 [BB-143] B-2. Fine or better. Traces of mint lustre. \$17.50.

1799/8 [BB-143] B-2. Fine. Two slight die defects, one on each side. \$16.00.

1799 [BB-151] B-13. Strictly Fine. A nice clean and lustrous coin, with the exception of two old and light scratches upon the reverse. Rarity-6. \$21.00.

1799 [BB-153] B-4. VG. Few light edge bruises, particularly on the obverse. \$16.00.

1799 [BB-154] B-18. VG. This coin has the usual quota of defects and has also been expertly plugged and retooled. \$3.50.

1799 [BB-155] B-19. Fine or better. Slightly tarnished. Rarity-5. \$21.00.

1799 [BB-155] B-19. VG. Minute edge nick on left side of obverse. \$12.50.

1799 [BB-156] B-7. VF. We note a few very slight signs of handling and an unimportant reverse edge bruise. Rarity-4. \$24.00.

1799 [BB-156] B-7a. VF or better. A boldly struck and lustrous dollar. Rarity-5. \$34.00.

1799 [BB-157] B-5a (Should be B-5c.) EF or better. Well struck, with considerable mint lustre. \$30.00.

1799 [BB-157] B-5a. About VF. One or two slight defects. Traces of mint lustre. \$15.50.

1799 [BB-157] B-5a. Fine to VF. The reverse borders are particularly well struck upon this coin. One or two minute obverse edge defects. \$15.50.

1799 [BB-157] B-5a. Fine to VF. There are a number of imperfections, particularly on the edges, and the obverse milling has been slightly improved upon. \$16.00.

1799 [BB-157] B-5a. Strictly Fine. Short scratch on left side of shield into reverse field. \$12.50.

1799 [BB-158] B-16. VF to EF. A beautifully toned impression with a minute obverse edge defect. Unusually choice. \$26.00.

1799 [BB-158] B-16a. Fine or even a little better. A nice, clean coin. \$12.50.

1799 [BB-158] B-16b. Strictly VF. Considerable mint lustre. Reverse shows slight evidence of file marks. A choice, attractive coin. \$37.50.

1799 [BB-158] B-16c. EF and lustrous. A nice coin, well struck and evenly rubbed. \$31.00.

1799 [BB-159] B-23. Fine. Shows usual handling defects which seem to have an affinity for this variety. Nicely centered, evenly worn. \$17.00.

1799 [BB-159] B-23. Strictly VF. Well struck with a few defects, most of which appear on the obverse. In particular, we note two small gouges in front of forehead and another on the edge, at point of bust. \$31.00.

1799 [BB-159] B-23. Thirteen stars, 8x5. Strictly VF. A bold and beautifully struck example of this popular "type" coin. Actually, this is one of the cleanest specimens we have seen. \$41.00.

1799 [BB-160] B-12a. VG or better. Minute gouge at top of head. \$11.00.

1799 [BB-160] B-12a. VG. Small reverse edge bruise. \$10.00.

1799 [BB-160] B-12b [Should be B-12c.] VG to Fine. Tarnished with the usual unimportant defects. Rarity-4. \$17.00.

1799 [BB-160] B-12b. Fine or better. Traces of mint lustre. A clean and attractive coin. \$13.50.

1799 [BB-160] B-12b. Strictly Fine. Minute reverse edge defect. \$12.50.

1799 [BB-160] B-12b. VF with some claims to EF. Well centered, well struck. \$25.00.

1799 [BB-160] B-12b. VF. There are a few file or adjustment marks upon the reverse, together with one or two minute edge defects. \$41.00.

1799 [BB-161] B-11b. Fine. Few edge bruises, including one rather obvious one upon the reverse. \$15.00.

1799 [BB-161] B-11b. Strictly Fine. One or two minor defects. \$12.50.

1799 [BB-161] B-11b. VF with considerable lustre. \$20.00.

1799 [BB-161] B-11b. VF. A boldly struck and well centered coin with traces of lustre. \$20.50.

1799 [BB-161] B-11b. VG or better. Several slight defects, including what appears to be a small star scratched in the left obverse field. \$10.50.

1799 [BB-162] B-6 [Should be B-6a.] Strictly Fine. Rarity-5 or better. \$20.00.

1799 [BB-162] B-6 [Should be B-6b.] VF. A lightly toned coin with traces of lustre. There are a few light nicks upon the obverse. \$31.00.

1799 [BB-162] B-6. Fine or better. Two minute obverse edge nicks do not impair the appearance of this rarity. \$15.00.

1799 [BB-162] B-6. Some claims to EF. A beautifully struck

piece with deep, sharp reverse borders. Nicely toned with traces of mint lustre. \$28.00.

1799 [BB-163] B-10. Fine. Small reverse edge bruise. \$15.00.

1799 [BB-163] B-10. Strictly Fine. \$15.00.

1799 [BB-163] B-10. Strictly VF and lustrous. Minor bruising upon obverse edge. \$15.50.

1799 [BB-163] B-10a. VF, with a slight edge bruise upon the obverse. \$22.00.

1799 [BB-163] B-10b. About Fine. Few edge bruises, mostly light, but one severe upon the reverse. \$10.50.

1799 [BB-164] B-17. VG. \$10.50.

1799 [BB-164] B-17a. Fine. A clean and well struck dollar. \$12.50.

1799 [BB-164] B-17a. VG. Several signs of mishandling, including a few light scratches and an edge bruise or so. \$8.50.

1799 [BB-165] B-8a. Almost VF. Minor edge bruise at top of reverse and a planchet defect at edge, above S of STATES. \$12.50.

1799 [BB-165] B-8a. VG, few defects, but a nice clean coin. \$10.00.

1799 [BB-165] B-8b. Fine. One or two minor defects. \$13.00.

1799 [BB-165] B-8b. Unc. A splendid, sharp impression with full mint lustre. \$57.00.

1799 [BB-166] B-9. Strictly Fine. A nice, clean coin. \$12.50.

1799 [BB-166] B-9. VG. Light obverse scratch and few minor edge bruises. \$10.00.

1799 [BB-166] B-9. VG. Unimportant obverse die bruise. \$10.00.

1799 [BB-166] B-9a. About Fine. Few signs of mishandling, including an edge bruise on each side. \$10.00.

1799 [BB-166] B-9a. VF. Struck on a wide, full planchet with even impressions of the dies. Traces of lustre. Few unnoticeable defects. \$17.00.

1799 [BB-167] B-14. Fine or better. Well centered and struck. Slightest signs of handling. \$15.00.

1799 [BB-167] B-14. Fine to VF. Rarity-4. \$17.00.

1799 [BB-167] B-14. VG. Small obverse nick under T of LIBERTY. \$10.50.

1799 [BB-167] B-14. VG. Usual unimportant defects. \$10.00.

1799 [BB-168] B-22. (Should be B-22a). Obverse Fine; reverse VF. This coin has an infinitesimal reverse edge nick. \$36.00.

1799 [BB-168] B-22. Obverse VG; Reverse Fine. Few unimportant defects. \$20.00.

1799 [BB-169] B-21. About VF. A sharp, desirable coin. Lightly toned. \$16.00.

1799 [BB-169] B-21. Almost EF. Slight signs of die roughness. A splendid, lustrous coin that is only touched by wear on the highest parts. Beautifully toned. \$27.50.

1799 [BB-169] B-21. Almost Fine. \$15.00.

1799 [BB-169] B-21. Fine or better. Usual infinitesimal signs of handling. \$12.50.

1800 [BB-184] B-12. Fine. Usual minor defects, including

a few light reverse scratches above eagle's head. \$12.50.

1800 [BB-186] B-4. Strictly Fine. Well centered and strongly struck. Slightest defects. \$21.00.

1800 [BB-187] B-16. Fine to VF. A nice, clean coin. \$13.00.

1800 [BB-187] B-16. Fine. A bright and almost perfectly clean coin. \$20.00.

1800 [BB-187] B-16. Fine. Somewhat roughly handled and holed above head. \$3.00.

1800 [BB-187] B-16a. VF. A nicely struck coin with broad, bold borders, evenly toned with one or two minor reverse edge bruises. \$23.00.

1800 [BB-187] B-16b. About Fine. Light scratch from chin to tenth star. \$13.00.

1800 [BB-187] B-16b. About Fine. Several serious defects including an obverse edge bruise. \$12.00.

1800 [BB-187] B-16b. Not quite Fine, but a beautifully struck and attractive coin. \$12.50.

1800 [BB-187] B-16b. Strictly Fine and well struck. Several minor signs of handling plus a small gouge at the base of throat. \$13.50.

1800 [BB-187] B-16b. VF or better. Sharp and bold impressions. A nicely toned coin with traces of mint lustre. \$21.00.

1800 [BB-188] B-8. Fine to VF. Wide flan with deep, bold borders. \$15.50.

1800 [BB-188] B-8. VG with a number of edge bruises and abrasions, many of which are upon the reverse. \$8.50.

1800 [BB-189] B-5. VF. Few defects including light obverse edge bruise above BE of LIBERTY. \$22.00.

1800 [BB-190] B-10. Fine. Nicely struck. Few reverse edge defects. \$14.50.

1800 [BB-190] B-10. VG. Odd punch mark on neck. \$8.50.

1800 [BB-190] B-10a. Fine to VF. Nicely toned, but with a few minor imperfections, including a slight obverse edge bruise. At least Rarity-3. \$18.50.

1800 [BB-191] B-11. About VF. A well centered, sharply struck and lustrous coin. There is a rather serious planchet defect upon the edge, above I in LIBERTY, which extends to the reverse. \$45.00.

1800 [BB-191] B-11. Fine. Small X scratched by some vandal in space under UNUM on reverse. \$12.50.

1800 [BB-192] B-19. About VF. Beautifully toned with traces of lustre. \$19.00.

1800 [BB-192] B-19. Not quite Fine. The edges are lightly bruised upon both sides, a common characteristic of these large, heavy coins. \$17.00.

1800 [BB-193] B-18. About EF. A boldly struck and nicely toned piece, worthy of a home in the finest collection. \$24.00.

1800 [BB-193] B-18. Fine to VF. One or two insignificant rim defects. \$18.00.

1800 [BB-193] B-18. VG. \$10.00.

1800 [BB-194] B-14. So-called "Dotted Date," flaws inside and above first 0 in date. Almost VF. This coin has a rather peculiar surface which is entirely too lustrous. We note a minute reverse edge bruise and one or two other unimportant defects. Rarity-3. \$19.00.

1800 [BB-194] B-14a. Fine to VF. Sharp and attractive. \$15.50.

1800 [BB-194] B-14a. Fine with a slight obverse edge

bruise. A nicely toned and desirable coin. \$12.50.

1800 [BB-194] B-14a. Fine with some claims to VF. \$13.00.

1800 [BB-195] B-15. Fine to VF and also struck upon a full flan. Usual unimportant signs of mishandling. \$17.50.

1800 [BB-195] B-15. VF. Wide, broad planchet with full borders. \$22.00.

1800 [BB-196] B-17. Almost VF, but has a light scratch across the bust to the right border plus a few other less important defects. \$13.00.

1800 [BB-196] B-17a. About Fine. Obverse edge bruise above ER in LIBERTY. \$12.50.

1801 [BB-211] B-1. Good to VG. Few defects. An edge injury has apparently been retooled on reverse close to eagle's left wing tip. \$7.50.

1801 [BB-211] B-1. VG to Fine. A few reverse scratches and a neat hole above the head. \$4.75.

1801 [BB-211] B-1. VG. A sharp and clean coin. \$14.00.

1801 [BB-211] B-1a. [Should be B-1b.] About Fine. Slight signs of mishandling. \$21.00.

1801 [BB-211] B-1a. About VF. Sharply struck and attractively toned with two small obverse edge nicks. Rarity-4. \$22.00.

1801 [BB-212] B-2. Almost VF. Planchet clip in the left obverse field. \$25.00.

1801 [BB-212] B-2. Strictly Fine or better, the reverse being particularly well struck. Traces of lustre. Rarity-4. \$25.00.

1801 [BB-212] B-2. Strictly Fine. Minute reverse edge bruise. \$18.00.

1801 [BB-212] B-2. VG or better. Numerous signs of mishandling, including several minor reverse edge bruises. \$11.50.

1801 [BB-213] B-3. Good to VG. Crudely plugged at top of head. \$3.50.

1801 [BB-214] B-4. VF. A strongly struck dollar with traces of toning. Unusually choice and decidedly above average. Rarity-5. V. rare. \$27.00.

1801 [BB-214] B-4a. Almost Fine. Few surface flaws. \$13.50.

1802/1 [BB-231] B-1. Strictly Fine. A nice, evenly worn and clean coin. \$20.00.

1802/1 [BB-232] B-4. Fine or slightly better. Rarity-5. \$19.00.

1802/1 [BB-232] B-4. Strictly VF, traces of lustre. \$27.00.

1802/1 [BB-232] B-4. VG or better. Minute handling defects. \$12.50.

1802/1 [BB-233] B-2. Good, few defects. \$8.00.

1802/1 [BB-234] B-3. Almost VF with one or two minor handling defects. \$19.50.

1802/1 [BB-234] B-3. Better than Fine. Small cut on reverse edge. \$18.00.

1802/1 [BB-234] B-3. Fine, purchased as VF. Several unimportant defects, including a short reverse scratch in the stars above the eagle. \$13.50.

1802/1 [BB-234] B-3. Good. Somewhat mishandled and well tarnished. \$11.00.

1802/1 [BB-234] B-3. Obverse Good; reverse Very Fair. \$7.50.

1802 [BB-241] B-6. About VF. Usual light signs of han-

dling, particularly upon the obverse. \$13.50.

1802 [BB-241] B-6. About VG. Two reverse defects. \$7.25.

1802 [BB-241] B-6. Almost VF. Slight reverse edge bruise above TE of STATES. \$15.00.

1802 [BB-241] B-6. EF. A splendid, sharply struck and bold coin with one or two handling defects that do not mar its beauty. Well centered and lustrous with slight reverse file marks. Traces of tarnish. \$27.00.

1802 [BB-241] B-6. Fine or better. A nice, clean coin with a simulated lustrous surface. \$13.00.

1802 [BB-241] B-6. Fine to VF. A well centered and struck coin. \$16.00.

1802 [BB-241] B-6. Fine to VF. One or two unimportant reverse nicks. Traces of golden toning. \$13.50.

1802 [BB-241] B-6. Fine. Two small reverse scratches above group of arrows. \$12.00.

1802 [BB-241] B-6. Strictly Fine. \$13.50.

1802 [BB-241] B-6. Strictly VG. \$11.00.

1802 [BB-241] B-6. Unc. A superb coin, almost as perfect as when it left the dies. The bright, frosty surface shows only traces of toning and tarnish. The bust displays evidence of contact with other coins, being lightly nicked in one or two spots. \$85.00.

1802 [BB-241] B-6. VF, but has an almost invisible scratch across the face into the hair, plus an edge cut that shows on both sides. \$15.00.

1802 [BB-241] B-6. VF. Well struck and sharp. \$18.00.

1803 [BB-252] B-5. VF, with traces of lustre. A splendid example of this rare variety. \$33.00.

1803 [BB-252] B-5a. VF. A boldly struck and lustrous coin. Unusually choice, and valued at \$50. Rarity-5. \$38.00.

1803 [BB-254] B-4. Almost Fine. Few edge or rim bruises, particularly upon reverse. \$17.00.

1803 [BB-254] B-4. Almost Fine. Several small nicks and bruises, on both sides, particularly at edges. \$15.50.

1803 [BB-254] B-4. VF. A lustrous, bold coin with sharp, even impressions. \$31.00.

1803 [BB-255] B-6. About Fine. \$15.50.

1803 [BB-255] B-6. About Fine. Few defects including a minute reverse edge bruise. Traces of lustre. \$16.50.

1803 [BB-255] B-6. Claims to Fine. Slight signs of handling, but otherwise a clean and attractive coin. \$14.50.

1803 [BB-255] B-6. Good to VG. Two light obverse edge bruises. \$11.50.

1803 [BB-255] B-6. Originally Fine or better. This coin has been buffed, upon the obverse, in an attempt to remove several scratches in the right field. Well struck and fairly attractive. \$10.50.

1803 [BB-255] B-6. VG to Fine. Simulated lustrous surface with a light reverse edge bruise. \$13.00.

1803 [BB-255] B-6. VG to Fine. There are several small nicks and cuts, particularly upon the obverse. Reverse edge bruise above AT in STATES. \$12.50.

1803 [BB-255] B-6. VG. Numerous indications of handling. There is an X lightly scratched across reverse. \$13.00.

1803 [BB-255] B-6a. VF, but somewhat mishandled. There is a light scratch in the obverse field and several surface nicks and minor edge bruises upon both sides. \$23.00.

In the **May 1953** issue of *The Numismatist*, **Bebee's**, by then located in Omaha (having moved from Chicago), offered the following early silver dollars for sale.

- 1795 [BB-27] B-5. About Unc. \$115.00.
- 1795 [BB-51] B-14. About Unc. \$95.00.
- 1796 [BB-61] B-4. VF \$55.00.
- 1797 [BB-71] B-3. VF \$55.00.
- 1797 [BB-71] B-3a. EF \$70.00.
- 1797 [BB-73] B-1. Fine-VF \$42.50.
- 1798 [BB-81] B-2. Fine-VF \$47.50.
- 1798 [BB-81] B-2. VF \$59.50.
- 1798 [BB-96] B-6a. VF \$59.50.
- 1798 [BB-105] B-23. About Unc. \$62.50.
- 1798 [BB-108] B-13. Unc. \$95.00.
- 1798 [BB-113] B-27. About Unc. \$57.50.
- 1798 [BB-122] B-14a. VG-Fine \$32.50.
- 1799 [BB-156] B-7. About Unc. \$67.50.
- 1799 [BB-157] B-5. EF \$45.00.
- 1799 [BB-158] B-16b. EF \$90.00.
- 1799 [BB-159] B-23. About Unc. \$110.00.
- 1799 [BB-159] B-23. VF \$75.00.
- 1799 [BB-160] B-12b. About Unc. \$70.00.
- 1799 [BB-166] B-9a. EF \$45.00.
- 1800 [BB-184] B-12. EF \$45.00.
- 1800 [BB-190] B-10. Unc. \$95.00.
- 1800 [BB-192] B-19. VF \$32.50.
- 1800 [BB-193] B-18. About Unc. \$47.50.
- 1800 [BB-193] B-18a. VF \$40.00.
- 1800 [BB-194] B-14. VF \$32.50.
- 1800 [BB-195] B-15. VF \$40.00.
- 1801 [BB-214] B-4. EF \$75.00.
- 1801 [BB-214] B-4. Fine \$42.50.
- 1802/1 [BB-231] B-1. EF \$59.50, AU \$69.50.
- 1802 [BB-241] B-6. EF \$52.50.
- 1802 [BB-241] B-6. Fine-VF \$31.50.
- 1802 [BB-242] B-5. EF \$69.50.
- 1803 [BB-254] B-4. About Unc. \$67.50.

Stack's sale of the Davis-Graves Collection, Part I, April 8-10, 1954. Offered was an unusually fine group of silver dollars, beginning with a particularly well struck 1794 and ending with a specimen of the rare 1804.

1794 [BB-1] Stars struck up on left—unusually so. Handling defects on both sides, slight edge dent below 14th star. This is a VF coin but for these small imperfections. We grade it Fine (and well above average for the year). The rarest of the early dollars struck for circulation. \$600.00.

1795 [BB-11] B-3. Rarity-4. 16 berries. Some fool put his initials in front of and in back of head. Still a choice dollar. EF, plus. \$55.00.

1795 [BB-18] B-7. Rarity-4. Wide date; three leaves under each wing. Choice; reverse prooflike. VF to EF. \$44.00.

1795 [BB-20] B-2. Rarity-2. Wide date; two leaves under

each wing; well centered. Obverse has edge dent under date. EF. \$75.00.

1795 [BB-21] B-1. Rarity-3. Head of 1794. Two leaves under each wing. Well struck and centered with wide, serrated borders. This is not quite EF; prooflike surface. \$70.00.

1795 [BB-25] B-6. Rarity-3. Choice, well struck and centered, showing only slight edge dent above LIBERTY. EF, but hair has been expertly tooled. \$35.00.

1795 [BB-27] B-5. Wide date, common variety. Diagonal bar close to top curl toward fifth star; large planchet, three leaves under each wing. Free of usual defects. About Unc. \$70.00.

1795 [BB-51] B-14. Rarity-3. Fillet bust; small eagle reverse. A beauty—but for slight wear on eagle's breast a truly Unc. dollar. We grade this About Unc. \$65.00.

1795 [BB-52] B-15. Rarity-4. Fillet bust. Well struck, reverse with mint lustre. About Unc. \$80.00.

1796 [BB-61] B-4. Very nice specimen with some mint lustre. Without usual handling marks. Light scratches in left field (done at mint). About Unc. \$140.00.

1796 [BB-65] B-5a. Usual handling defects. VF. \$45.00.

1796 [BB-66] B-1. Small Date, small letters. A nice specimen of a rare coin showing usual handling defects, otherwise clean. VF-EF. \$50.00.

1797 [BB-71] B-3. Well struck and centered; minor handling defects and several minor edge bruises. VF to EF. \$60.00.

1797 [BB-72] B-2. Weakly struck; perfect dies. Wide, serrated borders. VF to EF. \$155.00.

1797 [BB-73] B-1. The rare perfect dies—these dies broke early. Not well struck; showing only very little wear; well centered. EF. \$100.00.

1798 [BB-81] B-2. Rarity-5. Minute edge dents below lowest curl and 8, but still above average. This evenly worn specimen shows some reverse lustre and is graded VF. \$80.00.

1798 [BB-82] B-1a. Rarity-5. Fully struck up, showing none of the bagmarks so common on these heavy coins. Slight wear on ribbon and hair. Reverse worn only on eagle's breast and right leg, but slightly so. Advanced stage of dies. Just a shade from EF. \$90.00.

1798 [BB-94] B-3. Rarity-4. Knob 9. Struck slightly off center on a large planchet. Die dot above drapery (diagnostic). Sharp specimen with some mint lustre, showing some wear on face and hair. Reverse edge dig near right wing tip and light scratches on shield keep this in the VF-EF class. \$41.00.

1798 [BB-95] B-6. Rarity-3. Knob 9; close date; 5 berries. Well centered and struck, with mint lustre. Some wear on high points. EF. \$45.00.

1798 [BB-104] B-22. Rarity-2. Cleaned by some fool, but still only Fine. \$20.00.

1798 [BB-105] B-23. Rarity-3. Beautiful specimen with full mint lustre. Just a shade off Unc., struck weak in center. \$35.00.

1798 [BB-106] B-19. Rarity-5. Obverse and reverse show several handling defects. Fine. \$35.00.

1798 [BB-108] B-13. Struck slightly off center. Equalization marks on shield (done at mint, as said before). Much mint lustre. Choice specimen. About Unc. \$55.00.

1798 [BB-111] B-11 . Rarity-6. Reverse shield dig. About Fine. \$32.50.

1798 [BB-113] B-27. Rarity-2. Retaining much mint lustre and showing only the slightest, if any, wear. Well struck up and centered. Not quite Unc. \$60.00.

1798 [BB-118] B-28. Rarity-3. Same obverse as last, much later state of die, with many die breaks on both sides. Not well struck up in center, although showing little wear. Lustrous and well centered. EF. \$40.00.

1798 [BB-121] B-9. Rarity-4. Close Date; perfect dies; 5 berries. Fine. \$25.00.

1798 [BB-122] B-14b. Rarity-5. Obverse raised and appears rough beyond seventh star into LIB. A VG specimen, evenly worn. \$42.50.

1798 [BB-124] B-25b. Rarity-4. Well struck and centered, with extensive die breaks all around obverse; some mint lustre. EF. Well above average for this rarity. \$45.00.

1798 [BB-125] B-24. VG. \$12.50.

1799/8 [BB-141] B-3. Rarity-5. Unc., with almost full mint bloom. \$120.00.

1799/8 [BB-142] B-1. Rarity-5. This beauty, with its mint lustre, is just a shade from Unc. Shows none of the defects usually found on these heavy coins. \$85.00.

1799/8 [BB-142] B-1a. Rarity-4. Well struck and lustrous. Unc. \$110.00.

1799 [BB-152] B-15a. Rarity-4. Evenly worn, with a small edge bruise at bust point. Several minor, infinitesimal marks take absolutely nothing away from this underrated variety, which is not quite VF. \$45.00.

1799 [BB-153] B-4. Rarity-4. Irregular date, numerous obverse die cracks. A nice, slightly worn specimen, and with a small tarnish spot on hair. VF to EF. \$40.00.

1799 [BB-155] B-19. Slight rubbing on high points. Lustrous, and a shade from Unc. \$61.00.

1799 [BB-157] B-5a. Rarity-3. Slight edge bruises take nothing away from this strictly VF, choice coin. \$30.00.

1799 [BB-158] B-16a. Rarity-2. Evenly toned and worn; nice strike. VF. \$25.00.

1799 [BB-159] B-23. Rarity-5. Perfect dies; evenly worn; well centered. VF. \$42.50.

1799 [BB-160] B-12a. Rarity-4. Well struck and centered. EF. \$55.00.

1799 [BB-161] B-11a. Rarity-5. Sharp, well-centered lustrous specimen, showing "waves" above date where clouds from reverse die are incused. A shade from Unc. \$70.00.

1799 [BB-165] B-8B. Rarity-5. Weakly struck in star field on reverse, otherwise well struck and centered. Reverse mint lustre. EF. \$65.00.

1799 [BB-166] B-9. Heavy scratch from L in LIBERTY to back of hair. Reverse with two edge dents. Fine. \$20.00.

1799 [BB-166] B-9A. Rarity-2. Beautiful Unc. dollar with much mint lustre. \$70.00.

1799 [BB-167] B-14a. Evenly worn; light reverse edge dent. Fine. \$17.50.

1799 [BB-169] B-21. Rarity-4. Well struck and evenly toned with some mint lustre. VF to EF. \$45.00.

1800 [BB-181] B-1. Rarity-5. Minor edge bruise under bust point; some lustre and wear. VF to EF. \$55.00.

1800 [BB-187] B-16b. Rarity-3. Sharply struck. Nicely

toned, some wear on high spots. Lustrous VF. \$40.00.

1800 [BB-189] B-5b. Rarity-6. Nicely toned and evenly worn; well struck and centered. VF condition. \$45.00.

1800 [BB-190] B-10. Rarity-2. Choice VF-EF, showing some mint lustre and tarnish. \$35.00.

1800 [BB-190] B-10a. Rarity-3. Showing a minor bruise below first star; slight rubbing on high spots. Beautiful prooflike surface, nicely toned and struck. Just about Unc. \$50.00.

1800 [BB-191] B-11. Rarity-7. AMERICA variety. Lustrous, well-struck and centered example, showing little or no handling defects or wear of any sort, is no doubt the finest specimen known. EF. \$130.00.

1800 [BB-192] B-19. Nicely toned, struck and centered, reverse with prooflike surface. Little wear, with minor surface scratches and small edge bruise below date. EF. \$40.00.

1800 [BB-193] B-18. Rarity-2. Well struck and centered. Light scratches on cheek and field. EF. \$45.00.

1800 [BB-195] B-15. Rarity-4. Nicely toned and well struck. Shows some wear on ribbons and hair, and minor edge nick on reverse below right wing tip. Lustrous. EF. \$40.00.

1801 [BB-211] B-1. Rarity-4. Struck slightly off center, with two minute edge bruises under date. Reverse more lustrous than obverse; usual handling defects. Choice VF. \$40.00.

1801 [BB-212] B-2. Rarity-4. Planchet defect on rim at first star; edge bruise below bottom curl. Fine to VF. \$27.50.

1801 [BB-213] B-3. Rarity-3. Beautiful, well struck and centered specimen of high quality. Minor edge bruise at sixth star and slight bag defects take nothing away from this lustrous, Unc. dollar. \$85.00.

1801 [BB-214] B-4. Rarity-5. About Unc., showing only slight rubbing on bust and light scratches in hair. \$50.00.

1802/1 [BB-232] B-4. Rarity-5. The rare close overdate. Lustrous and nicely toned, but struck weakly on left side. Reverse has prooflike surface. Unc. \$105.00.

1802/1 [BB-234] B-3. Rarity-3. Sharp, lustrous strike, well centered, cabinet friction on high spots. A shade from Unc. \$110.00.

1802 [BB-241] B-6. Sharp, bluish gold, Unc. specimen. Slight nick on forehead. \$85.00.

1802 [BB-242] B-5. Rarity-6. Evenly worn and well centered; light scratch above bust. Well above average. Choice VF, a shade from EF. \$42.50.

1803 [BB-251] B-1. Rarity-5. Was cleaned and is now starting to tone. Evenly worn; edge bruises. VF-EF. \$45.00.

1803 [BB-252] B-5. Rarity-5. VF, with some mint lustre. \$50.00.

1803 [BB-255] B-6. Rarity-2. Well struck and centered, with much mint lustre. Choice EF. The slightest signs of friction keep this piece out of the Unc. class. \$110.00.

1804. R. Coulton Davis specimen. [Lengthy description omitted here.] \$8,000.00.

Stack's sale of the Anderson-Dupont Collection, November 11-13, 1954, included the following early silver dollars among which were several Mint State specimens.

1794 [BB-1] Strictly Fine to VF. Usual weakness at left stars and tops of UNITED STATES. Minute attempted puncture

near third star. Few pinpoint nicks; adjustment marks around reverse border. \$625.00.

1795 [BB-20] B-2. Unc., prooflike surface. Usual reverse adjustment marks. \$210.00.

1795 [BB-21] B-1. VF, some lustre around date, stars, legend and devices. \$70.00.

1795 [BB-27] B-5. VF. Even wear, much lustre. \$52.50.

1795 [BB-52] B-15. Choice Unc., prooflike. \$200.00.

1796 [BB-61] B-4. Obverse nearly Fine. Reverse VG. \$30.00.

1796 [BB-63] B-2. VF. Minute signs of mishandling, cleaned with an eraser. \$31.00.

1796 [BB-65] B-5. EF, lustrous. Small edge dent at top obverse; minor and inconspicuous nicks in field. \$50.00.

1797 [BB-71] B-3. VF or better. Cleaned long ago, probably with an eraser. \$35.00.

1797 [BB-73] B-1. VF. Obverse a little rough, probably from the way the planchet was made. Adjustment marks on reverse. Two tiny field nicks near head. \$36.00.

1798 [BB-81] B-2. Unc., full mint lustre, but weakly struck on center obverse and reverse. \$160.00.

1798 [BB-82] B-1a. AU. Faintest traces of friction; considerable lustre. \$125.00.

1798 [BB-105] B-23. VF. \$45.00.

1798 [BB-113] B-27. Unc. Weakly struck on reverse borders. \$80.00.

1799/8 [BB-141] B-3. Unc., full mint lustre. \$117.50.

1799 [BB-157] B-5a. Unc., nearly equal to last, but a trace of friction on eagle's breast, and two tiny nicks on drapery. Adjustment marks through LIBERTY. \$100.00.

1800 [BB-193] B-18. VF or better, with much original lustre on reverse. \$37.50.

1801 [BB-214] B-4. AU; almost full mint surface, but minor friction. \$42.50.

1801/2 [BB-233] B-2. VF or better: prooflike mint surface as on last. \$35.00.

1802 [BB-241] B-6. AU. Traces of cabinet friction; minute faint handling marks, but just about full mint bloom. \$50.00.

1803 [BB-252] B-5. Obverse about Fine, reverse VG. \$20.00.

1803 [BB-255] B-6a. EF, lustrous. \$45.00.

The André DeCoppet Collection, sold by James Kelly, April 29-30, 1955, with the Central States Numismatic Society convention, was one of the most comprehensive holdings of early silver dollars auctioned up to that time. Relatively little publicity was given to the sale at the time, and since then few scholars have been aware of the cabinet. (The gold coins in the André DeCoppet Collection were sold to private bids in a dispersal supervised by Henry Grunthal.)

1794 [BB-1] EF, coin shows marks of having been repaired at 14th star on obverse and back of F in OF on reverse. \$600.00.

1795 [BB-13] B-9. Flowing Hair. Choice EF, beautifully

toned. \$107.50.

1795 [BB-14] B-4. Flowing Hair. Fine. \$30.00.

1795 [BB-18] B-7. Flowing Hair. VF, but shows slight adjustment marks. \$37.50.

1795 [BB-20] B-2. Flowing Hair, two leaves. Fine, but nose badly mashed. \$15.00.

1795 [BB-21] B-1. Flowing Hair. Practically Unc. \$88.50.

1795 [BB-21] B-1. Same variety. Fine to VF. \$37.50.

1795 [BB-27] B-5. Flowing Hair. Unc. \$135.00.

1795 [BB-27] B-5. Same variety. VF. \$40.00.

1795 [BB-51] B-14. Bust type, well struck. Practically Unc. with considerable mint lustre. \$87.50.

1795 [BB-52] B-15. Bust type. Unc. and just as perfect as the day struck. Original mint lustre. \$115.00.

1795 [BB-52] B-15. Same variety. VG-Fine. \$18.00.

1796 [BB-61] B-4. Same variety. VG-Fine. \$20.00.

1796 [BB-61] B-4. Small Date, large letters on reverse. Practically Unc. with considerable mint lustre, really a beautiful coin. \$90.00.

1796 [BB-61] B-4a. Excessively rare variety. VF plus. \$70.00.

1796 [BB-65] B-5. Large Date. Practically Unc., a beautiful sharp specimen. \$70.00.

1796 [BB-65] B-5a. Same die as preceding but die lump is larger and extends to letter C. Choice Ext. Fine with some mint lustre. \$81.00.

1796 [BB-65] B-5a. Same variety as preceding. Fine but considerably scratched on reverse. \$18.00.

1796 [BB-65] B-5b. Large date, small letters. EF with some mint lustre. \$105.00.

1797 [BB-71] B-3. Stars 10x6. EF but slight edge nick and adjustment marks on reverse. \$52.50.

1797 [BB-71] B-3a. Stars 10x6, smaller planchet. This rare variety is strictly Unc. Original lustre and beautifully toned. \$115.00.

1797 [BB-71] B-3b. Stars 10x6. EF, shows very slight adjustment marks on obverse. \$81.50.

1797 [BB-73] B-1. Stars 9x7. EF. \$50.00.

1798 [BB-81] B-2. 15 Stars, small eagle. Only Fine but still a rare and desirable coin. \$35.00.

1798 [BB-81] B-2. Obverse is EF, reverse weak as usual. Minute planchet defect on edge. \$62.50.

1798 [BB-82] B-1a. Same as preceding but both obverse and reverse are double struck. Practically Unc. with some mint lustre. \$42.50.

1798 [BB-82] B-1a. VF. \$65.00.

1798 [BB-95] B-6. Large eagle as are all of the following. This is the Knobbed 9. Practically Unc., stars and all details sharply struck. \$50.00.

1798 [BB-104] B-22. Wide Date. This specimen does not show the die break on obverse. EF. \$35.00.

1798 [BB-105] B-23. Wide Date. Practically Unc. Very slight adjustment marks. \$71.00.

1798 [BB-105] B-23a. From same die as preceding but second curl defective. VF plus. \$36.00.

1798 [BB-105] B-23a. Same as preceding, only VG. \$9.50.

1798 [BB-107] B-21. Wide Date. A rare variety. EF to AU, well struck. \$62.50.

1798 [BB-108] B-13. Medium Date. EF to AU, some mint lustre. \$32.50.

1798 [BB-112] B-15. Wide Date. Spur on 9. Choice EF, well struck. \$35.00.

1798 [BB-112] B-15a. Similar to preceding but stars are smaller. Choice EF condition. \$72.50.

1798 [BB-113] B-27. VF. \$21.00.

1798 [BB-115] B-31a. Close date, high 8. Choice EF, stars and clouds on reverse weakly struck. \$55.00.

1798 [BB-116] B-30. Close Date. This is one of the finest specimens known of this very rare variety. EF, well struck. \$75.00.

1798 [BB-118] B-28. Close Date. Reverse does not show die cracks described by Mr. Bolender; possibly a sub-variety. VF plus. \$18.00.

1798 [BB-120] B-12. This rare variety is well struck and the stars on reverse sharper than usual. VF plus. \$42.50.

1798 [BB-121] B-9. Compact Date. Practically Unc. and well struck, beautifully toned. Really a gem dollar. \$120.00.

1798 [BB-122] B-14a. VF but has several hairline scratches on reverse. \$50.00.

1798 [BB-123] B-8. However shows some cracks on reverse as on B-8a, Rarity-5, Close Date, four berries in branch. Choice AU. \$51.00.

1798 [BB-123] B-8. VF. Fourth and fifth stars weak; fifth star missing. "ED" missing on reverse. VF and unusual. \$18.00.

1798 [BB-125] B-24a. Medium wide date, die break from neck through 12th star. EF, lightly toned. \$48.00.

1798 [BB-125] B-24a. Same variety as preceding. Fine. \$16.00.

1799/8 [BB-141] B-3. Practically Unc., well struck. \$55.00.

1799/8 [BB-141] B-3b. Nearly EF, very rare condition. \$52.50.

1799/8 [BB-142] B-1. Practically Unc., beautifully toned. \$55.00.

1799/8 [BB-142] B-1a. Practically Unc. \$85.00.

1799 [BB-152] B-15. Reverse of 1798, irregular date. A very rare variety, obverse EF, reverse VF, not quite as well struck. \$62.50.

1799 [BB-152] B-15a. EF. \$56.00.

1799 [BB-153] B-4. 15 stars on reverse. Points on two of them are all that shows. VF. \$35.00.

1799 [BB-154] B-18. Well centered, sharply struck. Practically Unc. \$100.00.

1799 [BB-155] B-19. Fine or slightly better but light nick on face. \$22.50.

1799 [BB-156] B-7a. EF, well struck. Considerable mint lustre. \$60.00.

1799 [BB-157] B-5a or 5b. Die crack on reverse. EF, some mint lustre. \$31.00.

1799 [BB-157] B-5a or 5b. This is the same die as preceding but has additional die breaks not listed under that variety. Ext. Fine, some mint lustre. \$42.50.

1799 [BB-158] B-16a. Practically Unc. with considerable mint lustre. \$60.00.

1799 [BB-158] B-16a. VF plus. \$38.50.

1799 [BB-159] B-23. Unc. with beautiful, lustrously toned surface. Very slight scar below bottom curl of hair. \$110.00.

1799 [BB-160] B-12a. Practically Unc. \$52.50.

1799 [BB-160] B-12a. Same as preceding but also shows curved die break from ninth star. VF plus. \$38.50.

1799 [BB-160] B-12b. Unc. with some mint lustre. \$115.00.

1799 [BB-161] B-11b or 11c. Practically Unc., some mint lustre. \$75.00.

1799 [BB-161] B-11b. Variety usually referred to as "without berries." Choice EF. \$67.50.

1799 [BB-161] B-11c. Fine to VF. \$40.00.

1799 [BB-162] B-6. Practically Unc., well struck. \$60.00.

1799 [BB-162] B-6. VF, several slight edge nicks. \$36.00.

1799 [BB-162] B-6a. Another very rare variety with heavy die break on reverse. Practically Unc. \$42.50.

1799 [BB-163] B-10a. Rarity-3, only VG. \$13.00.

1799 [BB-164] B-17a. VF plus. \$38.50.

1799 [BB-165] B-8a. Perfect dies, Liberty with open mouth. Die break on obverse. Fine. \$21.00.

1799 [BB-166] B-9. Large Stars, VF. \$21.00.

1799 [BB-166] B-9. VF but has light scratch on obverse. \$21.00.

1799 [BB-166] B-9a. EF, some mint lustre. \$41.00.

1799 [BB-166] B-9a. Fine to VF. \$22.00.

1799 [BB-166] B-9b. EF, some mint lustre. A few stars on reverse slightly weak. \$25.00.

1799 [BB-167] B-14. Choice EF. \$35.00.

1799 [BB-169] B-21. Another rare variety, well struck and just a shade from Unc. Some mint lustre. \$62.50.

1800 [BB-184] B-12. VF. \$26.00.

1800 [BB-187] B-16. Practically Unc., well struck with lustrous prooflike surface. A gem coin. \$60.00.

1800 [BB-187] B-16b. EF, toned. \$50.00.

1800 [BB-188] B-8. Practically Unc. A beautiful, well struck coin. \$67.50.

1800 [BB-190] B-10. VF plus. \$35.00.

1800 [BB-190] B-10a. Practically Unc. \$42.50.

1800 [BB-191] B-11. Ext. Fine, well struck, considerable mint lustre. \$90.00.

1800 [BB-192] B-19. AMERICA variety. Fine. \$20.00.

1800 [BB-192] B-19a. AMERICA variety. EF, lightly toned. \$50.00.

1800 [BB-192] B-19b. AMERICA variety. A choice practically Unc. specimen. \$47.50.

1800 [BB-193] B-18. Well struck and practically Unc. \$43.00.

1800 [BB-193] B-18a. VF or slightly better. \$22.00.

1800 [BB-194] B-14. EF. \$38.50.

1800 [BB-194] B-14a. "Dotted Date." Choice EF, beautifully toned. \$51.00.

1800 [BB-195] B-15. EF, sharply struck. \$51.00.

1800 [BB-196] B-17. About EF. \$38.50.

1800 [BB-196] B-17a. A beautiful Unc. specimen with original mint lustre. \$110.00.

1800 [BB-196] B-17a. Practically Unc. \$65.00.

1801 [BB-211] B-1. VF. \$35.00.

1801 [BB-211] B-1a. Choice EF. \$75.00.

1801 [BB-211] B-1b. Choice EF. \$67.50.

1801 [BB-212] B-2. Practically Unc., beautifully toned. \$77.50.

1801 [BB-214] B-4. Fine to VF. \$38.50.

1802/1 [BB-231] B-1. Fine or a shade better. \$30.00.

1802/1 [BB-233] B-2. VF. \$38.00.

1802/1 [BB-234] B-3. Choice EF. \$65.00.

1802/1 [BB-234] B-3. VF plus. \$25.00.

1802 [BB-241] B-6. Practically Unc. \$82.50.

1802 [BB-241] B-6. VF. \$23.00.

1802 [BB-242] B-5. Practically Unc. \$105.00.

1803 [BB-251] B-1. EF, well struck. \$45.00.

1803 [BB-252] B-5. Practically Unc. \$90.00.

1803 [BB-252] B-5a. EF plus. \$86.00.

1803 [BB-254] B-4. EF, well struck. \$45.00.

1803 [BB-255] B-6. VF. \$35.00.

1803 [BB-255] B-6. Well struck and practically Unc. Prooflike surface. \$55.00.

1803 [BB-255] B-6a. EF, well struck. \$65.00.

The T. James Clarke Collection, with additions, sold by New Netherlands Coin Company (48th Sale), November 1956. Clarke, one-time president of the American Numismatic Association, was a connoisseur and had important holdings in many different numismatic areas.

1794 [BB-1]. Close to EF; from a wear viewpoint, fully VF-35. \$625.00.

1795 [BB-13] B-9. Small bust with flowing hair. This obverse (same as B-3, B-11) has also been called the "Head of 1794" because of two low and thick curls. The third curl from the top turns downward. Rev. Two leaves. Strictly EF. \$130.00.

1795 [BB-18] B-7. Flowing hair in six curls. The lowest curl is very small and perfect, nearly forming a loop. This variety has many times been listed as the "Head of 1794," but there is no exact head of 1794. Rev. Three leaves. Only slightest friction on hair above ear and eagle's breast separate this from Unc. \$115.00.

1795 [BB-21] B-1. Bust with flowing hair to r., resembling the head of 1794. Wide date spaced 1 795. Rev. Two leaves under each wing of the eagle. Strictly EF, closer to AU. \$135.00.

1795 [BB-27] B-5. Flowing Hair. About Uncirculated: part of head and eagle's breast not fully struck up. Few faint adjustment marks below eagle's right wing and breast; four or five minor (easily removable) obverse spots. Prooflike bluish lustre with rose and golden colored overtones. \$52.50.

1795 [BB-51] B-14. Draped Bust. Variety with bust placed too far to left. Rev. Very small eagle. Called "Unc. Gem" and the "Finest Known" by Mr. Clarke. \$240.00.

1795 [BB-51] B-14. Strictly EF. \$65.00.

1796 [BB-61] B-4. Small, wide date, the 9 and 6 close. Curl on top of head perfect. Rev. Large letters. Choice Unc. \$225.00.

1796 [BB-63] B-2. Draped Bust, as on all following. Small, wide date. Rev. Small letters. A full AU-55, only a shade from Mint State. \$320.00.

1797 [BB-71] B-3. Sixteen Stars, 10x6, Rev. Large letters. Only a hair's breadth from full Unc. \$155.00.

1797 [BB-72] B-2. Sixteen Stars, 9x7. Rev. Small letters. Obverse a strong Fine, reverse weak (as always found upon this RRR variety). \$170.00.

1797 [BB-73] B-1. Sixteen Stars. 9x7. Rev. Large letters. Strictly EF, the obverse with strong claims to AU-55. \$67.50.

1798 [BB-81] B-2. Fifteen Stars. Rev. Small eagle and small letters. This identical reverse die was used for four years; 1795 (B-14), 1796 (B-1, 2, and 3), 1797 (B-2), and for this rare type. Strictly Unc. \$285.00.

1798 [BB-95] B-7. Knob 9. Curl touches 1. Rev. Star distant from eagle's beak. Strictly VG, called "Fine for coin." \$32.50.

1798 [BB-105] B-23a. Very wide date, 8 firmly united with bust; second curl from bottom defective. Rev. Several die flaws, one between ST, another between TE, another at right of E in STATES. Strictly Unc., but not quite in the "gem" class as claimed by Mr. Clarke. \$135.00.

1798 [BB-116] B-30. Close Date, high 8. Pronounced obverse die breaks emanating at border directly below 9 of date. Rev. All upper stars distant from clouds. Unc. \$165.00.

1798 [BB-121] B-9. Close Date. Rev. Five large berries on branch, second and third from top closest together. VF. \$32.00.

1799/8 [BB-142] B-1a. Last 9 of date very close to bust. Stars very close together; letters of LIBERTY widely spaced. Rev. Thirteen stars above eagle. Die flaws above and to left of I in AMERICA. Lustrous, iridescent Unc. \$95.00.

1799/8 [BB-142] B-1a. The reverse from even a more advanced die state. [Should be B-1b.] Flaws at I in AMERICA and breaks at ATES OF particularly prominent and advanced. While only VF plus, parts of this later impression are far superior to the last. \$47.50.

1799/8 [BB-143] B-2. Obverse from same die as previous two. Rev. Die break through D, as mentioned by Bolender, plus several other light cracks. Abt. EF and choice. \$82.50.

1799 [BB-153] B-4. Irregular date. Rev. Fifteen stars above eagle. Fully VF. \$57.50.

1799 [BB-158] B-16. Left stars distant from curl and L. Right stars close to Y and bust. Rev. Left corner off U in UNITED. About Unc. \$75.00.

1799 [BB-159] B-23. Thirteen Stars, 8x5. Rev. From the same die as B-16. Choice Unc. \$260.00.

1799 [BB-160] B-12a. Seventh star close to L, more so than eighth is to Y. Rev. Same as B-11. Unc. \$77.50.

1799 [BB-160] B-12b. Similar to last; shattered obverse die as described. Brilliant Unc., almost in the "gem" class. \$340.00.

1799 [BB-161] B-11b. Eighth star closer to Y than seventh is to L. Rev. Usually described as "Without berries," Strictly VF. \$50.00.

1799 [BB-162] B-6a. First and last stars appear small and thin. Rev. Right stand of A in STATES touches cloud. Lightly toned Unc. \$180.00.

1799 [BB-164] B-17. First and last stars appear small and thin. Rev. Five extra-large berries on olive branch, the two upper berries partly buried in leaves. Fully EF. \$24.00.

1799 [BB-164] B-17b. Similar to last; reverse die cracked clearly from border through UNITED, left wing, up through

ST. An additional crack, among others, at the base of ATES. (See lot 125, Bolender's 183rd sale.) Not quite full Unc. \$72.50.

1799 [BB-166] B-9. Large stars, appearing close together. Rev. "Apostrophe" die flaw after last S in STATES. About Unc. \$42.50.

1800 [BB-181] B-1. Die flaws at first and 11th stars. Rev. First T in STATES double cut. Misstruck freak; off-center with border 1/8" deep at lower left obv. and upper left rev. VF plus. \$32.50.

1800 [BB-183] B-3. The R in LIBERTY double cut. Rev. Leaf touches slightly right of center of stand in I in AMERICA; small rust mark in die below IT in UNITED. Full Mint State. \$460.00.

1800 [BB-187] B-16. Die dot just to left of highest curl on top of head. Rev. The T in UNITED double cut. EF. \$70.00.

1800 [BB-187] B-16. With unpublished obverse die crack clearly visible from border below last O in date, through drapery and bust, to 10th star. EF. \$70.00.

1800 [BB-190] B-10. Very wide date, 8 low. Rev. Die flaw in field left of second T in STATES. Very close to, but not quite Unc. \$66.00.

1800 [BB-192] B-19a. Right stars close to Y and bust. Rev. AMERICA. Strictly EF. \$42.00.

1801 [BB-211] B-1. Wide Date, 01 closest. Rev. Point of star almost touching tip of lower part of eagle's beak. EF, closer to AU. \$125.00.

1801 [BB-213] B-3. Rusted obverse die; same as last. Rev. Variety with right foot of all the T's missing. Remarkably sharp, and very close to Unc. \$75.00.

1802/1 [BB-232] B-4. Close date, the 1 firmly touching the curl. Rev. Only 12 arrows show plainly; Bolender's rev. "A." Strictly Unc. \$172.50.

1802/1 [BB-232] B-4. Short undescribed obverse break from top of bustline to last star, as upon the last. Close to EF, evenly and strongly struck. \$62.50.

1802 [BB-241] B-6. Variety with right foot of T in LIBERTY missing. Brilliant Unc. "gem." \$150.00.

1802 [BB-241] B-6. Unc., but hardly as desirable as last. \$75.00.

1803 [BB-255] B-6a. Better than EF, cleaner than the last. \$62.50.

1803 [BB-255] B-6a. Thick top to 3 of date. 180 wide and 3 somewhat low. Unc., but not pristine. \$95.00.

1803 [BB-256] B-3. Close Date; small 3. Rev. Point of star touches point of lower part of eagle's beak. Unc., a gorgeous first strike. \$450.00.

Stack's sale of the Samuel W. Wolfson Collection, May 3-4, 1963, included a rare 1804 dollar as well as many other notable coins.

1794 [BB-1] Strictly Fine and sharp. Usual weakness on left side of coin both obverse and reverse which is characteristic of this date. Liberty head on obverse very sharp. \$2,000.00.

1795 [BB-21] B-1. Flowing Hair. Strictly VF, free of edge bruises. Appears to have been burnished. \$250.00.

1795 [BB-27] B-5. Flowing Hair. VF, minor edge defect. Has been highly polished. \$220.00.

1795 [BB-51] B-14. Bust type. EF, lustrous. Planchet imperfections on obverse edge. \$245.00.

1795 [BB-51] B-14. Bust type. EF, sharp. Just the faintest evidence of wear. \$250.00.

1796 [BB-61] B-4. Small Date. VF, choice. Planchet imperfections on hair of Liberty. \$185.00.

1797 [BB-71] B-3. Stars 10x6. Br. Unc., full mint bloom, superb iridescent steel blue toning. Nicely centered. Usual weak strike in center of coin. \$600.00.

1797 [BB-73] B-1. Stars 9x7, Large Letters. About Unc. Beautiful iridescent toning. Nicely centered. \$350.00.

1798 [BB-81] B-2. Small Eagle, 15 Stars. Strictly Fine, usual weak reverse impression. \$150.00.

1798 [BB-82] B-1a. Small Eagle, 13 Stars. A beautiful VF, choice, example of this rare coin. Nicely centered, sharp denticles. Some mint lustre. \$320.00.

1798 [BB-95] B-6. Large Eagle, knobbed 9, 10 arrows. A VF obverse, with deep serrated borders. Reverse: VF for coin, as it shows usual weak impression. \$87.50.

1798 [BB-101] B-17. Large Eagle. Very wide date. Exceptionally small berries on reverse and some appear without stems. Only 10 arrows. VF. Due to die failure, it is somewhat weak on the high points. \$300.00.

1798 [BB-108] B-13. Large Eagle, 5 berries, 10 arrows. A lustrous Fine to VF example, with beautiful iridescent toning. \$62.50.

1799/8 [BB-141] B-3. 15 Stars. A lustrous, highly toned example, nicely struck. Unc., fairly well centered. \$260.00.

1799/8 [BB-142] B-1. 13 Stars. Br. Unc., sharply struck. Full mint bloom, deep serrated borders. \$435.00.

1799 [BB-153] B-4. Irregular date, 15 Star reverse. Strictly VF and sharp. \$150.00.

1799 [BB-159] B-23. Stars 8x5. Perfectly centered, sharply struck, almost full mint lustre. About Unc. \$300.00.

1799 [BB-166] B-9. Perfect Date. Lustrous About Unc. example, with almost full mint lustre. \$100.00.

1800 [BB-192] B-19. AMERICA. Just a shade from Unc., delicately toned, full mint lustre. \$125.00.

1800 [BB-194] B-14. Dotted Date variety. EF. Lovely blue steel toning. Most mint lustre is still adhering. \$90.00.

1801 [BB-213] B-3. Wide Date. EF, lightly toned. Sharp strike. \$120.00.

1802/1 [BB-231] B-1. Close Date. VF but cleaned. \$72.50.

1802/1 [BB-234] B-3. Wide overdate. EF. Light toning. \$90.00.

1802/1 [BB-234] B-3. Duplicate to preceding. VF, sharp. \$80.00.

1802 [BB-241] B-6. Close, perfect date. EF. \$150.00.

1803 [BB-252] B-5. Small 3. VF, choice. \$80.00.

1803 [BB-255] B-6. Large 3. VF, choice. \$95.00.

1804. The R. Coulton Davis specimen. Of all the specimens of the well known dollar, the one offered in this sale has the best known and best documented pedigree. Mr. R. Coulton Davis, the original collector-owner, purchased it from John W. Haseltine of Philadelphia on October 23, 1877 for \$500.00. This detail is vouched for by the bill of sale still extant and illustrated in Plate A. Almost a year later Mr. Davis submitted the coin to Mr. William E. DuBois, Assayer of the Philadelphia Mint and keeper of the Mint Coin Cabinet. Mr.

DuBois gave his unequivocal opinion that the piece was authentic in a letter illustrated here.

In due course Mr. Davis sold the dollar back to Haseltine in 1883 for \$1,050.00. It then passed into the collection of Mr. George M. Klein of Vicksburg for \$1,200.00 in the same year. When the Klein Collection was disbursed at the 95th Woodward Sale in May 1888, Mr. Davis repurchased the piece for \$660.00. After Mr. Davis died, Mr. John N. Hale of Phillipsburg, PA bought it for \$850.00. In his turn he bequeathed the coin to his friend Mr. R.H. Hull in whose possession and estate it remained until 1950. On May 12 of that year coins from the Hull estate were sold at the Park Bernet Galleries when Mrs. Fullerton, daughter of Mr. Henry P. Graves, purchased it for her father for \$3,400.00.

The dollar next appeared on the market in April 1954 in the Davis-Graves Sale, conducted by Stack's and sold for \$8,000.00. The purchaser, who remained anonymous, was a gentleman from Fairbanks, Alaska. When his collection was handled by Stack's at public auction in 1960, the famous coin passed to Mr. Samuel W. Wolfson for the record price of \$28,000.00. [Description shortened here.] \$36,000.00.

New Netherlands Coin Company's 57th sale, December 10-11, 1963, contained many specialized die varieties. Most of the cataloguing was by Don Taxay.

1794 [BB-1] B-1. Close to VF; faintly iridescent natural steel toning, undisturbed by cleaning or other mishandling. As usual, weakly struck at bottom left of date and at first few stars, with STATES very weakly impressed, though certain areas of the reverse are well above VF sharpness. A few hardly serious adjustment marks at the lower I. obverse, and two or three light scratches on the head, all very minor and hardly worthy of mention. \$1,900.00.

1795 (over 1195). B-1. Strictly Fine. Unevenly struck up; weak at the top reverse, and at the centers, but the wreath and letters suggest VF. The surfaces are lovely despite sporadic adjustment marks on reverse, one small planchet discoloration at the left wreath stem. \$200.00.

1795 [BB-13] B-9. A sharp Fine. With several light edge nicks, and a few still lighter scratches, most all of which are upon the reverse. \$160.

1795 [BB-14] B-4. Fine to VF. A V-shaped chopmark between the neck and cheek, the surfaces otherwise adequate for the grade. Cleaned, as have been most of these early silver pieces by now. \$160.

1795 [BB-27] B-5. EF to AU. A few light scratches on the eagle, but with clean, attractive fields. \$600.00.

1795 [BB-51] B-14. Draped Bust. Better than VF; highly lustrous with mottled toning. Small obverse rim dent over E. \$215.00.

1795 [BB-52] B-15. Fine to VF. \$125.00.

1795 [BB-52] B-15. More or less Fine; centers somewhat weak, but with peripheral details of VF or better sharpness. The surfaces also indicate the latter grade, but the obverse shows a very faint "X" scratch, and there are a couple of insignificant marks. \$75.00.

1796 [BB-61] B-4. VF. Weak in centers, faint adjustment marks in center of obverse. A coin showing signs of cleaning, but with no other noticeable defects. \$140.00.

1796 [BB-65] B-5. Obverse EF, reverse AU. Lustrous and magnificently toned to soft, iridescent sunset hues. With one or two small and very faint planchet scratches (as made). \$480.00.

1796 [BB-65] B-5a. Better than VF; weak in centers, but of EF sharpness on many peripheral details, and with some lustre. With one very faint pin scratch, too old to disturb the color, and a hidden edge dent or two, otherwise completely clean. \$117.50.

1796 [BB-66] B-1. Fine to VF, weak in centers, sharp and lustrous at peripheries. \$165.00.

1797 [BB-72] B-2. High R-6, nearly R-7. Obverse Fine or better, bold; attractive, relatively clean (fewer nicks than usual). Reverse VG or better, weak, flat strike as always; rim nick over F. \$210.00.

1797 [BB-73] B-1. Borderline R-4. Almost VF. \$150.00.

1797 [BB-73] B-1b. VF or better, clean, lustrous and toned to lovely sunset shades. \$275.00.

1798 [BB-81] B-2. Just a wisp away from EF. Bright and lustrous, with some very faint adjustment marks and signs of old cleaning. \$370.00.

1798 [BB-82] B-1. EF. Unevenly struck as always, but nevertheless of exceptional boldness. Lustrous variegated tone; free of noticeable defect save for a tiny obverse nick on the chin and a faint pin scratch on eagle's breast. \$300.00.

1798 [BB-82] B-1a. EF or better. A little weak in the centers as usual, but of practically full mint sharpness at peripheries. Considerable original brilliance. Showing only minute signs of handling, including a tiny nick above first T of STATES. \$355.00.

1798 [BB-92] B-4. EF, usual center weakness. \$80.00.

1798 [BB-101] B-17. Fine or better; very bold. Some areas and surfaces suggesting a better grade. Small rev. rim dent; tiny trace of verdigris on right wing. \$160.00.

1798 [BB-104] B-22. EF-45, identical central weakness as shown by the Bolender plate coin, hence inherent in striking. With a few of the usual bagmarks. \$160.00.

1798 [BB-104] B-22. VF. A faint pre-striking planchet scratch at the fourth star, another to the right of the shield. Lightly toned with a few splashes of golden coloring. \$67.50.

1798 [BB-105] B-23. Somewhat better than VF. Unevenly struck on a lightly adjusted planchet, but lustrous. Hidden tiny rim nick, a few minute bagmarks, otherwise completely clean. \$70.00.

1798 [BB-106] B-19. VF to EF. Tiny dig above eagle's head, otherwise very clean. \$65.00.

1798 [BB-107] B-21. Unc.; some light scratches, mostly upon the reverse. \$420.00.

1798 [BB-120] B-12. Nearly EF where struck-up, but due to die collapse, this coin is very flat in the centers. Highly lustrous. \$90.00.

1798 [BB-120] B-12. This unevenly struck piece is difficult to grade. Some areas exceed VF in sharpness, others suggest Fine (possibly because of incipient die collapse), and the surfaces display traces of mint lustre. \$44.00.

1798 [BB-122] B-14. VF/EF plus, some of the clouds flatly struck up. Excellent surfaces, iridescent toning; a tiny pre-striking pit on the bust. \$75.00.

1798 [BB-123] B-8. Better than EF, somewhat unevenly

struck; bright, possibly once cleaned, but with almost full original lustre. From a distance, this brilliant coin would pass as Unc. \$160.00.

1798 [BB-123] B-8a. Fine to VF. Possibly deserving of a higher grade, but with localized weaknesses, the result of its having been struck from clashed, shattered and worn dies. \$75.00.

1799/8 [BB-142] B-1. EF, possibly better for this flatly struck coin. Bright, cleaned, but also lustrous. \$120.00.

1799 [BB-153] B-4. Irregular date. Better than EF. Weakly and irregularly struck in centers on a planchet showing several though serious reverse adjustment marks. Iridescently toned with considerable mint lustre. \$220.00.

1799 [BB-155] B-19. Nearly EF-40; excellent surfaces. \$90.00.

1799 [BB-158] B-16. A classical example of VF-30, with some areas of EF sharpness and others reflecting weak striking. Clean save for a few bagmarks, and displaying considerable lustre. \$70.00.

1799 [BB-158] B-16. Choice EF. Beautifully toned with a rainbow iridescence, ranging in blended colors from a light golden to sunset shades. A couple of infinitesimal planchet pits, as made. \$105.00.

1799 [BB-158] B-16c. VF. Obverse rim nicks opposite first and ninth stars (the latter very tiny), and between ED upon the reverse. \$60.00.

1799 [BB-159] B-23. VF to EF. Unusually clean (generally found impaired); lustrous, well struck for coin, generally choice. \$170.00.

1799 [BB-159] B-23. VF, bold. Small obverse edge nick opposite the ninth star. Undoubtedly cleaned. \$45.00.

1799 [BB-161] B-11a. VF. Nicely toned with mauve and gold. \$60.00.

1799 [BB-163] B-10. Fully EF-45. Minor rim bruise opposite point of bust; otherwise with no obvious imperfections. \$82.50.

1799 [BB-165] B-8a. VF plus, weakly struck-up at reverse stars. Tiny pre-striking planchet scratch between 9 and bust, and a minor rim bruise opposite fourth and fifth stars. Bright, mostly due to cleaning, but better than it sounds. \$67.50.

1799 [BB-166] B-9a. Very close to EF; lustrous steel toning. Free from very noticeable blemishes, except for a faint hair-line scratch intersecting the obverse die breaks. \$77.50.

1799 [BB-166] B-9b. VF plus. Bright with traces of old cleaning, but displaying peripheral lustre. Excellent surfaces. \$57.50.

1799 [BB-168] B-22. VF. The obverse with its congenital die weakness. small and faint triangular scratch on obverse and a few scattered light bagmarks, scarcely noticeable on obverse due to toning. \$80.00.

1799 [BB-169] B-21. VF or better. Shows a few light surfaces scratches and traces of border patina. \$60.00.

1800 [BB-181] B-1. Fine to VF, attractively toned. The surfaces excellent, but for one pre-striking planchet scratch in the right obverse field and a few other tiny ones on the neck. \$50.00.

1800 [BB-184] B-12. A choice EF. The surfaces practically flawless and displaying a delicate iridescence. \$155.00.

1800 [BB-184] B-12. Fine plus; small and unimportant dent opposite first S in STATES. \$40.00.

1800 [BB-187] B-16. (Almost R-3.) VF, cleaned but attractive. \$70.00.

1800 [BB-189] B-5. Fine. Cleaned and extensively pitted, but nevertheless, one of the sharper pieces from this rare die combination. \$30.00.

1800 [BB-190] B-10b. Unlisted die state. VF or better. Displays considerable mint lustre, some sunset toning. \$85.00.

1800 [BB-192] B-19. EF, cleaned. \$165.00.

1800 [BB-196] B-17. VF. Weakly struck in centers; iridescent toning, and some mint lustre. Definitely above the average. \$70.00.

1801 [BB-211] B-1a. Unlisted die state. Very near to Unc. Highly lustrous with some iridescent toning. \$180.00.

1801 [BB-212] B-2. Near Unc. Weaker than last, but highly lustrous and iridescent. Couple of light scratches. Surfaces on the whole suggest EF or better. \$100.00.

1801 [BB-213] B-3. Obverse nearly EF, reverse emphatically so. Lightly toned, together with some traces of darker tarnish upon the reverse. \$125.00.

1801 [BB-213] B-3. Strictly Fine, though slightly scratched and once cleaned. \$35.00.

1802/1 [BB-233] B-2. VF with some mint lustre; unevenly struck as usual. \$60.00.

1802 [BB-241] B-6. Obverse VF, the reverse Fine plus. Cleaned; one old edge nick opposite the fifth star. \$30.00.

1802 [BB-241] B-6. VF. Free of defects of more than microscopic size, golden brown toning and signs of mint lustre. \$80.00.

1803 [BB-251] B-1. VF, but a weak strike from worn dies. The left stars, many curls, and the lower part of the bust upon the obverse, and the reverse stars, are all weakly brought up. Couple of reverse rim nicks and evidence of cleaning. \$60.00.

1803 [BB-252] B-5. Almost EF, where struck-up; indications of cleaning. Planchet defect (granulation) around TE in UNITED. Medium size nick on the lower neck, surfaces otherwise adequate. \$105.00.

1803 [BB-252] B-5. Fine, weak reverse. Suggestions of old cleaning. \$45.00.

1803 [BB-255] B-6. EF where struck-up; lovely lustrous iridescent surfaces. The centers are flatly impressed as usual. \$112.50.

1803 [BB-255] B-6. Fine, unevenly struck. Little evidence of actual wear, showing appreciable, natural prooflike gloss. \$135.00.

1803 [BB-255] B-6a. VF, with traces of original lustre. \$57.50.

Lester Merkin's sale of the A.J. Ostheimer, 3rd Collection, September 18-19, 1968. Catalogued by Walter H. Breen. Mr. and Mrs. Ostheimer lived in

Philadelphia and also maintained a home in Honolulu. The Ostheimers developed a deep interest in early dollars, and, among other acquisitions, acquired *en bloc* the early silver dollar collection of specialist K.P. Austin.¹

During the late 1950s and early 1960s they were familiar figures at coin conventions. In 1960, dealer Louis S. Werner, who sold him two "1804" and "1805" dollars which he had purchased as forgeries from Farran Zerbe years earlier; a brouhaha about these erupted in the pages of *The Numismatist* in 1961, when Alfred J. Ostheimer, 3rd, who had on hand an authentication from no less an authority than M.H. Bolender, stated that their "discovery" was "the most important chapter in the long and involved history of the 1804 silver dollars." Subsequently, Eric P. Newman pointed out that the dollars were fakes, and that this had been known for a long time. On June 14, 1968, the Ostheimer collection of silver dollars, including the by now discredited 1804 and 1805, was stolen from their Honolulu home. Fortunately, most coins were soon recovered. At one time, Mrs. Ostheimer announced that she was working with M.H. Bolender on a revision of Bolender's 1950 book.

The 1968 Merkin sale contained many fine coins, but many of Ostheimer's best—such as the Uncirculated 1794 bought at the Lord St. Oswald Collection sale at Christie, Manson & Woods in 1964, and an Uncirculated 1795 [BB-20] B-2 from the same event—were not included. The 1794 and other treasures were sold privately in 1972 to Superior Stamp & Coin Company, Inc., which the next year auctioned the coins as part of the Gilhousen offering. Who knows where the 1795 [BB-20] B-2 went (it was in neither the Ostheimer nor the Gilhousen listings).

Alas, neither the Bolender-Ostheimer book revision nor a definitive catalogue of the Ostheimer holdings ever appeared in print.

1794 [BB-1] B-1. Overall better than Fine, struck somewhat more strongly than average on a planchet showing light adjustment marks (mostly on obv.) and various lamination defects and splits near date, one of them visible also on edge and outer rim above second T. Comparatively clean surfaces, in some areas suggesting VF or better; two or three pinpoint nicks, of no importance. Pin scratch in 9. All of legend and stars clear, though 7 and tops of STATES are weak. \$2,700.00.

1795 [BB-11] B-3. Brilliant Unc., pale gold toning. Exceptionally sharp strike. \$1,250.00.

1795 [BB-13] B-9b. R-4. Brilliant Unc., needle-sharp strike, full breast feathers, full curls, full claws. Full frost. Severe

planchet defect on bust, long sliver-like lamination defect at N of UNITED. \$1,350.00.

1795 [BB-14] B-4. Almost R-5. Better than VF, irregularly toned, some mint lustre at letters; uneven strike. Minute rim planchet defect. \$400.00.

1795 [BB-18] B-7. High R-4. Really Unc., frosty, exceptionally clean surfaces, not fully struck up. Gray and blue tone, reverse iridescent. Obverse slight planchet defects. \$1,800.00.

1795 [BB-20] B-2. Fine or better; centers weakly struck. Periphery VF and showing traces of mint lustre at letters. Old scratch joins chin to 12th star. \$200.00.

1795 [BB-21] B-1. 1795 over 1195. Choice Unc., obverse field prooflike, reverse frosty. Faint obverse adjustment marks, two minute hidden reverse rim nicks, trivial bagmarks. Minute traces of cabinet friction. Above average strike. \$2,500.00.

1795 [BB-24] B-13. High R-7. VF plus, surfaces suggesting EF, striking very uneven with many details full EF and part of right wing flat. Beautiful iridescent tone. Minute pinpoint nick above eagle's head. \$500.00.

1795 [BB-25] B-6. R-4. EF. Exceptionally clean, lustrous surfaces, now toned to antique gold with blue at obverse; reverse sharper than obverse with nearly full mint lustre in fields, many border and some central adjustment marks. \$600.00.

1795 [BB-26] B-12a. Borderline R-7. Almost VF, RRR. Reverse bolder than obverse, showing traces of lustre. \$340.00.

1795 [BB-27] B-5. Borderline Unc., obverse well above AU, reverse fully Mint State and choice. Rainbow toning with lovely natural iridescence; uneven strike. Faint cabinet friction. Many adjustment marks at left and central obverse; tiny reverse rim nick. \$1,500.00.

1795 [BB-51] B-14. R-2, low. Draped Bust. Almost Unc. Iridescent steel, blue and dull gold tone; frosty surfaces, many reverse adjustment marks. Above average strike. Hidden reverse border dent. \$2,000.00.

1795 [BB-52] B-15. R-4. Draped Bust; faint beginnings of the B-15a cracks. More or less EF, gray and iridescent tone. Reverse much sharper than obverse; clean, frosty surfaces. \$600.00.

1795 [BB-52] B-15a. About Unc. Usual uneven strike, centers not as bold as remainder; faint touches of cabinet friction, small rim nick at top reverse, traces of old cleaning. Struck on a flan full of adjustment marks and with a tiny split at obverse rim above I. \$550.00.

1796 [BB-61] B-4a. R-3. EF, central areas weakly and unevenly struck, obverse full of adjustment marks; mint lustre with much iridescent gray and blue toning. Condition Census level. \$400.00.

1796 [BB-63] B-2. Nearly R-6. EF, flatly and rather weakly struck as always; beautiful surfaces, some area of practically full mint sharpness. Pastel sunset colors. \$400.00.

1796 [BB-65] B-5b. R-3. Large Date, small letters. AU or so, peacock blue and lilac iridescence over mint frost. \$425.00.

1796 [BB-66] B-1. R-5 high. Better than VF, some areas strongly suggesting EF especially on reverse; obverse less well struck up. Pastel iridescent toning, clean surfaces. \$400.00.

¹ Information from Jules Reiver, telephone conversation with the author, December 2, 1992.

1797 [BB-71] B-3. R-4. Stars 10x6. Choice Unc. Tiny spots and streaks, evidently in planchet before striking; minute bag marks. \$900.00.

1797 [BB-72] B-2. Low R-7. Stars 9x7, small letters. Nearly EF for this always weakly and unevenly struck coin; obverse with considerable mint lustre, weak in centers as usual; reverse exceptionally well struck for the variety. Average grade VG. Mint lustre around letters; gray tone, clean surfaces. \$525.00.

1797 [BB-73] B-1b. R-4. Stars 9x7, large letters. EF, usual weak uneven strike, with much mint lustre and iridescence; clean surface. \$425.00.

1798 [BB-81] B-2. Almost R-5. 15 Stars, Small Eagle. Some areas have almost full mint sharpness and there is some mint lustre around stars; other areas are weaker. Surfaces suggest EF or better, rather than VF. Rather warm gray toning. \$410.00.

1798 [BB-82] B-1a. R-4. 13 Stars, Small Eagle. Practically Unc. Unworn, but showing signs of old cleaning. \$650.00.

1798 [BB-92] B-4. Borderline R-7. Knobbed 9, wide date, "abnormally" arranged stars (in straight lines forming diamond patterns), R I far apart. Just about EF. \$300.00.

1798 [BB-93] B-5. R-8. VF, clean, pale gold tone, tiny rim planchet defect. \$190.00.

1798 [BB-94] B-3. Large Eagle. Classical VF grade, clean surfaces suggesting EF, edge planchet defect above I of LIBERTY. \$260.00.

1798 [BB-96] B-6a. High R-3. Knobbed 9. Better than EF, some mint lustre; flan granular, deep gold, blue and purple toning. Rather weak strike. \$210.00.

1798 [BB-101] B-17. R-7. EF, much frosty lustre, delicate pastel toning. \$210.00.

1798 [BB-102] B-20b. High R-4. Enormous rim break below tail and right. VF, many rev. adjustment marks, fairly clean surfaces, traces of lustre. \$160.00.

1798 [BB-104] B-22. Wide Date. VG-F, flat strike. Small rim nicks. \$85.00.

1798 [BB-105] B-23a. R-3. Pale golden toned Unc. Struck sharply except in centers. Planchet lightly streaked as made. \$420.00.

1798 [BB-106] B-19. High R-5. EF, weak in upper central obverse around the break as always. Iridescent steel toning, reverse with much mint lustre; lovely surfaces. \$180.00.

1798 [BB-107] B-21. R-6. Fine, cleaned long ago, retoning. \$125.00.

1798 [BB-108] B-13. R-1. EF, lustrous, deeply and irregularly toned to sunset and dusk; frosty fields. Condition Census. \$180.00.

1798 [BB-109] B-10. R-6. VF, weak in centers as on all specimens known. \$160.00.

1798 [BB-111] B-11a. R-5. Nearly EF. Considerable mint frost; iridescent sunset toning, clean surfaces, centers weak as usual. \$325.00.

1798 [BB-112] B-15. R-2. Golden and dull violet Unc., weak strike, the weakness in centers as usual. \$660.00.

1798 [BB-112] B-15a. RRR. AU plus, golden toning concealing traces of old cleaning; much original mint frost. Condition Census. \$290.00.

1798 [BB-113] B-27a. R-2. RRR. Perfect dies. Frosty, lightly toned Unc., light bagmarks. \$1,800.00.

1798 [BB-114] B-26. R-4. Fine, weak, scratch down from E of STATES. \$95.00.

1798 [BB-115] B-31a. R-6. EF-AU, mint lustre, obverse exceptionally sharply struck, reverse weak above eagle's head as always. Traces of old cleaning. \$250.00.

1798 [BB-116] B-30. R-5. Almost EF, uneven strike, traces of old cleaning, considerable mint lustre with golden and deeper border toning. \$200.00.

1798 [BB-118] B-28a. High R-5. Perfect reverse die. VF to EF, usual uneven strike, traces of lustre, excellent surfaces. \$160.00.

1798 [BB-120] B-12. R-4. Date 17 98. Marked EF, this is nearly that level in sharpness, with surfaces showing mint lustre and some streaky gray tone. Condition Census. \$160.00.

1798 [BB-121] B-9. Nearly R-5. About Unc., one of three finest known. Deeply toned, iridescent and frosty. \$330.00.

1798 [BB-122] B-14b. R-5. Really EF, lustrous, but weakly struck from injured, buckled and lapped dies. Beautiful mint frost with natural iridescent toning. \$330.00.

1798 [BB-123] B-8a. R-1. Pointed 9 from now on. Almost EF. \$175.00.

1798 [BB-124] B-25a. R-4. VF to EF, mint lustre and golden toning darkening here and there, relatively clean surfaces. \$180.00.

1798 [BB-125] B-24a. R-1. EF, deeply toned, with some mint lustre. Horizontal obverse pin scratch, minute rim nicks. Advanced die cracks. \$170.00.

1799/8 [BB-141] B-3a. High R-4. Overdate with 15 reverse stars. Really AU, usual weak strike, frosty, with pale gold toning; traces of old cleaning, now hardly visible. Touch of cabinet friction; some reverse adjustment marks. \$250.00.

1799/8 [BB-142] B-1. R-5. Overdate. About Unc., pale gold tone, frosty, bold but uneven strike. \$240.00.

1799/8 [BB-143] B-2a. R-4. Overdate. Unpublished advanced die cracks. AU, uneven and rather indefinite strike, frosty pale gold tone. \$250.00.

1799 [BB-151] B-13. High R-7. Practically Unc. Mint frost with iridescent cool tone; light adjustment marks on reverse; trivial handling marks. \$600.00.

1799 [BB-152] B-15a. Almost R-6. More or less Unc., irregular blue toning, uneven and somewhat weak strike. \$310.00.

1799 [BB-153] B-4a. High R-5. Irregular date with 15 reverse stars; shattered obverse. Choice Unc., weak in centers but with splendid lustre and prooflike surface; irregular toning and tarnish, natural streakiness and almost no bagmarks. \$800.00.

1799 [BB-154] B-18. Borderline R-7. EF, lustrous, sunset tone, faint bagmarks, light obverse tarnish spots. \$210.00.

1799 [BB-155] B-19a. R-5. VF-EF, dusky tone, some faded lustre, clean surfaces. Condition Census level. \$200.00.

1799 [BB-156] B-7a. R-5. EF, choice, lustrous, gray toned, clean and almost free of bagmarks. Condition Census level. \$210.00.

1799 [BB-157] B-5a. R-1. EF, lustrous; warmly toned. Faint pin scratches on left central reverse. \$200.00.

1799 [BB-158] B-16c. R-1. RRR. Unc., peacock blue and antique gold toning with sunset overtones; planchet defect at U; small rim dent on either side. \$650.00.

1799 [BB-158] B-16e. Golden and violet toned Unc., traces of cabinet friction, sharper strike than usual. \$380.00.

1799 [BB-159] B-23. Low R-4. Five Stars Facing. About Unc. plus. Lustrous, sunset toned. \$270.00.

1799 [BB-160] B-12a. R-1. No berries. About Unc., plus. Faintest traces of cabinet friction and a few minor handling marks on either side. Almost full mint frost. Condition Census level. \$360.00.

1799 [BB-161] B-11b. Almost R-5. No berries; RRR. Faintly iridescent pale gray toned choice Unc. Excellent sharp strike; one or two bagmarks short of gem level. \$1,000.00.

1799 [BB-162] B-6b. High R-5. Iridescently toned Choice Unc. Faint reverse adjustment marks; almost free of bagmarks. Unusually bold strike. \$475.00.

1799 [BB-163] B-10. R-2. More or less EF, somewhat iridescent cool tone, much mint frost; uneven strike as usual. Condition Census level. \$220.00.

1799 [BB-164] B-17. R-2. Largest berries. Unc., magnificent prooflike surfaces; faint obverse cabinet friction, reverse superior and with full breast feathers, though weak at parts of right wing as usual. Beautiful iridescent toning. Light reverse adjustment marks. \$450.00.

1799 [BB-165] B-8b. R-2, this die state RR. Frosty, iridescently toned gem Unc. Weak in central obverse, and above eagle's head, elsewhere needle-sharp. \$750.00.

1799 [BB-166] B-9b. R-1. Iridescent golden toned Unc., a couple of faint pin scratches short of gem grade. Advanced die cracks. \$410.00.

1799 [BB-167] B-14. R-4. EF, mint frost, touches of dark tone, traces of old cleaning; minor reverse adjustment marks, faint handling marks. \$200.00.

1799 [BB-168] B-22. Borderline R-7. Fine/VF, gray tone. Usual flat strike. \$130.00.

1799 [BB-169] B-21a. Nearly R-5. Nearer AU than EF, much mint brilliance, some sunset toning. \$200.00.

1800 [BB-181] B-1. R-6. Fine, small reverse rim dent. \$120.00.

1800 [BB-182] B-2. R-7. Nearly EF; lustrous, lightly bagmarked, sunset toned. \$210.00.

1800 [BB-183] B-3. High R-7. Just VF. \$210.00.

1800 [BB-184] B-12. R-4. More or less AU, considerable mint brilliance, gold and blue tone, traces of old cleaning; uneven strike, basically bold. \$260.00.

1800 [BB-185] B-20. Borderline R-8. Fine, obverse planchet flaws forming a cross. \$150.00.

1800 [BB-186] B-4b. High R-4. About EF, mint lustre, toning in cool colors, uneven strike, light scratch in hair below B, small faint obverse rim dent. \$220.00.

1800 [BB-187] B-16. High R-3. EF-AU, rainbow iridescence over mint frost; sharp impression but striking unevenness in usual places; faint touch of obverse cabinet friction; light rim dent just beyond final S. \$190.00.

1800 [BB-188] B-8a. R-2. VF, some mint lustre; defective planchet with many cracks; tiny rim nick either side. \$120.00.

1800 [BB-189] B-5a. High R-5. VF, uneven strike, some lustre, light warm tone, pleasing natural gloss. \$200.00.

1800 [BB-189] B-5b. Nearly EF, sharp, lustrous; tiny rim dent; reverse dark streak, in flan before striking. \$230.00.

1800 [BB-190] B-10b. R-2. EF/AU, lustrous, with signs of old cleaning and irregular natural tone. \$320.00.

1800 [BB-191] B-11. Low R-7. Reverse AMERICA. Where struck up, this is nearer AU than EF, with considerable mint brilliance. Central weakness on both sides as almost always, but mint frost even in some weak areas. Small but deep obverse planchet defect (split) above. Faint traces of old cleaning. \$300.00.

1800 [BB-192] B-19b. R-2. AMERICA. Extended cracks as described by Bolender. All things considered, AU; mint lustre, gold and sunset tones, rather weakly struck in centers. Condition Census level. \$310.00.

1800 [BB-193] B-18b. R-2. Brilliant Unc., peripheral tone, part of cheek and adjacent hair not up. Extremely rare with obverse cracks in stars. \$340.00.

1800 [BB-194] B-14b. R-3. Better than EF, faint cabinet friction, much mint brilliance, gold and blue tone. Very beautiful. \$300.00.

1800 [BB-195] B-15. EF to AU, much lustre, faint traces of old cleaning, light warm tone, light planchet streak on either side. \$210.00.

1800 [BB-196] B-17b. R-1. AU or so, dull gold toning, some mint lustre; reverse superior to obverse. \$240.00.

1801 [BB-211] B-1b. High R-4. AU. Condition Census level. \$380.00.

1801 [BB-212] B-2a. R-3. EF-AU, brilliant, doubtless cleaned long ago, lightly bagmarked. Condition Census level. \$380.00.

1801 [BB-213] B-3. R-3. EF/AU, brilliant, cleaned. \$210.00.

1801 [BB-214] B-4. R-4. Close Date. EF plus, highly lustrous, peripherally toned, cleaned long ago. Condition Census level. \$330.00.

1802/1 [BB-231] B-1. High R-5. Close overdate, EF or so, flat strike, much of flattening from die injury. Trivial handling marks, sunset and dusky tone. \$170.00.

1802/1 [BB-232] B-4a. R-3. Close overdate. VF, some mint lustre, delicate toning, central reverse adjustment marks. \$150.00.

1802/1 [BB-233] B-2. R-5. EF or so, some mint lustre with delicate gold and blue toning; light central scratches, some of which may be adjustment marks. Small reverse rim dent. \$150.00.

1802/1 [BB-234] B-3. Low R-4. VF plus, surface somewhat soft, porous and naturally streaky, traces of repairs around 02 where most probably corrosion was removed. \$210.00.

1802/1 [BB-235] B-9. High R-7. Close overdate. VF, light toning. \$170.00.

1802 [BB-241] B-6. R-1. Normal date divided 18 02. Slightly short of Unc., having light slide marks on cheek and bust; evidence of old cleaning. \$425.00.

1802 [BB-242] B-5. Normal date. R-7. Obverse VF-EF, reverse EF; gray tone; a single rim dent on either side. \$150.00.

1803 [BB-251] B-1a. Small 3. R-5. Wide Date, 1 free. VF or better, sharp, trivially bagmarked; small rim dent below 1 of date. \$130.00.

1803 [BB-252] B-5. R-6. Close date. EF, rainbow tone, obverse stronger than reverse. Tiny obverse rim nick above R, smaller border nicks near 2nd star. \$220.00.

1803 [BB-254] B-4a. R-3. Just VF, some mint lustre, some iridescent tone; small obverse rim dent. \$130.00.

1803 [BB-255] B-6. Large 3. R-1. More or less Unc.,

prooflike surface, struck from repolished dies. Exceptional. \$450.00.

1803 [BB-256] B-3. R-7. Close date. Just about VF, flat impression in the usual places, some areas of EF sharpness. \$190.00.

The Gilhousen Collection sold by Superior Galleries, October 1973. This magnificent offering, sold under the pseudonym of Clarke Gilhousen, included outstanding coins from specialized collection of silver dollars formed by Alfred J. Ostheimer, 3rd, mostly catalogued by Walter Breen. Ira Goldberg, president of Superior Stamp & Coin Co., Inc., told of the collection as follows:¹

I will try to shed some light on the Gilhousen silver dollars that we sold from 1973 to 1975. Actually, these coins were acquired directly from Mr. Ostheimer in Hawaii by my cousin, Larry Goldberg. He acquired all of the silver dollars that were not sold through Lester Merkin in 1968. I believe this transaction took place in 1972. The Ostheimer dollars were then sold to one of our clients, a member of the Huntington family, from whom we took the name Gilhousen (he was a Gilhousen descendant). Gilhousen was a pseudonym that we used for these silver dollars as well as our United States gold auction which we sold as the Gilhousen Collection Part I in 1971. This was our first major coin sale.

The Superior sale created quite a bit of attention, and numerous record prices were set. Certain of the silver dollars reappeared in the same firm's 1975 American Numismatic Association Convention Sale.

1794 [BB-1] Frosty, gray toned Uncirculated, one of the sharpest strikes ever reported. Date, all stars, all of back hair, feathers and leaves, dentils at left on both sides, and letters in UNITED STATES—all the details which normally come weak or illegible on 1794 dollars,—are here unusually bold. Minor field handling marks, one reverse rim dent; some adjustment marks (as made) near borders. Light clash marks but no rim break. One of two finest known. [From the Lord St. Oswald Collection, Christie's, London, 1964, Lot 138; to Alfred J. Ostheimer, 3rd; description condensed] \$110,000.00.

1794 [BB-1] A second, with the clash marks mostly faded out and with the beginnings of the exceedingly rare rim break at 7th star. VF and a far above average strike, the normally weak details at left being bold (except for tips of some dentils and the very tops of UNITED STA). \$12,500.00.

1794 [BB-1] A third. Intermediate die state, with plain clash marks but no rim break. Some areas of Fine sharpness, others of VF, but a large lamination defect behind head (as made) and about 1/3 the area of left reverse is covered by small pit marks. Usual strike with weak left stars and date, UNITED STATES hardly legible, dentils at left not discernible. \$5,250.00.

1795 [BB-13] B-9a. Surface suggests a grade almost VF as do those areas which are struck up, the remainder (mainly in centers and at left) being weaker. Rare, this die state particularly so. \$425.00.

1795 [BB-18] B-7. Richly toned prooflike Uncirculated, somewhat soft strike. Light handling marks near lowest curls. Believed to be by a small margin finest of four top examples of this variety. Ex Bolender, W.G. Baldenhofer, Ostheimer. Pictured (obverse and reverse) on the Bolender plates. \$9,000.00.

1795 [BB-21] B-1. Flowing hair type. VF, weak in centers, struck off center so that upper left obverse border is broad, lower right border not on flan, though stars and date are not affected. Planchet defect at edge below 9. \$825.00.

1795 [BB-23] B-16. Obverse of the regularly seen B-1; reverse with single outer berry at C, berry below upright of M. The variety was discovered by M.H. Bolender 30 years ago, remaining unique to the present day. A lovely borderline Uncirculated specimen with some faint obverse scratches, numerous reverse adjustment marks and lovely iridescent toning. Full breast feathers, though with a small round nick on them. Ex Bolender, K.P. Austin and A.J. Ostheimer. (Pictured on the Bolender plates). \$13,000.00.

1795 [BB-25] B-6. The regularly seen 3 leaves reverse as on the common Bolender-5 but with the rarer obverse die immediately identifiable by top of Y too high. Better than VF, with much mint lustre near letters, stars, and devices. Traces of old cleaning, couple of small light rim dents either side. Many obverse adjustment marks, as made. Unknown to exist in full Mint State, and a grossly undervalued coin, at least 10 times scarcer than the B-5. Early die state, no clash marks. \$825.00.

1795 [BB-26] B-12b. Three leaves. E repunched, I B too far apart, reverse of B-5, B-6; but the extremely rare state III, later than any known to Bolender, with heavy break from rim through 7 (a horizontal lump between 7 and the break) and extending up to near ear. VG/Fine, some of the central obverse weakness undoubtedly because of die failure. The variety is a very high R-6, this final die state R-8, the only other one seen to date being the former E. Taylor coin. \$675.00.

1795 [BB-27] B-5. Almost EF. Light reverse rim dent. Early state, only the beginning of the crack from stem end to rim. \$2,600.00.

1795 [BB-51] B-14. AU and richly toned with much of its original mint surfaces still intact. Central reverse adjustment marks. Ex Bolender, K.P. Austin and A.J. Ostheimer. Pictured obverse and reverse on the Bolender plates. \$5,000.00.

1795 [BB-52] B-15a. With the rare reverse advanced die cracks not known to Bolender (rim above D through S and leaves below TAT, and at tops of ICA); advanced rust marks in fields. EF, sharp, lustrous, with warm irregular toning. Probably one of the last ones made, late October 1795. \$2,500.00.

1796 [BB-61] B-4. Small Date, large letters. Perfect curls, struck before die was reground). AU or better, deeply toned and lustrous, though with two or three small rubbed places. Ex Baldenhofer, Ostheimer. \$5,750.00.

1796 [BB-63] B-2. Similar. The small date is slightly curved and almost evenly spaced. VF for the coin, central details weaker than the rest as always (compare the Bolender plate coin). R-5, or about as rare as last. \$850.00.

1796 [BB-65] B-5. Large date, small letters. AU, mostly deeply toned and lustrous, but with four or five similar light

¹ Information concerning the Ostheimer coins is from Ira Goldberg, cousin of Larry. Letter to the author, November 24, 1992.

areas of rubbing. Not known to exist in full Mint State. Ex Baldenhofer, Ostheimer. \$6,500.00.

1796 [BB-66] B-1. Practically Uncirculated, deeply toned but with much mint lustre, light cabinet friction in very center of reverse, many central obverse adjustment marks. Very rare and long known as the unequaled finest of this variety. Ex R. Coulton Davis, Baldenhofer, Ostheimer. \$5,000.00.

1797 [BB-71] B-3c. Warmly toned Uncirculated, a number of reverse scratches on eagle. Well struck, frosty and beautiful. Probably the finest known. Ex Baldenhofer, Ostheimer. \$6,250.00.

1797 [BB-72] B-2. Obverse almost VF and may qualify at that level; reverse better than Fine, probably should be graded as VF in terms of actual wear. This great rarity was struck from a very worn reverse die, and the reverse weakness is absolutely characteristic. (Compare 1798 B-2 below, which is struck from the same reverse die, and which though AU and lustrous still shows abnormal weakness in the same places as this coin.) Clean surfaces suggestive of VF, with only minimal handling marks. One of the top six specimens known, out of possibly 20 survivors of only 342 minted, February 28, 1797. \$1,550.00.

1797 [BB-73] B-1e. AU, deeply and irregularly toned, lustrous, with several tiny rubbed places. The most advanced die state known, shattered and bulged. Ex Baldenhofer, Ostheimer. \$6,750.00.

1798 [BB-81] B-2a. With the extended obverse scratches. AU, deeply toned with flashes of original mint brilliance; unusually sharp strike; a couple of small rubbed places, less noticeable than on some of the earlier pieces in this group. One of two finest known of this well known variety. Ex Lester Merkin, November 1965, Ostheimer. \$5,100.00.

1798 [BB-82] B-1a. VF or better. \$560.00.

1798 [BB-95] B-7. Same type. Same obverse, reverse with normal A. VG. One of possibly six known, all in worn condition. The first time one of this variety has been publicly auctioned, to our knowledge, in the last 20 years. \$485.00.

1798 [BB-96] B-6. Reverse solid base to first A of AMERICA. Struck before the die was cracked or reground. VF, lustrous, warmly toned, with few minute handling marks, mostly on obverse. Very scarce. \$445.00.

1798 [BB-101] B-17. Very wide date, dentils weak and widely spaced at bottom and left; reverse of Bolender-6b reground, berries almost invisible. EF, lustrous, iridescently toned. One of three finest known of this famous Rarity-7. Pictured (obverse) on the Bolender plate. Ex Boyd, WGC, Bolender, Ruby. \$1,050.00.

1798 [BB-102] B-20a. Rim break below tail. Nearly EF, weak in centers. Mint lustre and iridescent toning. Very rare break, unknown to Bolender at the time of writing his book, but presumably known to him later as this piece is ex Bolender, Ruby. \$475.00.

1798 [BB-104] B-22a. With the beginning of the break down through E of STATES (usually without break). VF or better, centers not well up; tiny rim dent near ninth star. Very scarce, much more than Bolender realized. \$260.00.

1798 [BB-105] B-23a. Lapped die, removing most of second curl from bottom and highest wave atop head. Better than VF, nearly EF, weak as always with this die state; excellent surfaces, irregular toning. \$300.00.

1798 [BB-107] B-21. Borderline Uncirculated, really full Mint State but too many plain adjustment marks in central obverse. Frosty, with beautiful iridescent tone. Finest known and unequaled. Approached only by three AUs. Ex Bolender, Ruby. \$1,800.00.

1798 [BB-111] B-11 b. Very rare break across head and field almost taking out last star. Fine or better for the coin, central obverse weakness unquestionably due to the advanced die failure. Probably one of the last made from this die. \$280.00.

1798 [BB-113] B-27. Very deeply toned Uncirculated, sharply struck and believed finest known. Ex K.P. Austin, Ostheimer. \$5,750.00.

1798 [BB-115] B-31a. Extremely rare shattered die. EF, the reverse seemingly VF but its weakness is definitely from die failure. Unusually broad border. Mint lustre and iridescent toning. One of three finest known of this famous Rarity-7. Ex Bolender plate coin. \$775.00.

1798 [BB-116] B-30. Fine double profile. Rainbow toned Uncirculated, lustrous and as sharp as this variety comes. Very rare, and long known to be finest of the variety. Nothing in this class has been auctioned in the last 30 years. Ex Baldenhofer, Ostheimer. \$5,300.00.

1798 [BB-120] B-12a. Unpublished shattered die. Obverse cracked between 79 up to drapery, from rim through first star, and from rim at lower right stars. Reverse crack described for B-12 now extends through dentils over ES OF AM; an obverse crack through drapery has occasioned massive die failure, weakening drapery and rendering opposite stars (behind eagle's head) illegible. Better than VF for coin. The only one we have heard of. \$725.00.

1798 [BB-121] B-9a. Shattered and rusted dies. Some areas suggest EF sharpness as do some surfaces, which display mint lustre, but this dollar is weaker in centers especially on reverse, possibly from die failure. Overall grade of VF. Very scarce. \$360.00.

1798 [BB-122] B-14a. (Listed as R-6.) Better than VF, some areas suggest EF, mint lustre. Iridescent tone. Rare die state, rarer condition; only one full EF has ever been reported (Miles Collection). This is probably one of three top examples. \$575.00.

1798 [BB-124] B-25b. Rare shattered die state. Sharpness of About Fine, surfaces suggest a higher grade; deep gray tone. The weaknesses are from extensive die failure. Ex Kreisberg sale, November 19, 1962, Lot 1172, Ruby. \$320.00.

1798 [BB-125] B-24a. Scarce advanced cracks. Obverse nearly EF, lustrous and iridescently toned, reverse VF, weakly struck. \$475.00.

1799/8 [BB-141] B-3. Very deeply toned Uncirculated, faintest suggestion of cabinet friction in one or two tiny places on reverse. Equal overall at least to the Miles and Taylor examples; has been called finest known. Ex Baldenhofer, Ostheimer. \$5,300.00.

1799/8 [BB-142] B-1a. Unlisted shattered reverse die state. VF, a rather weak soft strike as on the others seen from this die state (Clarke, Davis-Graves specimens). Many times rare than the early state described by Bolender. \$430.00.

1799/8 [BB-143] B-2. Fine or better, many light scratches, surface rough and porous—possibly from having rested for years in the sea. \$350.00.

1799 [BB-151] B-13. 13-star reverse showing die flaws at E of STATES. Surfaces of AU or better, much mint lustre and only minor handling marks (three on rims, not very noticeable). Touches of cabinet friction consistent with a grade above EF. Extremely rare, underrated by Bolender; a full R-7. In one of three top examples, apparently tied for second finest though of the three (this one, the Austin and the Taylor-Baldenhofer coins) there is at most 5 points spread in grade; the other 6 or 7 now known are in Good to Fine. The earliest variety of the year, its obverse a leftover from 1798 though with date originally minus final digit; die break progressions prove that this preceded Bolender-15, Bolender-4 and the three overdates. Hasty punching-in of the final 9, too low and leaning far to right, produced the "Irregular Date." A truly extraordinary coin, pictured (reverse) on the Bolender plate. Ex Bolender, Ruby. \$1,200.00.

1799 [BB-153] B-4. Irregularly toned, prooflike Uncirculated, weakly struck in centers but much better struck elsewhere. Advanced obverse cracks. Finer of only two Uncirculated examples reported. Rare in all grades, very rare above VF. Ex K.P. Austin, Ostheimer, via Lester Merkin auction, September 1968, Lot 275. \$4,500.00.

1799 [BB-154] B-18. Early state with only the first and last breaks mentioned by Bolender. Better than VF, traces of mint lustre, with its quota of minute handling marks. Edge planchet defects (as made) left of date and extending to above E of STATES. Very rare, a high R-6 though possibly not quite R-7. One of the half dozen or so finest, exceeded by three EFs and tied or minutely exceeded by a couple of others not quite reaching EF. Ex Fairbanks 562, Ruby. \$450.00.

1799 [BB-155] B-19a. With additional obverse cracks not mentioned by Bolender. Better than VF, some traces of lustre, gray toning. Very rare. Ex Bolender, Ruby. \$375.00.

1799 [BB-156] B-7d. Unlisted shattered and buckled reverse dies, one of two latest states seen. Seemingly VF, under a glass some areas display no more wear than would be consistent with EF grade, with plenty of mint lustre. One of only three seen in this die state. Ex Bolender, Ruby. \$525.00.

1799 [BB-157] B-5a. AU plus, deep iridescent toning and mint brilliance, but a plain old scratch from nose to 10th star. Ex Bolender, Ruby. \$1,150.00.

1799 [BB-158] B-16b. Shattered obverse die, clashed reverse, one of the later die states covered by this number. EF to AU. As fine as the variety comes, exceeded in the earlier and commoner die states by one or two with minutely fewer signs of handling, but so far as we know unsurpassed in the rare late die states. Ex Bolender, Ruby. \$1,050.00.

1799 [BB-159] B-23. Almost EF. Early die state, before the clash marks or the bulge developed. Rare and extremely popular type coin. Listed last by tradition, though if this was the last obverse die made it was not the last put into use, as this coin was made after Bolender-16 and before the reverse die was again reground to make Bolender-12. \$425.00.

1799 [BB-160] B-12b. The other No Berries variety. Surfaces suggest a grade of AU or better, with plenty of mint lustre and lovely iridescent toning, but there is enough cabinet friction to suggest EF grade. A splendid piece, one for the type collector. Ex Bolender, Ruby. \$875.00.

1799 [BB-161] B-11b. "No berries." The reverse breaks much extended and with others not mentioned by Bolender.

Nearly VF, irregularly toned, several small rim dents. This was the discovery specimen and the die state remains very rare. Ex O.K. Rumbel Collection, 1952 ANA Convention Sale, Lot 3172, Ruby. \$375.00.

1799 [BB-162] B-6a. Warmly toned Uncirculated, sharp except in centers (where adjustment marks show on reverse); minute rim nicks. Said to be finest known of this rare variety (R-5 in Bolender). Ex Bolender, K.P. Austin, Ostheimer. Pictured (obverse and reverse) on the Bolender plates. \$5,500.00.

1799 [BB-163] B-10b. Greatly advanced die breaks, the break through O heavy. More or less EF, much mint lustre even in those areas of fields where even brief circulation would have obliterated it; fails to qualify as AU or better only because of a little too much cabinet friction on three or four of the highest places. Few small plain bagmarks on either side, more on reverse than on obverse. Light traces of old cleaning. Well struck for this rare advanced die state, which is unusual. \$1,300.00.

1799 [BB-164] B-17b. Advanced die cracks on reverse (at OF and IC) unknown to Bolender at time of writing. Close to EF, softly struck, with some lustre (mostly on reverse) and some signs of old cleaning, now toning down naturally. Very rare, first reported in the Philip Straus estate, fewer than a dozen seen in all. Ex Bolender, Ruby. \$575.00.

1799 [BB-165] B-8a. Almost VF, even wear, comparatively well struck, gray tone with electric blue on reverse; unusually free of handling marks except for a small obverse rim nick. \$235.00.

1799 [BB-166] B-9c. Shattered obverse die unknown to Bolender at time of writing. Almost VF, two or three small rim nicks either side. This die state very rare. Ex Bolender, Ruby. \$425.00.

1799 [BB-167] B-14. VF and scarce; some mint lustre, deep irregular iridescent tone, and obverse shows central adjustment marks, as made. Scarce and important as only one full EF has been seen to date, nothing above. Ex Bolender, Ruby. \$350.00.

1799 [BB-169] B-21a. VF. The die cracks and rust marks are more advanced than Bolender mentions, particularly on reverse. Rare. \$600.00.

1800 [BB-184] B-12. R in LIBERTY double cut, plain flaw at E of AMERICA. VF. Very scarce and possibly rare; grossly undervalued by Bolender. Possibly the earliest variety of the year, as it has the defective U (corrected by hand on the die) found in some 1799 reverses. Only three are known that definitely exceed EF. Ex Bolender, Ruby. \$350.00.

1800 [BB-188] B-8b. Advanced crack through AMERICA unmentioned by Bolender. Much frosty mint lustre with warm irregular tone, but a little too much cabinet friction to qualify as full EF, though some areas do suggest this grade. Reverse struck from worn dies and grades VF. Important, as only two are now known that will grade EF or higher. \$675.00.

1800 [BB-189] B-5. Better than VF, faint traces of lustre, warm gray tone, minute handling marks; some parts suggest EF grade. Rare and important, probably one of the top three or four examples; only one full EF is known, and the other top specimens differ from this only by a point or two. \$625.00.

1800 [BB-190] B-10b. Advanced reverse cracks unknown to Bolender. VF. \$525.00.

1800 [BB-191] B-11. The rarer of the two "AMERICAN" varieties. EF, lustrous, richly toned, many areas suggesting AU. Tied for finest known with one other, and may even be a point or two finer. Extremely rare, high R-6 at least. Readily distinguished from the common Bolender-19 by lacking the die flaw near border below first star. Ex Bolender, Ruby. \$650.00.

1800 [BB-192] B-19. The regularly seen "AMERICAN." Surfaces full of frosty mint lustre with some iridescent tone, suggesting a grade of AU despite a couple of pin scratches, enough cabinet friction on high points to suggest a grade nearer to EF. Beautiful; one for the type collectors. \$525.00.

1800 [BB-193] B-18d. Extremely rare advanced breaks unknown to Bolender. Almost EF, deep gray tone, traces of lustre; one tiny reverse rim nick but no other handling marks worth mention. The B-18 with clashed dies but without any die breaks is common, but with any of the extra breaks it is a great and unappreciated rarity. (Same dies as "Bolender-13." The latter, extremely rare, before dies clashed.) Ex Bolender, Ruby. \$775.00.

1800 [BB-194] B-14. Almost EF. This has some, though not all, the breaks called for by Bolender-14a; very scarce so. \$500.00.

1800 [BB-195] B-15. VF. \$300.00.

1800 [BB-196] B-17. About EF. \$385.00.

1801 [BB-214] B-4. Choice VF. By a small margin, scarcest of the collectible 1801s. This is in the Condition Census; apparently only one full Uncirculated is known. Ex Bolender, Ruby. \$650.00.

1802/1 [BB-232] B-4a. Closest overdate. Early state of unlisted crack through bust to 13th star. EF, much mint lustre, lovely iridescent tone; tiny rim nick on either side. Very scarce. Ex Bolender, Ruby. \$575.00.

1802/1 [BB-234] B-3. VF. \$250.00.

1802/1 [BB-235] B-9b. With the diagnostic die chip between curl point and B, and the crack from rim into drapery, and the second crack through 11th and 12th stars to rim. Better than EF, richly toned; one of two top examples of this extreme rarity (R-7). Ex Baldenhofer, Ostheimer. \$1,300.00.

1802 [BB-241] B-6. "Close" date (really divided 18 02). Sharp but bagmarked AU cleaned years ago and now with natural sunset tone, which effectively conceals most of the faint scratches. Ex Baldenhofer, Ostheimer. \$2,000.00.

1802 [BB-242] B-5. Wide normal date. EF/AU, some original prooflike surface, warm light iridescent tone. Reverse with full breast feathers. Probably was not in circulation for more than a few days, thereafter displayed with the lovely reverse uppermost in a velvet tray. Tied with one other for second finest of this R-7; possibly the most undervalued single coin in the *Guide Book*. Obverse pictured on the Bolender plate. Ex Bolender, Ruby. \$1,600.00.

1803 [BB-251] B-1. Small 3. VF. Rare, none known above EF. Ex Bolender, Ruby. \$325.00.

1803 [BB-255] B-6a. Large 3. EF-45. This variety, and the 1802 Bolender 6 which immediately preceded it, doubtless made up the 19,570 dollars actually struck in 1804. Ex Baldenhofer, Ostheimer. \$1,500.00.

The Herdegen Collection sold by Hans M.F. Schulman, December 10-12, 1973, included dates and major varieties of early dollars 1794-1803.

1794 [BB-1] VG. Impression somewhat weak at lower left of date and left side of obverse, as well as lettering in STATES on reverse. \$6,000.00.

1795 [BB-21] B-1. Sharp struck in Choice EF condition. Minimal wear. Light blue toning on obverse with gold to blue toning on reverse periphery. \$3,000.00.

1795 [BB-27] B-5. EF with some light scratches on head. Light toning and nicely centered. \$625.00.

1795 [BB-27] B-5. Rather strong Fine, with heavier toning. \$400.00.

1795 [BB-51] B-14. Boldly struck strong EF, nicely toned, showing only modest wear for grade. \$800.00.

1796 [BB-61] B-4. EF, without blemishes. \$550.00.

1796 [BB-65] B-5a. Very choice EF, sharply struck, showing only light wear. \$1,200.00.

1796 [BB-66] B-1. EF, with two scratches near eagle's wing. Initials "H F" scratched on reverse below wreath. Toned. \$500.00.

1797 [BB-71] B-3. EF. Several indentations on rim. \$475.00.

1797 [BB-72] B-2. Strong VF, with some light scratches. \$450.00.

1797 [BB-73] B-1. EF. \$525.00.

1798 [BB-81] B-2. Choice EF, nice green to blue toning. \$650.00.

1798 [BB-82] B-1. EF. Nice uniform blue toning. \$525.00.

1798 [BB-104] B-22. EF, showing some lustre. \$350.00.

1798 [BB-113] B-27. Choice EF. Details quite sharp. Showing only small light scratch at chin. Very modest wear. \$600.00.

1799/8 [BB-143] B-2. Highly lustrous, choice EF condition. Reverse close to Unc. Nicely toned. \$860.00.

1799/8 [BB-143] B-2. Strong VF, lustrous, slight signs of handling. \$260.00.

1799/8 [BB-141] B-3. VF to EF. Some blemishes. \$220.00.

1799 [BB-161] B-11. Fine with several light edge dents, some blemishes. \$155.00.

1800 [BB-187] B-16. EF with nice uniform gray toning. \$275.00.

1800 [BB-190] B-10. Fine, VF with small edge dent above OF on reverse. \$160.00.

1800 [BB-192] B-19. Strong, EF with some lustre, minimum of blemishes. \$300.00.

1800 [BB-194] B-14. Strong EF, considerable lustre, struck somewhat off center. Some nicks on obverse which do not materially defect from appearance. \$365.00.

1801 [BB-212] B-2. Lustrous EF. \$375.00.

1802/1 [BB-231] B-1. Lustrous and a very choice EF, showing only light wear. Uniform light golden toning. \$450.00.

1802/1 [BB-233] B-2. EF with some lustre and nice gray toning. \$400.00.

1802 [BB-241] B-6. Very choice EF, with all details sharp. Lustrous, showing only moderate wear at any point. \$525.00.

1802 [BB-242] B-5, Strong EF. \$525.00.

1803 [BB-255] B-6. Few light scratches and nicks on obverse. Fine to VF. \$160.00.

1803 [BB-256] B-3. AU showing faint wear on rather weakly struck center. A beautiful coin with prooflike surface, but very likely a first strike. \$925.00.

The W. Earl Spies Collection sold by Stack's, December 9-10, 1974, comprised a truly memorable cabinet of early dollars by specialized die varieties, including numerous examples of die states not mentioned in the Bolender book.

1794 [BB-1] The first year of issue. (Only one pair of dies used this year.) Strictly VG. The stars are weak at the left as usual, as is the periphery of the coin. Although worn, there is something charming about our first silver dollar surviving the "commercial world" with no more than even wear and not even one tiny area of damage. A lovely coin with natural even pale steel and iridescent toning. \$3,100.00.

1795 [BB-11] B-3. Two Leaf variety, but the only reverse with 16 berries. Often called the "Head of 1794." A nice Fine, perfectly even wear on without a blemish. \$525.00.

1795 [BB-12] B-11. Two Leaf variety. A 19-berried reverse but in an altogether different style. Haseltine's was only Good and scratched in the field. Bolender only saw one specimen! This lovely coin is Fine and perfect but for one old small reverse edge ding. This could possibly be the finest known, and is listed as a Rarity-7. It really should be a Rarity-8. \$850.00.

1795 [BB-13] B-9. Two Leaf variety. The obverse of B-3-11 and the 4 reverse. Fine, with one nick each on the obverse and reverse edges. Rarity-5. \$350.00.

1795 [BB-13] B-9a-2. The clashing quite evident, but now the letters are noticeably bifurcated. A borderline VF, with exquisite surfaces and toning. (In this state really a Rarity-6.) \$525.00.

1795 [BB-13] B-9a. At this point the coins were struck from clashed dies, the reverse clearly displayed on the obverse. The bifurcation of the letters just noticeable. Fine, with a large planchet defect on the reverse. \$230.00.

1795 [BB-14] B-4. Two Leaf variety. The last star entirely under the bust. A nice VF, halo-like iridescent toning about its periphery. \$775.00.

1795 [BB-14] B-4a. From the same dies but with a crack developing in the center and another diagonally from the 5th star to the back of the head. VG with a few dings. \$375.00.

1795 [BB-15] B-8. Two Leaf variety. The head is poorly centered although well-executed. VF, but noticeably damaged by some severe dents obverse and reverse. From Bolender's Fox sale in 1951. A Rarity-7 item, and since Bolender only used an 8 point scale it makes this virtually uncollectible. Bolender himself states that he has seen only two specimens in 40 years! \$575.00.

1795 [BB-17] B-18. Unlisted in Bolender. The obverse is B-13, the reverse B-12. EF and wholly prooflike, with but a few very faint scratches between the 1 and 7. Bolender states that he examined 5,000 early U.S. dollars. Obviously he didn't know of its existence when his book was printed. Later though, he announced its discovery. We checked wherever possible and we cannot locate another specimen sold in recent years. A most exciting numismatic find! \$1,050.00.

1795 [BB-18] B-7. Three Leaf variety. The only 14 berry reverse. This also is sometimes referred to as the "Head of 1794," but the three distinct curls on the top of the head on the B-3 most closely resembles the 1794 head. A nice choice Fine. Rarity-4. \$500.00.

1795 [BB-20] B-2. Two Leaf variety. The diagonal "bar" near the 4th star very faint. VF, with a few light old scratches on the obverse. \$550.00.

1795 [BB-21] B-1. Although Bolender says that this head resembles that of the 1794, this cataloguer is more inclined to agree with Bolender that the B-3 is closer to the "Head of '94" (although an exact head doesn't exist on a 1795 dollar). A strong VF bordering on EF. The coin is wholly prooflike and was undoubtedly struck on a polished planchet. Streaky but attractive toning. \$600.00.

1795 [BB-24] B-13a. Two Leaf variety. The letters are bifurcated. A choice prooflike EF specimen without a flaw! Bolender states, "Haseltine met with only a single specimen and called it 'probably unique.'" This specimen is by far superior to the Bolender Plate coin, and the cataloguer seriously doubts if a better could exist. Rarity-7. \$900.00.

1795 [BB-24] B-13. As above, but the letters are not bifurcated. Actually this is probably rarer than the 13a. VF, but an "X" is scratched on the neck and another scratch in the field from the chin. Rarity-7. \$280.00.

1795 [BB-25] B-6. Three Leaf variety. The hair in six curls. The reverse of B-5. Fine, with small planchet defect on the obverse edge over "E" and the usual circulation marks for a coin of this grade. \$320.00.

1795 [BB-26] B-12. Three Leaf variety. Curl passes through a star point. The 13 berry reverse. Strictly Fine with a few reverse rim nicks. Rarity-6. \$550.00.

1795 [BB-26] B-12a. Same as the preceding but with a vertical die break from the bust through the 7 and then to the border. Bolender only saw one specimen in his life, his own. Rarity-7 (8?). A nice Fine. \$360.00.

1795 [BB-27] B-5a. Three leaves below each wing of eagle. Diagonal bar in the field between the 5th star and uppermost curl. The stem break extends only halfway to the edge. Struck on the largest planchet we've ever seen of a B-5. This coin is a borderline EF, with prooflike surface. Pale iridescent toning. \$1,400.

1795 [BB-51] B-14. The bust not centered properly. A strong VF with claims to a higher grade. An interesting note about this reverse die is that it was used in striking coins dated 1795, 1796, 1797, and 1798. \$625.00.

1795 [BB-52] B-15. The bust centered and by far, aesthetically more pleasing. Strictly VF and a good companion piece to the previous lot. \$525.00.

1796 [BB-61] B-4. Small Date, large letters. From the same obverse die, but the curl is perfect and the letters are bifurcated. Fine and choice. \$420.00.

1796 [BB-61] B-4a. Small Date, large letters. The obverse is from the B-3 dies, the reverse B-4. EF, with some prooflike surface. Beautiful iridescent toning. Bolender states that he only knows of one specimen, the Gable-Reeder specimen. Of the utmost importance as a high Rarity-7 item. A few others have been discovered since that statement, still it is a most important coin. \$750.00.

1796 [BB-62] B-3. Small Date, small letters. The letters

NOT bifurcated, and the curl on top of the head imperfect. One of only very few known. Probably a high Rarity-6 or perhaps 7. VF to EF. From our Straus Sale in 1959. \$950.00.

1796 [BB-63] B-2. Small Date, small letters. A nice strong VF, mottled iridescent toning. \$655.00.

1796 [BB-65] B-5. Large Date, small letters. The rather common variety with the die lump at the right top of "T" in AMERICA. Fine, a few minor nicks and scratches. \$300.00.

1796 [BB-65] B-5a. From the same dies as B-5 but the lump is now larger and the other breaks in and around "E" are much more prominent. VG. \$330.00.

1796 [BB-65] B-5c. The same dies as the preceding but the lump is now larger as are the other breaks. The letters are all bifurcated, and a short vertical break can now be seen between the chin and the 12th star. EF-AU, with a tiny planchet defect on the edge of the 1st star. \$700.00.

1796 [BB-66] B-1. Small Date, small letters. A nice Fine. \$400.00.

1797 [BB-71] B-3. Stars 10x6. Large planchet. Unc., full frosty mint lustre. Natural sea green, golden, and iridescent toning. Just a touch of friction on the cheek (which really is only missing tarnish) from the gem category. A beautiful and rare coin. \$3,750.00.

1797 [BB-71] B-3a. Same as above, but struck on a smaller planchet. It makes for a much neater appearing coin with its even denticles and square edge. EF, with lovely iridescent toning. \$1,200.00.

1797 [BB-72] B-2. Stars 9x7. Small letters. The obverse is Fine, the reverse is Good to VG. This is to be expected since the reverse die already had a good deal of use. A rare type and really quite nice. \$750.00.

1797 [BB-73] B-1. As above, but with a myriad of fine die cracks. A choice VF. \$450.00.

1797 [BB-73] B-1. Stars 9x7, large letters. Lightly burrished in an effort to remove adjustment marks. Still a beautiful VF specimen. \$310.00.

1797 [BB-73] B-1a. Same as above, but with the various die cracks as mentioned by Bolender. Nearly VF, deep steel and iridescent toning. A splendid specimen. \$400.00.

1797 [BB-73] B-1b. As above, but the die cracks are more pronounced including the cracks on the reverse. Fine, but with a serious gouge before the face. \$200.00.

1797 [BB-73] B-1c. Another specimen of this rare die state. Fine to VF, some cleaning marks before the face. \$320.00.

1798 [BB-81] B-2. 15 Star obverse. Small Eagle reverse. This is the only 1798 dollar with 15 stars. The obverse is strictly Fine, the reverse VG. \$450.00.

1798 [BB-82] B-1a. 13 Star obverse. Small Eagle reverse. The same reverse die as 1797 B-1C. The obverse is a strong VF, the reverse Fine to VF. Here again an old die was resurrected, therefore the coin's reverse would prove to be not as sharp as the obverse. Lovely pale steel toning. \$420.00.

1798 [BB-91] B-32. Unknown to Bolender or Haseltine. A new variety having the obverse of B-6 (Knob 9) and the reverse of B-17 (10 arrows). The rim break over the "I" in AMERICA clear. Here again, a new discovery in excellent condition. EF, with a few insignificant marks on the obverse. The only other specimen we know of is the Straus coin originally given the B-33 number and now changed by us to accommodate the discovery B-33 and B-33A in this sale).

\$525.00. [This is known today as BB-91.]

1798 [BB-92] B-4. Knob 9. From the same obverse dies as B-3, but the die break is not evident at all and the fourth star point recutting is very clear. Many of the letters are bifurcated. A beautiful coin. EF to About Unc. \$625.00.

1798 [BB-92] B-4a. As above, but most of the letters are not bifurcated. The break is not evident. VF. \$350.00.

1798 [BB-93] B-5. Knob 9. The variety with the massive vertical break which bisects the reverse. Fine to VF, and a Rarity-7. Both Haseltine and Bolender each saw only one specimen. \$330.

1798 [BB-93] B-5a. Knob 9. The B-3 obverse and the 5 reverse before it shattered. Virtually none of the breaks are evident on either obverse or reverse, but it does have a tiny crack from the rim to the right pendant of "T" of LIBERTY. VF. Unknown to either Haseltine or Bolender and probably unique. \$280.00.

1798 [BB-94] B-3. Another. Fine, evenly struck and worn. There is quite an obvious die crack which starts at the rim and goes between the second and third stars, terminating at a point of the second star. The previous double struck coin has this crack sharply in evidence. \$300.00.

1798 [BB-94] B-3. Knob 9. A freak specimen in that it was double struck. The stars are now undersized because of the double strike, giving the coin a most curious appearance. At least EF, and probably a trifle better. \$550.00.

1798 [BB-95] B-6. Knob 9. The "comma" variety. Struck from the rare perfect dies. EF and very choice but for a few minor handling marks here and there. \$540.00.

1798 [BB-95] B-7. The perfect obverse die (but still with the "comma" like B-6) coupled with the B-3 reverse die. VF. A very rare coin which Bolender has called a Rarity-6. \$500.00.

1798 [BB-95] B-7a. The last of the Knob 9 variety. Same dies as above, but "UNITED STATES OF" is bifurcated. A nice choice VF, delicate toning. From our Pelletreau sale. Very rare, probably only one or two are known. \$500.00.

1798 [BB-96] B-6a. Knob 9. Another of this variety, the obverse is beginning to bulge and the die breaks are very faint. Fine. \$260.00.

1798 [BB-96] B-6b. Knob 9. Another very curious coin. Double struck with a double row of denticles, etc. This, however, displays all of the breaks listed as B-6a. About Unc., delicate iridescent toning. Really a very beautiful coin. \$675.00.

1798 [BB-101] B-17. Very wide date. The reverse with 10 arrows. Another great rarity of which only two were ever seen by Bolender. This specimen is a beautiful EF coin, with mint lustre and delicate iridescent toning. From Lester Merkin's Sept. 1968 Sale. Better than our Straus coin in 1959. \$430.00.

1798 [BB-101] B-17a. Another specimen, but this is from the finished dies with the denticles regular, die flaws removed, and the stars better formed. VG with some planchet adjustment marks and a reverse edge nick. \$190.00.

1798 [BB-102] B-20. The reverse break very apparent. Fine, with a few light reverse planchet adjustment marks. \$290.00.

1798 [BB-103] B-18. Very wide date. The reverse struck from the unknown perfect dies. VG, with the central portion very weak. Only very few are known of this variety and this may be a "discovery piece" in its perfect state. Rarity-8.

\$525.00.

1798 [BB-104] B-22. Very wide date. The break from the right part of "E" through clouds has advanced to the shield. VG, with an obverse edge nick. \$190.00.

1798 [BB-104] B-22a. As above, but the reverse was struck from perfect dies. The letters are not bifurcated. VG to Fine. \$340.00.

1798 [BB-104] B-22b. As above, but the letters are bifurcated. VF, with a small reverse edge dent and a planchet defect at left wing tip. \$300.00.

1798 [BB-105] B-23. Very wide date. Spur on 9. The obverse die of B-22, the reverse die of B-19. Nearly VF. \$310.00.

1798 [BB-105] B-23a. The letters in "LIBERTY" are bifurcated, and the curl defective. Rarity-4 as indicated by Bolender. VF, iridescent toning. \$290.00.

1798 [BB-106] B-19. Very wide date. The vertical break which bisects the coin from "E" to "1" is quite obvious. EF, lustrous and prooflike. Rarity-5. \$525.00.

1798 [BB-106] B-19a. As above, but the vertical break is starting to crumble the left side of "E" and there is now a lump below the 1. VG to Fine. \$190.00.

1798 [BB-106] B-19b. The break is heavier and the obverse is starting to "mound." The breaks mentioned on the "a" obverse are now heavier. Fine, but some reverse gouges at the juncture of each wing. \$200.00.

1798 [BB-107] B-21. Very wide date. EF, with the central portion of the reverse just a trifle weak. Rarity-4. \$425.00.

1798 [BB-108] B-13. The obverse is from the B-10 die with the die break from the "L" now nearly touching the edge. The 10 arrow reverse. VF, pale iridescent toning. \$360.00.

1798 [BB-109] B-10. Spur on the lower part of the circle of the 9. Medium wide date. The eagle somewhat weak as is always the case with this variety. A nice VF, with some prooflike surface on the reverse. \$340.00.

1798 [BB-109] B-10a. As above, but the central portion of the reverse is now weaker obliterating some stars. VG. \$200.00.

1798 [BB-110] B-16. Wide Date. We quote from Bolender: "The die broke early and so badly that very few pieces were struck, possibly not over two as no others are known to the author." The break from the edge below the first star across the top of 179 is massive indeed. The spur over the E very clear. The reverse is from the virtually perfect dies of B-11. In most cases, unique or extremely rare die varieties are usually found in Poor to Good condition. This, however, is one case where we are virtually dealing with a gem. Fully EF or better with mint lustre and prooflike surfaces. Delicate golden toning. One of the most exciting coins of this collection! Rarity-8. \$625.00.

1798 [BB-111] B-11. Perfect dies. No cracks are in evidence although if the coin is held at an angle, the collector can see the "mound" just starting which will ultimately result in the obvious break. Strictly VG. Unknown to Haseltine and really rare in its perfect state. \$220.00.

1798 [BB-111] B-11a. Still the perfect dies, however, the "mound" is more obvious but still hasn't developed into a break. VF, with a small edge nick and a slight reverse scratch. \$230.00.

1798 [BB-111] B-11A. With the die break from chin to border as described by Bolender. VG. \$250.00.

1798 [BB-111] B-11Aa. The break is now more serious and extends across the face into the hair. VF, golden and iridescent toning. \$310.00.

1798 [BB-111] B-11B. With the die break as listed by Bolender but now the upper break is more prominent than the lower break (B-11A). VF, pale steel toning. \$330.00.

1798 [BB-111] B-11b. The "mound" now is quite obvious but it still hasn't started to shatter. A nice VF. \$350.00.

1798 [BB-111] B-11Ba. The breaks have now extended across the head into the field beyond, towards the "L" of LIBERTY. VG, a few reverse scratches. \$180.00.

1798 [BB-112] B-15. Spur on the 9. Wide Date. The reverse is that of B-11. EF, but weakly struck in the central portion, especially on the eagle's head and adjacent stars. Die flaws at the final "S" in STATES. \$450.00.

1798 [BB-112] B-15A. Struck from the unfinished dies with the stars smaller. This variety could easily be confused with the B-11 because of the weakness at the right side of the 9. A nice borderline VF. A Rarity-5 item. \$330.00.

1798 [BB-112] B-15a. Spur on 9. Wide Date. As above, but without the die flaws. Well struck in the central portion. Fine. \$310.00.

1798 [BB-112] B-15b. From the same dies as above, but a very curious strike with the 6th star, 7th star, and "LI" virtually invisible, and correspondingly "NITE." EF, but obviously weakly struck in portions. Still a splendid coin and one for the numismatic student. \$420.00.

1798 [BB-113] B-27. From the B-26 die without the obverse break. The reverse from the B-11 die, with a small reverse die crack. EF, with two microscopic X's in the obverse field. \$310.00.

1798 [BB-113] B-27a. As above, with the break mentioned but now there are further breaks from an arrowhead through the wing to STA. A choice VF. \$370.00.

1798 [BB-114] B-26. Close Date. This obverse was used for five subsequent varieties. VF, with a minor planchet defect on the edge at the third star. \$360.00.

1798 [BB-115] B-31. The obverse die of B-26 with a new reverse die. The reverse breaks fall into a category between 31 and 31A. A Rarity-7. Fine to VF. \$260.00.

1798 [BB-115] B-31A. As above, with all of the breaks mentioned by Bolender. Rarity-7. VF, with two old obverse gouges. \$200.00.

1798 [BB-116] B-30. Obverse of B-26, but some of the crack has been disturbed because of a very clever plugging beneath the I. It is virtually indiscernible. Fine. \$170.00.

1798 [BB-116] B-30A. As above, but with the further breaks as described by Bolender. A Rarity-6 item because very few could have been struck with this many breaks. The "mounding" has advanced considerably. EF and probably one of the finest extant. \$475.00.

1798 [BB-117] B-33. Unknown to either Bolender or Haseltine. The obverse is B-26, but the reverse is new. A tiny engraver's scratch from upper right point of the shield. A massive crack starts at the rim through the right part of "T" and terminates in a large "mound" at the juncture of the left wing of the eagle. A startlingly beautiful coin, fully EF and lustrous. \$850.00.

1798 [BB-117] B-33a. Obviously unknown as it is a die state of (B-33). The reverse crack has totally bisected the re-

verse from "T" to "M" in what must be the terminal state of the dies. Fortunately for the collector, in each case of either a discovery coin or a Rarity-8 in the Spies Collection, most of the coins are choice which takes the guesswork out of determining their varieties. EF with pale pink and iridescent toning. \$525.00.

1798 [BB-118] B-28. Close Date. The obverse of B-26 with the additional break. The reverse is perfect. A choice VF. Rare. \$360.00.

1798 [BB-118] B-28a. The obverse same as above. The reverse with most of the reverse breaks mentioned by Bolender. Struck slightly off center, but really a beautiful specimen. About Unc., with considerable lustre. Light golden and iridescent toning. \$675.00.

1798 [BB-119] B-29. From the B-26 die with additional breaks. The reverse is from the B-12 die. VF. \$290.00.

1798 [BB-119] B-29a. As above, but with further cracks across the bust back towards the second star. The reverse, however, was struck from perfect dies. EF, pale steel toning. \$800.00.

1798 [BB-120] B-12. Close Date. The die started to break up which makes for some unevenness in strike. The reverse break clear as mentioned. VF, steel and iridescent. \$320.00.

1798 [BB-120] B-12a. With the break as above, but with quite a few additional breaks obverse and reverse. The "mounding" is quite evident. VF, steel toning. \$320.00.

1798 [BB-121] B-9. Close Date. Small crack from "O" of "OF" to rim (not mentioned by Bolender). Fine, with lustre. A few minor edge dings but really a handsome coin. \$550.00.

1798 [BB-121] B-9a. As above, with the minor breaks as mentioned by Bolender. The break at the date just starting. VF, small reverse edge nick. \$280.00.

1798 [BB-121] B-9b. As above, but the breaks are just slightly more apparent, and the multiple cracks from the "O" of "OF" are more in evidence. VF. \$340.00.

1798 [BB-122] B-14. Medium wide date. A tiny spur on the 9. VF, with a tiny nick in the obverse field. \$310.00.

1798 [BB-122] B-14a. With the breaks as described. Fine, steel and iridescent toning. \$280.00.

1798 [BB-122] B-14b. The crack is now quite massive; the 7th star is barely evident and the "LI" and part of "B" is now affected. Fine, pale iridescent toning. \$280.00.

1798 [BB-123] B-8. Close Date. The only 4 berry reverse of this year. From the wear standpoint the coin is easily EF, however, it is marred by some very noticeable dents, mostly on the reverse. \$220.00.

1798 [BB-123] B-8a. The same dies as above, but with the cracks mentioned by Bolender. Bolender doesn't mention that the injuries are so severe that on the obverse the stars are very weak. On the reverse the "N" and "E" of UNITED are barely visible. VG. \$250.00.

1798 [BB-123] B-8b. The dies are now weaker and many more die cracks can be seen, mostly on the reverse. Fine. \$260.00.

1798 [BB-123] B-8c. A still further deterioration of the dies. The 5th star is invisible and the 7th just apparent. Most of UNITED is now gone and the central portion of the reverse is quite weak. VF, and a nice example of a badly injured die. \$310.00.

1798 [BB-123] B-8d. Probably the last stage of the dies, although the stars are a little sharper than on the 8c. The reverse die, however, is really badly shattered. There must be 15 different die breaks along with all the weaknesses previously mentioned. VG to Fine. \$210.00.

1798 [BB-124] B-25. Close Date. "Whisker" on chin. The reverse from the B-24 die with a lighter break from the stem end. Fine. \$260.00.

1798 [BB-124] B-25a. With the breaks lightly in evidence on the obverse. The reverse has the flaws in the stars. VF, with a dig on the cheek. Rarity-5. \$280.00.

1798 [BB-124] B-25b. The obverse breaks are clear as on the plate. VG, with a planchet flaw on the edge at 5:00. \$180.00.

1798 [BB-125] B-24. A quick check point to differentiate a B-24 from B-14 is a group of die flaws adjacent to the 8 (not mentioned by Bolender). Fine, small reverse edge dent. \$290.00.

1798 [BB-125] B-24a. As above, but with the die cracks as mentioned by Bolender. VF, the upper right stars on the reverse weak. \$350.00.

1798 [BB-125] B-24b. As above, but the die flaws and marks are a trifle more extended. The stars are weak like the 24A. VF. \$350.00.

1799/8 [BB-141] B-3. The overdate with the 15 star reverse. The extra two stars are buried in the clouds. A lovely EF, pale russet toning. Rarity-5. \$425.00.

1799/8 [BB-142] B-1. The overdate. The die cracks at "RI" and above "T" and a few other minor cracks. VF, with two shiny spots in the obverse field. \$260.00.

1799/8 [BB-142] B-1a. Same obverse as the preceding. The reverse cracks have now virtually enveloped most of the letters and clouds. VF, with some lustre. Very rare die state. \$280.00.

1799/8 [BB-143] B-2. An overdate. This, like the preceding coins has the 13 star reverse. VG. \$260.00.

1799 [BB-151] B-13. From the obverse die of B-4. Reverse die flaws in and around "E" of STATES. Fully EF, but marred by a large number of tiny nicks obverse and reverse. Rarity-6. \$310.00.

1799 [BB-152] B-15. Irregular date. The B-24 reverse of 1798. A very rare coin and much underrated. Fine. \$280.00.

1799 [BB-152] B-15a. Same as above, but with many more die cracks obverse and reverse. A choice VF, with delicate russet toning. \$310.00.

1799 [BB-153] B-4. The irregular date obverse. The reverse with 15 stars (the same die as used on B-3). VF. \$380.00.

1799 [BB-154] B-18. Diagnostic because of the noticeable break between "ED" of UNITED. Strictly VF, with iridescent toning. Rarity-6. \$420.00.

1799 [BB-155] B-19. The obverse of B-18 with the crack through the date as described, as well as the other cracks. The reverse is B-2 (the overdate reverse). About Unc., with considerable mint lustre and light toning. Rarity-5. \$650.00.

1799 [BB-156] B-7. This obverse die lasted longer than any other, it was used in six different combinations. Very nearly EF, the reverse is slightly prooflike. \$425.00.

1799 [BB-156] B-7a. As above, but with the breaks as mentioned by Bolender. EF. \$425.00.

1799 [BB-156] B-7b. As above, but the reverse a myriad of breaks. The central portion starting to "mound." VF, steel and iridescent. \$280.00.

1799 [BB-157] B-5. Slight "pocket" under the throat, light "waves" above the date. Fully EF or slightly better. The obverse with considerable frost, the reverse wholly prooflike. \$600.00.

1799 [BB-157] B-5a. The obverse cracks not visible, but the reverse crack is evident. VG, a few old scratches above the head. \$230.00.

1799 [BB-157] B-5b. The obverse crack still not visible but the reverse has many cracks through all of the letters which are bifurcated. A nice VF with russet toning. \$320.00.

1799 [BB-158] B-16. Perfect Dies, and as such really rarer than the broken dies which lasted quite some time as can be seen by the next five lots. EF, frosty. \$450.00.

1799 [BB-158] B-16a-1. As above, but the obverse is starting to mound and a few breaks are now apparent. VF and choice but for an edge nick or two. \$290.00.

1799 [BB-158] B-16a. "Waves" above the date. The single break through the "O" of "OF" clearly in evidence. VF, with considerable lustre. \$325.00.

1799 [BB-158] B-16b-1. The swellings and breaks apparent but partially worn down. "ER" is partially gone. Single break through "O" of "OF." VG, steel toning. \$270.00.

1799 [BB-158] B-16b. The obverse now with a profusion of breaks, mounds, and swelling, and injury at "BER" (not mentioned by Bolender) just starting. Two breaks through "O" and "OF." EF and a nice study specimen. \$420.00.

1799 [BB-158] B-16c. A mass of breaks like the 16B, but now the "BER" is almost sunken completely. EF and choice but for a dig near the first star. \$420.00.

1799 [BB-159] B-23. Stars 8x5. Struck from perfect dies. The reverse is the B-16 die. Fine to VF. \$320.00.

1799 [BB-159] B-23a. Stars 8x5. A bulge of stars 4 through 7. "Waves" under the bust and a few thin die flaws at LIBERTY and the stars. VF and choice. \$350.00.

1799 [BB-159] B-23b. Stars 8x5. The bulge at the upper stars is quite prominent and there is an arc-like crack with a huge bulge from the first star across the neck to the rim, just below the last star. Fine to VF. \$260.00.

1799 [BB-160] B-12. The light cracks under the date are just barely visible. The "No Berries" reverse. EF, light planchet defect on neck. \$310.00.

1799 [BB-160] B-12. Another, but the cracks are much more obvious. VF, steel and iridescent. \$340.00.

1799 [BB-160] B-12a. The dies of B-12 with the additional breaks as described. VF, but faintly pin scratched in the obverse field is "1821" behind the bust and "JAN 7, 1841" in front. \$200.00.

1799 [BB-160] B-12b. As described by Bolender with some swelling at the last three stars. Some of the cracks are not distinguishable completely because of wear. Fine to VF, faint pin scratch outlines the profile. \$240.00.

1799 [BB-161] B-11. Perfect Die, no "pocket" at the throat. The "No Berries" reverse (actually one tiny berry and stem is apparent). VF, small obverse edge nick. \$300.00.

1799 [BB-161] B-11a. The obverse die WITH the "pocket" under the throat. The "No Berries" reverse with the break as

described. Very rare. VF, mottled russet and steel toning. \$300.00.

1799 [BB-161] B-11b. As above with some vestige of the "pocket." The "No Berries" reverse with the break. A strong Fine, bordering on VF. \$310.00.

1799 [BB-162] B-6. A choice EF to AU, pale iridescent toning. Rarity-5. \$550.00.

1799 [BB-162] B-6a. As above, but on the reverse there are quite a few die cracks and flaws. VF, with an edge cut on the reverse. \$290.00.

1799 [BB-163] B-10. Same obverse die as B-5, the "pocket" removed. The various die cracks as described are in evidence. A choice VF. \$350.00.

1799 [BB-163] B-10a. As above, with the additional breaks as described. VF, light iridescent toning. \$340.00.

1799 [BB-163] B-10b. The obverse of B-10 with the cracks of B-10a (much heavier). VF, well struck, pale steel toning. \$370.00.

1799 [BB-163] B-10c. The obverse of B-10 with a perfect reverse. About Unc., full frosty mint lustre. \$625.00.

1799 [BB-163] B-10d. As above, LIBERTY is very noticeably bifurcated, and there is now two "apostrophes," one before and one after the "S." VG, with a small planchet defect on the edge next to the first star. \$250.00.

1799 [BB-163] B-10d. The obverse and reverse are perfect. VG, and the rarest of the B-10 series. \$240.00.

1799 [BB-164] B-17. From the B-5 obverse die without the "pocket." On the reverse the stem is very short. VG, a nice clean coin. \$260.00.

1799 [BB-164] B-17a. As above, but with the cracks as described. Fully VF, with claims to a higher grade. \$340.00.

1799 [BB-164] B-17b. As above, but with quite a few more die cracks, mostly on the reverse. About Unc. Struck on a glossy planchet which has a minor area of porosity on the obverse. \$550.00.

1799 [BB-165] B-8. Liberty with open mouth. Reverse die flaws in and about the final "S" of STATES. A strong Fine. \$280.00.

1799 [BB-165] B-8a. As above, but the delicate crack from "LIB" can be seen, the flaws now more extended on the reverse. About Unc. and frosty. \$825.00.

1799 [BB-165] B-8b. As above, but with the additional breaks as mentioned by Bolender. The stars on the reverse somewhat weak due to "mounding." VF. \$300.00.

1799 [BB-165] B-8c. The obverse similar to the 8A, but the reverse is as badly shattered as the 8B. Fine to VF. \$340.00.

1799 [BB-166] B-9. From the perfect obverse die where the flaw from "I" to ribbon does not show, nor any cracks. The "apostrophe" is neat and clear. VF and choice. \$370.00.

1799 [BB-166] B-9a. As above, with the die cracks and flaws as mentioned. Fine. \$260.00.

1799 [BB-166] B-9b. As above, but the crack between the 9th and 10th stars now branches out over most of the right obverse. About Unc. or very nearly so. \$575.00.

1799 [BB-166] B-9d. All of LIBERTY is bifurcated and the cracks are now just faintly more extended. A large dent behind the head and highly buffed. Deep steel toning. Fine to VF. \$250.00.

1799 [BB-167] B-14. The obverse die flaws are obvious

along with extra flaws not mentioned, including a noticeable one in the wreath. VF, sea green and iridescent toning. \$300.00.

1799 [BB-167] B-14a. Struck from perfect dies displaying only the flaws, not any cracks. VF. \$310.00.

1799 [BB-167] B-14b. Perfect obverse without flaws, the reverse like B-14. VF, but struck on a planchet which was slightly clipped (at the time of striking). \$280.00.

1799 [BB-168] B-22. From the B-14 obverse die. A die crack from "E" of UNITED to the "M" of AMERICA bisects the coin. VG. Rare. \$260.00.

1799 [BB-168] B-22a. From the B-14 obverse die with a crack from the rim upwards between the 17 branching out between the hair and first star. VF, but weak because of the horizontal crack on the reverse which is now more prominent. \$280.00.

1799 [BB-168] B-22b. Very similar to the 22a, but the cracks are just a shade more prominent, and there are a few tiny new cracks in the stars. Fine to VF. \$250.00.

1799 [BB-169] B-21. All of the cracks and flaws as described are apparent. The reverse is B-14. Fine to VF. \$300.00.

1800 [BB-181] B-1. The obverse with the various die flaws as mentioned in the earliest state. Fine and rare. From Merkin's Sept. 1968 sale. \$260.00.

1800 [BB-181] B-1a. As above, but the die flaws are bold and now extend from the chin through the 11th star to edge. The "bar" at the first star is bold. EF, with considerable frosty lustre. \$450.00.

1800 [BB-182] B-2. Another specimen. From the wear standpoint it is Fine, but there are some disfiguring dents on the obverse. Rare. \$270.00.

1800 [BB-182] B-2. The "R" in LIBERTY and on the reverse the first "T" in STATES are double cut. The reverse of B-1 with a break from the fourth feather to the first "A" in AMERICA to the rim, and another break branching out through OF. A nice VF, with a few minor reverse scratches. Rarity-7. \$350.00.

1800 [BB-183] B-3. The obverse of B-2, with the double cut "R." According to Bolender, "Haseltine found but one (Very Fair) and it was 1949 before I found my only specimen." This coin is Bolender's specimen and the reverse is illustrated in the plate section. EF, with mint lustre, some mottled iridescent toning. \$575.00.

1800 [BB-183] B-3. Another specimen. To the best of our knowledge we have never handled a B-3 before. This second specimen which we are fortunate to offer, will now make this a collectible variety. VF, iridescent toning. \$340.00.

1800 [BB-184] B-12. From the B-2 obverse. The die flaw on the reverse is quite obvious. VF. \$320.00.

1800 [BB-184] B-12a. As above, but the die buckled along with the cracks, partly obliterating the "O" of "OF." A nice VF. \$320.00.

1800 [BB-185] B-20. The obverse is new and was unknown to Haseltine. The obverse is starting to bulge in the center but the central hair is still fairly strong. The reverse is from the B-4 die with the die flaws not too prominent. Fine, with a rubber-band (?) "burn" in the shape of an "X" across the obverse. Bolender only saw one specimen and rates it a Rarity-7. \$280.00.

1800 [BB-185] B-20a. A similar specimen, but this is an

advanced die state with the obverse bulge very prominent, making the central portion very weak. VG. \$200.00.

1800 [BB-186] B-4. With the light break as described. VF, a few minor edge nicks. Iridescent toning. \$340.00.

1800 [BB-186] B-4a. With the more extensive breaks as mentioned. The obverse is now starting to show signs of swelling in the lower portion of the devices. VF, a few light obverse scratches. \$370.00.

1800 [BB-187] B-16. Die dot adjacent to top curl. The reverse die of B-4. VF, with a small dig in the neck. \$260.00.

1800 [BB-187] B-16a. As described with most of the letters bifurcated. A strong Fine. \$280.00.

1800 [BB-187] B-16b. As described with the "waves" along the top of the date. EF and lustrous. Delicate iridescent toning. \$625.00.

1800 [BB-187] B-16c. Similar to B-16A, but an intermediate state of bifurcation and die flaws. Fine. \$280.00.

1800 [BB-188] B-8. The obverse from B-5, the reverse as described, and the letters bifurcated. VF, pale iridescent toning. \$350.00.

1800 [BB-188] B-8a. As above, but all the letters are bifurcated, and there is a die crack through "AMER." VF, with some light edge nicks, mostly on the reverse. \$280.00.

1800 [BB-189] B-5. As described with the die dot in the "R" and the reverse die flaw. Fine to VF. \$300.00.

1800 [BB-189] B-5b. As described with the light die crack. Fine. \$280.00.

1800 [BB-189] B-5c. Similar to the B-5B, but the cracks are stronger and there are a few on the reverse. Fine-VF, with an old scratch on the neck. \$250.00.

1800 [BB-190] B-10. Very wide date. The reverse that of B-8, with a light die crack from leaf through "C" to border. Fine. \$290.00.

1800 [BB-190] B-10a. With the cracks as described by Bolender. VF, lovely iridescent toning. \$330.00.

1800 [BB-191] B-11. The obverse of B-10 with the very wide date. The reverse is the popular AMERICAI variety. But this reverse coupled with the B-10 obverse is as Bolender states, "Excessively rare." Fine to VF. A Rarity-7 item and well worth a premium bid. \$320.00.

1800 [BB-192] B-19. As described. The reverse is the popular "AMERICAI" variety with the vertical die break after "A" heavier than on the B-11 die. EF, deep iridescent toning. \$425.00.

1800 [BB-192] B-19a. As described. VG, even wear without any damage. \$270.00.

1800 [BB-192] B-19b. As the 19A with the additional die crack as mentioned by Bolender. A borderline EF and really very choice. \$400.00.

1800 [BB-193] B-18. The obverse from the B-13 die. The reverse with the "spray" of die breaks. VF and choice. \$370.00.

1800 [BB-193] B-18a. As above, but with the obverse breaks. The reverse breaks, however, are not quite as extended. VF, with a tiny nick or two in the field. \$300.00.

1800 [BB-193] B-18b. Similar to the obverse without breaks, but the reverse "spray" is composed of many breaks and there is reverse crumbling at "AME". VF, with a large planchet defect from the chin to the last two stars. \$280.00.

1800 [BB-193] B-18c. Exceedingly rare as it is from the perfect state of the dies before the "spray" breaks started. It is the cataloguer's opinion that this coin is extremely rare. VF. \$330.00.

1800 [BB-194] B-14. The popular "Dotted Date" variety. Quite a few die flaws in and around the first "O" of the date. The reverse with 12 arrows. VF. Rarity-3. \$350.00.

1800 [BB-194] B-14a. As above, but with the die breaks as noted. In this state the cracks are quite light and there isn't a bulge at the date. Fine. \$280.00.

1800 [BB-194] B-14b. In this state of the "Dotted Date" the die is bulged heavily and the reverse breaks are more pronounced. EF with lustre. \$425.00.

1800 [BB-195] B-15. Another specimen of this popular variety. VF as above. Nice pale iridescent toning. \$330.00.

1800 [BB-195] B-15. The 10-arrow reverse. A nice VF. Rarity-4. \$350.00.

1800 [BB-196] B-17. With the "collar" along the neck. The 12-arrow reverse. Fine. \$270.00.

1800 [BB-196] B-17a. As above. Fine. \$280.00.

1800 [BB-196] B-17a. With the additional cracks as described by Bolender. A strong VF, with a small obverse edge dent. \$360.00.

1801 [BB-211] B-1. Wide Date. Small dot next to center dot. Most of the letters are not bifurcated. VF, delicate toning. \$350.00.

1801 [BB-211] B-1a. Dies as above. The letters are lightly but mostly bifurcated. VG. \$270.00.

1801 [BB-211] B-1b. Letters not bifurcated, but there is now a break from the wing tip through "STA" through the clouds to first "A" of AMERICA. "Waves" through "ERICA." Fine, with some scratches across the obverse. \$250.00.

1801 [BB-211] B-1c. As above, but LIBERTY partly bifurcated and the break similar to the above. About Unc., lustrous with pale steel toning. \$675.00.

1801 [BB-211] B-1d. No bifurcation. With cracks as above and with an additional crack through "OF." Fine, some scratches in the field which someone has attempted to remove. Light toning. \$180.00.

1801 [BB-212] B-2. Same obverse die as B-1 according to Bolender, but in this combination there is a distinct "Double Collar" along the front of the neck (like the 1800 [BB-196] B-17) and the engraver's lines around the fillet as well as the ear. Neither the B-1 or B-3 has these features. The reverse with the break at "OF." VF, with a tiny nick in the obverse field. \$290.00.

1801 [BB-212] B-2a. Similar to the above, but most of the letters are bifurcated. VF, mottled iridescent toning. \$340.00.

1801 [BB-213] B-3. The obverse die of B-1. On the reverse all of the T's are lacking their right foot. Fine, light toning. \$290.00.

1801 [BB-214] B-4. Another of this very rare variety. Only VG, but nice even wear, with a tiny reverse scratch. \$240.00.

1801 [BB-214] B-4. Close Date. The obverse shows considerable signs of bulging and no doubt this die was short lived. EF, with some prooflike surface. Rarity-5. \$450.00.

1801 [BB-214] B-4a. As above, but some of the letters are bifurcated. A strong Fine, with iridescent toning. \$280.00.

1802/1 [BB-231] B-1. "Pocket" at throat and a light "collar" at neckline. Reverse "A." Fine to VF and choice. \$280.00.

1802/1 [BB-232] B-4. Close Date. The one joins the curl. VF. Rarity-5. \$350.00.

1802/1 [BB-232] B-4a. As above, but with a delicate die crack through the clouds to bases of "TA" of STATES. A strong Fine and rarer than the B-4. \$280.00.

1802/1 [BB-233] B-2. Wide Date. Fine or very nearly so. \$290.00.

1802/1 [BB-234] B-3. Wide Date. A strong VF, deep iridescent toning. \$480.00.

1802/1 [BB-235] B-9. A new obverse with an evenly spaced date. With the die lump between the "B" and curl. Reverse "B." Mr. Bolender only saw one specimen in all of the years he spent compiling this book. Strictly VF. \$350.00.

1802/1 [BB-235] B-9a. As above, but with the following die cracks: From the milling through the 02 into the field above the 8. Another into the bust and a third through the 12th star into the field. VF, small obverse edge dings. Both this and the B-9 are very important pieces and should bring substantial prices. The only other specimen known was in our Straus Sale. \$360.00.

1802 [BB-241] B-6. Close Date. VF, with considerable lustre. \$350.00.

1802 [BB-242] B-5. Wide evenly spaced date. Reverse "B." Fine, delicate steel and iridescent toning. Rarity-6. \$280.00.

1802 [BB-242] B-5a. As above, but most of the letters are bifurcated. A strong Fine, bordering on VF. Deep iridescent toning. \$280.00.

1803 [BB-251] B-1. Small Date. The die crack from rim through left side of "R" to hair is very clear. Reverse "B." VF, and Rarity-5. \$350.00.

1803 [BB-252] B-5. Small Date. Very close date. Reverse "B." VF, even steel and iridescent toning. Rarity-5. \$330.00.

1803 [BB-254] B-4. Small date. Fine, with a few small rim nicks. \$340.00.

1803 [BB-255] B-6. Large Date. Reverse "A." Fine, a small scratch at the 11th star. \$290.00.

1803 [BB-255] B-6a. As above, with the delicate crack connecting the stars at right. Strictly VF, with claims to EF. \$400.00.

1803 [BB-256] B-3. Small Date. A strong Fine. Rarity-6. \$330.00.

The Austin Collection, Bowers and Ruddy Galleries, May 31 and June 1, 1974, contained these early dollars. This collection was the property of a midwestern numismatist and had no relation to the holdings of well-known early dollar specialist K.P. Austin, of Salisbury, Maryland.

1794 [BB-1] EF with adjustment marks, particularly around the reverse border. There is some slight and normal weakness of striking on the left side, as always seen with this issue. \$20,000.00.

1795 [BB-21] B-1. Flowing Hair type of '94. Reverse with two leaves under each wing. EF, some light adjustment marks seen under a glass. Well struck, well centered, sharp denticles. \$1,400.00.

1795 [BB-25] B-6. Brilliant Unc., virtually flawless fields. Slight friction on the very highest points. \$5,250.00.

1795 [BB-27] B-5. Flowing Hair. Three leaves under each wing. AU. \$3,100.00.

1795 [BB-27] B-5. Flowing Hair. Three leaves under the eagle's wing. VF, evidence of retooling in the obverse field. \$400.00.

1795 [BB-51] B-14. Draped Bust, Small Eagle. VF. Bust not properly centered on obverse. Light adjustment and rim marks. \$550.00.

1795 [BB-52] B-15. Draped Bust, Small Eagle. AU. \$2,200.00.

1795 [BB-52] B-15. Draped Bust, Small Eagle. Unc., slight rubbing, prooflike fields. \$3,500.00.

1795 [BB-52] B-15. Draped Bust, Small Eagle. VF, some light retooling in obverse field. \$450.

1795 [BB-52] B-15. Draped Bust, Small Eagle. VF. \$825.00.

1796 [BB-61] B-4. Small Date, large letters. EF-AU, sharp. Tiny pinpricks, very minor adjustment marks. \$1,025.00.

1796 [BB-61] B-4. Small Date, large letters. Unc., with light friction on highest parts. \$1,800.00.

1796 [BB-65] B-5. Large Date, small letters. 6 of date recut at top. Tiny die break or lump at I of AMERICA. AU. \$1,700.00.

1797 [BB-71] B-3a. Draped Bust, Stars 10 left and 6 right. large letters. Choice BU. \$10,000.00.

1797 [BB-72] B-2. 9x7 Stars, small letters. Choice EF, exceptional strike. Reverse characteristically weakly struck. \$4,000.00.

1797 [BB-73] B-1a. Draped Bust, Stars arranged 9 left and 7 right. large letters. EF. \$1,400.00.

1798 [BB-82] B-1a. Small Eagle reverse. large letters. EF. \$1,000.00.

1798 [BB-95] B-6. Heraldic Eagle. 10 arrows and two headless sticks. EF. \$525.00.

1798 [BB-105] B-23. Heraldic Eagle. 13 arrows. Unc. Some minor marks visible with a glass. \$2,300.00.

1798 [BB-113] B-27. Close Date. Final digit 8 high. BU, sharply struck. A gem coin. \$9,750.00.

1798 [BB-113] B-27. Heraldic Eagle. VF-EF. Small weak area on reverse as struck. \$500.00.

1798 [BB-124] B-25. Heraldic Eagle. EF. \$800.00.

1798 [BB-125] B-24a. Heraldic Eagle. Crack through 12th star to border, prominent break from die stem to milling on reverse. EF. \$575.00.

1799/8 [BB-142] B-1. 13 Reverse Stars. AU, small planchet flaw at right side border. \$550.00.

1799 [BB-154] B-18. Unc. Very minor rubbing. \$2,000.00.

1799 [BB-156] B-7. VF, cleaned. \$300.00.

1799 [BB-158] B-16. EF-AU. \$1,111.00.

1799 [BB-158] B-16. EF. \$525.00.

1799 [BB-159] B-23. Stars 8x5. EF. \$780.00.

1799 [BB-160] B-12b. Hairline breaks. VF-EF. \$400.00.

1799 [BB-161] B-11a. EF. \$850.00.

1799 [BB-166] B-9a. Brilliant Unc. \$2,500.00.

1799 [BB-166] B-9a. EF-AU. \$880.00.

1799 [BB-169] B-21. AU. \$900.00.

1800 [BB-189] B-5. EF. \$600.00.

1800 [BB-192] B-19. AMERICA variety. AU, carelessly cleaned long ago. \$1,400.00.

1800 [BB-193] B-18. EF. \$750.00.

1800 [BB-195] B-15. 10 arrows on reverse. Unc., some evidence of rubbing. \$2,200.00.

1801 [BB-211] B-1. EF. \$700.00.

1801 [BB-213] B-3. BU, some rubbing. \$3,000.00.

1802/1 [BB-232] B-4. Close overdate. EF-AU. \$725.00.

1802/1 [BB-232] B-4. EF-AU. \$875.00.

1802 [BB-241] B-6. Choice BU. Very minor marks visible with glass. \$3,200.00.

1802 [BB-241] B-6. Close Date. AU. \$2,000.00.

Superior Stamp & Coin Company's ANA Convention Sale, August 19-23, 1975, contained an outstanding listing of early dollars, a number of which had been sold two years before in the same firm's Gilhousen Collection Sale. Most of these were owned earlier by Mr. and Mrs. A.J. Ostheimer, 3rd, who for much of the previous 15-year period had endeavored to build a truly memorable collection of early dollars. Cataloging was by Jon Hanson.

1794 [BB-1] Flowing Hair. From Superior's Charles L. Ruby Part I sale, Lot 1446: Intermediate die state, dies clashed but as yet without the rim break at 7th star. VF, steel gray tone; usual strike, weak at left stars and UNITED STATES, but at least all digits and stars can be made out, as can at least lower halves of all letters affected; complete dentilated border on reverse. Adjustment marks at left obverse; small planchet chip in wing feathers near ER, as made. Tiny sharp rim nick above space between AM. (The mark within U is a tiny lamination defect.) Minute rim nick above first upright of N of UNITED. \$11,000.00.

1794 [BB-1] Another, similar die state, but differently struck. VF-20 or so; dull gray tone, usual strike, but border sharpness and the stars on the left on this example are much superior to that of the preceding. Without any adjustment marks, but there are some obverse handling marks and a few faint pin-scratches around and below LIB of LIBERTY. Remarkably clean and pleasing reverse, just weak at and around OF. \$9,500.00.

1795 [BB-11] B-3. Two leaves. R-5. Close Date, 5 recut. Reverse with 16 berries, eight on each side (only variety of year so). VF-35, well tarnished, faint iridescent tone, and with traces of very old cleaning. Well centered with bold hair detail, but there are a few tiny center reverse adjustment marks and the obverse shows plenty of light handling marks. \$2,000.00.

1795 [BB-12] B-11. R-8. VF-20, slight rainbow tone and very clean. Struck a little weak at right obverse border as usual. \$1,600.00.

1795 [BB-13] B-9. Two leaves. R-4. Close Date obverse, same as Bolender's 3 and 11; reverse of B-4. EF-40, heavily toned gray and iridescent. Well centered and struck. One pinprick right of eagle's neck and one above Liberty. Condition Census and rare so fine. \$2,600.00.

1795 [BB-13] B-9a. Obverse die partly flattened and roughened by severe clash marks from the reverse, parts of the wings and wreath being very plain behind the head. VF-30 or better for this miserably struck coin. Mostly gray in color, but

with some areas of golden iridescence. Obverse relief much better than that of the reverse. Exceptionally clean surfaces, perfect, except for two small nicks on reverse denticles. \$1,050.00.

1795 [BB-13] B-9a. Close Date, recut 7 and 5; ends of double leaf entirely under 0; obverse die partly flattened and roughened by severe clash marks from reverse, parts of wings and wreath being very plain behind head. Surface suggests a grade of Almost VF as do those areas which are struck up, the remainder (mainly in centers and at left) being weaker. Overall grade of F-12. Blunt reverse edge dent at 7:00. \$500.00.

1795 [BB-14] B-4. Two leaves. High R-4. Variety with the 15th star entirely under the bust. EF-40, mostly bright from old cleaning and with a touch of tarnish. There is much evidence of minute handling marks on both sides, plus a small reverse planchet defect at 12:30 just on the border. A few edge nicks are trivial. Not perfectly centered. \$1,900.00.

1795 [BB-15] B-8. Two leaves. R-8. VF-20, some faint iridescent toning about the edges, and exceptionally well centered and clean, save for a few superficial marks below Liberty's eye and a minute nick at the edge opposite the 3rd star. \$1,850.00.

1795 [BB-18] B-7. EF-45 or so, brilliant, and faintly reflective beneath the lightly handled surfaces. Flatly struck-up centers and some adjustment marks in the center of the reverse. There are also four small obverse rim bruises. \$1,350.00.

1795 [BB-18] B-7. High R-4. Lowest curl very small; two small berries under D. Richly toned prooflike Unc., somewhat soft strike. Light handling marks near lowest curls. \$6,500.00.

1795 [BB-20] B-2. Similar two leaves. High R-2. Eighth star distant from L. VF-30 or better, lustrous light golden toning on the obverse, while the reverse is mostly pearl gray. Adjustment marks in the center of the reverse, but otherwise very clean and desirable. Hair flatly struck up as usual, but the borders are broad and well struck. \$1,650.00.

1795 [BB-21] B-1. 1795/1195. B-1. VG-8 or better, but there is one dull scrape before Liberty's mouth and three tiny reverse edge nicks. \$425.00.

1795 [BB-21] B-1. 1795/1195. Bolender-1. Rarity-1. Common two leaves. AU-55, lovely rose and blue-green or rainbow toned, and has partly lustrous or iridescent surfaces. Despite some very minor obverse handling, a few tiny rim nicks, and one noticeable rim bruise, choice, well centered and attractive. Condition Census. \$3,300.00.

1795 [BB-22] B-10. R-8. Fully F-12, natural toned with an iridescent green outline to Liberty and a few of the stars. Reverse mostly even gray with a little golden lustre around the wreath. Minor adjustment marks on reverse. \$1,050.00.

1795 [BB-23] B-16. Unique. A lovely borderline Unc. specimen with some faint obverse scratches, numerous reverse adjustment marks and lovely iridescent toning. Full breast feathers, though with a small round nick on them. \$7,750.00.

1795 [BB-24] B-13. R-7. AU-50 or better, brilliant obverse with a lustrous toned reverse. The obverse shows many microscopic handling marks, some minor rubbing, and a crescentlike scratch on Liberty's jaw, reverse with many adjustment marks. \$3,300.00.

1795 [BB-25] B-6. R-4. Early die state. VF-25 or better, but cleaned and having many obverse adjustment marks, as made. Fairly good centering and the few light rim dents on

either side aren't worth mentioning. \$925.00.

1795 [BB-25] B-6. Three leaves. Y of LIBERTY above T; same reverse as the common B-5. VF-35, traces of old cleaning. Bright obverse; reverse gray toned with iridescent lustre among leaves and branches. Some adjustment marks around obverse border, and parts of the reverse border are irregularly struck up at the denticles. Rather clean surfaces with just a few of the slightest edge dents. \$1,400.00.

1795 [BB-26] B-12. R-6. VF-25, gray toned with some iridescence. Very clean, save for a minute rim bruise between 13th and 14th stars. A good strike except for the denticles at left on the obverse; reverse not perfectly centered. \$1,200.00.

1795 [BB-26] B-12a. Fully F-15, dark gray tone and quite clean with just one obverse mark behind the head and some minute reverse rim nicks. \$650.00.

1795 [BB-26] B-12a. VG-8 to About F-10, clean gray color with one or two microscopic pin scratches. Central weakness as usual. \$500.00.

1795 [BB-27] B-5. AU-55, frosty and pearl gray toned with full original mint lustre. Not perfectly centered, but with a few microscopic obverse handling marks; reverse, splendid with just a few signs of adjustment marks. \$9,000.00.

1795 [BB-27] B-5. G-6 or better with a bold reverse and clean, without any impairments. \$375.00.

1795 [BB-27] B-5. Three leaves. R-1. Variety with 2 mm long bar behind top curl point; fine die crack from end of left stem downward. MS-60 to 65. pale iridescent tone of mixed colors with darker backgrounds. Well struck with practically flawless surfaces, the reverse being truly superb. Well struck (full hair detail), but breast of eagle not fully struck up as usual. There are a few adjustment marks on center of obverse as made; light spot on Liberty's cheek as the result of a celluloid slide. \$8,750.00.

1795 [BB-27] B-5a. Minute trace of bar and without most of the thin line extending from left stem downward to the border. Obviously re-ground dies, as the stars are also much smaller or more thinly cut. EF-45, light gray to darker iridescent toning, and lustrous with faintly reflective surfaces. Not quite perfectly centered, but, nevertheless, far above average with bold centers and borders. Minor spot outside 10th star mentioned for identification purposes only. \$3,400.00.

1795 [BB-27] B-5a. VG to F-10. Bold and clean, but with two small edge bruises opposite the 7th and 8th stars and a nick opposite the fifth star on the denticles. \$550.00.

1795 [BB-51] B-14. About F-12, naturally toned, and rather clean. \$575.00.

1795 [BB-51] B-14. About VF-35, cleaned, with many tiny reverse scratches, some of which are adjustment marks. Well centered with otherwise clean surfaces, but there are some trivial reverse edge nicks. \$1,000.00.

1795 [BB-51] B-14. AU, richly toned with much of its original mint surface still intact. Central reverse adjustment marks. \$3,800.00.

1795 [BB-51] B-14. EF-40, but less desirable and downgraded because of a slight obverse scratch in the right field. Few other handling marks, plus some small reverse rim nicks, but there are many, many unattractive reverse adjustment marks as done at the Mint before striking. \$1,350.00.

1795 [BB-51] B-14. Low R-2. Head placed too far left. MS-65. Iridescent gray toned uniformly on the obverse with un-

even tones and partially light pearl tone on reverse. Full original mint lustre, well struck, beautiful and a "gem" example. Good centering, but there are a few tiny nicks on the rims, the most noticeable at 2:00 on the reverse. \$9,200.00.

1795 [BB-51] B-14. Not quite MS-60. Obverse a deep bluish-gray tone, reverse a much lighter shade of delicate iridescence. Prooflike surface, most obvious on the reverse. Some infinitesimal handling marks, but most of these were on the planchet before striking. One or two tiny rim nicks. \$4,250.00.

1795 [BB-52] B-15. R-4. Well centered head. EF-40, lightly toned, with reflective surfaces and lightly bagmarked and handled. Not perfectly centered, but all devices struck up. \$2,800.00.

1795 [BB-52] B-15a, but counterstamped EB in Liberty's hair above her eye level for Ephraim Brasher. VF-30, natural gray toned, but with a couple of obverse rim nicks or bruises and a few minor reverse scratches and digs. Fair centering on the obverse and well struck up. \$2,500.00

1795 [BB-52] B-15a. The other Draped Bust variety, with head properly centered; with the rare reverse advanced die cracks not known to Bolender (rim above D through S and leaves below TAT, and at tops of ICA); advanced rust marks in fields. EF, sharp, lustrous, with warm irregular toning. \$2,000.00.

1796 [BB-61] B-4. About VF-20, quite clean, and has a very heavily toned reverse. Evenly struck and well centered. \$625.00.

1796 [BB-61] B-4. F-12, evenly gray toned and struck. Few adjustment marks on Liberty's neck and hair, plus a minor reverse rim bruises. \$500.00.

1796 [BB-61] B-4. F-15 or better, but there are some faint obverse pinscratches along with some dreaded adjustment marks. Well tarnished and toned. Obverse much more bold than the reverse. \$625.00.

1796 [BB-61] B-4. R-3. Small Date, large letters. Perfect curls, struck before die was reground. Almost Unc. or better, deeply toned and lustrous, though with two or three small rubbed places. \$2,200.00.

1796 [BB-61] B-4. VF-25. with some faint iridescent toning on the obverse, while the reverse shows signs of old cleaning. A few minor reverse rim bruises, plus a planchet defect on E of AMERICA and a die defect on the wreath from the right side of M to wing tip. Rather dull appearance, but very scarce. \$925.00.

1796 [BB-63] B-2 obverse, but with a semi-unique and *un-listed reverse* having a long vertical die break from the denticles at 1:00 passing left edge of O in OF, through wreath, wing tip, wreath, C of AMERICA and curving left slightly to a denticle. Was VF before someone scratched the lines across the diameter of the obverse in a wheel spoke fashion; after which someone else tried improving this piece by lightly burnishing the entire obverse. Reverse is untouched and shows the unmistakable weakness on the left three quarters of the coin due to the die failure. Damaged, but still semi-unique to date. \$850.00.

1796 [BB-63] B-2. R-5. VF-35 or better, lightly toned, and sharp (except for the stars). Obverse not perfectly centered and nicked at the 8th star; reverse with a small gouge from left upright of U to the edge. \$1,150.00.

1796 [BB-65] B-5. R-3. About Unc., mostly deeply toned and lustrous, but with four or five similar light areas of rubbing. Not known to exist in full Mint State. A lustrous EF-45 at best, but unusually well struck up at the centers. \$1,750.00.

1796 [BB-65] B-5. Sharpness of EF-40 where struck up. Partly lustrous and well toned. Poorly struck up in the centers and with plenty of adjustment marks on the reverse. Overall grade of VF-30. \$925.00.

1796 [BB-66] B-1. High R-5. Straight date nearly evenly spaced. Practically Unc., deeply toned but with much mint lustre, light cabinet friction in very center of reverse, many central obverse adjustment marks. \$1,850.00.

1797 [BB-71] B-3. R-4. 16 Stars. 10x6; large letters. AU-50, lightly toned, and lustrous. Well centered, but struck with tiny streaks and spots, evidently in the planchet before striking. One reverse rim nick at 1:00 is mentioned mainly for identification purposes. \$3,800.00.

1797 [BB-71] B-3. VF-20, well toned, iridescently so about the devices. Well struck, centered and very clean, save for a few microscopic edge bruises. \$800.00.

1797 [BB-71] B-3b. Really AU-50, lustrous, but a rather dull pale color and rubbed on the high spots. Irregularly struck up about the obverse rims. There is one tiny rim nick at the 10th star; otherwise, perfect. Condition Census level. \$1,750.00.

1797 [BB-71] B-3b. Small Eagle. EF-45 sharpness and very bold, but the surfaces are extremely dull as a result of undoubtedly old clipping. Well struck, centered, and clean, with many reverse adjustment or file marks as made. Nearly full feather on eagle's breast—unusual so. \$2,000.00.

1797 [BB-71] B-3c. Warmly toned Unc., a number of reverse scratches on eagle. Well struck, frosty and beautiful. \$4,200.00.

1797 [BB-72] B-2. F-12, even gray color and almost an exact match for the latter from a standpoint of obverse wear; however, the reverse is weaker, struck slightly off center, and has three or four rim bruises. \$600.00.

1797 [BB-72] B-2. F-12. Devices outlined with a golden iridescent color. Reverse weak, but exceptionally clean for the grade and a piece with which we can really find no fault. \$975.00.

1797 [BB-72] B-2. R-6. 16 Stars, 9x7. Reverse small letters. VF-30, even natural toned, and really a superior example for this usually poorly struck coin. Well centered obverse and free from defects, except for one or two obverse pinpricks. \$1,850.00.

1797 [BB-73] B-1. R-4. 16 Stars, 9x7; large letters. VF-25, natural partially gray toned, and exceptionally clean. Broad full borders, reverse with minor adjustment marks. \$875.00.

1797 [BB-73] B-1. VF-20, but cleaned. Minor obverse handling, but without any signs of adjustment marks. \$1,050.00.

1797 [BB-73] B-1b. Similar obverse state, but reverse is very finely cracked at the second T of STATES. Really better than F-15 for this miserably struck coin. Well tarnished and toned; but there are many light pinscratches before Liberty's face and downward, plus a few obverse rim bruises and nicks. Reverse with adjustment marks at the lower border. \$575.00.

1797 [BB-73] B-1b. Strictly VF-25 where struck up. Warmly toned with a little lustre. Numerous obverse adjustment marks at left as made. \$800.00.

1798 [BB-81] B-2. F-12, cleaned, but with excellent, unimpaired surfaces. A tiny rim nick on either side isn't really worth mentioning. \$500.00.

1798 [BB-81] B-2. R-4. 15 Stars. VF-30 or better, but marked right of the 6th star and bluntly scratched between the 10th and 11th stars. There are also several rim nicks and/or bruises on either side. \$675.00.

1798 [BB-81] B-2. VF-20, faintly iridescent and gray tone, and clean except for several obverse rim bruises (the most noticeable at 7:00). Weakly struck reverse as usual. \$750.00.

1798 [BB-81] B-2a. Extended obverse die cracks. About Unc., deeply toned with flashes of original mint brilliance; unusually sharp strike; a couple of small rubbed places, less noticeable than on some of the earlier pieces in this group. \$3,000.00.

1798 [BB-82] B-1a. Small Eagle. (R-4). 13 Stars. VF-30, dull tarnish, and quite bold. Exceptionally clean; reverse lustrous and with many adjustment marks. \$975.00.

1798 [BB-82] B-1a. About VF-30, dull even light gray color. Very clean and attractive. \$800.00.

1798 Unlisted. Reverse of Bolender 4; obverse B-1. [BB-91] different from B-4 as follows. . . . F-15, clean, but with the usual amount of handling marks we would expect on a coin of this grade. \$1,300.00.

1798 [BB-92] B-4. R-6. Knobbed 9, wide date, "abnormally" arranged stars (in straight lines forming diamond patterns), R I far apart. EF-40, beautiful iridescent bluish and sunset hues on the obverse, lustrous golden gray reverse. A bold strike, though not perfectly centered on the obverse. Faint reverse adjustment marks, as well as identifiable dent at D where the letter was hit with a blunt object. \$800.00.

1798 [BB-92] B-4. VF-35, warm gray and faintly iridescent tone. Very clean and well centered. A beauty, comparable to the last. Condition Census level. \$675.00.

1798 [BB-93] B-5. R-7. Obverse as B-3 and 4. Reverse with vertical die break along right side of shield entirely across the reverse. VF-20, clean, with a touch of gold. \$550.00.

1798 [BB-93] B-5. About F-12, even gray, and clean except for a few minute obverse handling marks. \$375.00.

1798 [BB-93] B-5. F-12, clean, and with the usual poorly struck reverse. \$375.00.

1798 [BB-94] B-3. R-5. Large Eagle, 13 Stars (as are all the following). VF-20, clean, obverse adjustment marks, and with two noticeable reverse rim bruises above right side of second T in STATES and equal distance between S and O. \$475.00.

1798 [BB-95] B-7. R-7. Fully F-15. Even natural dark toning, mostly gray. Weakly struck up on some of the borders and with an identifiable nick on the denticles above U of UNITED. \$425.00.

1798 [BB-96] B-6a. High R-3. Knobbed 9, close date. EF-40, highly glossy finish, very clean, but struck off center towards the top of the obverse and correspondingly on the reverse about 2%. \$775.00.

1798 [BB-96] B-6b. Not quite VF-20, even gray tone, very clean, and has just a few obverse adjustment marks at the center. \$400.00.

1798 [BB-101] B-17. F-15, some obverse toning, weakly struck up at the borders. Reverse shows some light adjustment marks center and right through AME. \$375.00.

1798 [BB-101] B-17. R-7. VF-20 where struck up, dull light gray tone, and a relatively clean specimen. \$500.00.

1798 [BB-102] B-20a. High R-4. Reverse rim break below eagle's tail. VF-25, pearl gray tone and partly iridescent reverse. Weakly struck up in the centers as usual and slightly off center. \$475.00.

1798 [BB-102] B-20a. Same die state. F-15 and clean, but there is a planchet defect at the bust and correspondingly at O of OF on the reverse. \$275.00.

1798 [BB-102] B-20a. VF-25, rainbow toned, and very decent, but someone shaved a small piece off the edge above D of UNITED. Obverse better struck up than the last. \$450.00.

1798 [BB-104] B-22. R-6. About VF-20, oddly toned, but clean. Minor obverse pin scratches barely visible. \$400.00.

1798 [BB-105] B-23. R-3. VF-30 or better, although the bold reverse certainly qualifies for a full EF-40 grade. Lightly toned, well centered, and struck. Clean and attractive except for a flat rub on Liberty's cheek. \$675.00.

1798 [BB-105] B-23. VF-25, light gray and clean. Well struck. \$450.00.

1798 [BB-105] B-23a. Defective second curl from bottom. AU-55 or so, brilliant centers bordered with iridescent blue toning. Beautiful and lustrous, but obverse is well handled and shows much contact with other coins. \$2,000.00.

1798 [BB-105] B-23a. VF-20, even dark blue tone, but slightly dented below 179 of date; after which, some repairman attempted to improve the damage by buffing the dented spot. \$325.00.

1798 [BB-106] B-19. High R-5. The bisecting break. Early strike. EF-40, but processed. While the obverse shows many handling marks, none are really serious. Not quite perfect centering, but well struck considering the state of the dies. \$725.00.

1798 [BB-107] B-21. R-6. EF-40, lovely iridescent toning, clean and very bold. Four small reverse rim bruises above UNITED and the left wing. \$1,350.00.

1798 [BB-108] B-13. R-1. Reverse with 10 arrows. EF-40, lustrous with a light tone, but obviously cleaned at one time. Not perfectly centered, but clean with more than the usual amount of reverse adjustment marks. \$825.00.

1798 [BB-109] B-10. R-6. VF-30 where struck up. Dull gray and iridescent tone and clean, except for some edge bruises and nicks above LIBERTY. \$425.00.

1798 [BB-110] B-16a. Unpublished perfect obverse die (unique?) without any trace of the usual break (see following lot). VF-20 where struck up, mostly gray toned with some iridescence around the stars on the obverse and devices on the reverse, and without defects. Weakly struck up at Liberty's bust and the general right portion of the obverse and correspondingly the reverse. \$475.00.

1798 [BB-110] B-16. R-7. EF-40, lovely even natural toning, very clean, with a well centered obverse. Reverse struck slightly off towards the top. There are a few microscopic edge nicks, the most noticeable between ES of STATES. \$925.00.

1798 [BB-111] B-11. R-5. No spur on 9. VF-30, natural light tone, many light handling marks, but generally well appearing. Reverse struck off center to the upper left. Minor scrape between the 9th and 10th stars and a minute rim nick opposite the 11th star. \$600.00.

1798 [BB-111] B-11b. About F-12, dark gray, very clean, but with a handful of minute obverse and reverse rim nicks. \$300.00.

1798 [BB-111] B-11 b. Fine or better for the coin, central obverse weakness unquestionably due to the advanced die failure. \$325.00.

1798 [BB-112] B-15 . R-2. EF-45 obverse, there are just too many obverse handling marks to qualify for AU; reverse fully AU-50. Well centered, struck, and lustrous. \$1,000.00.

1798 [BB-113] B-27. R-2. Reverse cracked. Very deeply toned Unc., sharply struck and believed finest known. An MS-60, the deep toning is partly iridescent and conceals full, nearly flawless, lustrous mint surface. A good strike, the silhouette of Liberty's chin, lips, and nose is outstanding. Not perfectly centered. \$3,500.00.

1798 [BB-114] B-26. R-4. Close Date, 8 high and out of position. VF-30, poorly struck up at centers, but relatively clean and attractive. High Condition Census. \$425.00.

1798 [BB-115] B-31a. R-6. EF-45, lightly toned obverse, with a darker gray tone on the reverse. Reverse weakly struck up above eagle's head as usual. Minimal signs of handling, but well rubbed on the high spots. Not perfectly centered, but very attractive and lustrous. \$925.00.

1798 [BB-115] B-31a. VF-30, mostly even gray color, and exceptionally clean. Good obverse centering and flatly struck up at Liberty's bust and correspondingly on the reverse as always with this variety. \$475.00.

1798 [BB-116] B-30. F-15 or better for this usually weakly struck variety. Very clean with some original lustre around some of the devices. \$350.00.

1798 [BB-116] B-30. R-5. 13-arrow reverse. Fine double profile. AU-50, slight rainbow toning, lustrous, as sharp as this variety comes. Tiny rim bruise opposite 10th star. Fairly well centered and has some signs of obverse handling. \$1,500.00.

1798 [BB-116] B-30a. Advanced reverse die cracks. About F-10, golden toned, and clean except for a few of just the slightest rim bruises, the only obvious one above A of AMERICA. \$300.00.

1798 [BB-118] B-28a. High R-5. Perfect reverse die. VF-30, rather dull obverse is somewhat iridescently toned. Without visible defects, unless one might notice a tiny rim bruise or two above IT and part of E of UNITED on the reverse. \$800.00.

1798 [BB-118] B-28. F-12, even color, lightly polished at one time and there is one medium obverse scratch before Liberty's neck and a handful of rim bruises or nicks on both sides, the most serious being a large one just left of OF. Rare variety that will probably go unappreciated to some type or date collector. \$275.00.

1798 [BB-118] B-28. Later state of the reverse die break. F-12, but there are a dozen or more obverse pin scratches before Liberty's face and one small nick on her lower neck. Reverse off center and with two edge nicks and a rim bruise. \$275.00.

1798 [BB-118] B-28. Possibly the latest die state known, as the two reverse breaks on either side of the eagle's right foot are joined together to form a very large, bulging break. VG-7, even color, off center to the right and exceptionally clean. \$220.00.

1798 [BB-119] B-29. R-3. AU-50, but rubbed on the high

points of the obverse. Bluish toning around part of the edges, clean, and partly lustrous. Obverse very poorly centered. \$1,250.00.

1798 [BB-120] B-12. R-4. EF-45 or better, but cleaned. Well centered and struck, except for the center portion of the reverse. \$925.00.

1798 [BB-120] B-12a. F-12 or so, natural tone, but there is one obverse rim bruise at 7:00 and half a dozen more noticeable ones on the reverse. \$375.00.

1798 [BB-120] B-12a. Unpublished shattered die, Better than VF for coin. \$500.00.

1798 [BB-121] B-9. R-4. Compact date. VF-35. Uneven gray tone with a partly lustrous and sunset toned reverse. Weakly struck up at the centers, as usual. Clean, but has a few distinguishing tiny handling marks. \$750.00.

1798 [BB-122] B-14a. A classic F-15, toned, and clean, save for a few microscopic rim bruises above LIBERTY. \$375.00.

1798 [BB-122] B-14a. High R-5. Better than VF, some areas suggest EF, mint lustre. Iridescent tone. \$600.00.

1798 [BB-122] B-14a. Just VF-20, toned, and clean. \$510.00.

1798 [BB-123] B-8. R-1. Pointed 9, EF-40, sharp with minor obverse handling, but comparatively clean. Probably "dipped" some years ago, now beginning to lightly tarnish a little. \$850.00.

1798 [BB-124] B-25. R-4. "Whisker" variety. F-15 with a trifle iridescent tone. Pleasing well centered and clean, save for an edge bruise at 3:00 on the reverse. \$350.00.

1798 [BB-124] B-25b. Extensive die breaks all around the obverse. VF-35, once cleaned, now retoning iridescently. Poorly centered with a microscopic edge nick midway below 98. There is also a defect on Liberty's bust and correspondingly on the reverse side, possibly from being hit with a blunt object. \$700.00.

1798 [BB-125] B-24. R-1. Perfect obverse die. VF-35 or better, even natural light silver color. Clean except for some edge nicks on the obverse and a few light handling marks. \$550.00.

1798 [BB-125] B-24a. Nearer AU-50 than EF-45, but the neck, bust and drapery show many signs of handling. Beautiful blue iridescent toning, especially on the reverse. \$1,250.00.

1798 [BB-125] B-24a. VF-20, poorly struck up (as usual for the variety), lightly pinscratched several times on both sides, and with two small obverse drill marks and two dull reverse attempted punctures. \$250.00.

1798 [BB-125] B-24a. VF-30 where struck up. Golden toned obverse; reverse a dullish rainbow tone. Planchet crack at 2:30 and correspondingly on the reverse, which, also, is a trifle off center. \$525.00.

1798 [BB-125] B-24a. F-12, unevenly tranished (especially on the reverse. \$325.00.

1799/8 [BB-141] B-3. EF-45, beginning toning, and very clean and attractive. Not perfectly centered, but rather bold. \$1,200.00.

1799/8 [BB-141] B-3. High R-4. Overdate; 15 Star reverse. MS-60 or so, frosty with a touch of golden about the devices, and lustrous. Excellent surfaces with minimal handling marks. Not fully struck up in the center portions of the reverse as usual for this variety. \$5,000.00.

1799/8 [BB-141] B-3. Very deeply toned Unc. Faintest suggestion of cabinet friction in one or two tiny places on reverse. Not quite MS-60, but nicer looking than the cleaned Miles example. \$1,600.00.

1799/8 [BB-142] B-1. Shattered reverse die. F-15 and clean except for a rim bruise above T of UNITED. \$325.00.

1799/8 [BB-142] B-1. R-5. Overdate; 13 star reverse. Shattered reverse. AU-55, frosty and iridescent. Softly struck up at the center portions as usual. \$1,600.00.

1799/8 [BB-142] B-1. With the shattered reverse die. VF-35, some areas of EF sharpness, but not fully struck up. Warm gray tone with a little lustre around the devices. Excellent surface and very clean and attractive. \$750.00.

1799/8 [BB-143] B-2. AU-50 or so, the reverse nicer than the obverse and with fully lustrous cartwheel effect. Obverse rubbed on forelock and has many small handling marks. \$1150.00.

1799 [BB-151] B-13. F-15 or better, yellow and faint rose golden toning. Irregularly struck up upon Liberty and the central portions of the reverse. Struck a little off center, but without any impairment except for two minute reverse rim bruises and a microscopic one below the second 9 on the date. \$325.00.

1799 [BB-151] B-13. R-7. Die dot above E in STATES. EF-40, iridescent tone with mint frost about the devices. Poorly struck up in the centers, central reverse adjustment marks and has some trivial obverse handling marks before Liberty's face. \$625.00.

1799 [BB-151] B-13. VF-25, light tone, and clean for the grade except for a noticeable rim nick above TY on the obverse and another above TA on the reverse. \$500.00.

1799 [BB-152] B-15. High R-5. Not quite AU-50, dull frosty tone with a speck here and there of iridescent tone. Needle sharp where fully struck up, but there are many file marks on Liberty's bust and correspondingly weakly struck up on the reverse which is also off center. \$975.00.

1799 [BB-152] B-15a. EF-40, toned predominantly gray, clean, with a few file marks in the central portions of the obverse. Small vertical nick on Liberty's drapery just below the hair and a couple microscopic reverse planchet defects and nicks. \$625.00.

1799 [BB-153] B-4. High R-5. Irregular date; 15 star reverse. Obverse die cracks, as usual. EF-45 or better, but very weakly struck up in the center portions. Irregularly toned and has prooflike surfaces. \$825.00.

1799 [BB-153] B-4. Very advanced state of the obverse dies. EF-45, similar but better struck than the last, cleaned, but lustrous and beginning to tone. Light handling marks visible to the naked eye. \$800.00.

1799 [BB-154] B-18. About VF-30, similar grade as last, but cleaned at one time, and now lightly toning. Not perfectly centered with a few minute reverse rim nicks, the major one just right of center of eagle's wing tip. \$550.00.

1799 [BB-154] B-18. R-6. Perfect dies. VF-25, cool gray tone, and exceptionally clean. Well centered and an above average strike. \$425.00.

1799 [BB-155] B-19a. R-5. EF-45 to AU-50, partly lustrous, partly iridescent toned. Blunt obverse struck as usual (due to die failure) but with broad borders. Very clean with one or two infinitesimal edge nicks. \$900.00.

1799 [BB-155] B-19a. VF-20 or better, some traces of lustre, and gray toned. \$325.00.

1799 [BB-156] B-7. R-5. Perfect reverse. About EF-40, natural toning and uneven tarnish. Boldly struck, but a trifle off center. Condition Census level. \$675.00.

1799 [BB-156] B-7a. Faint crack through bottoms of UNITED. VF-25, warm gray tone, and with clean surfaces. \$450.00.

1799 [BB-156] B-7d. Unlisted shattered and buckled reverse die. Seemingly VF, under a glass some areas display no more wear than would be consistent with EF grade, with plenty of mint lustre. \$450.00.

1799 [BB-157] B-5a. EF-40 and cleaned long ago, now toned. There is a planchet crack above 7th star and L of LIBERTY extending through to the reverse. Very bold and attractive. \$600.00.

1799 [BB-157] B-5a. R-1. Almost Unc. plus, deep iridescent toning and mint brilliance, but a plain old scratch from nose to 10th star. \$1,050.00.

1799 [BB-157] B-5a. VF-30, iridescent gray tone, clean but pin-scratched on the reverse around the eagle's right wing. There are also a few minor edge nicks plus one rim bruise. \$525.00.

1799 [BB-158] B-16a. F-15 to VF-20, dark gray, and clean save for some minor reverse edge bruises. \$325.00.

1799 [BB-158] B-16a. F-15, uneven wear, several obverse rim nicks and one reverse rim nick above O of OF. \$300.00.

1799 [BB-158] B-16a. R-1. VF-25, even gray color, and very clean except for a rim bruise above the 5th and 6th stars and another above ED on the reverse. There is also a slight granular area behind Liberty's hair. \$375.00.

1799 [BB-158] B-16b. F-15, naturally toned, and unevenly struck due to die failure. There is one medium reverse edge bruise above wing tip on the left and several smaller ones on the obverse; otherwise, clean. \$300.00.

1799 [BB-158] B-16b. VG-8 or better, some toning, and clean for the grade. Planchet defect above first A of AMERICA. \$250.00.

1799 [BB-158] B-16c. EF-40, lustrous, but scratched between the 6th and 7th stars on the obverse and a few minor rim bruises on that side. \$675.00.

1799 [BB-159] B-23. Low R-4. AU-50, lustrous and bright. Minor obverse handling marks, plus four tiny nicks on Liberty's cheek, and not perfectly centered; otherwise, choice. \$1,250.00.

1799 [BB-160] B-12. About F-10, but there is an "X" carved in the left obverse field behind the lower curls; plus a dull, blunt vertical scratch in the right obverse field and a rim bruise above the 7th star. \$150.00.

1799 [BB-160] B-12. R-1. No berries, same die as B.11. Perfect dies. VF-35, dull toned, reverse partly iridescent. Without impairment, unless one might complain about a microscopic rim nick above the 10th star. \$625.00.

1799 [BB-160] B-12b. F-15, tarnished about the stars, and a clean example. \$375.00.

1799 [BB-160] B-12b. Shattered obverse. MS-60 to 65, fully lustrous, partly brilliant, but mostly with an even grayish tone. Struck partially off center on the obverse and irregularly about the rims. A bold impression with fantastic surfaces. \$3,800.00.

1799 [BB-160] B-12b. VF-25, iridescent gray tone, and clean for the grade. Smoothness at the rim at the second and third stars is a result of wear upon the slightly high irregular edge (as made) and is not to be confused with "a slight rim bruise" by new collectors. \$525.00.

1799 [BB-161] B-11a. High R-4. No berries in olive branch. VF-30, gray and iridescently toned with lovely clean surfaces. Couple of minute dull nicks on Liberty's neck are mentioned. \$550.00.

1799 [BB-161] B-11b. Heavy breaks, more advanced than described in Bolender's book for 11a. EF-45 to AU-50, mostly well toned with a little brilliance on either side; however, there is a dull streak across the top from the 6th star to the left upright of Y, probably resulting from being in contact with a rubber band. Then, someone in an attempt to obliterate the stain superficially abraded the surface. \$775.00.

1799 [BB-162] B-6a. F-15 or better, natural rainbow toning, few minute obverse rim nicks; reverse bold. \$325.00.

1799 [BB-162] B-6a. High R-5. Cracked reverse. Warmly toned Unc., sharp except in centers; minute rim nicks. \$1,850.00.

1799 [BB-163] B-10. Intermediate die state: faint evidence of obverse crack through last three stars; reverse more advanced than B-10. Similar to B-10a but not as advanced. VF-25 where struck up, dull toned, but clean and evenly worn. \$375.00.

1799 [BB-163] B-10. R-2. Light crack through last three stars. EF-40, lustrous, but artificially toned. Still clean, quite attractive. Condition Census level. \$850.00.

1799 [BB-163] B-10b. Also VF-25, but not toned nor quite as clean. Minute rim nick above E of UNITED. \$450.00.

1799 [BB-163] B-10b. More or less EF, much mint lustre even in those areas of fields where even brief circulation would have obliterated it; fails to qualify as Almost Unc. or better only because of a little too much cabinet friction on three or four of the highest places. Few small plain bagmarks on either side, more on reverse than on obverse. Light traces of old cleaning. Well struck for this rare advanced die state, which is unusual. \$950.00.

1799 [BB-163] B-10b. VF-25, sunset toning, and well centered. Excellent, clean surfaces, except for a few, tiny handling marks behind Liberty's ribbon and a tiny rim bruise above TE on the reverse. \$425.00.

1799 [BB-164] B-17a. R-2. VF-30. Iridescently toned, but under the toning there are unmistakable signs of old cleaning and brushing. Clean with a small planchet defect above the hair ribbons. Flat on the high points of the obverse. \$575.00.

1799 [BB-164] B-17b. Close to EF, softly struck, with some lustre (mostly on reverse) and some signs of old cleaning, now toning down naturally. \$450.00.

1799 [BB-164] B-17b. VG-7, clean, few small edge nicks on either side and with a bold reverse. \$210.00.

1799 [BB-165] B-8. R-2. Perfect obverse die. VG to About F-10, but dark, rough, with a few tiny pinscratches before Liberty's mouth, and with some reverse roughness. Dies swollen at second curl up from the bottom—unusual. \$210.00.

1799 [BB-165] B-8a. Almost VF, even wear, comparatively well struck, gray tone with electric blue on reverse; unusually free of handling marks except for a small obverse rim nick. \$300.00.

1799 [BB-165] B-8a. Cracked obverse. EF-40, but poorly struck up on the high points of the obverse. Gray and iridescently toned, but there are a few small handling marks and a tiny pinscratch on the obverse and a rim bruise above F on the reverse. \$625.00.

1799 [BB-165] B-8a. F-15, evenly worn, perfectly centered, and pinkish-gray colored example. Flat on the obverse high spots, but exceptionally clean. \$325.00.

1799 [BB-166] B-9. R-1. Perfect obverse dies. VF-35, partly lustrous, partly tarnished and toned, well centered, but a trifle flatly struck up on the high points of Liberty. Fairly clean and attractive. \$525.00.

1799 [BB-166] B-9b. Curved crack across right obverse from 10th star, below chin, across neck to drapery; reverse "apostrophe" break right of final S of STATES. EF-45, dull gray tone, good centering, clean, and attractive. \$1,025.00.

1799 [BB-166] B-9c. F-12 and struck up, naturally toned, but with two "X" marks scratched in the left obverse field behind Liberty's hair. There are also eight or nine small reverse rim nicks. \$160.00.

1799 [BB-166] B-9c. R-1. Additional fine obverse die cracks, including one connecting 9th and 10th stars. MS-60 to 65, frosty and iridescently toned with full original mint lustre. Well centered obverse with lovely clean surfaces, although two minute pinscratches can be seen with a glass. The most noticeable being just left of the 10th star. Few adjustment marks on Liberty's bust. \$3,900.00.

1799 [BB-166] B-9c. Shattered obverse die unknown to Bolender at time of writing. Almost VF, two or three small rim nicks either side. \$300.00.

1799 [BB-167] B-14. R-4. AU-50, iridescent toned, and partly lustrous. Excellent surfaces with minimal handling marks, the most noticeable being on Liberty's neck. Hair detail poorly struck up. \$925.00.

1799 [BB-167] B-14a. VF-25 or better, dull even gray tone, reverse darker. Clean and a coin without any problems. Rare die state. \$425.00.

1799 [BB-168] B-22. Better than VG-8, but there are a handful of medium obverse rim bruises. Bold reverse, as usual. \$300.00.

1799 [BB-168] B-22. R-6. Die flaw in field before eye; horizontal reverse break. About F-15, considering the usual flat strike. Iridescent toning and quite clean. \$375.00.

1799 [BB-169] B-21a. High R-4. AU-50, frosty and lustrous. Obverse unevenly struck, but better centered than the reverse. There is a scratch on the latter's side from the clouds just above the eagle's head. Minor signs of obverse handling and abrasion, but, nevertheless, one of two finest known of this very scarce variety. \$900.00.

1799 [BB-169] B-21a. VF, warm gray, and iridescent tone, some mint lustre, no handling marks worth mention except a small obverse rim dent and a small reverse dig at second star. \$375.00.

1800 [BB-181] B-1. R-6. VF-30, bright, obviously cleaned at one time, and now acquiring a delicate tone. Not perfectly centered, but clean and fairly attractive. \$450.00.

1800 [BB-182] B-2. R-7. VF-20, well toned and tarnished. A flat strike, but clean with only two tiny obverse rim dents left and right of the 11th star. \$375.00.

1800 [BB-183] B-3. R-7. AU-50, well toned, struck, and has

highly polished surfaces. Not perfectly centered, but bold detail with sharp denticles. A few minor edge nicks, mostly above CA of AMERICA. \$1,150.00.

1800 [BB-184] B-12. R-4. Double cut R in LIBERTY. AU-55 or so, lustrous olive, but not fully struck up in the centers on both sides. Lovely cartwheel effect and very minimal signs of contact with other coins or handling marks. \$1,650.00.

1800 [BB-185] B-20. R-8. EF-45, lovely blue-gray iridescence, and a choice impression. Trifle central weakness and a faint scratch is under LI of LIBERTY toward the 6th star; otherwise, virtually perfect. \$1,000.00.

1800 [BB-186] B-4a. VF-30, or better where struck up, partial iridescent tone. Irregularly struck up about the rims. Very clean except for an old mark or two behind the hair ribbons and a few nicks on Liberty's cheek and neck. \$425.00.

1800 [BB-186] B-4b. Also VF-20. Bright from old cleaning. Few microscopic rim marks. \$350.00.

1800 [BB-186] B-4b. High R-4. VF-20, blunt strike as usual, well toned and clean save for a very minor dull scrape from L down to junction of Liberty's hair and ribbon knot. \$375.00.

1800 [BB-187] B-16. High R-3. EF-40, lustrous with iridescent toning, and choice. Fairly well centered; clean surfaces. Weakness at right breast as made. \$1,100.00.

1800 [BB-187] B-16. High R-3. VF-30, sharp and bright, and obviously cleaned. A nick on a denticle just left of first star, plus several others above first A of STATES. \$500.00.

1800 [BB-188] B-8. R-2. EF-40 or better, even color, and exceptionally clean and attractive. Not perfectly centered and a little irregularly struck up about the obverse rims. Faintly reflective reverse surfaces. \$825.00.

1800 [BB-188] B-8. VF-30 or better, iridescent tone, and lustrous. Well centered and clean, but there is a small nick in the left obverse field above the ribbons. \$575.00.

1800 [BB-189] B-5. Die dot inside lower part of R of LIBERTY. Perfect die. VF-35 where struck up, lightly iridescent, and exceptionally clean. Minute nicks above the 7th star. \$500.00.

1800 [BB-189] B-5b. VF, faint traces of lustre, warm gray tone, minute handling marks; some parts suggest EF grade. \$400.00.

1800 [BB-189] B-5b. VF-30, dark gray with blue-green iridescence about the obverse stars and reverse legend. Clean and beautiful, but with small, dull rim bruises above Y of LIBERTY and IC of AMERICA. Condition Census level. \$450.00.

1800 [BB-189] B-5b. VF-30, lightly tarnished, obverse off center, but clean. \$425.00.

1800 [BB-190] B-10. R-2. MS-60, fully lustrous, but well tarnished. Microscopic obverse handling marks, reverse reflective. \$1,650.00.

1800 [BB-190] B-10a. F-15, possibly a hairbreadth better. Natural gray tone, clean, and with a minute rim bruise right of the first star. \$325.00.

1800 [BB-190] B-10a. VF-30, though softly struck up, deep gray tone, and very clean and attractive. \$600.00.

1800 [BB-190] B-10b. EF, the amount of rubbing on high points suggests VF. Cool iridescent tone. Minimal handling marks; the short reverse streaks were in the planchet before striking. Honestly, only about VF-20 at best. \$350.00.

1800 [BB-190] B-10b. F-15 or better, partial iridescent reverse tone. Usual soft strike. \$325.00.

1800 [BB-190] B-10b. VF, weak, bluish-gray tone. \$400.00.

1800 [BB-190] B-10b. VF-20 or so, natural gray color, obverse superior to last, reverse much weaker. \$360.00.

1800 [BB-191] B-11. F-15, deeply toned, and clean except for a faint initial "F" lightly scratched on Liberty's upper jaw. \$260.00.

1800 [BB-191] B-11. R-6. AMERICA. VF-25, iridescently toned, with central weakness on both sides from striking as this variety usually comes. \$575.00.

1800 [BB-192] B-19. R-2. AMERICA. AU-50, heavily toned with highly glossy surfaces, and partly lustrous. Minor evidence of handling and a single spot on Liberty's neck at hair curl. Poorly centered obverse, but attractive. \$1,350.00.

1800 [BB-192] B-19b. About F-12 and very lightly, but well scratched on the obverse. Oddly colored and flat on the high spots. \$250.00.

1800 [BB-193] B-13. Clashed die reverse. MS-60, fully lustrous and iridescently toned. Very choice despite a small edge nick above the left upright of U of UNITED on the reverse. A trifle flat at Liberty's brow; otherwise, superb. \$1,800.00.

1800 [BB-193] B-13. R-6. VF-30, well toned blue gray color, and fairly clean. Softly struck on the high points of the obverse. \$525.00.

1800 [BB-193] B-18. R-2. VG-8 or better, but rim dented on both sides, and scratched and scraped on the right reverse side. \$175.00.

1800 [BB-193] B-18d. Almost EF, deep gray tone, traces of lustre; one tiny reverse rim nick but no other handling marks. \$400.00.

1800 [BB-194] B-14. R-3. So-called "Dotted Date," flaws inside and above first 0 in date. VF-35, partly iridescent to golden and bluish tones. More than usual light obverse handling marks, plus a few rim bruises or nicks (the most serious above TA of STATES). \$625.00.

1800 [BB-195] B-15. R-4. EF-40, but a very soft strike. Pale toning with nice surfaces and edge definition; reverse off center. \$700.00.

1800 [BB-196] B-17. R-1. VF-30, gray and iridescent tone; flat on the high points, but clean with very minor obverse handling marks. \$525.00.

1801 [BB-211] B-1. High R-4. EF-45, lustrous with warm iridescent tone. Flatly struck up as usual for this variety. Both sides off center and lightly handled all over. \$850.00.

1801 [BB-211] B-1a. Waves or suction marks at top of date. Reverse cracked. VF-20 where struck up, flat on hair high points, cheek, and drapery. Clean save for some edge bruises on either side, the most noticeable above the third star and R of LIBERTY. \$375.00.

1801 [BB-212] B-2. R-3. Obverse as last; only 12 arrows show plainly. About EF-40, but dull with an irregular gray toned. Mostly bold and clean with a few microscopic rim nicks on either side. \$600.00.

1801 [BB-212] B-2. About F-10, considering some light obverse scratches behind the head of Liberty, plus a dozen or so rim nicks on either side. Dull gray. \$300.00.

1801 [BB-212] B-2a. Crack developing above bust. VF-35, cleaned and now retoning. There is a short scratch below 18 of the date. A few obverse rim bruises are barely noticeable; reverse better centered than obverse. \$450.00.

1801 [BB-213] B-3. Almost VG-8, but repaired above LI,

rim bruised on the obverse, and scratched on the reverse, top to bottom, and in the left field below the wing on the left. \$140.00.

1801 [BB-213] B-3. R-3. Obverse as last two; reverse with right foot of T's missing. AU-55, partly frosty with some blue and green iridescence around the stars and the reverse legend. Rubbed on the high spots and with too much obverse handling and abrasion marks to qualify for MS-60. Choice and one of two finest known of the variety. \$1,450.00.

1801 [BB-213] B-3a. Reverse clash marks at upper right. F-15, gray color, but with the initials G W stamped in left obverse field behind the hair adjacent to stars two, three and four. There is also an attempted puncture after G resembling an out of position period. \$120.00.

1801 [BB-214] B-4. R-4. Close date, figures evenly spaced; spur on curved part of D of UNITED. Choice VF, light warm iridescent tone, pleasing natural gloss, tiny obverse rim nick, and a bagmark near 12th star, but no other handling marks worth notice. \$475.00.

1801 [BB-214] B-4a. Faint crack from a denticle to a cloud, right of S of STATES. EF-45, frosty and tarnished gray with some faint signs of iridescent toning. Flatly struck up upon the upper portions of the hair and the central portions of either side. Minor obverse bag and abrasion marks, mostly hidden by the toning. \$950.00.

1801 [BB-214] B-4a. VF-30 to 35, mostly an even gray tone, darker iridescence about the denticles. Quite clean with somewhat reflective surfaces (resulting from repolished dies). \$625.00.

1802/1 [BB-231] B-1. High R-5. Close overdate, "pocket" at throat and "collar" at base of neckline. AU-55, sharpness with a prooflike surface obverse, but cleaned neither too wisely nor too well. Some original lustre still evident, mostly about the devices on the reverse, along with a little iridescent toning. Obverse has handling marks and one medium-sized rim bruise at 3:00, the reverse is virtually free from any defects. \$1,010.00.

1802/1 [BB-232] B-4a, but without the faint die break connecting first A of AMERICA to the feather. F-15 overall, well toned to blue, green, gray and rose colors. Weakly struck up on the high points of Liberty as usual and we are not calling this a higher grade because of a handful of minor nicks and bruises on either rims. \$355.00.

1802/1 [BB-232] B-4a. R-3. About EF-40, but peculiarly struck in that the center of the obverse appears bulged. Well toned to dark gray, but lustrous about devices and legends. Clean, save for some small obverse nicks on the denticles, most noticeable between the 8th and 9th stars, plus a few tiny reverse edge bruises. \$725.00.

1802/1 [BB-232] B-4a. Really better than VF-35, but flatly struck up on the high points of the obverse. Lustrous surfaces with lovely iridescent toning (mostly on the obverse), reverse well struck and full deserved of the EF grade. Tiny rim nicks and/or bruises on either side do not impair this coin's appearance. \$575.00.

1802/1 [BB-233] B-2. R-5. VF-25, cool gray with a little obverse iridescence about the denticles. Clean and desirable, though not perfectly centered. Flatly struck up on the obverse high points. \$475.00.

1802/1 [BB-234] B-3. Low R-4. Small die lump in upper

right obverse field between the 8th and the 9th stars. About VF-30, violet and gray tone, and relatively clean. There is a tiny reverse rim nick just left of the first A in AMERICA. \$425.00.

1802/1 [BB-235] B-9b. R-7. Better than EF, richly toned; one or only two known in this final die state. EF-40 to 45, very flatly struck and off center is more accurate a description. \$775.00.

1802 [BB-241] B-6. R-1. Normal "close" date, really divided 18 02. Sharp but bagmarked AU. Cleaned years ago and now with natural sunset tone, which effectively conceals most of the faint scratches. \$1,075.00.

1802 [BB-241] Another B-6. VF-30, traces of old obverse cleaning, reverse nicely mottled. Weakly struck up on the obverse, but clean, well centered and attractive. \$575.00.

1802 [BB-241] B-6. VF-25, once cleaned, beginning to retone, well centered, and has a few obverse and reverse handling marks. \$500.00.

1802 [BB-241] B-6. VF-30, cleaned, beginning to tone golden about the denticles. Clean without any imperfections worth mentioning. \$500.00.

1802 [BB-242] B-5. R-7. EF-40, unevenly toned, and quite lustrous and attractive. Minor obverse handling, reverse bold and exceptionally clean. Well centered and a delightful example. \$1,200.00.

1803 Another B-6a. EF-45 or better, lustrous, but color hues rather dull. Well struck and clean, but there are three or four noticeable reverse edge bruises, the worst at 9:30. \$925.00.

1803 [BB-251] B-1. About F-10, uneven gray obverse tone, and clean except for some very minor reverse rim bruises. \$275.00.

1803 [BB-251] B-1. R-5. Small 3. F-15, slight iridescent tone around the edges, and clean except for a small cut between the 5th and 6th stars on the left. Obverse bolder than the reverse; well centered. \$350.00.

1803 [BB-251] B-1a. F-12 or so, light gray tone, but there is a light inch-long obverse scratch at the right across Liberty's breast. A couple of small rim bruises. \$275.00.

1803 [BB-252] B-5. R-6. About VF-35, although the lovely lustrous and light iridescent surfaces suggest a higher grade. Very flatly struck up in the centers, but clean. \$625.00.

1803 [BB-252] B-5a. Bifurcated letters. VF-20, warm gray tone, and clean. Obverse slightly off center. \$375.00.

1803 [BB-254] B-4. R-3. AU-55 or better, mostly iridescent blue toning about the boldly struck borders. Centers partly brilliant and the surfaces prooflike. Minor handling and a few microscopic handling marks remove this beauty from the strict MS class. \$1,950.00.

1803 [BB-255] B-6. R-1. VF-20 where struck up, and gray colored, but counterstamped 188 vertically across the cheek, neck, and drapery. Except for a few minute rim nicks, clean. \$150.00.

1803 [BB-255] B-6a. F-15, light gray color with a few rim nicks and bruises and bagmarks in Liberty's hair. Obverse not perfectly centered; reverse weak about the rims. \$300.00.

1803 [BB-255] B-6a. Overall nearer to almost Unc. than to EF, much mint lustre, irregular gray tone, few minute rim nicks; few border adjustment marks. \$735.00.

1803 [BB-255] B-6a. VF-30, but the iridescent and lustrous obverse surfaces suggest a higher grade. Reverse is dull gray and iridescent and has two small rim bruises; while the obverse has two scratches vertically down from the chin. High points of obverse very flatly struck up, borders and the reverse bold. \$500.00.

1803 [BB-255] B-6a. Virtually MS-60, dark iridescent toning, and fully lustrous with a sparkling cartwheel effect. Minor signs of handling a few microscopic rim nicks, and not fully struck up on the high points. \$1,350.00.

1803 [BB-256] B-3. R-7. Not quite VF-20 and a flat impression on the high points as usual. Uneven tarnish mixed with faint original lustre around the devices. Clean except for some reverse edge bruises and nicks, the most serious at 7:00. \$450.00.

The Fairfield Collection, Bowers and Ruddy Galleries, October 6-8, 1977, contained these early dollars:

1795 [BB-18] B-7. Flowing Hair. Three leaves. Scarcer die variety. Rarity-4. VG-Fine. \$425.00.

1795 [BB-21] B-1. Flowing Hair, Small Eagle. Two leaves beneath each wing. AU. \$5,250.00.

1795 [BB-24] B-13. Flowing Hair. Two leaves under each wing. F-VF, some marks. \$675.00.

1795 [BB-27] B-5. Flowing Hair, Small Eagle. Gem Unc. \$13,000.00.

1795 [BB-27] B-5. Flowing Hair, Small Eagle. Three Leaves. Borderline Unc. \$7,250.00.

1795 [BB-27] B-5. Flowing Hair. Three leaves. VF-EF, some slight discoloration from cleaning. \$1,000.00.

1795 [BB-52] B-15. Draped Bust, Small Eagle. Choice BU. \$10,000.00.

1795 [BB-52] B-15. Draped Bust. VF-EF, rim nick. \$800.00.

1795 [BB-52] B-15. VF, weak centers. Some slight adjustment marks. \$270.00.

1798 [BB-125] B-24. Heraldic Eagle. EF with a few rim nicks. \$550.00.

1799/8 [BB-143] B-2. Rarity-4. Choice Unc. \$4,200.00.

1799 [BB-154] B-18a. Borderline Unc. \$1,650.00.

1799 [BB-158] B-16. EF. \$720.00.

1799 [BB-158] B-16. VF-EF. Small planchet defect on rim at 4:00 obverse. \$440.00.

1799 [BB-163] B-10b. VF-EF. \$425.00.

1799 [BB-165] B-8. Unc. \$4,200.00.

1799 [BB-166] B-9a. VF, some pin scratches and field marks. \$325.00.

1799 [BB-167] B-14. Rarity-4. VF. \$420.00.

1800 [BB-190] B-10. AU. \$1,450.00.

1800 [BB-193] B-18a. Gem Unc. \$10,000.00.

1802 [BB-241] B-6. Choice Unc. \$5,750.00.

1803 [BB-252] B-5. Small 3. EF. \$775.00.

1803 [BB-254] B-4. Small 3 in date. EF-AU, weakness in clouds on reverse as struck. \$525.00.

The Bowers and Ruddy Galleries sale of the Garrett Collection (The Johns Hopkins Univer-

sity), March 26-27, 1980, included a set of early dollars beginning with 1794 and ending with the rare 1804.

1794 [BB-1] B-1. VF-30 with some burnishing in the fields. Normal planchet adjustment marks. A light golden tone evident on the reverse. Traces of parallel striae, or adjustment marks are visible on and near the eagle on the reverse. \$40,000.00.

1795 [BB-14] B-4. Flowing Hair. AU-50. Full borders. The usual adjustment marks are hardly noticeable and the details are outstanding. Most of the original mint frost is evident. In certain areas of the field and the highest parts of the design the frost has disappeared. Two very small edge marks on the obverse rim between the 6th and 7th stars. The coin is so lightly toned as to be almost subliminal. A light gray pervades with nuances of golden hues particularly around the stars and the letters of LIBERTY. \$15,000.00.

1795 [BB-27] B-5. Flowing Hair. Choice AU-55. The obverse displays nearly full mint lustre and may have been cleaned in the previous century. Just the barest whisper of friction appears. The reverse is nearly fully frosty, except for the highest central portion of the eagle. Well centered and well struck. \$27,500.00.

1795 [BB-51] B-14. Draped Bust. Choice Brilliant Proof. The obverse and reverse have a full Proof surface. \$170,000.00.

1795 [BB-51] B-14. Draped Bust. Choice AU-55. Sharply struck and well centered. The piece has the majority of its original mint frost, especially on the reverse. Adjustment marks are missing and the overall strike is extraordinary, with sharpness of detail. \$19,000.00.

1796 [BB-61] B-4. Draped Bust. Choice EF-45. Well centered and well struck. \$6,750.00.

1796 [BB-65] B-5. AU-50. Extremely sharply struck. Ample evidence of original lustre. \$9,500.00.

1797 [BB-71] B-3. Stars 10 left; 6 to the right. VF-30. Well centered and well struck. Lightly toned to gray overall, with some iridescent areas in the protected parts of the coin's design. \$3,500.00.

1797 [BB-73] B-1. Early die state. Stars 9 left, 7 right. Reverse with small letters. EF-40, with evidence of light striking at the center, particularly on the reverse. The borders are quite sharp. Overall the piece is toned a light gray, with traces of brown and blue iridescence in protected areas of the coin's surface. \$3,750.00.

1798 [BB-81] B-2. Small Eagle reverse. 15 obverse stars. AU-50. Sharply struck, well centered and with a generous quotient of original mint lustre. Friction appears on the higher areas. Numerous adjustment marks on Liberty's face. \$9,000.00.

1798 [BB-82] B-1. Small eagle reverse. 13 obverse stars. EF-40, some tinges of mint lustre in protected areas, and light golden-gray toning. \$6,500.00.

1798 [BB-113] B-27. Heraldic Eagle reverse. Choice Br. Unc., MS-65. Well centered, well struck, and nearly fully brilliant. \$65,000.00.

1798 [BB-122] B-14. AU-50. Traces of original mint lustre remain in the protected areas of the surface. An exceptionally sharp strike. \$4,000.00.

1799/8 [BB-142] B-1. Overdate. AU-50. Much original lus-

tre remaining. Traces of prooflike surface. Toned an attractive light gray with brown iridescence in protected areas of the coin's surface. \$5,250.00.

1799 [BB-159] B-23. Obverse stars 8 to the left and 5 to the right. VF-30, with attractive light gray toning. \$1,400.00.

1799 [BB-161] B-11. Choice EF-45. Both the obverse and reverse, particularly the reverse, display much original mint lustre. The sharpness and strike are extremely good. \$4,250.00.

1800 [BB-193] B-18. Choice AU-55. With many claims to full Unc. status. The strike is very nearly perfect. The obverse displays nearly complete mint frost. \$34,000.00.

1801 [BB-213] B-3. AU-50. A very sharply struck specimen of extraordinary quality. The obverse has at least half of the original mint lustre, mostly in protected areas of the design, and the reverse is even more lustrous. The surfaces have light gray toning with suggestions of magenta mottling in some areas. \$4,500.00.

1802/1 [BB-233] B-2. EF-40. Some suggestions remain of what may have been a prooflike surface at the time of issue. Light gray toning overall with some darker areas among the stars and letters. A few marks on the reverse are hidden among the clouds. \$1,750.00.

1802 [BB-241] B-6. VF-30. Light gray toning with mottled iridescent areas. \$2,700.00.

1803 [BB-252] B-5a. Small 3 in date. EF-40 with some suggestions of a prooflike surface which is especially visible in protected areas. Some light mint adjustment marks are visible at the lower part of the bust. Light gray toning overall, with some nuance of darker hues. \$4,000.00.

1804 King of American Coins. [Lengthy description omitted here.] From T. Harrison Garrett, earlier from O.H. Berg, John Haseltine. EF-40. Class III style. \$400,000.00.

Stack's sale of the Amon G. Carter, Jr. Family Collection, January 18-21, 1984, included one of the finest cabinets of early silver dollars ever to cross the auction block. Gems abounded, and notable coins ranged from the first in the list, a magnificent 1794, to the last, the rare 1804. A complete set of 1801-2-3 Proof "restrikes" was included as well.

1794 [BB-1] Silver dollar. Probably the finest known specimen. Unc. [Description from the Will W. Neil Collection sale repeated here.] \$264,000.00.

1795 [BB-13] B-9. Two leaves below each wing. Often called the "Head of 94." Struck from clashed dies which show prominently on the obverse. EF, iridescent toning mixed with pale golden toning. \$5,500.00.

1795 [BB-14] B-4. Two leaves below each wing. The last star entirely under the bust. Br. Unc., full frosty mint lustre. Planchet adjustment marks on the head, mostly in the area of the temple. This caused a slight weakness on the lower portion of the eagle. Gray, russet, and iridescent toning. Certainly in the Condition Census for the variety. \$15,400.00.

1795 [BB-18] B-7. Three leaves below each wing. The only 14 berry variety. EF. A splendid coin save for a small dig behind the eye. Golden and iridescent toning about the edges. \$3,520.00.

1795 [BB-21] B-1. Two leaves below each wing of the eagle. AU and a "gem." Perfect surfaces and edges, prooflike and slightly frosty which gives an overall satiny appearance. Lovely peripheral toning. \$14,300.00.

1795 [BB-51] B-14. Draped Bust, Small Eagle. The bust far to left. Br. Unc. and wholly prooflike. Some tiny marks in the field but indeed second only to the incredible Garrett specimen. Exceptionally well struck, with pale russet-iridescent toning. \$23,100.00.

1795 [BB-51] B-14. Strictly Good, no defect or damage. Pale gray toning. Really an amazing coin. \$770.00.

1795 [BB-52] B-15. Draped Bust. The bust is centered and, by far, aesthetically more pleasing. Die break in hair before the fillet. Br. Unc., slightly prooflike, a couple of minuscule reverse rim nicks. Well struck, with very attractive peripheral toning. \$24,200.00.

1796 [BB-61] B-4. Small Date, large letters. The only large letter reverse. EF and a perfectly balanced example of this rare date. A very choice specimen, with light russet toning. \$6,050.00.

1796 [BB-63] B-2. Small Date, small letters. AU and a beauty with some prooflike surfaces. Lovely pale russet toning with iridescence about the edges. \$13,200.00.

1796 [BB-65] B-5. Large Date, small letters. Reverse die break between IC. EF, lightly burnished years ago, now with nice purple and golden toning. \$5,225.00.

1797 [BB-71] B-3. Stars 10x6. EF and choice with claims to a higher grade. Frosty mint lustre with purple and iridescent toning. \$4,950.00.

1797 [BB-72] B-2. Stars 9x7. Reverse with SMALL LETTERS. AU, frosty lustre. The reverse only shows the weakness but shows no signs of wear. This certainly is one of the finest extant and, by far, surpasses the beautiful coin in our March 1983 sale. \$6,600.00.

1797 [BB-73] B-1a. Stars 9x7, large letters. AU, full frosty mint lustre. An exceptionally attractive coin and certainly far above average for this date. \$5,500.00.

1798 [BB-81] B-2. Small Eagle, 15 Stars. The only 1798 dollar with a 15-Star obverse. AU. Full frosty mint bloom and exceptionally well struck. The eagle is weak, as usual, but really rather sharp considering the tough 1795 [BB-51] B-14 reverse die lasted for four years of striking. \$6,600.00.

1798 [BB-82] B-1a. Small Eagle, 13 Stars. A strong VF, nearly EF. Russet and iridescent toning. Rarity-5. \$3,080.00.

1798 [BB-94] B-3. Draped Bust, Heraldic Eagle. Knob 9. EF and choice. Splendid gray and iridescent toning. \$2,310.00.

1798 [BB-105] B-23a. Heraldic Eagle. Very wide date. AU, frosty mint lustre, and nicely struck. The coin has a cameo effect with its peripheral toning. Rarity-4 and undoubtedly in the Condition Census. \$4,125.00.

1799/8 [BB-142] B-1. The 13-Star reverse. Die cracks at T and RI on the reverse. Br. Unc. and choice. A prooflike specimen with exquisite golden and pale iridescent toning. A splendid example of this overdate. \$8,250.00.

1799 [BB-158] B-16a. Intermediate die state. Lacks second reverse crack at OF and crack to 5th and 6th stars. Choice Br. Unc., blazing lustre. Virtually as struck. \$18,700.00.

1799 [BB-159] B-23b. Stars 8x5. An exceedingly rare type (R-5), especially so in this condition. Br. Unc., frosty and sat-

iny, with iridescent and russet toning. The toning missing from a few very high points. The terminal state of the die, with an arc-like crack from star one across the neck to below star 13, resulting in a massive bulging of the die. Without question, the finest known of this die state. \$9,350.00.

1800 [BB-187] B-16. Close Date. Die dot adjacent to the top curl. Choice EF, with lustrous surfaces. Iridescent toning about the edges. \$2,640.00.

1800 [BB-187] B-16a. Close Date. Most letters are bifurcated. The die breaks are advanced, with multiple areas of swelling. AU, blue and iridescent toning. \$6,050.00.

1800 [BB-190] B-10a. Wide Date. Br. Unc. Frosty and satiny, with considerable prooflike surface, mostly on the reverse. A simply splendid coin from any point of view. Pale golden russet and iridescent. \$7,150.00.

1800 [BB-191] B-11. The obverse of B-10 with the very wide date. The reverse is the popular AMERICA variety. However, this reverse coupled with the B-10 obverse is, as Bolender states, "Excessively Rare." Br. Unc., with just a tiny rub or two on the high points. Full mint lustre with delicate peripheral toning. Rarity-7 and to the best of this cataloguer's recollection, the first one we've sold since the W. Earl Spies Sale (Fine to VF), December 1974. This is undoubtedly the finest known. \$9,900.00.

1800 [BB-195] B-15. 10 arrows. Actually 10 perfect arrows and 3 arrowheads only. AU, just a whisper from full Mint State. Fully lustrous and nicely struck. A tiny "concealed" dig just below the lower ribbon. \$7,700.00.

1801 [BB-214] B-4. Spur on D of UNITED. Gem Br. Unc., wholly prooflike. At first glance one might think they were looking at the restrike because of the prooflike surface, strike, and edges. There is a circular area in the center of the obverse which is frosty, otherwise this cataloguer would have no qualms about calling it a specimen striking. The coin is so beautiful, with its russet and iridescent toning, that it virtually defies description. We cannot see how a better silver dollar of this date could exist. \$20,900.00.

1801 B-5. "Restrike." Br. Proof. The obverse with an arc-like crack from the B through the hair as well as the usual cracks through the bottom of the date and the first eight stars. The reverse with the mirror of that crack. Delicate pale gray and golden russet toning. Obverse: Same as adopted design but the 1's have a curved top. Tip of top curl missing. Reverse: Same as used with the Class I 1804 Dollar. Ex Will W. Neil Collection, B. Max Mehl, June 17, 1947, Lot 28. \$55,000.00.

1802/1 [BB-232] B-4. The close overdate. The 1 firmly touches the curl. Br. Unc., full blazing lustre with splendid satiny surfaces. Exquisite golden russet toning. This certainly must be one of the finest extant. \$7,700.00.

1802 [BB-241] B-6. Close Normal Date. Wide space between 8 and 0. Br. Unc. and a pristine example. A small "kegmark" on the chin but really "as struck." Full blazing mint lustre with satiny iridescence. Perfectly struck where all of the stars on the obverse and virtually all on the reverse have their radial lines. A sensational coin. \$33,000.00.

1802 B-8. "Restrike." Br. Proof. A gem with superb russet-golden and iridescent toning. Obverse: Same as adopted design but the 2 differs from the other 1802 dies because the tip of the upper end of the 2 ends in a vertical position rather than in a horizontal position. Reverse: Same as used with the

Class I 1804 Dollar. Ex Neil Collection, Lot 29. \$60,500.00.

1803 [BB-252] B-5. Small 3. AU, sharply struck about its periphery. Nearly as nice as the central portion (as is always seen with this variety). Full frosty mint lustre with golden and iridescent toning. Rarity-5. The finest known of this variety and undoubtedly one of the best Small 3's in existence. \$9,350.00.

1803 [BB-254] B-4. Small 3. Strictly VF and, as a type, the scarcest. \$935.00.

1803 [BB-255] B-6. Large 3. Only one die variety. AU and a lovely coin with nearly full prooflike surfaces. An exceptionally attractive coin with delicate iridescent toning. \$5,500.00.

1803 Bolender-7. "Restrike." Br. Proof. A gem with exquisite cobalt blue and golden iridescent toning. Obverse: Same as the adopted design with the large 3. Some rust spots on and around the 4th star. Reverse: Same as used with the Class I 1804 Dollar. Ex Neil Collection, Lot 30. \$68,750.00.

1804 Class III. Obverse: Draped bust of Liberty, with flowing hair, facing to right. There are 13 stars, six stars to right and seven to left of bust. The word LIBERTY above, and the date, 1804, below. The upper right-hand star almost touches the Y in LIBERTY. Reverse: An heraldic eagle with broad shield on breast carries a scroll inscribed E PLURIBUS UNUM in the beak, and holds 12 arrows in right talon and an olive branch in left talon. An arc of clouds extends from wing to wing of eagle with 13 stars in field beneath the clouds, and the legend, UNITED STATES OF AMERICA around. The edge is lettered, HUNDRED CENTS ONE DOLLAR OR UNIT. Extremely Fine.

Six of the Class III 1804 dollars are now known. When they began to appear on the market in the years immediately following the Civil War, John W. Haseltine of Philadelphia, one of the pioneer dealers in U.S. coins, was associated with many of them. The "ubiquitous J.W. Haseltine," as Walter Breen was moved to call him, seemed to have a magic touch. If there was an 1804 to be had, somehow Haseltine had it.

Haseltine turned up at the sale of the Jewett Collection in New York on January 24 and 25, 1876, with this particular Class III 1804 in his pocket. At suitable moments he allowed his treasure to be examined. He was a bit vague about the origins of the coin, only mentioning an unnamed collection in England. There was nothing vague about his price. He wanted \$600.00 for the piece. There were no buyers.

The next move remained hidden in the archives until a recent bit of research brought it to light. In March 1876, Haseltine scheduled his "1776 Centennial Coin and Curiosity Sale, Part I" (there were many other parts to follow). Under the general heading of "United States Silver Dollars," Lot 194 read, "1804; a fine impression of this extremely rare dollar, about as fine as the one sold in the Sanford Sale and a great deal finer than the one in the Cohen sale; guaranteed genuine and original." From this it would appear that when he showed what was presumably the same dollar in New York in January it probably did not belong to him. The reference to the Cohen coin also shows that in the early collecting days the 1804s had not yet been overtaken by the class system.

On the afternoon of March 3, 1876, the dollar sold for \$395.00 and Haseltine himself was the buyer. Later in the year he parted with the piece to Phineas Adams of New Hampshire for the consideration of \$550.00, thus allowing

himself a profit of \$155.00, less expenses. This was about the price pattern for the coin in those years. The less satisfactory Cohen specimen itself, had sold for \$325.00 in 1875 and the next year was acquired at auction by L.G. Parmelee of Boston for \$500.00.

The New Hampshire Adams coin was destined to have 11 owners, if the count starts with the "ubiquitous" Haseltine who owned the coin for only a few months in 1876. The others were Phineas Adams 1876-1880; Henry Ahlborn c. 1880; John P. Lyman 1880-1913; Waldo Newcomer 1913-1932; Col. E.H.R. Green 1932-1940; A.J. Allen 1940-1946; F.C.C. Boyd 1946; Percy A. Smith 1946-1950; Amon Carter and Amon Carter, Jr. 1950-1983. All these men were important collectors although Waldo Newcomer, Colonel Green, and F.C.C. Boyd are among the best known names. The piece finally came under the hammer again in B. Max Mehl's "Golden Jubilee Sale" held in Fort Worth in May 1950. It was bought by Amon Carter, Sr. for \$3,250.00. In the course of natural events it passed to his son, Amon Jr.

In the succession of owners the name of Carter is among the most distinguished. Amon Carter, Jr. was a highly respected and much loved figure in the numismatic world. We trust that the charisma of this particular 1804 dollar may also be transferred to the next fortunate possessor. \$198,000.00.

Superior Galleries' sale of the Hoagy Carmichael and Wayne Miller Collections, January 27-28, 1986. Included were several outstanding early dollars, most notably the Neil-Carter 1794 in Mint State.

1794 [BB-1] MS-63. Prooflike surfaces. Adjustment marks (file strokes are noted on the obverse rims). There is some weakness of strike around the periphery and the corresponding part of the reverse. This magnificent coin exhibits a blending of multicolored toning; a mixture of steel blue, violet and naturally grayish-golden tone. This is the Amon G. Carter coin, January 1984, Lot 207; previously from B. Max Mehl's Will W. Neil Collection, 1947. \$209,000.00.

1795 [BB-27] B-5. R-1. MS-63. \$8,800.00.

1795 [BB-51] B-14. Draped Bust. AU-55. Well struck with Liberty's hair and other details extremely well defined. Just a touch of friction is evident on the high points and a small scuff extends from Liberty's neck into the adjacent right field. The reverse exhibits some characteristic adjustment marks running diagonally across the eagle's chest. Lustrous surfaces throughout with an attractive golden glow; maintains outstanding visual appeal. \$4,840.00.

The balance of early dollars from this sale were not attributed, thus they are not included here.

The Bowers and Merena sale of the Norweb Collection, November 14-15, 1988. Offered were many important early dollars. The 1794 is one of the two Unc. pieces from the Lord St. Oswald Collection.

1794 [BB-1] B-1. Flowing Hair. MS-60/63. Believed to be second or third finest known. The obverse and reverse are of nearly full brilliance, modified by just a whisper of light gray

toning. Stars on the left side of obverse are lightly struck, and at that point some mint-caused adjustment marks can be seen. The portrait of Miss Liberty is needle-sharp. The reverse is well struck, save for the tops of the letters in the area of TED STA. \$242,000.00.

1795 [BB-20] B-2. Flowing Hair. Two leaves beneath each wing. AU-58 to MS-60, prooflike. Light golden toning blends to gunmetal blue at the borders, with areas of silver and gold in between. \$7,700.00.

1795 [BB-27] B-5. Three leaves beneath each wing. AU-50. Silver and iridescent toning. A lustrous, sharply struck example. \$9,900.00.

1795 [BB-27] B-5. VF-30. Glossy surfaces, with magenta, lilac, and blue toning. \$2,640.00.

1795 [BB-27] B-5. Flowing Hair. F-15. Medium gray toning with some iridescence. \$1,320.00.

1795 [BB-51] B-14. Draped Bust obverse, Small Eagle reverse. EF-45. Glossy medium gray surfaces. A chip is out of the border milling by the 7th star. \$5,500.00.

1796 [BB-61] B-4. Small Date, Large Letters. EF-45. A small planchet crack is seen on the rim below the date. Lightly toned a golden and gray hue. \$3,080.00.

1796 [BB-65] B-5. Large Date, Small Letters. VF-35. Medium gray and iridescent toning. Well centered and quite beautiful overall. \$2,640.00.

1796 [BB-66] B-1. Small Date, Small Letters. VF-20. Medium gray toning with some iridescent gold on the obverse. \$2,970.00.

1797 [BB-71] B-3a. Stars 10 left, six right; Large Letters. VF-20. Some rim marks are seen around the reverse. Light gray-golden toning. \$2,200.00.

1797 [BB-72] B-2. Stars 9x7; Small Letters on reverse. F-15. Silver gray surfaces. An edge bump is noted at the left border on the reverse. \$1,650.00.

1797 [BB-73] B-1. Stars 9 left and 7 right; Large Letters. AU-55. Bright, brilliant surfaces. Well centered and struck, with a broad rim of denticles serving to "frame" the interior devices. Much mint lustre still survives, particularly in protected areas. \$7,260.00.

1798 [BB-81] B-2. 15 Stars; Small Eagle. VF-20. Medium gray toning. Boldly struck, well centered. \$3,520.00.

1798 [BB-82] B-1. 13 Stars. Small Eagle reverse. VF-20. Lilac and gray toning. \$2,200.00.

1798 [BB-92] B-4. Heraldic Eagle. EF-40. Mottled light gray toning. Some darker streaks of toning are seen on the obverse and the reverse and may have been the result of a rubber band coming into contact with the surface at one time. At the center of the obverse some mint-caused adjustment marks can be seen. Well centered and exceptionally well struck. \$825.00.

1798 [BB-113] B-27. Heraldic Eagle. MS-60 to 63. Gorgeous bright silver surfaces, accented on the obverse by splashes of light gold. \$33,000.00.

1799/8 [BB-141] B-3. AU-58. Lustrous, frosty with most original mint surface still visible. Bright silver surfaces accented with areas of light gray and gold. Rarity-5. \$10,450.00.

1799/8 [BB-141] B-3. EF-45. Lilac and light gray surfaces. Rarity-5. \$2,530.00.

1799/8 [BB-142] B-1. AU-50. Mottled medium lilac and

gray surfaces. Rarity-5. \$8,250.00.

1799 [BB-155] B-19. AU-50. Bright silver surfaces accented with splashes of gold. \$9,350.00.

1799 [BB-159] B-23. Stars eight left and five right. VF-20. Silver gray surfaces. Rarity-5. \$1,430.00.

1800 [BB-190] B-10a. VF-20. Mottled light gray and steel toning. Well centered. \$825.00.

1800 [BB-194] B-14. Dotted Date. F-15. Lilac and gray toning. \$528.00.

1800 [BB-193] B-18. Counterstamped. VF-30. Silver, lilac and gray toning. B. COLLINS appears 3X in one area. US boldly impressed on the neck. \$550.00.

1800 [BB-192] B-19. AMERICA variety. VF-30. Light gray toning. \$770.00.

1801 [BB-213] B-3. VF-20. Lilac and gray toning covers the surfaces. \$1,100.00.

1802/1 [BB-232] B-4. VF-30. Medium gray, lilac and iridescent toning. Rarity-5. \$990.00.

1802/1 [BB-234] B-3. AU-50. Boldly defined overdate. The fields are an attractive light gray with tinges of gold toning, particularly in protected areas. Rarity-3. \$6,600.00.

1802 [BB-241] B-6. AU-58. Sharply struck, well centered, and very lustrous with delicate heather toning. \$9,075.00.

1802 Proof Restrike. B-8. Proof-65. The fields are toned a beautiful mixture of iridescent electric blue and gold. Just six to 10 specimens are known. \$71,500.00.

1803 [BB-252] B-5. Small 3. VF-30. Light lilac and gray toning. Rarity-5. \$1,320.00.

1803 [BB-255] B-6. Large 3. VF-20. Toning somewhat similar to the preceding. A tiny edge mark is noted near the first star. Rarity-2. \$660.00.

Superior Galleries sale of the H. Roland Willasch Collection (with additions), **May 27, 1990.** Mr. Willasch was a well-known collector of die varieties. Many of the coins are said to have been cleaned on a periodic basis.¹ Thus, prices were lower than uncleaned coins would have realized at the time.

1794 [BB-1] B-1. Rarity-4. VG-10. No rim bumps. Adjustment marks are far fewer than those usually seen. Medium gray color. A small mark just right of the eagle's belly button should help identify this coin. \$14,300.00.

1795 [BB-11] B-3. Rarity-5. F-12. Cleaned to a dull gray but otherwise quite nice for the grade. \$550.00.

1795 [BB-12] B-11. Rarity-7. VF-30. Dark sunset toning and well struck except along the right side perimeter. A few minor rim marks, both on the obverse and reverse. \$2,090.00.

1795 [BB-13] B-9. Rarity-5. F-12. Light gray color and well struck before the dies clashed. The third curl from top turns sharply downward, unlike all other varieties of this year. The reverse has some minor rim marks. \$1,045.00.

1795 [BB-14] B-4. Rarity-3. EF-40 (PCGS). Abundant mint frost in the fields and sharply struck. Light golden toning. Not part of the Willasch Collection. \$3,190.00.

1795 [BB-14] B-4. Rarity-3. VF-20. Original gray toning. A couple of tiny marks in the obverse fields are all that a glass reveals, the rims and devices are far better than usual for this grade. \$1,650.00.

1795 [BB-14] B-4. Rarity-3. VF-35. Gently cleaned retoned with a pleasing blue about the periphery. A sharp strike with excellent hair detail. A couple of minute rim nicks on the L near L of LIBERTY. Not part of the Willasch Collection. \$2,530.00.

1795 [BB-14] B-4. Rarity-3. VG-8. Cleaned many years ago and now retoned to gray about the periphery. Not part of the Willasch Collection. \$632.50.

1795 [BB-15] B-8. Rarity-7. VF-20. Medium gray toning with faint cleaning lines atop the surfaces. Very well centered and only a few marks. Sharp die crack on obverse. Shows some doubling on some letters of LIBERTY and a few stars. \$7,975.00.

1795 [BB-18] B-7. Rarity-4. VF-20. Cleaned and retoned with evidence of minor buffing on the obverse. Expertly retoned and now little evidence remains. \$632.50.

1795 [BB-20] B-2. Rarity-3. F-12. Very clean and original with lovely toning. Sharply impressed and well centered. A couple of reverse adjustment marks as often seen. \$1,100.00.

1795 [BB-21] B-1. Rarity-2. AU-55 (NGC). Fully struck with each detail solidly impressed. Warm gray color throughout. Some faint marks above and near the date. High points reveal only minor cabinet friction. Not part of the Willasch Collection. \$9,900.00.

1795 [BB-21] B-1. Rarity-2. F-12. Lovely surfaces and toning, the rims a touch darker than the centers. Well struck. Not part of the Willasch Collection. \$990.00.

1795 [BB-21] B-1. Rarity-2. F-15. Cleaned and retoned. Surfaces show myriad hairlines, but are partially hidden by retoning. \$1,210.00.

1795 [BB-21] B-1. Rarity-2. VF-30. Lightly cleaned with trivial hairlines, but starting to retone. A couple of minor marks, including a rim bump at the last star and some adjustment marks about the lower obverse periphery. Not part of the Willasch Collection. \$1,815.00.

1795 [BB-22] B-10. Rarity-6. F-15+. Well struck and graced with perfect old silver toning. The coin's reverse is plated in Bolender's standard reference. Light adjustment marks about the reverse. \$1,430.00.

1795 [BB-24] B-13. Rarity-5. F-15. Cleaned to an unnatural bright silver color with minor hairlines on the surfaces. A single scratch from Liberty's neck to the field is the only defect that scrutiny reveals. Like all B-13's, minor adjustment marks are visible, on this coin's reverse. \$687.50.

1795 [BB-25] B-6a. Rarity-3. VF-35 (PCGS). Steel gray and very lustrous for the grade, in fact, this coin has virtually complete lustre, like a Mint State coin. Usual weak strike on upper strands of Liberty's hair drag down the overall grade. The reverse is at least a grade better. A few hidden and very light adjustment marks on the obverse and faint hairlines in the fields. Not part of the Willasch Collection. \$781.00.

1795 [BB-25] B-6a. Rarity-4. VF-30. Splendid "old cabinet" toning atop immaculate surfaces and devices. Reverse has some minor adjustment marks. Boldly impressed. \$1,870.00.

¹ Cf. Russell J. Logan, "Condition Census: Pre-Turban Bust Dollars." Article in the *John Reich Journal*, October 1990, p. 10.

1795 [BB-26] B-12a. Rarity-6. EF-40. Cleaned long ago and starting to recover with light gold toning. An "X" scratch in the field before Liberty's face and a few more crisscrossing scratches in the hair, which may be adjustment marks. Not part of the Willasch Collection. \$3,190.00.

1795 [BB-26] B-12a. Rarity-6. VG-10. Pleasing surfaces and lovely original toning. Sharp die break from rim up through the 7 toward Liberty's ear brought this die pairing to an abrupt end. \$797.50.

1795 [BB-27] B-5. Rarity-1. AU-50. Abundant mint lustre subdued only by a gentle whisper of golden toning. Minor adjustment marks on the obverse rim. A small test mark above the T of LIBERTY is also noted. Sharply struck; smooth, lustrous fields. Not part of the Willasch Collection. \$1,870.00.

1795 [BB-27] B-5. Rarity-1. AU-58. Deeply toned with dark gray highlighted by iridescent blues and velvet in the fields. Just a touch of cabinet friction from Mint State. A minor disturbance in the toning on the neck, which should tone back if given a chance. Not part of the Willasch Collection. \$4,510.00.

1795 [BB-27] B-5. Rarity-1. EF-45. Steel gray and magnificent. Bold rims. Minor adjustment marks about the periphery on the reverse. Engraver's scratch behind Liberty is as bold as we've ever seen. Not part of the Willasch Collection. \$2,640.00.

1795 [BB-27] B-5. Rarity-1. F-15. Lightly cleaned and now retoned to a medium gray. Weak at the central reverse, possibly from minor buffing. Not part of the Willasch Collection. \$1,155.00.

1795 [BB-27] B-5. Rarity-1. VF-30. Gorgeous toning in the fields, varying from gold and sea green to medium gray. Lighter on the devices, accentuating the limited wear. Sharply struck. Not part of the Willasch Collection. \$1,760.00.

1795 [BB-27] B-5. Rarity-1. VG-10. Lightly cleaned to a silvery white brilliance, but well struck for the variety. The reverse is nearly a grade better. \$770.00.

1795 [BB-51] B-14. Rarity-3. AU-58. A razor-sharp strike that brings up every curl and feather attests to the mint's superior quality and workmanship. Gold and blue toning produce a cameo effect. Not part of the Willasch Collection. \$7,150.00.

1795 [BB-51] B-14. Rarity-3. EF-40. Lightly cleaned with a few minor handling marks. \$990.00.

1795 [BB-51] B-14. Rarity-3. F-15. Peppered with a variety of handling marks, perhaps from a mounting in a bezel or from exposure to sweating. Holed and plugged at BE of LIBERTY, but well enough done to fool the naked eye. Not part of the Willasch Collection. \$715.00.

1795 [BB-52] B-15. Draped Bust. Rarity-4. MS-60+. Magnificent gold and russet toning about the periphery and frosty, well struck devices. Not part of the Willasch Collection. \$14,300.00.

1795 [BB-52] B-15. Rarity-4. AU-50 (PCGS). Boldly struck with irregular toning on the obverse and reverse. A good number of the breast feathers on the eagle show clearly, as indicated by the high grade. Free of all but the most minute adjustment marks, which have been neatly blended with the toning. \$4,620.00.

1795 [BB-52] B-15. Rarity-4. VF-25. A strange die chip can

be seen on virtually all coins struck from this die, located just above and to the right of the ribbon knot. Lightly cleaned to remove dark toning, a hint of which remains, and now beginning to retone. Well struck, centered and appealing, the only mark being a tiny one above the M of AMERICA. \$880.00.

1796 [BB-61] B-4. Rarity-2. EF-45 (NGC). Impeccable. Silvery gray with a touch of gold about the periphery and mark free. The only impairment, if one must find fault, are hidden, nearly invisible, adjustment marks about the reverse periphery. Not part of the Willasch Collection. \$3,520.00.

1796 [BB-61] B-4. Rarity-2. VF-20. Medium gray and pleasing for the grade. Perhaps cleaned long ago, now fully recovered. No significant marks or abrasions on this sharply impressed and popular coin. \$1,072.50.

1796 [BB-63] B-2. Rarity-3. VF-20. Steel gray and completely retoned from a minor cleaning. Superb surfaces and rims. \$1,072.50.

1796 [BB-65] B-5a. Rarity-4. VF-25. Light gray and very pleasing. Some minor obverse adjustment marks are visible, but no other surface or rim marks. \$1,265.00.

1796 [BB-66] B-1. Rarity-3. VF-30. Lovely yellow and gold toning about the periphery hides the minor evidence of an ancient cleaning. Perfectly centered and defect-free. \$1,650.00.

1797 [BB-71] B-3. Rarity-3. EF-40. Irregular dull gray toning that is not too pleasing. Well struck, and retaining much of the original detail. A few minor contact marks, none of which detract, as well as some hidden adjustment marks. Not part of the Willasch Collection. \$1,925.00.

1797 [BB-71] B-3. Rarity-3. VF-25. Original blue and russet hues surround. Minor adjustment marks can be seen on the lower obverse but like other Willasch coins, this has no rim bumps. A cluster of shallow marks is visible between STATES on the reverse; there is a single mark on Liberty's chest. \$880.00.

1797 [BB-72] B-2. Rarity-4. Recent ANACS photo certified EF-40/40. Deep blue and gold toning on the obverse, even deeper gray color on the reverse. Numerous tiny contact marks seen on most early silver from this era and some planchet roughness. Not part of the Willasch Collection. \$3,520.00.

1797 [BB-72] B-2. Rarity-4. VF-20. Well struck on the obverse and as always a touch weak on the reverse. Perhaps cleaned as the surfaces are too bright for a coin of this age. The obverse and reverse are peppered with a variety of tiny marks, a minor one in Liberty's nose should help trace the pedigree. \$1,980.00.

1797 [BB-73] B-1. Rarity-2. VF-30. Well proportioned with wide dentils that serve to frame Gilbert Stuart's lovely rendition of Liberty. Light gray toning with original surfaces and hints of blue about the periphery. Immaculate rims and devices free of all but the most minute contact marks. \$1,980.00.

1798 [BB-81] B-2. 15 Stars, Small Eagle. Rarity-4. AU-50 (PCGS). Ex Garrett. Boldly struck. Not part of the Willasch Collection. \$7,975.00.

1798 [BB-81] B-2. Rarity-4. VF-25. Sharply struck and enhanced by medium gray toning throughout. Surfaces and rims have minor marks a few of which may have been buffed down. \$1,430.00.

1798 [BB-82] B-1. 13 Stars, Small Eagle. Rarity-4. EF-40.

Medium silver at the centers and surrounded by delightful blue and russet color about the periphery. Boldly struck with full separation of Liberty's flowing tresses and many of the eagle's breast feathers still visible. The rims and surfaces are without a flaw, and only a single adjustment mark can be discovered traversing through the eagle's cloud base. \$4,400.00.

1798 [BB-82] B-1. Rarity-4. VF-25 (PCGS). Steel gray toning on the devices, deeper somber gray in the fields. Clean surfaces and quite choice. Not part of the Willasch Collection. \$1,760.00.

1798 [BB-82] B-1a. Rarity-4. VF-30 (PCGS). Irregular deep gold toning throughout and well struck. A few die cracks on the reverse. Not part of the Willasch Collection. \$2,255.00.

1798 [BB-91] B-32. Rarity-5. F-12. One of the six new varieties rooted up by die variety collectors since the 1950 publishing of Bolender's reference. This die pairing is B-1 obverse and B-4 reverse. A few minor surface scratches on the obverse, as well as one under left wing of eagle on reverse. \$462.00.

1798 [BB-92] B-4. Rarity-4. VF-20. Cleaned long ago and retone about the rims with a golden hue. Excellent rims and surface but minor cleaning lines. \$385.00.

1798 [BB-93] B-5a. Rarity-5. VF-25. Magnificent steel gray toning with multicolored highlights about the periphery. A touch weak in the strike as the reverse die had all but collapsed with a terminal bisecting break. In the Condition Census for the variety. Knobbed 9 variety. Not part of the Willasch Collection. \$880.00.

1798 [BB-93] B-5a. Rarity-5. VF-35. Cleaned long ago with toning starting to form about the periphery. Very sharply struck. The reverse die broke severely with a bisecting crack after a handful were struck. \$1,980.00.

1798 [BB-94] B-3. Rarity-4. VF-35. Deep gray fields with lighter devices combine to give this coin a great look. Well struck throughout, each device fully brought up. \$770.00.

1798 [BB-95] B-6. Rarity-4. AU-55. Choice for the grade with hints of lustre in the fields graced with delicate golden toning. Perfectly centered. Knobbed 9. Not part of the Willasch Collection. \$3,960.00.

1798 [BB-95] B-6. Rarity-4. VF-20. Even gray and recovering from an old cleaning, now with toning about the rims. Somewhat of a shallow strike, but all devices and detail visible. \$390.50.

1798 [BB-95] B-6. Rarity-4. VF-30. Cleaned and now retone to a sunset gold. Clean surfaces and rims. \$660.00.

1798 [BB-95] B-7. Rarity-4. F-12. Original toning with the centers weakly struck, more so on the reverse. \$319.00.

1798 [BB-101] B-17. Rarity-4. VF-25. Steel gray and original with a single small mark above the bow of Liberty. \$374.00.

1798 [BB-102] B-20b. Rarity-5. VF-25. Medium steel color and well struck but for the central devices. Some minor adjustment marks in the central reverse contribute to the weakness. A heavy rim cud has developed below eagle's tail to last A of AMERICA. \$484.00.

1798 [BB-103] B-18. Rarity-5. VG-10. Heavy scratches in the left field and another on Liberty's hair which have been buffed down. Some adjustment marks visible in the center of obverse. Cleaned and starting to tone to a medium gray. \$137.50.

1798 [BB-104] B-22. Rarity-3. F-15. Steel gray and original with excellent surfaces. A single rim mark is noted below Liberty's bust. Minor adjustment marks at the central reverse and a touch weakly struck on a few of the shield lines. \$330.00.

1798 [BB-104] B-22. Rarity-3. VF-30. Steel gray and a touch bluntly struck on reverse. \$440.00.

1798 [BB-105] B-23. Rarity-3. EF-45. Boldly struck throughout but harshly cleaned to a dull white. A single mark on the star and nearby field near the eagle's beak. \$1,870.00.

1798 [BB-106] B-19. Rarity-4. VF-25. Boldly struck with superior fields and devices. Vertical bisecting die crack on obverse. \$1,320.00.

1798 [BB-107] B-21. Rarity-4. F-12. Lovely surfaces and rims. Small die lump above date. \$440.00.

1798 [BB-108] B-13. Rarity-3. F-15. Lightly cleaned and with resulting hairlines in the fields and on the devices. Retoning now and should be quite normal looking in a few more years. \$374.00.

1798 [BB-108] B-13. Rarity-3. MS-63. Frosty and untone with no surface impairments. A minute planchet flaw above the N of UNITED on the reverse. A tiny rim mark above A of STATES. Not part of the Willasch Collection. \$7,700.00.

1798 [BB-109] B-10. Rarity-4. VF-25. Steel gray and original, greatly enhanced by clean surfaces. Well struck for the variety, only a hint of weakness on the curls near Liberty's neck. \$374.00.

1798 [BB-110] B-16b. Rarity-6. AU-58. Deep blue and russet toning throughout, atop semiprooflike fields. Struck from latest die state known. Fields show faint evidence of cleaning, but have fully toned over. A touch of rub on the high points and minor handling marks in the fields. \$27,500.00.

1798 [BB-111] B-11a. Rarity-3. VF-30. But heavily buffed at the central obverse, probably to remove some marks. Completely retone to a somber gray. A heavy die crack from last star toward the L of LIBERTY. \$286.00.

1798 [BB-112] B-15a. Rarity-5. VF-20. Even gray toning although some faint cleaning lines show in the fields, and well struck. The reverse has some adjustment marks and the obverse has a few scattered marks, commensurate with the grade. \$231.00.

1798 [BB-113] B-27. Rarity-4. MS-60. Dark irregular toning on both sides. Deep blue color about the periphery and original mint bloom ooze up from flawless fields. Boldly struck. Not part of the Willasch Collection. \$2,530.00.

1798 [BB-113] B-27. Rarity-4. VF-20. Cleaned with the resulting hairlines. A few handling marks on Liberty's jaw, otherwise little evidence of circulation. Only a trace of the die crack below the 9 of date. \$330.00.

1798 [BB-113] B-27. Rarity-4. VF-20. Lovely steel gray toning although "March the 11 1864" has been very faintly engraved in the obverse fields, but a glass is needed to read it. Another single pin scratch through IBE of LIBERTY. Not part of the Willasch Collection. \$93.50.

1798 [BB-114] B-26. Rarity-6. VF-25. Cleaned to a bright white on both sides, with a hint of toning starting to form on reverse. The obverse has cleaning lines. \$352.00.

1798 [BB-115] B-31. Rarity-3. EF-45. Glossy with golden toning gracing clean devices and fields. A minor planchet flaw across star 12 will assist in tracing the pedigree of this rare

coin. Faint scratches are visible above the eagle's head. \$1,100.00.

1798 [BB-115] B-31a. Rarity-3. EF-40. Medium gray toning with hints of lustre in the fields peeking out. Well struck and defect-free. Not part of the Willasch Collection. \$1,265.00.

1798 [BB-116] B-30a. Rarity-6. EF-45. Sharp and beautiful, but harshly cleaned leaving the surfaces dull and denuded of lustre. \$2,310.00.

1798 [BB-117] B-33a. Rarity-6. EF-40. Boldly struck with original gray and pink toning throughout. The obverse is well struck even though a massive die crack appeared on the reverse, which often renders the obverse strike weak. \$4,620.00.

1798 [BB-118] B-28. Rarity-3. AU-50 (ANACS). Lovely mottled color throughout, centers glowing yellow, the periphery ranging from light green to blue. Struck a touch off center. Lustre still resides in the fields. Not part of the Willasch Collection. \$2,090.00.

1798 [BB-118] B-28. Rarity-3. VF-25. Medium gray and quite pleasing because of the original toning. A bit of weakness in the field stars above the eagle. \$522.50.

1798 [BB-119] B-29. Rarity-4. F-15. Steel gray and struck from worn and badly cracked obverse die. Lovely original toning with clean rims and devices. A bit too glossy, probably from an ancient cleaning. \$231.00.

1798 [BB-120] B-12a. Rarity-4. VF-30. Light silver gray and recovering from a gentle cleaning. The rims, devices and fields are without a significant flaw, attesting to Mr. Willasch's demanding standards. Reverse stars are very weak, owing to die failure and not wear. \$770.00.

1798 [BB-121] B-9. Rarity-4. VF-30. Well struck and very original with dark gray toning about the surfaces. Typical marks for the grade. \$825.00.

1798 [BB-122] B-14. Rarity-3. VF-30. Dark gray toning with a few recent disturbances in the fields, which should tone over in a few years. A single rim mark at the D of UNITED. Not part of the Willasch Collection. \$352.00.

1798 [BB-122] B-14a. Rarity-6. VF-20. Well struck from dies that suffered some sort of damage as the obverse has a strange rough area at the inside of stars 2 through 6, around the 7th star and L of LIBERTY and in a couple of other areas to a lesser extent. \$231.00.

1798 [BB-123] B-8a. Rarity-5. VF-25. Lovely original gray color with clean surfaces. One obverse star very weak (the 12 star variety). \$577.50.

1798 [BB-124] B-25. Rarity-3. VF-20. Light silvery color with darker highlights on the devices. Superb for the grade. Not part of the Willasch Collection. \$522.50.

1798 [BB-124] B-25b. Rarity-4. VF-20. Steel gray and magnificent, the obverse is surrounded by a die crack which is connected to the rim below the 1 in the date, the 7th star and between the IB in LIBERTY. \$632.50.

1798 [BB-125] B-24. Rarity-4. AU-50 (PCGS). Steel gray color and sharply impressed. A perfect type coin for the collector. Not part of the Willasch Collection. \$2,970.00.

1798 [BB-125] B-24a. Rarity-2. VF-25. Mottled gray toning and weakly struck about the central areas. Clean rims and fields with only nominal marks acquired during its foray into circulation. \$462.00.

1799/8 [BB-141] B-3. 15 Star reverse. Rarity-4. VF-20. Well centered and struck. Perfect medium gray toning. Not part of

the Willasch Collection. \$440.00.

1799/8 [BB-141] B-3. Rarity-3. EF-45 (PCGS). 15 Star reverse. Boldly struck. A normal scattering of marks. Not part of the Willasch Collection. \$1,265.00.

1799/8 [BB-141] B-3. Rarity-3. F-12. Smooth and original, the fields reflect few of the marks one would expect on a medium grade coin such as this. The overdate is bold to the naked eye. A touch weak above the eagle. Not part of the Willasch Collection. \$357.50.

1799/8 [BB-141] B-3. Rarity-3. VF-25 (PCGS). Lightly cleaned with a myriad of faint lines in the fields. Now toned with hints of gold about the devices and boldly impressed. Not part of the Willasch Collection. \$742.50.

1799/8 [BB-141] B-3. Rarity-3. VF-25. 15 Star reverse. Original toning about the periphery and pleasing. \$374.00.

1799/8 [BB-142] B-1. Rarity-4. VF-25. Steel gray and sharply struck. \$880.00.

1799/8 [BB-143] B-2. Rarity-4. VF-30. Cleaned to an unnatural brightness but starting to acquire golden toning here and there. Some scattered marks on the obverse and reverse. Well struck for the variety. \$396.00.

1799 [BB-151] B-13. Rarity-3. VF-25. Dark gray fields offset the lighter devices producing an appealing two tone effect. Choice fields and rims for the grade and one of the scarcest 1799 varieties. Interesting "irregular date" obverse with both 9's leaning away from each other and a band of die lumps in the star field above the right wing of eagle. \$506.00.

1799 [BB-152] B-15a. Rarity-4. F-15. Silvery gray toning and well struck for this late die state. Once cleaned, with very faint lines in the fields. \$484.00.

1799 [BB-153] B-4. Rarity-4. F-15. 15 Star reverse. Irregular date obverse. Medium gray toning and excellent surfaces. The obverse has numerous die cracks. \$330.00.

1799 [BB-154] B-18. Rarity-5. VF-35. Pleasing steel gray color and sharply impressed. The surfaces are quite nice. Heavy die break from rim to D of UNITED to the left wing of eagle. \$1,870.00.

1799 [BB-155] B-19. Rarity-5. F-15. Pleasant gray toning on the obverse, more yellow and gray on the reverse. Struck from worn dies as the central reverse appears indistinct when compared with other early die state varieties. \$286.00.

1799 [BB-156] B-7a. VF-25. Lovely color combines to offset Gilbert Stuart's ornate ensemble. A few scattered tiny marks can be found with diligent examination. A rare late die state with light cracks about the lettering on the reverse. \$528.00.

1799 [BB-157] B-5. VF-20. Cleaned to an even steel gray and starting to retone, a few minor hairlines still visible in the fields. A long hairline pin scratch on the obverse and a single tiny rim mark on the reverse. Not part of the Willasch Collection. \$396.00.

1799 [BB-157] B-5. Rarity-4. F-15. Well struck and centered and very original. Probably cleaned many years ago, but fully recovered now. U of UNITED missing upper serif. \$385.00.

1799 [BB-158] B-16. Rarity-2. VF-35. Some old marks on the obverse consisting of a gouge from the curl to the lower part of R of LIBERTY as well as some faint pin scratches in the obverse fields. Not part of the Willasch Collection. \$495.00.

1799 [BB-158] B-16b. Rarity-6. F-15. Smoky gold toning enhances the surfaces of the very late die state coin. Well struck from shattered obverse die with all devices complete. Pronounced mounding is visible on the obverse. A single rim bruise at T of UNITED. \$352.00.

1799 [BB-159] 8x5 Stars. B-23. Rarity-4. VF-25. Lovely surfaces enhance this popular variety. Choice surfaces with light toning. A crack is developing from the rim to the 10th star on the obverse. \$506.00.

1799 [BB-160] B-12a. Rarity-4. VF-25. Cleaned and perhaps lightly polished as the fields are too reflective for a coin with this much wear. Well centered and struck with all devices sharp. Interesting die cracks below and through date and right field. \$352.00.

1799 [BB-161] B-11a. Rarity-2. VF-25. Somber and glossy toning throughout perhaps from a gentle cleaning. Few marks distract the eye as it peers over the surfaces. A heavy reverse die break from the rim near the D of UNITED to eagle's mouth. \$440.00.

1799 [BB-162] B-6. Rarity-3. VF-25. Harshly cleaned on the obverse and probably used as jewelry as the rim below the date and bust show evidence of mounting. \$187.00.

1799 [BB-163] B-10. Rarity-4. AU-50. Impeccably struck. Smoky gold toning on obverse, while the reverse has more abundant gold. The fields hint toward prooflike. Not part of the Willasch Collection. \$1,870.00.

1799 [BB-163] B-10. Rarity-4. MS-60. Medium gray with ample lustre in the fields. Defect-free save for a faint hairline scratch on Liberty's neck and a reeding mark above the eagle's head. Reverse color is most pleasant, a soft sea green with loads of frost. Not part of the Willasch Collection. \$6,875.00.

1799 [BB-163] B-10a. Rarity-3. AU-50. Bright and frosty and blessed with a sharp strike. Perfectly centered with broad, fat dentils. Whispers of toning just beginning to cling to edges. Not part of the Willasch Collection. \$1,760.00.

1799 [BB-163] B-10a. Rarity-3. F-15. Cleaned a bit too harshly to recover fully, the fields show roughness associated with experimentation. Starting to retone with cloudy silver color. Fairly well struck. \$308.00.

1799 [BB-164] B-17a. Rarity-4. VF-30. Faint lustre adheres in the fields protected by the devices. Gently cleaned with minute lines visible in a strong light. Nevertheless, the devices are sharply struck, and on the reverse the engraving is especially sharp. \$990.00.

1799 [BB-165] B-8a. Rarity-3. EF-40. Graced with dark green and blue peripheral toning and bright centers. Excellent rims and surfaces with no noteworthy marks to detract the inquiring eye. Hints of lustre abound in the protected areas. \$770.00.

1799 [BB-166] B-9. Rarity-1. EF-45. Clean and original with peripheral gold toning and remnants of lustre. Strike is complete, each star and curl sharp, the reverse too exhibits full detail. A single nominal rim mark, near the E and some minute etching below IT of UNITED are mentioned for accuracy's sake. Not part of the Willasch Collection. \$880.00.

1799 [BB-166] B-9. Rarity-1. G-4. Steel gray fields with lighter devices. No impairments, just abundant wear. Weak at the reverse center from die failure. Not part of the Willasch Collection. \$220.00.

1799 [BB-166] B-9a. Rarity-2. AU-50. Boldly impressed with abundant mint lustre throughout. All devices are clear; moderate golden toning. Not part of the Willasch Collection. \$3,300.00.

1799 [BB-166] B-9a. Rarity-2. VF-25. Light silvery surfaces enhanced by golden highlights. \$495.00.

1799 [BB-167] B-14. Rarity-3. F-12. Cleaned and retoned to a dark gray, perhaps to hide some minor buffing as the fields don't look quite right. A single rim bump below bust. \$374.00.

1799 [BB-168] B-22a. Rarity-3. VG-10. This coin should grade higher, because of the complete failure of the reverse die, the obverse always is found poorly struck, normally a full grade below the reverse. Gunmetal-gray fields offset the lighter devices. The reverse die exhibits sharp horizontal die break. \$330.00.

1799 [BB-169] B-21. Rarity-3. AU-53 (PCGS). Dark irregular toning, especially on the reverse. Hints of lustre remain in the fields. Well struck on the periphery, although the central reverse is a touch weak on the right wing of the eagle. Struck from cracked dies, the obverse crack through the date is visible to the naked eye. Not part of the Willasch Collection. \$2,860.00.

1799 [BB-169] B-21. Rarity-4. EF-40. Sharply struck, perfectly centered and without a flaw. Medium steel iridescence with hints of lustre in the fields. Not part of the Willasch Collection. \$1,155.00.

1799 [BB-169] B-21. Rarity-4. F-15. Surfaces have been harshly cleaned leaving myriad cleaning lines and full, flat relief. Beginning to retone a warm russet color on both sides. \$220.00.

1799 [BB-169] B-21. Rarity-4. VG-7. Cleaned and retoned with dull gray surfaces. Not part of the Willasch Collection. \$165.00.

1800 [BB-181] B-1. Rarity-4. F-12. Gently cleaned with resulting faint lines, but no other problems to evidence this coin's rather extended stay in circulation. A scarce die pairing. Original gray color. \$374.00.

1800 [BB-182] B-2. Rarity-5. VF-30. Somber gray toning with hints of original mint frost peering out from the fields. Bolender found but a single example of this die pairing, now, a few more have turned up reducing this to a Rarity-5 rating. Some minor rim marks, one on the obverse and few tiny ones on the reverse are the only evidence of circulation aside from wear. An interesting combination, the obverse die has a sharply double cut R in LIBERTY and the reverse has a similar double cut first T in STATES. \$880.00.

1800 [BB-183] B-3. Rarity-5. VF-25. Iridescent gray toning atop clean surfaces. One of the rarest varieties of the year. A single tiny mark at the outer point of star nine on the obverse and another on the right side of the M of AMERICA should serve as hallmarks for this particular example. \$440.00.

1800 [BB-184] B-12. Rarity-3. VF-20. Steel gray iridescence with deeper gray about the periphery. Broad fat dentils serve to frame the obverse and protect the devices from wear. A tiny mark below the base of the T in UNITED identifies this coin. \$440.00.

1800 [BB-185] B-20. Rarity-7. VF-25. Even gray but cleaned long ago with faint hairlines in the fields. A small planchet defect is visible between the 3rd and 4th stars on the obverse and corresponding area of the reverse, only affecting the den-

tils. Weakly struck on Liberty's neck and surrounding curls, probably from buckling of the die. \$2,420.00.

1800 [BB-186] B-4. Rarity-4. VF-20. Mottled toning on the obverse, more even steel on the reverse. Close examination finds some minor cleaning lines, but these have begun to tone over. A rim bruise below the date and some minor adjustment marks on the right wing of the eagle and lower right cloud are the only detractors. \$418.00.

1800 [BB-187] B-16b. Rarity-3. AU-50 (PCGS). Smoky gold toning on the obverse and reverse. A bit weakly struck, perhaps due to die cracks as much as anything. Lustre peeks up from beneath the toning and provides a touch of originality. Some faint rim marks above LIBERTY on the obverse. Not part of the Willasch Collection. \$2,530.00.

1800 [BB-187] B-16b. Rarity-3. F-15. Original gray toning. Not part of the Willasch Collection. \$484.00.

1800 [BB-187] B-16c. Rarity-4. VF-20. Lightly cleaned and now starting to retone. \$418.00.

1800 [BB-188] B-8a. Rarity-4. VF-30. Sharpness of VF but cleaned to an unnatural brilliance. Now returning to a steel gray in color. Well struck and still an acceptable example of this scarce variety. \$467.50.

1800 [BB-189] B-5c. Rarity-6. VF-25. Iridescent gray color and very pleasing, only the faintest wipe lines appear on the surfaces. Well struck although a very late die state. A single hidden mark on the I of LIBERTY and a minute rim bump at the right wing tip. \$577.50.

1800 [BB-190] B-10b. Rarity-3. F-15. Lightly cleaned with the usual faint hairlines on the surfaces and starting to retone on the reverse. A very late die state on the reverse with multiple cracks through AMERICA and the eagle's wings. The base of the right wing on the eagle is flat. \$352.00.

1800 [BB-191] B-11. AMERICAI. Rarity-1. VF-20. Steel gray toning and only faint evidence of cleaning. A few light marks are visible on Liberty. \$396.00.

1800 [BB-192] B-19b. AMERICAI. Rarity-3. AU-50. Glistening lustre blazes from the fields, enhanced by russet and blue color evenly distributed across the millimeters of the obverse and reverse. Bluntly struck, as often seen on this variety, with minor weakness. Not part of the Willasch Collection. \$4,180.00.

1800 [BB-192] B-19b. AMERICAI. Rarity-3. F-15. Cloudy gray toning with the devices pleasantly offset by darker areas in the fields. \$286.00.

1800 [BB-193] B-13. Rarity-3. VF-30. Deep midnight toning atop the surfaces and boldly struck. Each star and device is sharp. A faint mark on the back of Liberty's jaw is the only readily visible defect. A glossy jewel that has probably been retone. \$797.50.

1800 [BB-193] B-13a. Rarity-2. VF-30. Light silver and only shows minimal evidence of cleaning. It was struck from badly clashed and worn dies, the reverse die becoming bulged and buckled. Still, a hint of lustre remains, stubbornly clinging near the devices. \$660.00.

1800 [BB-193] B-13b. Rarity-3. VF-20. Cleaned with some minor mottling on the obverse, the reverse still fairly bright. Unevenly struck from badly clashed dies. Not part of the Willasch Collection. \$550.00.

1800 [BB-194] B-14a. Dotted Date variety. Rarity-3. VF-25. Light gray and doubtless cleaned years ago, but starting to

recover. Well struck with clean surfaces and rims. Both dies have several defects on them, appearing as raised lumps on the coin. \$319.00.

1800 [BB-195] B-15. Rarity-2. AU-50 (PCGS). Deep gray toning throughout with some minor planchet streaks and spotting on the reverse. Faint lustre remains atop the lightly worn devices. Not part of the Willasch Collection. \$2,970.00.

1800 [BB-195] B-15. Rarity-2. F-15+. Clean surfaces and hints of lustre give this coin an alluring look. \$396.00.

1800 [BB-196] B-17. Rarity-4. AU-50. Bright and frosty, but expertly repaired below Liberty's bust to remove a rim bump. Lovely light golden toning on both sides and really quite pleasing. Not part of the Willasch Collection. \$1,375.00.

1800 [BB-196] B-17. Rarity-4. VF-20. Clean fields and devices, and quite original. Medium toning. Not part of the Willasch Collection. \$352.00.

1800 [BB-196] B-17. Rarity-4. VF-25. Harshly cleaned with heavy handling lines in the fields. The stars on the right are bold, but the left stars are weak as the obverse die began to break apart. Well struck on Liberty and the reverse. A single sharp clash mark showing through OF. \$462.00.

1801 [BB-211] B-1a. Rarity-3. AU-50. Bright and lustrous, glowing lustre dances in the fields. A hint of golden toning further offsets the devices. Exceptional strike for the variety. Not part of the Willasch Collection. \$4,620.00.

1801 [BB-211] B-1a. Rarity-3. VF-25. Lightly cleaned. Moderate wear and no significant handling marks. \$550.00.

1801 [BB-211] B-1a. Rarity-3. VF-30. Gently circulated, somehow avoiding the usual rim bumps and scratches seen on the large coins. Harmonious gray toning. Not part of the Willasch Collection. \$627.00.

1801 [BB-212] B-2. Rarity-4. EF-45. Attractive toning graces the surfaces of this well struck dollar. A few tiny contact marks. Not part of the Willasch Collection. \$2,310.00.

1801 [BB-212] B-2. Rarity-4. EF-45. Lightly polished on the obverse and retone with consummate skill. A few minor rim marks on both sides. The reverse is choice and original, sea green about the periphery lightening to russet at the centers. Not part of the Willasch Collection. \$715.00.

1801 [BB-212] B-2. Rarity-4. VF-30. Bright from a recent cleaning but starting to retone. Well struck and centered. \$715.00.

1801 [BB-213] B-3. Rarity-3. EF-40. Faint toning starting to form over gently cleaned surfaces. Lustre still adheres in the protected areas. \$990.00.

1801 [BB-214] B-4. Rarity-5. F-15. Cleaned to a dull white with only a hint of toning. Sharply impressed for the date. \$396.00.

1802/1 [BB-231] B-1. Rarity-3. VF-30. Steel gray and magnificent original toning. Boldly struck with each star sharp as well as every curl of Liberty's ample tresses. The reverse, too, is bold and original. Perfectly centered. \$1,210.00.

1802/1 [BB-232] B-4. Rarity-4. VF-20. Mottled original toning combines to make a delightful and attractive coin. Sharply struck. A couple of faint adjustment marks. \$555.50.

1802/1 [BB-233] B-2. Rarity-4. F-15+. Sharply struck but a number of minor pin scratches are visible when examined with a strong glass at the perimeter. Lovely toning about the rim. \$352.00.

1802/1 [BB-234] B-3. Rarity-3. VF-20. Marred only by a

faint cleaning lines and a single pin scratch from the rim to the I of UNITED to the arrowheads. Pleasant toning. \$462.00.

1802/1 [BB-235] B-9. Rarity-4. VF-25. Mottled gold and sea green toning throughout and boldly struck. \$1,210.00.

1802 [BB-241] B-6. Rarity-2. AU-50. Gold and gray highlights atop well struck devices. Not part of the Willasch Collection. \$3,190.00.

1802 [BB-241] B-6. Rarity-2. AU-50. Lightly cleaned long ago and now retuned about the periphery. Still bright at the centers. Boldly struck with sharp detail everywhere. A few minor pin scratches visible in the fields. Not part of the Willasch Collection. \$1,265.00.

1802 [BB-241] B-6. Rarity-2. MS-63. Extra bold detail on Liberty's hair curls and drapery folds. Small defect above eagle's beak, and two tiny rim marks. Not part of the Willasch Collection. \$7,150.00.

1802 [BB-241] B-6. Rarity-2. Sharpness of MS-60 but cleaned and retuned to a medium gray. Superb strike. Not part of the Willasch Collection. \$1,430.00.

1802 [BB-241] B-6. Rarity-2. VF-25. Cleaned to an unnatural brilliance with faint lines in the fields. Sharply struck. Some extra cross lines engraved in the vertical shield lines. \$352.00.

1802 [BB-242] B-5a. Rarity-4. F-15. Lovely iridescent toning which hides numerous faint pin scratches on the reverse. Some minor marks in the field before Liberty's face. Well struck. \$253.00.

1803 [BB-251] B-1a. Rarity-3. VF-25. Lightly buffed leaving the fields a touch too bright for the grade, now retoning with lovely gold color which adheres to the fields. Well struck and centered. \$462.00.

1803 [BB-252] B-5. Rarity-2. VF-25. Recently cleaned and brighter than most coins in this extensive collection. Hints of toning have already established a beachhead along the perimeter. Boldly struck. \$550.00.

1803 [BB-254] B-4. Rarity-2. VF-25. Traces of cleaning in the fields, but like quantities of others in this collection, toning now hides most of the evidence. Age and toning now mask most of the trivial evidence, and, as with virtually every silver coin from the period the cleaning does not significantly impair the surfaces. \$500.50.

1803 [BB-255] B-6. Rarity-2. F-12. Rather harshly cleaned and now toned a dark gray. Only Large 3 variety of the year. A couple of marks in the central shield. \$198.00.

1803 [BB-256] B-3. Rarity-3. F-15+. Broad, fat rims protected the delicate engravings during its foray in circulation. Ample detail remaining. Rarest variety of the year. Minor cleaning lines in the fields, but these are hidden by sprinklings of toning. \$385.00.

Summary

The auction record shows that collecting early silver dollars has been a popular numismatic pastime since the middle of the last century. Most offerings have been by dates and major varieties. Relatively few sales have featured comprehensive runs by Haseltine, later Bolender, numbers.

Unlike the situation with later silver dollar series,

even the finer collections were apt to have many VG, Fine, and VF coins. Higher grade pieces such as AU and Uncirculated have always been few and far between.

Descriptions of Varieties

In the following sections, each variety is illustrated with an *actual specimen* of the particular variety (or, when noted, a composite made by taking the obverse of one variety and the reverse of another). For each variety, the following information is given:

- **ATTRIBUTION NUMBER:** A typical variety is listed as follows:

1795 Draped Bust. BB-51

(B-14. H-14)

The large-type designation gives the year on the coin, the major type (if there is more than one type that year), such as Draped Bust, and the Bowers-Borckardt (BB) variety number, such as BB-51.

For cross-reference purposes, the Bolender and Haseltine numbers (B-14. H-14.) are given.

- **OBVERSE:** Under this designation is a description of the characteristics of the obverse die used to strike BB-51. Each obverse die has been given an identification number, i.e. Obverse 7. Then follows a notation as to which other varieties, if any, utilize the same obverse die.

- **REVERSE:** Under this designation is a description of the characteristics of the reverse die used to strike BB-51. Each reverse die has been given an identification letter, i.e. Reverse C. When a reverse die has been used with obverse dies of different years, the identification letter may be changed from one year to another. Then follows a notation as to which other varieties, if any, utilize the same reverse die.

- **DIE STATES:** Different progressions of die breaks, die damage, relapping, etc., are described as die states, as Die State I, Die State II, etc.

- **AUCTION POPULATION SURVEY:** Under this heading is given the number of coins of the variety found in different grades during Mark Borckardt's survey of auction listings. It is to be remembered that many of these listings represent duplicate offerings of the same coin, and also that many coins change hands privately and do not appear in auction catalogues. However, the information is very useful in a *relative* sense. For example,

consider two coins, each with these auction records:

Coin A: Good: 1 coin; Fine: 2 coins; VF: 4 coins; and EF: 1 coin.

Coin B: Good: 8 coins; VG: 20 coins; Fine: 31 coins; VF: 56 coins; EF: 19 coins; AU: 10 coins; and Mint State: 6 coins.

With this information, it becomes obvious that Coin A is a rarity, and that should an EF come on the market, it would represent a great prize. An AU coin would be even more important. On the other hand, for Coin B, an EF coin, while desirable, is not in the same rarity league as Coin A.

In addition, the *average grade* is given in parentheses, such as (Average grade: VF-26). This is made by totaling the coins using the lowest category for each adjectival grade (G-4, F-12, VF-20, EF-40, etc.) and dividing by the number of coins. This technique was first used by David W. Akers in his illustrious series of studies on American gold coins published serially beginning in 1975. This figure is quite useful as it indicates whether, on average, specimens of a given variety are apt to be quite worn, in higher grades, or whatever. For example, among 1798 silver dollars average grades range from a low of VG-10 (for 1798 BB-103) to a high of VF-37 (for 1798 BB-113). As interest in early dollars increases (assuming that it will), and more and better data become available, the average grade concept may suggest clues as to how a particular variety was distributed. Biases in the average calculation include these: 1. Use of the lowest number within the grade category, such as VF-20 for all VF listings. 2. The somewhat erratic space distribution of the adjectival-numerical system, under which, for example, VG goes from VG-8 to VG-11 (just below F-12), for just four numbers, while VF goes from VF-20 to VF-39, for a total of 20 numbers (grading scales can be debated forever, it seems). 3. Higher grade coins tend to appear in auctions more frequently than lower grade specimens; this is especially true of commoner varieties.

• **COLLECTING NOTES:** Under this heading will be found information about the availability of coins on the market today, including an estimate of the total population, a commentary on the distribution of grades, and various numismatic details.

• **NOTABLE SPECIMENS:** This category comprises from a few (in the case of great rarities) to a half dozen or more high-grade, interesting, or important coins that have appeared in auction catalogues, especially in sales of recent decades. It is *not* a Condition Census, nor are all high-grade pieces listed. Rather, it is a *representative* listing of significant specimens of the variety. It may well be the case that the same coin appears in more than one listing, as it is not always possible to identify duplicate offerings of the same specimen over a period of years, unless the cataloguer gives the pedigree or clearly illustrates it. The title or name assigned to the specimen is generally that of the first, or most important, private owner of record.

• **POPULATION DISTRIBUTION:** Under this heading, estimates are given of the number of coins surviving in various grade categories. The Universal Rarity Scale (URS) rating is given after each. A sample listing may look like this:

Approximate population MS-65 or better: 0 (URS-0)
 Approximate population MS-64: 0 (URS-0)
 Approximate population MS-63: 0 (URS-0)
 Approximate population MS-60 to 62: 0 (URS-0)
 Approximate population AU-50 to 58: 0 (URS-0)
 Approximate population VF-20 to EF-45: 20 to 25 (URS-6)
 Approximate population G-4 to F-15: 10 to 15 (URS-5)
 Approximate population for all grades combined: 30 to 50 (URS-6)

• **CONDITION CENSUS:** The Condition Census represents the numerical grades of the top six specimens believed to exist. In some instances, there are more specimens of the lowest number, and in such cases, the word *multiples* is used in parentheses, as: (multiples). A sample listing looks like this:
 40-40-35-30-30-25 (multiples)

Easy-Finding Guide to Early Dollars

Distribution of BB Numbers

BB Nos.

1794: BB-1.

1795 Flowing Hair: Begins with BB-11.

1795 Draped Bust: Begins with BB-51.

1796: Begins with BB-61.

1797: Begins with BB-71.

1798 Small Eagle reverse: Begins with BB-81.

1798 Heraldic Eagle reverse, Knob 9: Begins with BB-91.

1798 Heraldic Eagle reverse, Pointed 9: Begins with BB-101.

1799/8: Begins with BB-141.

1801-4 Novodels: Begins with BB-301.

Easy-Finding Guide to Early Dollars

How to use the Easy-Finding Guide

The following Easy-Finding Guide is intended to make it easy to attribute a given dollar to a BB number. Use the Easy-Finding Guide by following these steps. Be sure to follow the steps in order. Do not jump ahead or skip any step. The final step in the process should yield a likely BB number for your coin. Once this number is found, then check your coin against the detailed individual listing in that variety's special section.

First, pick a Roman numeral category (I, II, or III) that fits your coin. Second, under that Roman numeral heading, pick a number (1 or 2) that fits your coin. Third, under that number, pick a letter (A, B, C, etc.) that fits your coin. When you have completed the third step, you should have a match. The BB number is given in parentheses, such as (BB-11).

Some sorting procedures will not require all three steps if there are not multiple selections. Go as far as you can.

Once you have tentatively identified the variety, check it against the text description and photographs in its section.

1794 Dollars

Easy-Finding Guide

I. Only one variety (BB-1)

1795 Flowing Hair Dollars

Easy-Finding Guide

I. Two leaves below each wing

1. Reverse: 16 berries arranged 8 + 8 (BB-11)
2. Reverse: 17 berries arranged 9 + 8
 - A. Star 15 partially under bust point (BB-13)
 - B. Star 15 completely under bust point (BB-14)
3. Reverse: 18 berries arranged 9 + 9 (BB-22)
4. Reverse: 19 berries arranged 8 + 11 (BB-17)
5. Reverse: 19 berries arranged 9 + 10
 - A. Outside berry under left upright of N of UNITED (BB-23)
 - B. Berry under extreme left foot of first A of AMERICA. Star 15 partially under bust point (BB-16)
 - C. Berry under extreme left foot of first A of AMERICA. Star 15 distant from bust point (BB-15)
 - D. Berry under center of first A of AMERICA. (BB-12)
 - E. Berry under right foot of first A of AMERICA. Diagonal bar inside point of star 4. Star 1 pierces and separates lowest curl. (BB-20)
 - F. Berry under right foot of first A of AMERICA. Normal date. Two points of star 1 close to or touching lowest curl. (BB-24)
 - G. Berry under right foot of first A of AMERICA. Blundered date, 7 over 1 (BB-21)

II. Three leaves below each wing.

1. Paired berries below D of UNITE
 - A. Star 15 points below bust point (BB-18)
 - B. Star 15 points above bust point (BB-19)
2. Paired berries below first T of STATES
 - A. Diagonal bar behind top curl towards star 5 (BB-27)
 - B. Lowest curl passes through star 1 (BB-26)
 - C. E in LIBERTY punched over erroneous R (BB-15)

1795 Draped Bust Dollars

Easy-Finding Guide

1. Top left curl under B of LIBERTY (BB-51)
2. Top left curl under E of LIBERTY (BB-52)

1796 Dollars

Easy-Finding Guide

I. Berry below left foot of I in UNITED (BB-64)

II. Leaf touches first S of STATES

1. Leaves touch N, T and D of UNITED (BB-65)
2. No leaves touch letters of UNITED (BB-61)

III. Paired berries below first S of STATES

1. In date, 1 is distant from curl (BB-62)
2. Two points of star 1 touch hair curls (BB-66)
3. One point of star 1 touches hair curl (BB-63)

1797 Dollars

Easy-Finding Guide

I. Obverse: 6 stars on right (BB-71)

II. Obverse: 7 stars on right

1. Reverse: Small letters, paired berries below first S of STATES (BB-72)
2. Reverse: Large letters, leaf below first S of STATES (BB-73)

1798 Small Eagle Dollars

Easy-Finding Guide

1. Obverse: 13 stars (BB-82)
2. Obverse: 15 stars (BB-81)

1798 Heraldic Eagle Dollars

Easy-Finding Guide

I. Knob Tail 9, Arc star pattern

1. 1 and 8 virtually touch curl and bust (BB-95)
2. 1 and 8 separated from curl and bust (BB-94)

II. Knob tail to 9, Line star pattern

1. Star points left of center of B in PLURIBUS (BB-93)
2. Final A well separated from claw (BB-96)
3. Final A appears to touch claw. Obverse star pairs 10-11 and 11-12 equally spaced (BB-92)
4. Final A appears to touch claw. Star pair 10-11 three times as wide as star pair 11-12 (BB-91)

III. Pointed tail to 9, Arc star pattern

1. Only 4 berries (BB-125)
2. Star appears to touch upper beak point
 - A. Leaf point just left of left base of I (BB-116)
 - B. Leaf point under left upright of I (BB-117)
3. Leaf point right of center of I (BB-118)
4. Top of 8 touches bust.
 - A. Middle berry on right joins leaf point (BB-104)
 - B. Middle berry on right distant from leaf point (BB-105)
5. Star points to I of PLURIBUS.
 - A. Star 8 closer to Y than star 13 is to bust (BB-102)
 - B. Star 8 farther from Y than star 13 is to bust (BB-121)
6. Star point distant from cloud 1.
 - A. Right base of F closer to cloud 8 than top is to border (BB-103)
 - B. Star 8 points to base of Y (BB-106)
 - C. Star 7 and 8 closer to L and Y than star 13 is to bust (BB-107)
 - D. Die chip between star 13 and bust. Middle berry on right closer to leaf above (BB-108)
 - E. Die chip between star 13 and bust. Middle berry on right closer to leaf below (BB-109)
7. Star point appears to touch cloud 1.
 - A. 8 high and vertical (appears to lean right) (BB-113)
 - B. Base of IB closer than width of upright of I (BB-110)
 - C. Star 1 to curl is same distance as star 8 is to Y (BB-111)
 - D. Star 1 to curl is twice distance of star 8 to Y (BB-112)

IV. Pointed tail to 9, Line star pattern

1. Star point touches upper beak point
 - A. Same star points to left side of U (BB-114)

- B. Same star points to right side of B. Distance between IB at base half width of upright of I (BB-123)
- C. Same star points to right side of B. Distance between base of IB wider than upright of I (BB-124)
- 2. Star point touches lower beak point.
 - A. 8 closer to bust (BB-119)
 - B. 8 closer to denticles (BB-119)
- 3. Star does not touch beak
 - A. Same star points to center of B (BB-122)
 - B. Only one reverse star point touches clouds (BB-101)
 - C. Several star points touch clouds (BB-115)

1799 Dollars

Easy-Finding Guide

I. Obverse: 5 stars right (BB-159)

II. Overdate, 1799 over 8

- 1. Star points protrude from clouds 1 and 8. 15 Star reverse. (BB-141)
- 2. Leaf points under center of I, berry under right foot of A. (BB-142)
- 3. Leaf points under left upright of I, berry just right of center of A (BB-143)

III. Upper left serif of U in UNITED missing

- 1. Reverse star points all free of clouds (BB-168)
- 2. Base of B higher than adjacent I
 - A. No berries (BB-161)
 - B. With berries (BB-157)
- 3. Bases of IB even
 - A. No berries (BB-160)
 - B. With berries (BB-158)

IV. Star 13 touches bust

- 1. Star points protrude from clouds 1 and 8. 15 star reverse (BB-153)
- 2. Star points overlap clouds 4, 5, and 6 (BB-152)
- 3. One star point touches cloud 4 and 1 point touches cloud 5 (BB-151)

V. Right edge of E directly above center of highest hair wave

- 1. Reverse star right of head points to center of second U in UNUM (BB-154)
- 2. Leaf tip under left edge of upright of I (BB-155)
- 3. Leaf tip under center of I (BB-167)

VI. Edge of eagle's neck at middle of N in UNUM

- 1. Leaf tip right of center under I (BB-162)
- 2. Leaf tip under left foot of I (BB-164)

VII. Star point touches eagle's upper beak (BB-156)

VIII. Star point touches eagle's lower beak

- 1. Star right of eagle's head points to center of U in UNUM (BB-163)
- 2. Leaf tip right of upright of I (BB-166)
- 3. Distance from tip of 1 to curl is about the same as the distance from point of star 8 to base of Y (BB-165)
- 4. Star 13 closer to bust than is star 8 to base of Y (BB-167)
- 5. Star 8 closer to base of Y than is star 13 to bust (BB-169)

1800 Dollars

Easy-Finding Guide

I. "AMERICA" reverse

- 1. Star 1 farther from hair than star 7 is to base of L (BB-191)
- 2. Star 1 closer to hair than star 7 is to base of L (BB-192)

II. "Dotted Date" (Die chips inside and around first 0) (BB-194)

III. Leaf tip joined to lower right tip of I

- 1. Die dot below right base of Y, another elongated chip below upright of B. Outer points of star 11 bent up (BB-181)
- 2. Star 8 points above base of Y (BB-182)

IV. Right base of F touches cloud 8

- 1. Tip of 1 just touches curl (BB-186)
- 2. Star 8 extremely close to Y, almost touching at top. Die dot below tail of R (BB-185)
- 3. Star 8 farther from Y than star 13 is from bust (BB-187)

V. Leaf tip right of center below I

- 1. Leaf joins I slightly right of center (BB-183)
- 2. Leaf separated from I
 - A. Tip of lowest arrowhead under center of U (BB-193)
 - B. Tip of lowest arrowhead under right edge of U (BB-195)

VI. Leaf tip left of center below I

- 1. Reverse star points clearly do not touch cloud 1 (BB-184)
- 2. Lowest arrow just left of center of U (BB-188)

3. Lowest inside berry has long stem (BB-196)
4. Lowest inside berry large and very close to stem.
 - A. Star 7 closer to L than star 8 is to Y (BB-189)
 - B. Star 8 closer to Y than star 7 is to L (BB-190)

1801 Dollars

Easy-Finding Guide

- I. Star 13 twice as far from bust as star 8 is to Y**
 1. Leaf under I touches base right of center (BB-213)
 2. Star touches eagle's lower beak and points to left upright of U (BB-211)
 3. Star touches eagle's upper beak and points to right side of B (BB-212)
- II. Star 8 and 13 about the same distance from Y and bust.**
 1. Denticulated borders (BB-214)
 2. Squared rims, beaded borders (Proof)

1802 Dollars

Easy-Finding Guide

- I. Overdate, 1802 over 1**
 1. In date, 1 touches (or extremely close to) hair curl.
 - A. Star 1 and star 7 same distance from hair and L (BB-231)
 - B. Star 1 closer than star 7 (BB-232)
 2. In date, 1 noticeably separated from curl
 - A. Die chip midway between point of curl and B (BB-235)
 - B. Star 7 farther from L than are star 1 to curl and star 8 to Y, which are equi-distant (BB-234)
 - C. Star 1 very slightly farther from curl than

are star 7 and 8 from L and Y. These are about equal in distance (BB-233)

II. Normal Date

1. T in LIBERTY missing right base (BB-241)
2. T in LIBERTY has perfect base
 - A. Denticulated borders (BB-242)
 - B. Squared rims, beaded borders (Proof)

1803 Dollars

Easy-Finding Guide

- I. Large 3 with upper left serif**
 1. Left tip slightly left of left upright of I (BB-255)
 2. Leaf tip below center of I (Proof)
- II. Reverse star touches (or is very close to) eagle's lower beak (BB-256)**
- III. Reverse star touches eagle's upper beak**
 1. Leaf tip under center of I
 - A. Star 7 twice distance from L as star 8 is from Y (BB-251)
 - B. Stars 1, 7, 8 and 13 each slightly closer than preceding (BB-252)
 2. Leaf tip under I slightly left of left upright.
 - A. First star close to hair, top of 3 slants down to left (BB-254)
 - B. First star distant from hair, top of 3 parallel to bust (BB-253)

1804 Dollars

Easy-Finding Guide

- I. A in STATES centered over cloud 3. (Second reverse, "Restrike")**
- II. A in STATES centered over junction of clouds 3 and 4. (First reverse, "Original")**

1794 Silver Dollars

Mintage

Calendar year, Mint report: 1,758 distributed
(from total mintage of c. 2,000)

Coinage Context

Dollars authorized: The Mint Act of April 2, 1792 authorized the production of silver dollars of 416 grains weight, with silver content of 371.25 grains, equivalent to .89243 fine. The remaining metal was to be copper, added for strength. Such coins were intended to circulate at par with Mexican and other Spanish-American silver "dollars" (of the eight reales denomination) which were common in the states at the time. Indeed, earlier the Continental Congress had denominated its paper currency in Spanish milled dollars. The framers of the Mint Act of 1792, mindful of Alexander Hamilton's Report of January 28, 1791, chose the gross weight of 416 grains and the pure silver content of 371-1/4 grains for the silver dollar, and other silver coins in preparation, to match the average weight of Carolus dollars then in circulation, and to exceed the middle fineness Hamilton had specified. (Hamilton had specified pure silver content as ranging from 374 grains to 371 to 368, corresponding to 899, .8918 and .8846 Fine.) No one knew the official Spanish fineness ($65/72=902\text{-}7/9$ or .90278), but the actual Spanish dollars were not then coined in that quality.

A problem with the weight: Albion Cox, Mint assayer who was well versed in coinage (and who earlier produced New Jersey coppers), found that the statutory fineness of .89243 was difficult to attain, and he proposed adjusting it to the point at which the silver content of the dollar was 371.25 grains (thus achieving the amount of silver Congress wanted), but with the copper content lowered to 41 grains, thus yielding a 412.25-grain coin of .900456 fine silver (which was close to what Congress authorized over 40 years later under the Act of March 31, 1837). Congress did not agree with the Cox plan.

Mint Director David Rittenhouse then proposed to increase the silver content from 371.25 grains to

374.74, for a total coin weight of 416 grains, resulting in .90084 silver fineness. Under this proposal, unauthorized by Congress, all 1794 dollars and, it is believed, most if not all 1795 Flowing Hair dollars were minted. Each had 3.49 grains of extra silver, above the Mint Act's limit of 1/144 deviation (2.578-1/8 grains) in weight of fine silver. Depositors receiving silver dollars in exchange for bullion were thus short about 1% in value for each dollar received (see Additional Information below).

Concerning the copper with which to alloy the silver, R.W. Julian noted this: ¹

It is my opinion, based on the fact that I have yet to find in the Mint records any purchases of scrap copper after 1792, that the source of 99% of the copper alloy for the dollars of 1794-1804 was the copper coinage, either in misstruck half cents and cents or in the scissel (the remainder of the flattened copper ingot after the planchets had been punched out). Depositors usually had to wait several weeks for their coins, and very rarely obtained them within a month. For example, years later when silver coinage was heavy and regular in 1814, the delays were sometimes for several months.

Dies made: The dies for the 1794 dollar are almost certainly the work of Robert Scot, a medalist and die sinker. He had begun his career in England as a watchmaker, and had come to America, where he engaged in engraving plates for money and bills of exchange during the Revolutionary War, scales used in the office of financier Robert Morris, and plates illustrating architectural items for *Dobson's Encyclopedia*, among numerous other commissions. In 1780 he produced an Indian peace medal, "Happy When United," for the state of Virginia. In 1781 his workshop was located in Philadelphia on the west side of Front Street, near the corner of Vine.

Following the death from yellow fever in the summer of 1793 of Joseph Wright, a talented artist of whom many fine things were expected, the Mint sought to add a full-time engraver to the staff.

¹ Letter to the author, December 7, 1992.

Wright had worked on and off for the Mint, and today is credited with designing the 1792 eagle-on-globe patterns and the 1793 Liberty Cap cent, both beautiful works of art.

On November 23, 1793, Secretary of State Thomas Jefferson, who was in charge of the affairs of the Mint, wrote to Robert Scot and sent him a commission to be engraver at the Mint. To Scot fell the task of cutting the dies for coinage, including the 1794 Flowing Hair dollar. In November 1794, John Smith Gardner was hired as his assistant, but by this time the initial delivery of silver dollars had been accomplished. Probably, Gardner worked on some of the 1795 and later dies.

Planchet preparation: Silver was obtained by the Mint from various depositors, who primarily brought foreign silver coins, but often furnished silver utensils and other wrought items as well. The silver was received by the Mint, and in due course, dollars or other coins were made from the metal and paid out. Unfortunately, the Mint did not have a bullion fund, or house account, to provide for the purchase of silver and the immediate payment in kind from earlier-minted coins on hand. Under the procedure in effect during the era of the 1794-1803 silver dollars, depositors often had to wait several days or more for their coins.

After receipt, the silver would be melted, refined, cast into ingots, rolled into bars, and then rolled and drawn into sheets the thickness of the desired planchets. Great difficulties were experienced during these processes, especially with the rolling mills, as the rollers tended to deteriorate and produce strips of metal with uneven thickness. At one time, the Mint operations almost shut down because of rolling mill problems.

From the finished strip of the proper thickness, a small punch and die would cut out planchets one at a time. By this point in time, a great deal of effort and expense had been invested in creating each planchet. However, there was more to be done.

Adjustment marks: At the time the Mint did not have elaborate quality-control procedures in place, and it was difficult to produce planchets precisely of the required weight. Accordingly, the typical planchet was made slightly heavier than needed, and the weight was adjusted by hand filing to the correct level. Underweight planchets would have been useless, as their weight could not have been increased, and they instead were discarded, to go through the entire process of melting, conversion to ingots, roll-

ing the strip, and punching planchets again. (In 1795, the problem of underweight planchets may have been solved by plugging; see description under 1795.)

Evidence of the hand filing is seen today in the form of parallel or criss-cross grooves known as adjustment marks. The majority of 1794 dollars show these marks, usually at the lower left obverse and the corresponding part of the reverse, where metal flow was not as great (due to non-parallel die alignment; in this area the dies were too far apart, little metal movement occurred, and adjustment marks on the original planchet were less likely to be obliterated).

Edge lettering: To prevent filing and clipping by the public to reduce a minted coin's weight, it was desired to ornament the edge. In this way, the removal of silver could be detected. For the silver dollar, lettering was applied by a machine which rolled the finished planchet between two parallel steel bars, upon each of which was half of the edge lettering inscription: HUNDRED CENTS ONE DOLLAR OR UNIT and ornamentation between words.

These steel bars compressed the letters incuse into the edge of each planchet, and at the same time raised a rim around the border of each side of the planchet. Apparently, the height of the rim varied over a period of time, for some 1794-1803 dollars are known with rims that are almost flat, and others have rims that are quite high.

The raised rim did several things:

1. During the striking process, the metal could flow more easily into the toothlike notches at the edge of each die, to create denticles around the border.
2. The raised rim would protect the coin's surface from wear, and it would last longer in circulation. Coins with low rims wore quickly; those with high rims preserved their details for a greater length of time.
3. The coins would stack better, a convenience to banks, merchants, and counting houses.

In later years (beginning with the 1836 Gobrecht issues), the Mint would raise the rims on silver dollars by means of an upsetting machine; the closed collar equalized diameters. However, in the 1790s, whatever rim was to be raised was a by-product of the process of squeezing the edge of the coin during the lettering process.

Dollars struck: In 1793 and 1794, the largest press at the Mint was intended for striking no coins larger than a half dollar. Surviving documents indi-

cate that Mint officials lamented the lack of a press suitable for coining silver dollars and medals. It was not until spring 1795 that one was installed.

In the meantime, a screw press suitable for coining cents and half dollars was put into service to make silver dollars. The initial coinage of the new denomination was accomplished in the first part of October 1794. The effort was not completely successful, as evidenced by surviving coins which show areas of weak striking. Apparently, just one blow of the press was used (as evidenced by the lack of double struck features on surviving pieces).

Known silver dollars dated 1794 are from a single pair of dies and are believed to have been made to the extent of, perhaps, 2,000 coins (Walter H. Breen's estimate), of which 1,758 pieces were considered to be satisfactory delivered by the coiner on October 15, 1794. The remaining impressions, possibly amounting to 242 coins, rejected as being too weak, probably were kept on hand for later use as planchets. Supporting this theory is the existence of at least one 1795 silver dollar (BB-14) plainly overstruck on a 1794 dollar.

As several die states exist, the striking could not have been continuous, but was interrupted by the removal of the dies from the press for resurfacing (relapping) after clash marks were sustained early in their life (see Die States below). The silver for striking these came from ingot deposits made by Director Rittenhouse and Charles Gilchrist. This is certain, because Rittenhouse personally received all the first coinage of dollars.¹

The obverse and reverse die faces were not parallel, with the result that on almost all pieces surviving today the lower left obverse side appears weaker than the upper right obverse side, with corresponding weakness and strength on the opposite areas of the reverse. As the die faces remained out of parallel after having been removed from the press for resurfacing and removal of clash marks, and re-inserted in the press, the cause of the maladjustment must have been that the face of one die (or, less likely, both) was not perpendicular to its shank.

After the effort at coining dollars, the project was abandoned as a bad job, and a large supply of silver dollar planchets was put into chests for storage until a larger, satisfactory press could be installed.

Thus, the mintage of 1794 dollars was much smaller than had been intended.

Reception of the dollars: So far as is known, the new 1794 silver dollars slipped into circulation and immediately began doing their duty in the channels of commerce. Despite all good intentions, when the first 1794-dated United States silver dollars reached merchants and bankers, and when their successors dated 1795, 1796, etc., did also, the Spanish-American dollars, or eight-reales pieces, were preferred over the native American product. The old eight-reales coins were worth slightly more on the market than were the sparkling new United States coins with the head of Miss Liberty on one side and an eagle on the other. The reason is that the citizenry was familiar with the eight-reales coins, and especially in the export trade they were welcomed worldwide. Although the new United States dollars might test properly by weight or analysis, most business was done at sight, and the new coins had yet to prove their status.

By early December 1794, a few of the new dollars had traveled north to the Granite State, where the *New Hampshire Gazette* reported the following on December 2nd:

Some of the dollars *now* coining at the Mint of the United States have found their way to this town. A correspondent put one into the editor's hands yesterday. Its weight is equal to that of the Spanish dollar but the metal appears finer. One side bears a *head*, with flowing tresses, encircled by *Fifteen Stars*, and has the word "LIBERTY" at the top, and the date, 1794, at the bottom. On the reverse, is the *Bald Eagle*, enclosed in an *Olive Branch*, round which are the words "One Dollar, or Unit, Hundred Cents." The *tout ensemble* has a pleasing effect to a connoisseur; but the touches of the graver are too delicate, and there is a want of that boldness of execution which is necessary to durability and currency.

Numismatic historian Don Taxay viewed the 1794 dollar as unsatisfactory, noted that engraver Robert Scot's "talents, never marked, show a rapid decline."² He took the position that Mint Director Rittenhouse's successor (after June 1795), William DeSaussure, did not like Scot's work, and, apparently, not his assistant Gardner's either, and in September 1795 went over the heads of Scot and Gardner to enlist an outside artist, John Eckstein, to redesign the dollar and replace the Flowing Hair motif with the Draped Bust obverse, Small Eagle reverse, type.

I, for one, disagree with Don Taxay—and find the

¹ Certain information in this paragraph is from R.W. Julian, letter to the author, December 7, 1992.

² *U.S. Mint and Coinage*, p. 106.

Scot and/or Gardner work on 1794-1795 Flowing Hair coins to be very attractive, not only on the early dollars, but on half cents, large cents, half dimes, and half dollars as well. Unfortunately, very few contemporary accounts survive to tell us of the contemporary public reception of the newly minted 1794 silver dollars and their use in commerce. Coins were taken for granted, and relatively little notice was taken in print concerning them.

All too often, historians judge by today's standards what happened two centuries ago. In 1794, the almighty Spanish-American dollar, showing "that boldness of execution which is necessary to durability and currency," had little in the way of aesthetic appeal. Depicting the kings of Spain and, earlier, the Pillars of Hercules and two globes, these coins had virtually no fine detailing. The dies were made quickly, and crudely. By contrast, we have it on the word of an unnamed editor of a New Hampshire newspaper that the new 1794 United States silver dollar had "a pleasing effect to a connoisseur." What more could be asked for?

Numismatic Information

Desirability of the 1794 dollar: Today, the 1794 dollar is recognized as a great classic, not only because it is rare, but because it stands as the first silver dollar produced by the fledgling Philadelphia Mint. From the inception of coin auction sales on a large scale in the 1860s, to the present day, the appearance of a 1794 silver dollar in an auction usually has provided the opportunity for the cataloguer to provide an extended comment. Similarly, 1794 dollars have occupied the spotlight in numerous dealers' fixed-price lists over the years.

Charles Steigerwalt, in *The Coin Journal*, September 1880, commented as follows concerning the 1794 dollar:

The number of pieces coined in this year was not large and they have become very rare. Good specimens bring about 50 dollars. The dies of the dollars and half dollars of this year were not sharp and the impressions are generally weak; good specimens being difficult to obtain.

When Ebenezer Locke Mason wrote *Rare American Coins: Their Description, and Past and Present Fictitious Values*, in 1887, he focused upon this coin and noted the following:

The 1794 United States silver dollar, which occupies the centre of the group in our illustration [a collage of coins at

the top of the page], was authorized by an act of Congress, April 2, 1792, and was struck at the old Mint, opposite Filbert Street, in Seventh Street, Philadelphia, and is still standing. This dollar, which is considered very rare, commanded a premium of about \$25 in 1860, and has steadily advanced in fictitious value from year to year, and commanded, in every condition, in 1885, the sum of three hundred dollars.

It is said that but few of the 1794 dollars were struck, and the earliest from the dies equaled Proof pieces in their glistening splendor. The British Museum contains the best known specimen of the 1794 dollar, and probably received it as a gift from our government the year it was coined.¹

Population of 1794 dollars. The number of 1794 silver dollars known is subject to conjecture. Many pieces offered in nineteenth and early twentieth century catalogues were not illustrated, making it difficult to trace their pedigrees with certainty today. Jack Collins, who has made a detailed study of this date, suggests 120 to 130 possibly survive.

Mint State grades: Over the years several different specimens of the 1794 dollar have been designated as Uncirculated by various cataloguers. Today, fewer than 10 coins are believed to be MS-60 or finer by current grading interpretations.

Circulated grades: Nearly all 1794 dollars seen today are in lower grades ranging from Good to Fine. Not many make the VF grade, and perhaps fewer than 15 totally are EF or better. Population report data are not particularly useful in determining the number of EF 1794 dollars known, as a number marked "EF" (or the curious "XF") are, in my opinion, only VF. There seems to have been a grade escalation in regard to this particular date.

Caveat emptor: It is apparent that possibly two dozen or more 1794 silver dollars in numismatic hands today, ostensibly normal coins exhibiting varying degrees of wear, were at one time holed, plugged, initialed, or otherwise damaged. Over the years numerous of these have been expertly repaired so as to almost defy detection. Jack Collins, in the course of his research on dollars of this date, has found numerous instances of damaged pieces being described as such in auction catalogues, and then later reappearing as "undamaged" coins. The inescapable conclusion is that they were cleverly repaired in the meantime. Purchasers of 1794 dollars are urged to check carefully for signs of repair.

One explanation for the survival of so many impaired coins is probably that bullion dealers and others were alerted to the rare 1794 dollars by coin col-

¹ In a conversation with the author, August 6, 1992, Jack Collins stated that in the course of his research involving 1794 dollars he had learned that the specimen in the British Museum had been cleaned to the extent that it now shows extensive hairlines. Also, this was not a gift from any government, but came from the estate of Sara Sophia Banks who bought it from Captain Hawkins Whitshed in 1796.

lectors when the hobby was in its infancy in the 1840s and 1850s. While holed and damaged dollars of other dates, such as 1795, were even more common, the bullion dealers did not extract these as they passed through their hands. However, *any* dol-

lar dated 1794 was saved, no matter what the damage was. Accordingly, a higher proportion of this date survived in damaged condition in numismatic hands than any other early dollar issue of either the Flowing Hair or Draped Bust types.

Varieties

1794. BB-1.

(Bolender-1, Haseltine-1).

Dollars bearing the 1794 date were struck from a single pair of dies. Nearly all seen by the author are lightly struck at the lower left of the obverse and corresponding part of the reverse. Some few pieces display a well-balanced strike and are exceedingly rare. Perhaps because there was just one variety of the year, Bolender did not assign a number to it in his 1950 book. However, specialists since then have called it Bolender-1. Bolender was following the tradition of Haseltine (1881), who omitted a description of the dies, simply noting this: "There is but one die known of the 1794 dollar."

• **OBVERSE 1:** Flowing Hair design with six curls, the third curl weak. First star close to 1 in date. Second star near first curl, but does not touch it. The head of Miss Liberty in the 1794 dollar has a fuller cheek and more pronounced jaw line than does any of 1795, and admits of consanguinity with some of the finely-detailed heads seen on large cents

made early in the year 1794. Blunt tip to neck point.

No head on a 1795 dollar is *exactly* like this head, although three obverse dies of 1795, one used to coin BB-11, 12, and 13; another to produce BB-14; and a third to strike BB-16, 17, and 18, each have a blunt tip to neck point and are more like the 1794 head than any others. If any 1795 obverses are worthy of the "Head of '94" appellation, these three are. In the 1795 Flowing Hair dollar study, below, I designate these "Head of '94" coins as Portrait I (PI) issues.

A curious fact is that while the eight stars on the left of the 1794 silver dollar are each oriented with a point toward the denticles (as standard), the seven stars on the right are each positioned differently, unique to 1794 in the early dollar series, with two points toward the denticles (see plate).¹

• **REVERSE A:** Eagle perched on a rock within a wreath; 21 leaves on each branch. The wreath has 19 berries, 10 on the left branch, 9 on the right. A leaf is joined to second T in STATES, and another al-

¹ Illustrated as such in the 1893 Scott catalogue. Described by George Rice in *The Numismatist*, August 1895.

Pattern and Regular Dies of 1794

1794 pattern silver dollar, Judd-18, struck in copper, lettered edge, unique. The obverse die, without stars, was never used for regular coinage. The position of the lettering and date with relation to the denticles and portrait is slightly different than on the regular issue (illustrated below), indicating that the regular issue was not made by simply adding stars to the die shown above. Note also differences in the lowest hair curl. On the pattern obverse, Miss Liberty seems to have a rosy "apple cheek." The reverse is the same as used on regular silver coinage.

Regular 1794 silver dollar, BB-1, struck in silver. This particular piece is typical inasmuch as it is finely detailed at the center of the obverse, but along the left border is somewhat flat due to non-parallel alignment of the die faces. Note that on the right side of the coin each of the seven stars has two points toward the border, the only year in which this was done; all later dollars have a single point toward the border as, indeed, does the manner of the eight stars on the left side of the 1794 shown here. Note that the Head of 1794 (a general style also used early in 1795) has no loop at the neck truncation, and has a slight "pinch" about half way along the truncation line. Other differences can be noted in the hair.

most touches the right corner of F in OF. "Lobster claw" leaf pair under second T of STATES and first A of AMERICA. Eagle's wing touches R in AMERICA. Ribbons below wreath thinner and much closer together, and branch ends thinner and straighter, than on any 1795 reverse. Ribbon (not a knot) around junction of the two wreath stems. Seven feathers in eagle's tail. Rock under eagle's feet extends much farther to the left than on any 1795 die. This die was retired after the 1794-dated coinage and was not used in 1795.

• DIE STATES:

Die State I: Perfect dies. No clash marks in fields. Cf. Neil Collection (Mehl, 1947): 1 to Amon G. Carter, Sr. to Carter Family Collection (Stack's, 1984): 207.

Die State II: Light clash marks in obverse and reverse fields (usually visible only on coins grading EF or better). The ends of Miss Liberty's hair locks extend farther into the field and are more detailed than on the next. End of curl approaches innermost point of star 2. Cf. Lord St. Oswald (Christie, Manson & Woods, London, 1964): 137 to A.J. Ostheimer, 3rd, to the Gilhausen Collection (Superior, 1973), to Frank Andrews (temporarily), to Jonathan Hefferlin, to Newport Collection (Bowers and Ruddy, 1975): 371, via intermediaries to Jimmy Hayes Collection (Stack's, 1985): 72; Lord St. Oswald (1964): 138 to Norweb (1988): 3741; Somerset Collection (Bowers and Merena, 1992) coins; and others.

Die State III:¹ Obverse (especially) and reverse dies lightly reground, removing clash marks. The ends of Miss Liberty's lower hair locks are now shortened; the tips are missing. This is the usually seen die state.

Notes:

A prooflike impression of these dies (State I) struck in copper (Judd-19) is in the National Collection in the Smithsonian Institution, a gift of Stack's (in 1954, it appeared as Lot 1264 in Stack's Davis-Graves (James Davis) Collection sale, \$1,400). Bolender reported a second, in copper, silver plated, but this was the American Numismatic Society's electrotype (illustrated in the Bolender book as the plate for 1794; his own coin was only VG).

A 1794-dated pattern without obverse stars (Judd-18) is from a different 1794 die, a fact first noted by Andrew W. Pollock III; earlier, it was believed that stars were added to the pattern die for use in regular coinage.

• **COLLECTING NOTES:** See narrative above.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 13, Fine: 21, Very Fine: 34, Extremely Fine: 15, About Uncirculated: 4, Mint State-60 or better: 12. Total: 102. (Average grade: VF-25)

These numbers, while interesting, are skewed in two ways. First, dollars of 1794 are very valuable, and

an inordinate number of them have crossed the auction block, as compared to private sale. Second, in the past 20 to 30 years, several Uncirculated coins, in particular the two Lord St. Oswald specimens, have been listed in auction catalogues multiple times. The 12 Mint State listings probably represent only about five or six different coins.

• NOTABLE SPECIMENS:

Neil Specimen. MS-65 (PCGS). Neil catalogue description: "Uncirculated, some short file marks in the die on upper obverse right edge, undoubtedly a very early impression of the die as the stars on the left are as bold as on right and legend on reverse is perfect and well struck, hardly the slightest touch of cabinet friction, feathers on eagle's breast all show, full iridescent mint luster." • Will W. Neil Collection (Mehl, 1947): Lot 1. \$1,250. • Amon Carter, Jr. Collection (Stack's, 1984): Lot 207. \$264,000 to the following. • Hugh Sconyers for the American Rare Coin Fund Limited Partnership. • Superior sale, May 1991, certified MS-65 by PCGS. Jack Collins considers this to be the finest Mint State 1794 dollar. Die State I, prooflike.

Lord St. Oswald-Ostheimer Specimen. MS-63. Description from Gilhausen sale: "Uncirculated, frosty, gray toned, one of the sharpest strikes ever reported; date, all stars, all of back hair, feathers and leaves, dentils at left on both sides, and letters in UNITED STATES unusually bold; minor field handling marks, one reverse rim dent; some adjustment marks (as made) near borders; light clash marks but no rim break." One of two 1794 dollars believed to have been obtained during a visit to Philadelphia in 1795. • Major the Lord St. Oswald, late October 1795, on his visit to Philadelphia; in the hands of St. Oswald's descendants until 1964, when it appeared as Lot 137 of the Christie, Manson & Woods auction of the St. Oswald Collection. • Alfred J. Ostheimer, 3rd • Superior Stamp & Coin Co., 1972 • Gilhausen Collection (Superior, 1973): Lot 1209, sold for \$110,000 to the following, but, apparently, problems developed, and it was reacquired. • Ralph Andrews • Superior Stamp & Coin Co. • Jonathan Hefferlin for a reported \$127,500. • Newport Collection (Bowers and Ruddy, 1975): Lot 371, \$75,000.² • Jimmy Hayes Collection (Stack's, 1985): Lot 72, \$22,000. Die State II.

Lord St. Oswald-Norweb Specimen. MS-63. Obverse and reverse of nearly full brilliance, light gray toning, stars at the left side of the obverse are lightly struck, mint-caused planchet adjustment marks, Miss Liberty sharp with superb definition, reverse well struck except for tops of letters TED STA, which are intact but not as bold as their bases; eagle's breast feathers, wing details, head, eye, beak and all other features well defined. One of two 1794 dollars believed to have been obtained during a visit to Philadelphia in 1795. • Family collection of Lord St. Oswald which was sold at auction by Christie's in London October 1964, Lot 138. Sold to the following. • A.H. Baldwin & Sons and Lester Merkin, on behalf of the following. • Ambassador and Mrs. R. Henry Norweb. Norweb Collection (Bowers and Merena, 1988): Lot 3741,

¹ A later die state has been reported with a rim break at 7th star; very late impression from the dies. Cf. Gilhausen (Superior, 1973): 1210, VF; there called one of just two reported. However, Jack Collins (in a commentary received by the author on December 31, 1992) noted that the "rim break" is believed to have been a rim bump, and no specimen is known to exist with a break at the 7th star.

² Details from *Walter Breen's Complete Encyclopedia of U.S. and Colonial Coins*, p. 424.

MS-60/63. \$242,000. Since graded MS-63. • Additional information: The two Lord St. Oswald coins: Certainly among the very finest Mint State 1794 silver dollars are two coins sold at auction in 1964 by Christie's of London, as part of the family collection of Lord St. Oswald, who is said to have visited Philadelphia in 1795, possibly in October. These coins, long forgotten with a group of other copper and silver issues dated 1794 and 1795, appeared on the market to delight and surprise numismatists, several of whom traveled from the United States to attend the London event. At the sale each 1794 silver dollar brought the American equivalent of \$11,200. The first, Lot 137, went to A.J. Ostheimer, 3rd. The second, Lot 138, was knocked down to A.H. Baldwin & Sons, Ltd., London dealers, on behalf of Hon. and Mrs. R. Henry Norweb. As to which was the better coin has been a toss-up in discussions since. Lot 137 has fewer adjustment marks but is not quite as sharp on the 1 of the date, and has a few carbon marks on the reverse. Lot 138 has more adjustment marks. Both are brilliant and lustrous, and both are from an early state of the dies showing light clash marks. (There were three other early dollars in the sale: a specimen of 1795 BB-18 and two of 1795 BB-20. All told, the miscellaneous group of 1794 and 1795 pieces owned by Lord St. Oswald, representing an investment of less than \$10 in 1795, brought the princely sum of \$72,000! Die State II.

Boyd Specimen. MS-63 (PCGS). Uncirculated, graded MS-63 by PCGS in 1992. Lustrous, brilliant surfaces with detailed centers, clash marks in the fields, and the usual light striking at the left side of the obverse and corresponding part of the reverse. Some carbon marks at stars 3 and 6 serve to identify the coin. • B. Max Mehl, unknown date, probably the 1930s. • F.C.C. Boyd Collection. "World's Greatest Collection" sale, Numismatic Gallery, 1945, Lot 1. • Unknown intermediary. • Stack's (Fixed Price List No. 47, 1950 at \$1,595). • B. M. Eubanks. • Sold at auction by Quality Sales (Kreisberg-Cohen) on September 10-12, 1973, Lot 464 at \$51,000. • The Somerset Collection (Bowers and Merena, 1992): Lot 1300, MS-63 \$115,500. Sold to following. • Jeff Isaac, who had it certified by PCGS (as MS-63).

Ostheimer Specimen (another). MS-62. Described as following in Lester Merkin's sale: "Choice Uncirculated, obverse field prooflike (new die retaining polish), rev. frosty, faint obverse adjustment marks, two minute hidden reverse rim nicks, trivial bag marks—only one needing mention above T on obverse and that one not disturbing color, minute traces of cabinet friction from when this coin rested in a nineteenth century velvet display tray, above average strike, all obverse sharp but very center, borders bold, eagle's head very sharp,

claws plain, part of breast feathers visible." • A.J. Ostheimer, 3rd Collection (Lester Merkin, 1968): Lot 224.

French Specimen. MS-60. Auction '84 description: "Uncirculated 60+, exceptional strike with less weakness on the left obverse stars and left reverse legend than usual, evidently a very early strike; date full and Liberty's hair is boldly defined; cheek completely rounded; reverse (which grades full MS-63) eagle's breast and leg feathers are all visible and very sharp; some very light mint-made adjustment marks on reverse rim but surfaces remarkably free of abrasions; toning entirely natural, a warm medium blend of gray violet, russet, and greenish-gold." • Auction '84 (Paramount, 1984): Lot 725, Uncirculated 60+. • L.R. French, Jr. Family Collection (Stack's, 1989): Lot 2 • Gary Minsey Collection, MS-61 (PCGS).

Murdoch Specimen. AU-58. Empire Sale description: "Uncirculated; just the barest touch of cabinet friction, with frosty mint lustre. Perfectly centered, and an unusually bold impression. Stars rather bold." • Murdoch Collection, London (July 1903) • George H. Earle (Henry Chapman, 1912, Lot 2667) • Empire Collection (Cass Collection), 1957. • The Gibson Collection (Stack's, 1974): Lot 75, 32,500.

Austrian Specimen. AU-55. Bowers and Ruddy description, 1976: "Sharply struck, borderline Uncirculated, faint adjustment marks, traces of clashed dies, complete & well-defined denticles all around, sharp & square rims, hairlines from cabinet friction and some handling marks, shallow pit just about at eagle's 'navel' " • "Austrian private collection" (or possibly the Paris Mint Collection or that of the *Bibliothèque Nationale*. • Paul H. Wittlin • 1956 A.N.A. Convention sale conducted by James Kelly (Lot 1509, fetching \$8,000). • Stack's • Private owner. Sold to the following in 1975. • Stack's • Julian Leidman and Mike Brownlee • Paul Nugget • Dave Berg • Private owner • Dr. Edward Willing Collection (Bowers and Ruddy, 1976): Lot 412,

The Miles Specimen. AU-50. Adjustment marks on left obverse; usual weak strike left obverse and reverse sides. • R.L. Miles, Jr. Collection (Stack's, 1969): Lot 1525, AU. • "Autumn" Sale (Stack's, 1978): Lot 287, AU.

Connecticut Historical Society Specimen. AU-50. Bowers and Merena description: "EF-45, natural golden gray toning with some greenish blue highlights, trace of original mint lustre in protected areas, only slightest evidence of circulation wear or cabinet friction, Miss Liberty's head very bold with nearly all hair detail present, eagle and wreath are almost fully struck." • Many years in the Connecticut Historical Society Collection; sold in 1983 by Bowers and Merena. Described as EF with adjustment marks. • Auction '88 (David Akers, 1988): Lot 628, AU-50. • Auction '90 (David Akers, 1990): Lot 1626, AU-50.

1794: Summary of Characteristics

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer: Robert Scot, with some credit due to Joseph Wright, who engraved the Liberty Cap *cent* in August 1793.

Statutory weight: 416 grains; .8924 silver, balance copper; actual fineness used (unauthorized by Congress): .900 silver, .100 copper

Melting value (silver bullion value) in year minted (discussion for all years 1794-1803):¹ Considered by Mint officials to be on a par with the Spanish dollar, and worth about \$1.00 intrinsically. Silver values varied widely, and published data for prices on the London and Hamburg exchanges are not necessarily relevant for Philadelphia. Using European data, irrelevant as noted, the figure \$0.907 is obtained. Again using European data (the Hamburg Exchange ratios of silver to gold), and reckoning the American gold eagle (\$10) at its statutory weight of 247.59 grains gold, and the silver dollar at 371.25 grains silver, and using 1793's ratio of 15 to 1 (silver to gold) computed the yearly silver bullion value of the U.S. silver dollar as follows: 1794 (ratio: 15.37 to 1) \$0.976; 1795 (ratio: 15.55 to 1) \$0.964; 1796 (ratio: 15.65 to 1) \$0.958; 1797 (ratio: 15.41 to 1) \$0.973; 1798 (ratio: 15.59 to 1) \$0.962; 1799 (ratio: 15.74 to 1) \$0.953; 1800 (ratio: 15.68 to 1) \$0.956; 1801 (ratio: 15.46 to 1) \$0.970; 1802 (ratio: 15.25 to 1) \$0.983; and 1803 (ratio: 15.41 to 1) \$0.973. In 1794, the Bank of Maryland deposited in the Mint the *écu* equivalent of 69,692.4 ounces of silver, for which \$80,715.735 was paid out, equal to \$1.15 per ounce of pure silver. By this reckoning, a silver dollar (statutory weight of 371.25 grains pure silver) would have been worth \$0.889. However, as R.W. Julian has pointed out,² there is no way to determine the exact value of silver at the Mint at the time, except to note that Mint officials always considered Spanish (later, Mexican) dol-

lars to be worth par, or \$1 in terms of a U.S. silver dollar. Values of silver in terms of gold are, as noted, not particularly relevant. "Part of the difficulty lies in the fact that, while the United States officially had a bimetallic system, in reality we had the single standard of silver, and all monetary matters were judged on this basis."

Dies prepared: Obverse: 1 (plus another, of which only a pattern striking is known, without obverse stars); reverse: 1

Business strike mintage, calendar year: 1,758 delivered; possibly 2,000 or so minted; Delivery figures by day: October 15: 1,758.

Estimated quantity melted: None specifically. Possibly 250 or so poorly struck 1794 dollars, from an original mintage of 2,000, were rejected as unsuitable for circulation and were used in 1795 as planchets for 1795 dollars.

Approximate population MS-65 or better: 1 (the Neil-Carter coin) (URS-1)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 3 or 4 (URS-3)

Approximate population MS-60 to 62: 1 or 2 (URS-1)

Characteristics of striking: Nearly always seen lightly struck at lower left of the obverse and corresponding part of the reverse.

Known hoards of Mint State coins: Two pieces were in the Lord St. Oswald Collection auctioned in London in 1964, hardly a "hoard," but an inter-

¹ In addition to the above, anyone desiring European melt-down values of U.S. silver dollars 1794-1799 can adapt them from Table 15, Jastram, *Silver: The Restless Metal*. Dollars 1794-1795 are to be computed on the basis of .900 fine silver per coin, while those 1796-1799 are to be computed at .8924 fine. These are London metal market prices translated at the fictitious exchange rate of \$4.44 per £, without allowance for normal discounts and/or premiums; prices in the United States were different. I have been unable to locate any reliable yearly figures for the 1794-1799 years. Quite probably, in New York a 1794 dollar was worth more than \$0.907 in bullion value. Hamburg calculations courtesy of Andrew W. Pollock III. Michael J. Hodder provided information concerning Mint deposits.

² Letter to the author, January 2, 1993.

esting instance of two pieces from the same source.

Known hoards of circulated coins:¹ Dealer John Saunder owned about 7 or 8 at one time in the late 1880s; George H. Earle had a few in the decade or so after 1900; Dr. Charles Ruby, Fullerton, California, is believed to have had 6 by the late 1960s; in the 1980s an Ohio numismatist consigned about 15 pieces to Auctions by Bowers and Merena, Inc. for sale.

None

Commentary

The 1794 silver dollar, the first year of issue of the denomination, has always been a highly prized classic.

Additional Information

Dickeson and the 1794 \$1 (1859)

Dr. Montroville W. Dickeson included this information about the 1794 dollar in *The American Numismatist Manual*, 1859, the earliest widely-circulated text on numismatics published in America:

"1794. The first issue of the dollar, by our government, occurred in the latter part of October of this year. We are unable to furnish the exact number issued, as the mint report aggregates the sum for this and the succeeding year. As near as we have been able to learn, it was about 94,000."

Dickeson went on to say: "Of the dollar of this year we have met with but one type and four varieties, the latter of which may be determined by the variation in the size of the eagle, and the arrangement and size of the leaves in the wreath. This coin has become exceedingly rare, and fair specimens command a handsome premium."

Dickeson surely erred in regard to the multiple varieties, for later generations of numismatists have recognized just one variety of the 1794 dollar. Apparently, Dickeson may have examined worn coins or altered dates, or in some other way came to a conclusion there were multiple varieties. Perhaps his notes on 1794 dollars were mixed with his notes on 1795 issues (of which many die varieties are known). He noted that his findings were "based upon the knowledge of them, which we have, with much great care and labor, been able personally to acquire."

Snowden and the 1794 \$1 (1860)

The Cabinet Collection of the Mint of the United States, by Mint Director James Ross Snowden, 1860, p. 107, told of the first coinage of dollars:

"The first deposit of silver bullion for coinage took place on the 18th day of July 1794. The deposit was made by the Bank of Maryland, and consisted of 'coins of France,' amounting to eighty thousand seven hundred and fifteen dollars seventy-three cents and five-tenths (\$80,715.735.)

"The first return of silver coins from the Chief Coiner to the Treasurer was made on the fifteenth day of October, and comprised 1,758 dollars. The second delivery was on the first

day of December, and consisted of 5,300 half dollars. This embraced the entire silver coinage of the year. There was a small coinage of half dimes, but they were only struck as pattern pieces, for the purpose of trying the dies, and were not regularly issued.

"The types were as follows: Obv. A head of Liberty, facing to the right, with flowing hair. Above was the word 'Liberty,' and beneath the date '1794.' To the left of the effigy were eight stars, and to the right seven, fifteen in all. On the reverse was an eagle with raised wings, encircled by branches of laurel, crossed. . . ."

A Study of the 1794 \$1 (1876)

The Coin and Stamp Journal, Kansas City, Missouri, January 1876, contained the following:

"RARE AMERICAN COINS: We will endeavor, from the facts within our reach, to show what are our rare American coins, and their value. We do not attempt to give all the sales that have taken place, but only a few in different years. The great difference in prices brought at these sales are not caused so much by the real changes in the value of the coins, as from other circumstances, such as bad weather, numerous sales in succession, and lastly, our present hard times."²

"THE DOLLAR OF 1794 is the first U.S. silver coin we will notice, and is, with the exception of 1804, the rarest of dollars. At the Mickley sale in 1867, the 1794 dollar brought \$75. Described, 'one of the finest dollars of this date in existence. The impression excellent and condition superb; much finer than one once sold for \$285.'

"At the MacKenzie sale, June 23, 1869, one brought \$145. Described, 'This dollar is known to many collectors as the one sold in the collection of coins belonging to Mr. Zanoni, of Cincinnati, and is in my estimation the best that has ever been offered at auction, showing less marks of circulation than any other, and very rare in this state of preservation.' Another sold at the Fewsmith sale, Oct. 4, 1870, for \$25. Described: 'Good for date; obverse, head of Liberty bold and good; stars weak; date plain. Reverse, eagle and wreath well preserved; legend weak, extremely rare.'

¹ Most of this information is courtesy of Jack Collins.

² QDB note: A reference to the unfavorable economic conditions which began with the Panic of 1873.

"At Cauffman's sale, May 3, 1871, the price was \$32. Described: 'A better impression of this rare dollar than is usually found, being less injured by circulation than most of those offered at auction.'

"At a sale in New York, June 1, 1871, the dollar sold for the sum of \$5.50. Thus described: '1794 dollar. Had it not been for an imperfection in the planchet, which has partly erased the three first figures in the date, it might have been called very good for this rare date, as in other respects there is not much to find fault with.'

"Sanford's sale, November 1874. Price procured was \$180. Described: 'This, in my opinion, is about the best impression that has ever been offered at auction. It is but little circulated and is exceedingly rare in this condition.'

"Parker's sale, May 5, 1875, only \$30. Described: 'Rather weak date, head rubbed, altogether fair for this rare piece.'

"At a Philadelphia sale, Jan. 25, 1875, one sold for \$41. Described: '1794. Very good for this rare date; the head on obverse and eagle on reverse unusually bold; very desirable specimen; date all plain.'

"The one of Col. Cohen's collection, sold in October last, for \$125. Described: 'A remarkably fine impression of this date, being all but Uncirculated on obverse and reverse, and as fine, if not finer, than the one sold in Mr. Sanford's sale, and extremely rare in this condition.'

"The last one sold, Col. J.H. Taylor's, November 16th, brought \$100. Described: 'The best impression from the dollar dies of this date, and on the best planchet that I have ever seen—a remark I have often heard from others since the piece came into my hands. There has been a name engraved on the obverse and burnished out, the effect being observable, though not greatly hurtful; it is a beautiful dollar, and equaled by few. Rare.' "

1794 \$1 Sold for Face Value (1916)

The Numismatist, June 1916, page 294 reported an article from the *Cincinnati Times-Star*, April 20, 1916, which noted the following: "A silver dollar of 1794, the first standard dollar ever coined by the United States, was received at the United States Sub-Treasury Wednesday from a Louisville Bank, and it was redeemed as a one dollar Silver Certificate."

Venn on "Daddy Dollars" (1921)

The Numismatist, November 1921, contained an article, "Are the 'Daddy Dollars' Again Coming Into Their Own?" by Theodore J. Venn. The author was especially interested in the subject of coin popularity and investment and was a few decades ahead of most other writers in this field:

"There was a time, far beyond the recollection of our present generation of numismatists, when our earliest silver dollars, the 'dollars of our daddies,' or 'daddy dollars,' as they were usually called, were the most popular coins among American collectors. This was years before the collecting of large United States cents became general and when these coins and the half cents still constituted our active copper circulation.

"These early dollars, with their fine hair lines,¹ unquestionably made a strong appeal to the artistic eye, and many people therefore saved the few specimens that chanced to fall into their hands. From the time of their introduction in 1794 until the date of their suspension in 1803 (or 1804, as some will have it) fewer than 1,500,000 of these coins, all told, had been struck, so it will be readily seen that they could not have had much circulation among the people at large.

"During the lapse of 36 or 37 years which followed prior to the resumption of silver-dollar coinage for general circulation in 1840 with a change of type, collectors eagerly sought these 'daddy dollars' and paid large premiums for them. During the long hiatus the silver dollars had, so to speak, become obsolete, and many non-collectors who possessed a few of the coins became so attached to them that they refused to part with their specimens for any reasonable consideration. To some degree they had become heirlooms. And this continued for many years after the new type dollars made their appearance, for these were not 'daddy dollars.'

"In examining early coin auction catalogues and price lists of the dealers of bygone days one will be surprised at the quotations for some of these dollars, even in Good or VG condition, as compared to what they had been bringing for about 20 years until the recent reaction in their favor set in. And the surprise will be increased when one stops to figure the vast difference between the purchasing power of money in those days and in our own.

"It is difficult to attribute a cause for the decrease in interest in the early silver coinage which took place about a score or so years ago, unless it be laid to the influence of the preponderant number of collectors of copper coins who had entered the numismatic ranks within more recent years. This and a decline or absence of interest in the antique on the part of those into whose hands the 'daddy dollars' had chanced to fall, thus temporarily glutting the coin market, would have been sufficient to bring about the condition that then prevailed.

"The advent of so many new collectors within the past two years, however, has entirely changed the aspect of affairs and those who have been steadfast in their affection for the 'daddy dollars' are about to be rewarded by seeing them once more come into their own. So many of the younger generation among the numismatists are showing a preference for these old dollars that bind us to the past that they probably will place them on a pinnacle higher than they formerly occupied, and the early silver half dollars, for which they also show a strong fancy, appear slated for deliverance from the slough of despondence in which they so long have been floundering. In fact, they have been on the upward trend for a year or more.

"The numismatist who is inclined to doubt the good news need but examine his dealer's stock or make inquiries from collectors who unsuccessfully have been trying to secure some of the dates and varieties of the early dollars during the past year. Fortunately for the collector who wishes merely a specimen or two, the 1798, 1799 and 1800 still are readily procurable, but in most instances it is a different story with the other dates. A review of the auction sales of recent months also will show that the offerings have greatly decreased.

¹ QDB note: A reference to the finely detailed hair strands of Miss Liberty on the 1798-1803 Draped Bust portrait.

"It is to be hoped the tribe of 'daddy-dollar' collectors will continue to increase. Every true numismatist will be glad to learn that the shadows finally have lifted from these rare antiques that have been in partial eclipse so long."

More From Venn (1922)

The Numismatist, January 1922, carried more from Venn, under the title of "Liberty Dollars, 'Daddy' Dollars, Et Al.":

"When the writer contributed a short article to the November issue of *The Numismatist* on the 'daddy' dollars, he was aware there was a misconception on the part of some collectors as to which issue of United States silver dollars was really entitled to the appellation, but it is only within the past few weeks he has learned so many have been led into the delusion that the term applies to the 'Liberty-seated' dollars, the coinage of which began in 1840.

"There is a slight excuse for this error, as it is partially based on custom, but custom frequently rests upon a false foundation and manages to perpetuate itself, nevertheless. Custom grows rapidly, but it is often a poor schoolmaster. For instance, custom wrongfully causes us to turn a German into a Dutchman and to shock purists with such expressions as 'ain't' for 'isn't,' etc. Hence a small additional explanation as to the early dollars may not come amiss. The historical facts are as follows:

"When coinage on the first issue of dollars, also frequently called 'Liberty' dollars, was suspended, they soon went out of active circulation and few people saw any of them. When shown one of the coins, the exhibitor often was wont to remark, 'These were the dollars of the daddies'—hence 'daddy' dollars. Finally, to the average man, they became a mere tradition. When the later issue appeared in 1840, many of the younger generation who had heard the older issue referred to as 'daddy' dollars would exclaim, 'We again have the dollars of our daddies,' and thus the custom grew until it finally even made some inroads on collectors, who also began to accept the term 'daddy' dollars for the later issue. But this error on the part of custom does not make the earlier dollar lose any of its prerogatives—it is still the 'daddy' dollar."

The Hilt Theories (1980)

No discussion of the 1794 dollar would be complete without noting the revisionist theories proposed by Robert P. Hilt II in his 1980 book, *The Die Varieties of Early United States Coins*. Among his theories was that of a sharply revised mintage figure for dollars bearing the date 1794.

Hilt relates that the initial deposit of silver at the United States Mint was made by the Bank of Maryland on July 18, 1794, and consisted of 94,532 ounces of French minor coins of an inferior alloy. The Mint had but crude refining facilities at the time, and when the metal from this deposit was brought up to the required standard the silver was imperfect. Planchets made from this batch "show splitting and craters on the surfaces," according to Hilt. However, in actuality, 1794

silver dollars were *not* made from the Bank of Maryland deposit (but were made from silver ingots deposited by Director David Rittenhouse and Charles Gilchrist).

He further related that 5,574 silver dollar planchets had been prepared by October 1794, and coinage began. Initial production consisted of 1,758 pieces, after which coinage was suspended. Hilt identified dollars from this first group by the poor striking of the stars at the lower left obverse and lightness of detail on the corresponding part of the reverse. He called these pieces Class I, and noted they were struck from perfect dies and blackened planchets. 1,758 such pieces were delivered on October 15, 1794.

He noted that Class II 1794 dollars were struck from lapped dies and blackened planchets, and that 3,810 coins were delivered on May 6, 1795. Class III 1794 dollars were struck from lapped dies and normal planchets, and 1,200 additional pieces were delivered on May 16, 1795. These figures add up to a revised total of 6,768 dollars dated 1794.

In his narrative comments, Mr. Hilt stated that after 1,758 1794 dollars were struck the dies were badly clashed and coinage was halted. He noted that survivors from this group of 1,758 are identifiable by having the stars on the lower left obverse and the corresponding area of the upper left reverse sharply struck. These were struck on a press intended for large cents, but which was put into service to make dollars [a fact which no one disputes]. Hilt suggested that when a correct large press was put into service in May 1795, lapped dies of 1794 were used, and that the lapping, intended to remove clash marks, weakened the design on the lower left obverse die on the corresponding area of the upper left of the reverse. The same writer stated that about 105 dollars of the 1794 date survive today.

Most students of the series, including the present author, believe that the weakness was caused by aligning the obverse and reverse die in a non-parallel fashion. Mr. Hilt illustrates and shows "presentation" coins from October 15, 1794 and notes that coins in the Lord St. Oswald Collection were also "presentation" pieces. I am not aware of any documentation for such presentations, or, for that matter, that anyone connected with the Lord St. Oswald Collection ever visited the Mint (the collection consisted of mixed coinage, dated *no later* than 1795, but including worn pieces as well as Uncirculated coins).

While the Hilt theories are interesting, I prefer to adhere to the commonly accepted delivery figure of 1,758 coins (plus, perhaps, 250 or so coins of defective strike held back for later use as planchets in 1795). I believe that the typical weakness of striking at the lower left of the obverse and corresponding area of the reverse on all known coins was due to the die faces not being parallel in the press, not, as Hilt suggests, to die resurfacing.

With regard to other early dollars, the Hilt study employs some highly interesting methods and ideas. Although I do not agree with certain of his conclusions concerning die progressions and mintage quantities, his text furnishes much excel-

¹ Notwithstanding this article, it is a fact that the Treasury Department called Liberty Seated dollars "daddies" and "daddy dollars." (See Liberty Seated section of this book.) However, traditionally the term was applied in numismatics to dollars of the 1794-1803 years, as Venn relates.

lent food for thought. (See also my comments about Robert Hilt's numbers for the 1797 BB-72 dollar, under that heading.)

The Year 1794 in History

The Whiskey Rebellion took place in western Pennsylvania when farmers on what was then the American frontier objected to a federal tax on whiskey. At the time, liquor was a medium of exchange and a store of value, as corn distilled into whiskey could be shipped more economically to eastern markets and was more easily stored and traded than grain. Tax collectors were tarred and feathered—or worse. President George Washington ordered the federal militia to stop such acts, which he called treasonous. Some Rebellion leaders were taken to Philadelphia (then capital of the United States) and tried. Two were convicted but were pardoned by the president. The Whiskey Rebellion was the first test of government power to enforce laws enacted by Congress.

On March 22, 1794 Congress forbade the states to engage in the slave trade with foreign nations. Nevertheless, the law was widely ignored, and slavers, as they were called, continued to bring their ships from Africa to ports in the southern United States. Slave markets flourished. In 1794, France declared that all slaves within its borders were free, becoming the first country in the world to make such a move.

The Battle of Fallen Timbers, August 20, 1794, was won by the government ending attacks on American settlers by Indians in the Kentucky and Ohio districts. Indians had been encouraged by the British to attack white settlers.

Jay's Treaty was signed on November 19, 1794, settling certain outstanding, unresolved disputes between the United States and Great Britain, but certain terms—including the provision that the British could search American vessels and take as prisoners any seamen of British citizenship—were met with disfavor in the United States. The Insurance Company of North America, chartered from Philadelphia, became the first United States firm to offer life insurance policies.

The Lancaster Road, financed by a \$465,000 stock issue, opened to link Lancaster with Philadelphia and the Delaware River. The dirt thoroughfare, 62 miles in length, was a great success and paid dividends as high as 15% in some years. This set the tone for other toll road projects, including the Cumberland Road in 1811. In an era before canals and railroads, toll roads provided the main links between cities. Transportation was by horse and carriage. Few Americans traveled far from home. Eastern cities, mainly located on the Atlantic coast or on large inland tributaries, were connected by sailing ship routes which facilitated trade.

The membership rolls for Peale's Museum were opened in Philadelphia by portrait artist Charles Willson Peale in January 1794. For the sum of one dollar, a patron could gain admission for the year. The first to subscribe was President George Washington, who bought four tickets. Exhibits in this, the first notable popular museum in America, pertained to natural history, art, and science.

Bowdoin College was founded in Maine in 1794; it would go on to have such illustrious instructors as Henry Wadsworth Longfellow and Harriet Beecher Stowe and to be recognized as a premier institution of higher learning. John Trumbull, American artist, produced his heroic-sized painting, *The Declaration of Independence*, which would become famous (and which in 1976 would be used on the reverse of the \$2 bill). The first section of Thomas Paine's *The Age of Reason* was published in Paris, and solidified public opinion about Paine into two starkly opposing camps: staunch supporters, and vehement opponents. 1794 was, after all, the beginning of the Reign of Terror in France.

At the Philadelphia Mint, the emphasis was on copper coinage, and numerous varieties of half cents and large (as they would later be called) cents were struck. Half dollars and silver dollars were also made. Dies were prepared for 1794-dated half dimes but were not used until the following year. In New York City, the trading firm of Talbot, Allum & Lee issued copper one-cent pieces imported from Birmingham, England.

Coinage Context

Mintage figures and estimates: The government figures, per the annual Mint report, stated that 203,033 silver dollars were coined in calendar year 1795.

Based upon the number of 1795-dated dollars in the 1878 Economite hoard and the number certified today, I estimate that about 390,000 were struck bearing the 1795 date. I believe that nearly 185,000

of these were struck in later years, through 1798. Further information concerning these and other estimates may be found in Appendix II. These estimates are based upon the frequency of appearance of coins in the Economite hoard unearthed in 1878, coins certified since 1986-7 by PCGS and NGC, and quantities believed to exist in numismatic circles today.

Walter H. Breen's estimates: Believing that Flowing Hair dollars were made at the Mint at least through early autumn 1795, and Draped Bust dollars were made after that, Walter H. Breen, in his *Encyclopedia*, has estimated that the mintage through and including October 10, 1795, consisted of Flowing Hair dollars, to the extent of 160,295 pieces, and that the last two deliveries of the year, on October 17 and 24, amounting to 42,738 coins, consisted of the Draped Bust type.

Author's estimates: As of October 1992, NGC and PCGS certified 692 specimens of the 1795 dollar, divided into 493 Flowing Hair dollars (71% of total) and 199 Draped Bust dollars (29%).

If these percentages are applied to the 390,000 1795-dated dollars I believe were struck, the estimated mintage (rounded off) of 1795-dated Flowing Hair dollars is 280,000, and that of 1795-dated Draped Bust dollars is 110,000.

I caution the reader to remember that these estimates are simply that: estimates. As one estimate is used to create another, we have the situation of estimates being built upon other estimates, and the reliability diminishes. Because of this, all estimated figures should be taken as approximations. The way I see it, while the certification service percentages of 71% and 29% are as good as any, perhaps the truth is really 68% and 32%, or 75% and 25%, or whatever. We are dealing with *concepts*, not with mathematical precision. However, these concepts are a valuable aid to understanding the relationships among early dollar types and varieties. Further, al-

though the relative availability of surviving Flowing Hair types and Draped Bust dollars can be observed, and coinages can be estimated from these numbers, there is no documentation that the Draped Bust dollars were first struck in autumn 1795. There is always the possibility that they could have been made later.

Number of dies used: The number of dies employed to create 1795-dated dollars is as follows:

- 1795 Flowing Hair, obverses: 9
- 1795 Flowing Hair, reverses used with this obverse style: 10
- 1795 Draped Bust, obverses: 2
- 1795 Draped Bust, reverses used with this obverse style: 2
- Total: 11 obverses and 12 reverses for dollars of this year.

Die use averages: By dividing the number of obverse dies and the number of reverse dies each with the mintage figure for the appropriate design, estimates of the average number of impressions per die can be obtained. In practice, some dies lasted a long time and others broke quickly; the figures here are averages, as noted.

9 Flowing Hair obverses divided into estimated Flowing Hair coinage of 277,980 = 30,887 coins per obverse die.

10 Flowing Hair reverses divided into estimated Flowing Hair coinage of 277,980 = 27,798 coins per reverse die.

2 Draped Bust obverses divided into estimated Draped Bust coinage of 113,541 = 56,770 coins per obverse die.

2 Draped Bust reverses divided into estimated Draped Bust coinage of 113,541 = 56,770 coins per reverse die (the inclusion of the long-lived 1795 BB-51 die, which was used later, distorts this figure).

Numismatic Information

Collecting possibilities: For the numismatist interested in die varieties, 1795 Flowing Hair dollars offer 17 possibilities (or 18, if Die State I and Die State III of 1795 BB-25 are collected separately). As most early dollars on the market are unattributed, there is always a chance of finding a rare variety for a “type” price. Even when varieties are attributed—such as in sales held by the leading auction houses—rare varieties often sell for only a little more than common ones. Extremely rare varieties are an exception, however. A variety of which fewer than a dozen are known will always command wide attention. Even so, current market prices are apt to be much less than one would pay for a large cent of the same era and of comparable rarity.

Of the 17 known varieties of Flowing Hair dollars, it should be possible to acquire about half of them within a year or so. The others will be located

a few at a time. If the majority of the dealer community and the NGC and PCGS certification services begin attributing dollars by die varieties, they will be advertised widely and will be easier to find. Of course, this is a two-edged sword, for then the prices of scarce and rare varieties will probably be higher than it is now.

There are only two varieties of 1795 Draped Bust silver dollars, BB-51 and BB-52. Both are readily available, and you will have no difficulty in acquiring a specimen of one or both. The 1795 BB-51, employing as it does the off-center Draped Bust on the obverse and the curious and long-lived Small Letters die for the reverse, is certainly one of the most interesting varieties in the early dollar series.

Technical Information

(Flowing Hair and Draped Bust types)

General information: All 1795 dollars have 8 stars to the left and 7 to the right, as in 1794. This 15-star count was used on all Flowing Hair and Draped Bust dollars of 1795.

Making punches: Master dies, puncheons, or hubs (they have been known under many names over the years) were created for certain elements in the design of the 1795 (and later) dollars. For dollars of the 1795-1803 period, these punches, as I shall call them here, consisted of major design elements. Punches for the head of Miss Liberty, eagle, and much of the wreath were probably made as follows using the wreath punch as an example:

1. The engraver prepared a smooth, polished die surface at the end of a steel shank. A light coating of wax was applied to the surface, and a sketch of a design was transferred by rubbing or burnishing into the wax. By use of engraving tools, the craftsman cut the features of the wreath, including the branch and some leaves—*intaglio* (incuse) into the die. From time to time, wax impressions would be made of the engraving as it progressed, to show in raised or relief features what the wreath would look like on a finished coin. Some of the leaves were put in with punches. Finally, all details were completed, and the punch was ready for further use.

2. The die was heated slowly, then quenched in water, to harden the steel. The surfaces of the die were cleaned, and another wax impression was taken of the wreath, to be sure it was what was wanted.

3. The hardened die was placed in a screw press that operated slowly (alternatively, with a series of

quick, light blows), as to squeeze the image from the hardened die into the face of another die, the second die being of soft steel (not yet hardened). The second die had a slightly conical face, rather than a flat one, to facilitate metal movement into the recesses of the hardened die.

4. The second die, with the wreath appearing raised (in relief), was inspected, and any minor changes needed were made. The second die was then subjected to the hardening process, after which it was cleaned, and was ready to use as a finished punch.

A punch could be made by engraving the design in relief, rather than in intaglio, equivalent to step 4. This was done with letter, star, numeral, and certain other punches, which were easier for the artist to create in this manner.

Any punch could be replicated by hardening it, pressing it into soft steel, hardening the soft steel, and using the just-hardened die to press into still another soft steel blank, to create a positive (in relief) copy. This would be hardened, and used as a punch. This hard-soft steel transfer process resulted in some detail being lost each time, but this loss could be compensated for by retouching.

The making of design punches, such as the portrait of Miss Liberty, the eagle, and, to a lesser extent, the wreath, was assigned to a skilled engraver. The preparation of numeral, star, leaf, letter, and other small punches was sometimes done on a contract basis with outsiders.

Earlier in this book, R.W. Julian related that Frederick Geiger had been hired in early 1794 by Director David Rittenhouse to make letter punches for coinage; his tenure as a Mint employee was brief. On October 19, 1795, Thomas Bingham, not a Mint employee, was paid \$48 for 96 letter and numeral punches for use on various coin denominations.¹

For some dies it is possible, indeed probable, that the engraver who made the motif punches was not the same engraver who made the coining die by utilizing the motif punches and adding the lettering, etc. It is presumed that over the years duplicate punches were made of letters used frequently, such as in the familiar (today) E (most frequently used letter), T, A, O, I, N, S, H, R, D, L, U, etc., sequence, although for coinage in the 1790s, the letters in commonly used inscriptions such as LIBERTY and

UNITED STATES OF AMERICA were those for which duplicates were needed. Examination of 1796-1797 coins reveals that two different "Small Letters" E punches were used on dollars, for example.

Making dies: An obverse die for a 1795 silver dollar was made by punching the portrait into a die blank of soft steel. Probably, LIBERTY was added next, then the stars, and finally the date.

To make a reverse die for a 1795 silver dollar, the finished eagle motif punch was used to impress the eagle design into the center of a soft steel coining die. After this was done, the wreath punch was used. Then, wreath stems, ribbon ends, and letters of UNITED STATES OF AMERICA were added, and the coining die went through the hardening process. Then it was cleaned and made ready for use in a coining press.

The classification of die varieties today is accomplished by studying the positions of these elements in relation to each other.

Classifying 1795 Dollar Obverse Die Styles (Flowing Hair type)

There were two different portrait punches used on obverse dies for 1795 Flowing Hair dollars and two different eagle punches used on reverse dies. In addition, reverses were made in two different styles of wreaths: These are described below:

PI Portrait: "Head of 1794." The Head of 1794 portrait was made from a master punch depicting Miss Liberty with rounded cheek and prominent jaw line. There is no double line under bust truncation. The bust point is blunter than on the following (Head of 1795). At the back of the head, the highest curl is thin. All of these portrait characteristics are also found on the 1794 silver dollar.

No 1795 head is *exactly* like 1794, as hair details were finished by hand. However, dollars from the PI portrait punch come quite close. It is believed that this punch die was the work of Robert Scot, on the knowledge that as of the initial delivery of 1794 dollars on October 15, 1794, Scot was the chief engraver at the Mint. (An assistant, John Smith Gardner, was hired in November 1794, and continued at the Mint intermittently until summer 1796.) The dies could have been finished by either Scot or

¹ Walter Breen's *Complete Encyclopedia of U.S. and Colonial Coins*, p. 425.

Major Design Variations of 1795 Dollars

P I Obverse of 1795 BB-13, Head of 1794 style. Note absence of loop at neck truncation, and also a "pinch" at the neckline (above the 9 in the date). The tip of the neck is rounded.

P II Obverse of 1795 BB-25, head of 1795. Note the loop at the left side of the neck truncation, the absence of a "pinch," and the pointed neck end.

EI-WI Reverse of 1795 BB-21. General style with two leaves beneath each wing of the eagle, the primary style used this year, and for the earlier period.

EII-WII Reverse of 1795 BB-27. Three leaves beneath each wing of the eagle. Two reverse dies were made with this characteristic. While the three leaves feature is the most obvious, the wreath leaves are heavier and more detailed than on the earlier style.

Gardner, by punching the stars, letters of LIBERTY, and date. It is popular to suggest that the chief engraver (in this case, Scot) did the main design work, and the assistant (Gardner) did the routine job of making dies. In actuality, probably the work was divided. Once the motif punches were made (and this was done only at widely separated intervals as new designs or replacement punches were called for), the primary work for the chief engraver and his assistant was creating dies.

PII Portrait: “Head of 1795.” The Head of 1795 portrait was made from a new master punch with the cheek of Miss Liberty in shallower relief than the preceding, and the jaw line not prominent. There is a double line, sort of a flattened loop, under the center and left side of the bust truncation. The bust point is sharp. At the back of the head, the highest curl is thick. It is not known who made the master hub for the Class II obverse, but John Smith Gardner may be a candidate.

Distribution of varieties:

Varieties with PI Portrait (Head of 1794, no line under truncation):

Obverse Die No. PI-1: Used to strike 1795 BB-11, BB-12, and BB-13.

Obverse Die No. PI-2: Used to strike 1795 BB-14 (although BB-14 is of the PI style, the bust point is less rounded than on the other dies).

Obverse Die No. PI-3: Used to strike 1795 BB-16, BB-17, and BB-18 (on this, the highest curl at the back of the head is slightly thicker than usually seen on PI, but thinner than usually seen on PII).

Varieties with PII Portrait (Head of 1795, line under truncation): This obverse portrait hub was used to create the majority of 1795 obverse dies as follows:

Obverse Die No. PII-1: Used to strike 1795 BB-15.

Obverse Die No. PII-2: Used to strike 1795 BB-19 and BB-20.

Obverse Die No. PII-3: Used to strike 1795 BB-21, BB-22, and BB-23.

Obverse Die No. PII-4: Used to strike 1795 BB-24, and, in original and relapped states, to strike 1795 BB-25.

Obverse Die No. PII-5: Used to strike 1795 BB-26

Obverse Die No. PII-6: Used to strike 1795 BB-27.

Classifying 1795 Dollar Reverse Die Styles (used with Flowing Hair type)

EI Eagle: The EI and EII eagle punches are somewhat similar to that used in 1794, but are not the same. The EI has six feathers in the eagle’s tail (EII has five). On EI the leftmost claw (from the

observer’s viewpoint) is at the top *edge* of the rock (on EII it is in from the edge). There are some slight differences in the feather details; see under the eagle’s right or dexter (to observer’s left) wing, for example. Both the EI and EII punches seem to be from the same engraver’s hand.

EII Eagle: Five feathers in eagle’s tail; leftmost claw is not on the edge of the rock.

WI Wreath, 2 Leaves Under Each Wing: The WI wreaths, of which there are several variations (as finishing work was done by hand) are stylistically similar to that used in 1794 (but are not from the motif punch used in 1794, if indeed a motif punch was used for the reverse then), and are quite different from WII (described below). Perhaps, the 1794 wreath and 1795 WI were the work of Robert Scot, and 1795 WII was from the hand of John Gardner, although I believe that insufficient evidence is on hand to make such attributions.

WI wreaths have two leaves beneath each wing—a quick guide to identification (WII wreaths have three leaves). On the WI wreaths, the two branches to the wreath are thinner, and the leaves are smaller and less finely detailed. On the eagle’s right (observer’s left) wing there are two leaves at the point at which the branch crosses it. On the inside of the wreath at the top, below the single leaves at the apex, are found pairs of leaves, one on each side, drooping downward. Where the wreath branches join at the bottom, the ribbon has a knot (unlike 1794, which lacks this feature). The engraver’s work on the reverse dies with WI wreath was probably accomplished in this order:

1. The eagle motif was punched into the steel blank.

2. The wreath motif was punched into the die.

3. Wreath details were added and/or strengthened, the wreath apex was completed, leaves were punched into the right side of the die (left side of the coin) where the wreath is *above* the eagle’s wing, berries and their stems were added, the branch ends were added, and the lettering UNITED STATES OF AMERICA was added around the border.

WII Wreath, 3 Leaves Under Each Wing: The two known dies using WII wreaths are each quite different from the preceding WI varieties. There are three leaves beneath each wing, which is the least important consideration from a style viewpoint. The leaves are larger than on the WI wreaths, are more finely detailed, and have raised edges or outlines; overall, the wreath is more sturdy. On the eagle’s

dexter (observer's left) wing there are more than two leaves at the point at which the branch crosses it. The inside pairs of leaves at the top are larger and not as "droopy" as on the preceding. Where the wreath branches join at the bottom there is no knot; the junction is wrapped with a ribbon (as in 1794).

Both known WII wreath dies were made from the same wreath punch, which did not include the top-most part of the wreath (which was added by hand). The engraver's work on the reverse dies with WII wreath was accomplished in this order:

1. The eagle motif was punched into the steel blank.
2. The wreath motif was punched into the die.
3. Wreath details were added and/or strengthened, the wreath apex was completed, leaves were punched into the right side of the die (left side of the coin) where the wreath is *above* the eagle's wing, the branch ends were added, and the lettering UNITED STATES OF AMERICA was added around the border.

The WII wreath punch was more sophisticated than that used for WI, in that most of the berries were in place on WII as were nearly all of the final leaves (except at the apex). Thus, it is certain that WII reverse dies were made later than WI reverse dies. In general, reverses with WII wreaths appear bolder than those with WI wreaths. The structure and appearance of individual leaves in WII wreaths is similar to that on leaves on the reverse of the 1795 Draped Bust obverse, Small Eagle reverse dollars, further indicating that the WII reverse style was the latest made before the end of the Flowing Hair coinage. I believe that WII wreaths were not made before late summer or autumn 1795.

Distribution of varieties (by reverses):

Varieties with EI Eagle (6 tail feathers) and WI Wreath (2 leaves under each wing):

Reverse Die No. EI-WI-1: Used to strike 1795 BB-11.

Reverse Die No. EI-WI-2: Used to strike 1795 BB-12.

Reverse Die No. EI-WI-3: Used to strike 1795 BB-13 and BB-14.

Reverse Die No. EI-WI-4: Used to strike 1795 BB-15 and BB-16.

Reverse Die No. EI-WI-5: Used to strike 1795 BB-17.

Reverse Die No. EI-WI-6: Used to strike 1795 BB-20, BB-21, and BB-24.

Reverse Die No. EI-WI-7: Used to strike 1795 BB-23.

Varieties with EI Eagle (6 tail feathers) and WII Wreath (3 leaves under each wing):

Reverse Die No. EI-WII-1: Used to strike 1795 BB-18 and BB-19.

Varieties with EII Eagle (5 tail feathers) and WI Wreath (2 leaves under each wing):

None.

Varieties with EII Eagle (5 tail feathers) and WII Wreath (3 leaves under each wing):

Reverse Die No. EII-WII-1: Used to strike 1795 BB-25, BB-26, and BB-27.

1795 Die Combinations (Flowing Hair Type)

PI Obverse/EI-WI Reverse: 1795 BB-11, BB-12, BB-13, BB-14, BB-16, and BB-17.

PI Obverse/EI-WII Reverse: 1795 BB-18.

PI Obverse/EII-WI Reverse: 1795 None.

PI Obverse/EII-WII Reverse: 1795 None.

PII Obverse/EI-WI Reverse: 1795 BB-15, BB-16, BB-20, BB-21, BB-22, BB-23, and BB-24.

PII Obverse/EI-WII Reverse: 1795 BB-19.

PII Obverse/EII-WI Reverse: 1795 None.

PII Obverse/EII-WII Reverse: 1795 BB-25, BB-26, and BB-27.

BB Varieties / Portrait / Eagle / Wreath Styles

1795 BB#	Portrait	Eagle	Wreath
BB-11	I (Hd of '94)	I	I (2 leaves)
BB-12	I (Hd of '94)	I	I (2 leaves)
BB-13	I (Hd of '94)	I	I (2 leaves)

BB-27	II (Hd of '95)	II	II (3 leaves)

Delivery Dates

Had dollar-minting operations been in normal

order at the Mint, it would be logical to assume today that the earlier dies—PI Portrait obverses and WI Wreath reverses—would have been used first, followed by the PII Portrait and WII Wreath dies. However, after the initial delivery of 1794 dollars on October 17, 1794, dollar production was suspended, as it was felt that a larger press was needed. On October 28, 1794, Director David Rittenhouse wrote to Secretary of State Edward Randolph stating, in part: “A large parcel of blank dollars is ready for coining, waiting for a more powerful press to be finished, in order to complete them for currency.” Obviously, it was intended that these blank planchets be coined into 1794-dated dollars, but as the striking of 1794 dollars had not been completely satisfactory (the coins were weak on the left side of the obverse and corresponding part of the reverse), and the dies had been damaged by clashing and relapping, it was deemed best to wait. In the meantime, large quantities of silver half dollars were struck.

Collectors of *half* dollars can be grateful that the Mint had no suitable press for silver dollars, for in the absence of dollar coinage from October 1794 through May 1795, deliveries of half dollars were frequent and massive. Depositors of silver bullion could not obtain silver dollars. Thus, they were given specimens of the largest silver denomination available, half dollars. Once silver dollar production resumed with vigor in May 1795, half dollar deliveries diminished. The last half dollar delivery of the year was on June 5, 1795, after which no half dollars were delivered until 1797 (in which year 1796- and 1797-dated halves were paid out). On the other hand, if the Mint had not obtained a suitable silver dollar press until 1798, then today 1796 and 1797 halves would be common! It is interesting how a single event, such as the availability of a coin press, dramatically affected the production and relationship of silver dollar dies of 1795, the quantities of half dollars produced late 1795 through 1797, and other situations.

By May 6, 1795, a large press was in working order, silver dollars had been struck, and a delivery of 3,810 silver dollars took place. Presumably, in the more than half year that elapsed since the last delivery of dollars on October 15, 1794, many new silver dollar obverse (dated 1795) and reverse dies had been created, probably including all three of the known PI (Head of 1794) obverses and many of the WI style reverses (but not the two known WII reverses).

When completed, these dies were coated with grease (to protect against rusting) and put in the die chest or vault, awaiting call for their use. When that call came in May 1795, the earliest dies made were not necessarily the earliest dies used. The business strike mintages of the *calendar year* 1795 are given below, per the research of R.W. Julian.

In addition, in *italic type*, delivery dates for \$10 gold coins are given. If the same large press was employed for minting this denomination, the coinage for these deliveries would have interrupted the production of silver dollars and would have necessitated the removal of the dollar dies from the press. (Probably, half dollars were made on a smaller press—as evidenced by multiple deliveries of half dollars early in 1795, before the large-size press for dollars was installed. It may be that \$10 pieces, about the diameter of a half dollar and in slightly softer alloy, were coined on a smaller press as well.)

Business strike mintage (combined for all 1795 dollars, Flowing Hair and Draped Bust types): 203,033 (not including pieces reserved for the Assay Commission; these are additional and are given in parentheses); Delivery figures by day:

May 6: 3,810 First delivery of silver dollars since the one and only 1794 dollar delivery on October 15, 1794. By now, a new, larger press had been installed specifically to make silver dollars.

May 16: 15,268 (+3 for Assay Commission)

June 5: 10,917 (+3)

June 5 (same day): 10,430 (+2) In June, Mint Director David Rittenhouse resigned, and William DeSaussure took his place.

June 17: 10,000 (+3)

June 20: 5,986 (+3)

June 26: 6,000 (+3)

June 29: 4,000 (+3)

July 2: 5,243 (+3)

July 9: 5,000 (+3)

July 13: 7,000 (+3)

July 17: 4,500 (+3)

July 21: 6,000 (+3)

July 23: 4,876 (+3)

July 30: 1,184 (+3)

July 31: Delivery of \$10 eagles. Silver dollar coinage interrupted.

August 10: 3,500 (+3)

August 11 through August 21: multiple deliveries of eagles. Silver dollar coinage interrupted.

August 22: 4,385 (+3)

August 29: 6,500 (+3)

August 31: 1,106 (+3)

September 1: 830 (+3) New WII wreath may have been introduced about this time; in the meantime, WI wreaths con-

tinued to be used on extant dies.

September 1: Delivery of \$10 eagles. Silver dollar coinage interrupted.

September 12: 4,260 (+3)

September 22, 24: Deliveries of \$10 eagles. Silver dollar coinage interrupted.

September 24: 4,000 (+3)

October 3: 15,000 (+3) New Draped Bust/Small Eagle design may have been introduced about this time.

October 7: 6,000 (+3)

October 10: 14,500 (+3)

October 10: Delivery of \$10 eagles. Silver dollar coinage interrupted.

October 17: 23,368 (+3)

October 22: Delivery of \$10 eagles. Silver dollar coinage interrupted.

October 24: 19,370 (+3).

October 27: Resignation date of Mint Director DeSaussure; no more silver dollars minted this calendar year.

November 27: Delivery of \$10 eagles.

The preceding deliveries demonstrate that silver dollars were coined on many different occasions throughout the 1795 year. Most deliveries were of Flowing Hair type dollars, with the later deliveries being of the new Draped Bust type. It is not known exactly when Draped Bust dollars were first delivered, nor is it known that from that point all were of the new type. I consider it likely that leftover 1795 Flowing Hair dollar dies and their appropriate reverses were also used after 1795.

When it was desired that dollars be coined, a pair of dies would be taken from the die chest or vault and placed into the press. Inasmuch as there are few instances of random mixing of dies, it was probably the usual case (with some exceptions) that a die pair would be used until one of the dies broke or otherwise became unusable. The defective die would be removed, and another die put in its place. Coining would resume. Eventually, another die would break—perhaps the newer one put in recently, or perhaps the older of the two dies. Another die would be installed. This process went on and on, creating die linking. By means of studying die states, numismatists today can determine the order of striking of certain varieties.

I assume that the earlier mintage of 1795 dollars, for the deliveries for May 1795 and a month or two afterward, were from dies with the PI (Head of 1794) obverse and the WI (two leaves under each wing) reverse. As more dies were made, these were mixed up with dies already on hand, and any semblance of logical sequence was lost. I believe that the

two reverse dies with the WII style wreath (three leaves under each wing) were the last made for use with the Flowing Hair obverses, and were manufactured no earlier than late summer 1795.

Coinage in 1795 vs. later years: As noted in the introduction to the section on early dollars, it seems likely to me that tens of thousands of 1795-dated dollars were made after 1795, perhaps in 1796 but most likely in 1798. If this is the case, can it be determined which varieties were coined in 1795 and which were minted later? The answer cannot be definitive, but there are some varieties which were certainly minted in 1795. These include the following:

BB-11, BB-13, BB-14, BB-18, and BB-21, because these varieties are known with silver alloy plugs in the center, the correction of a problem believed to have been unique to the 1795 year (see “A curious situation” below).

BB-14 (additional verification), because an example of this variety is known overstruck on a 1794 dollar, presumably one on hand early in 1795. It is believed that a couple of hundred or more defective 1794 dollars were kept at the Mint and overstruck in May 1795 when the new press became available.

BB-18 and BB-20, because these varieties were a part of the Lord St. Oswald Collection consisting of coins said to have been gathered in America in autumn 1795.

Putting together the preceding, the list of “positive” 1795 striking includes these varieties: BB-11, BB-13, BB-14, BB-18, BB-20, and BB-21. These are a mixture of motif punch styles, verifying that these die classes were employed at the Mint in no particular order. To be specific:

BB-11: Portrait I, Eagle I, Wreath I. Earlier obverse portrait and reverse styles.

BB-13: Portrait I, Eagle I, Wreath I. Earlier obverse portrait and reverse styles.

BB-14: Portrait I, Eagle I, Wreath I. Earlier obverse portrait and reverse styles.

BB-18: Portrait I, Eagle I, Wreath II. Earlier obverse portrait and earlier eagle style with later wreath style.

BB-20: Portrait II, Eagle I, Wreath I. Later obverse portrait in combination with earlier eagle motif and wreath style.

BB-21: Portrait II, Eagle I, Wreath I. Later obverse portrait in combination with earlier eagle motif and wreath style.

Arranged another way:

Earlier obverse portrait and reverse styles. BB-11, BB-13, and BB-14.

Earlier obverse portrait and earlier eagle style with later wreath style: BB-18.

Later obverse portrait in combination with earlier eagle

motif and wreath style: BB-20 and BB-21.

A curious situation:¹ Several examples of 1795 Flowing Hair dollars (including BB-11, BB-13, BB-14, BB-18, and BB-21 varieties) have been seen with a circular (more or less) silver plug in the center, the outline of the plug being visible at the center of the obverse and reverse.² The plugs were inserted before the coins were struck, as they were flattened by the dies and carry impressions of the design. Why these plugs were used is not known. It is quite possible, indeed likely, that numerous other dollars exist with central plugs, but that the flattening during the striking process was so complete that no trace remains of them today. Often, the different alloy of the central plug caused it to tone differently.

It may have been that during the weighing process, certain planchets were found to be slightly too light. Rather than go through the process of melting the planchets, casting the metal into ingots, rolling strips from the ingots, and making new planchets, it may have been deemed more expedient to drill a small hole in the center of the lightweight planchet and insert a silver plug, extending slightly above and below the planchet surface; a plug with enough extra weight to compensate for the drilled hole and also the deficiency in the original planchet weight. The planchet-with-plug was then struck by dies, flattening the plug and producing coins as observed. The Mint had the technological capability of inserting such plugs, as evidenced by the 1792 silver-center pattern cents (Judd-1).

The complicated nature of planchet making in 1801, a year not distant from the 1795 year under discussion, is illustrated by this quotation from *The U.S. Mint and Coinage*.³

“Voigt said that the gold and silver planchets underwent 32 operations before they were ready to receive an impression.” However, the same text also noted this: “Voigt’s 32 operations must have included many subdivisions, and perhaps the labor of various clerks.” Even so, it is clear that planchet making was not an simple process.

A commentary upon and summary of the 1795 plugged dollars by Kenneth E. Bressett follows:⁴

Certain United States silver dollars dated 1795 are known to have a silver plug in the center of the coin. This plug was imbedded in the planchet prior to the coin being struck by regular dies. In some cases the only evidence of the plug is a tell-tale seam or discoloration at the center of the coin on one or both sides.

Just why a plug was added to these coins is a mystery. Most silver dollars of 1795 do not have such a plug, and no other dollars of any other date have been seen with this feature. As far as is now known no other coin denomination in the regular United States series was officially altered with a plug of any kind. The only similar occurrence can be found in the 1792 silver center patterns where a silver plug was added to a copper planchet prior to striking the coin.

The 1795 dollars with silver plug have been known to a few students for the past decade, but no one has been able to determine the reason for this strange alteration to normal coinage. It is reasonable to believe that many such pieces have been overlooked in the past because of the subtle difference in appearance. The number of pieces originally made can only be roughly estimated by the availability of surviving specimens. The fact that about a dozen pieces were identified by the author in a six-month period indicates that the coinage was perhaps quite extensive.

All of the examined dollars of 1795 with plug are of the Flowing Hair type. None of the 1795 Draped Bust type pieces have been observed with this feature. Varieties seen are: BB-11, 13, 14, 18, and 21 (equivalent to Bolender-3, 9, 4, 7 and 1 respectively). Each of these varieties is also known with plentiful specimens of normally made coins without the plug. In each case the plugs were inserted before the coins were struck, as they were flattened by the dies and carry impressions of the design. The plugs average about 8 mm. in diameter and are always located in the exact center of the coin. The effect can usually be seen on both sides.

It has been suggested by Q. David Bowers that the striking sequence of 1795 dollars indicates that BB-11, 13, 14, 18, and 21 were varieties made earlier than many of the others, but no earlier than late summer 1795. It also seems likely that all of the silver plug pieces were made in 1795 and none later.

The use of multiple dies for striking plugged pieces seems to negate the possibility of the plug being used to alter the fineness of these coins. The notion of that possibility was originally suggested by the author and Roger W. Burdette, among others, because of the situation created by Mint director David Rittenhouse whereby he allowed coins to be made of an illegal standard to reconcile the strange .8924 fineness (1485/1664) mandated by Congress. A plug might have been used to correct or adjust coins found to be too far from the authorized fineness.

A simpler, and more plausible solution seems to be in the use of the plug to adjust the weight of these coins. Planchet

¹ This situation was first described by the author in 1981. Tom DeLorey, Kenneth E. Bressett, and Roger W. Burdette, among others, corresponded with the author on the subject in 1991-1992.

² As of October 26, 1992, Kenneth E. Bressett had examined three plugged specimens of BB-12, one of BB-11, one of BB-13 (plus a photograph of another BB-13), one of BB-14, and two of BB-18. Letter to the author, October 26, 1992.

³ Don Taxay, 1966, p. 35. The discussion was part of a Mint effort to discredit one Robert Leslie, who proposed introducing roller dies (“double cylinder dies”) to the Mint.

⁴ Created for inclusion in this book.

preparation in those days was costly and time consuming. Any that were too heavy could be filed to remove excess metal, but those that were underweight had to be melted and remade into blanks. An alternate remedy may have been to cut a hole in the center of the blank, insert a plug of proper weight and then stamp the coin.

Evidence of this later theory comes from testing known pieces to ascertain the metal content of coin and plug. If plugs were added to adjust the fineness they should be lower than the basic coins which according to Rittenhouse were of a fineness higher than specified by law. If on the other hand the plugs were added to adjust the weight, they would be of a fineness similar to the rest of the coin.

Testing by spectrographic x-ray analysis showed that most of the coins with plugs were made of the same alloy both in the plug area and in the surrounding coin. One showed that the plug was of higher fineness, and one of lower fineness. Although the tests were inconclusive as to the nature and reason for being added to these coins, it seems safe to conclude that the most likely reason was to add silver to underweight planchets. Why this was done only on silver dollar blanks and only for the Flowing Hair pieces remains a mystery. Perhaps it was an experimental practice tried on the blanks that were made and stored for a time awaiting a more powerful coinage press.

By May 6, 1795, a large press was put into use and delivery of 3,810 silver dollars took place. Thereafter followed many thousands of additional pieces, some of which were surely made from the stockpile of silver dollar planchets that had been in waiting since late 1794.

Perhaps we will never know exactly why the Mint made these unusual silver plug dollars. Their existence and purpose has been hidden for nearly 200 years. Are there other coins like these in the United States series? Hopefully knowledge of these pieces will lead to still other unexplored areas of numismatics that no one before suspected. It is discoveries like these that keep the hobby alive and enjoyable.

Similar circumstances occurred at the Lima (Peru) Mint in 1805, according to a passage from *Narrative of Voyages and Travels in the Northern and Southern Hemispheres*.¹

The next process is the weighing; the person who performs this has a little square box containing silver pins that are no longer than the thickness of a dollar, and of different weights and sizes; the dollars are thrown one by one into the scales, but it is seldom that any of them are too heavy. When they are, they generally pass them without notice, but if any are too light, a pin is thrown into the scale, which brings it to the standard weight. The dollar is then put under a screw that has a pointed instrument in the end of it, which is screwed down and pierces a hole in the dollar sufficiently large to receive the pin; then it is placed under another screw, with a smooth end, which completely fastens the pin in the coin; they are then passed into another room and scoured . . . (after the pieces were coined) . . . the master stepped to the pile and took a handful which he brought to

me to inspect, and shewed me where the pins were put in to make up the weight, which were very plain to see.

As the known die varieties with visible plugs are distributed throughout the striking sequence (as evidenced by the inclusion of BB-18, which uses the WII wreath employed, in my opinion, no earlier than late summer 1795), it seems that the plugging process was employed from May to at least late summer. In any event, I believe that varieties known with silver plugs were struck in calendar year 1795 and not later. If the plug was inserted to correct the planchet weight, the problem must have been solved after 1795, as no later-dated dollars are known with this feature. As Kenneth E. Bressett has said, it is such situations that keep numismatics interesting.

Creating Emission Sequences Facts and Assumptions

Known facts: The following is an attempt to build a die linkage and sequence of emission of 1795-dated silver dollars. Each die linkage constitutes a "striking period." If possible, the authors of this section (Q. David Bowers and Mark Borckardt) will devise a chronology for the different striking periods.

Known facts include the following:

1. BB-11, BB-13, BB-14, BB-21 are known with silver alloy plugs. Presumably, these were among the first varieties of 1795 dollars made.

2. BB-14 is known overstruck on a 1794 silver dollar. If unsatisfactory 1794 silver dollars had been saved as planchet stock, then BB-14 would have been one of the first 1795-dated dollars struck to use up this stock.

3. BB-18 and BB-20 are varieties known to have been included in the Lord St. Oswald Collection, which contained coins believed to have been obtained in America in autumn 1795. Thus, these varieties would have been struck in 1795.

4. When dies were placed on the presses, they remained there unless one or another die broke, at which time the useless die was removed and replaced with another. If a die became damaged and had to be relapped, it was removed from the press; in such an instance, it could have been replaced immediately after relapping, or it could be put on the shelf to await a later use. If the press was required for other purposes—such as for coining \$10 gold eagles—both obverse and reverse dollar dies would

¹ Delano, Amasa, *Narrative Voyages and Travels in the Northern and Southern Hemisphere*. Boston, 1817. This quote was provided by Horace P. Flatt in a letter dated March 11, 1993 from Flatt to Barbara Gregory of the American Numismatic Association.

be removed; when dollar coinage resumed, the mating of a particular obverse might be with another reverse, and vice-versa. However, the earlier-listed schedule of silver dollar and \$10 gold deliveries show that there were more interruptions to dollar coinage than there are known dollar striking periods (see below). Thus, in some instances, dollar dies must have been removed from the press briefly, \$10 coins minted, and then the same silver dollar die pair re-installed. In all instances, \$10 coinages were very small, and must have taken little time to produce. If the Mint had to be closed for an extended period—such as during one of the periodic yellow fever epidemics—dies were removed from presses and taken to a vault in a bank; when coinage resumed, die mating might be different.

Reasonable assumptions: Reasonable assumptions include the following:

1. Certain obverse dies have the Head of 1794 style and were probably made earlier than those with the Head of 1795 style.

2. Certain reverse dies are of the WI wreath style of simpler design and were probably made earlier than the more ornate WII wreath style.

3. As 1795-dated obverse dies and appropriate reverse dies were not used for coinage until May 1795, because a suitable coining press was not available, these dies were not stored in the sequence in which they were made. Instead, they were kept as a mixed group.

4. When coinage of 1795-dated dollars began in May 1795, the inventory of silver dollar dies would have consisted mostly if not entirely of the earlier styles (Head of 1794 obverses and WI reverses).

5. As there are three extended die-link sequences of 1795 dollars, it is assumed that if one of these sequences had more early-type obverses and reverses than any other die-link sequence, that sequence would have been made first.

6. Similarly, if an extended die-link sequence of 1795 dollars contained most or all late-type obverses and reverses, it would have been the last made. (Any mixed group of early- and late-type dies would fall in between.

(Flowing Hair and Draped Bust types)

Striking Period 1: At the very beginning, a pattern emerges. One of the die sequences contains four coins, all of which have early characteristics.

These seem to constitute the initial production of 1795-dated dollars, called Striking Period 1. These varieties are as follows:

STRIKING PERIOD 1.

1795 BB-11 (equivalent to Bolender 3). Believed to be the first 1795 silver dollar variety struck.

1795 BB-12 (Bolender-11)

1795 BB-13 (Bolender-9)

1795 BB-14 (Bolender-4)

The rationale for assigning the foregoing varieties to Striking Period 1 is as follows:

BB-11, BB-12, and BB-13 all share a common obverse die of the Head of 1794 style. BB-13 is from a later state of the die. Therefore, it was struck after BB-11 and BB-12. All examples of BB-12 studied by the authors are weakly struck on the right side of the obverse. This is the only evidence to place BB-12 after BB-11. Should extremely high grade specimens of BB-11 and BB-12 become available for examination, die state differences may be revealed, and it is possible that the order given above could be transposed.

It is a certainty that BB-11 and BB-12 were the first two struck (although the order of the two is not certain), and then BB-13 came next. As BB-13 and BB-14 shared a common reverse die, BB-14 had to have been struck when the obverse of BB-13 failed and was replaced with a new die.

As a further indication of the early time of Striking Period 1, we note that BB-11, BB-13, and BB-14 are known to exist with a silver plug. Quite possibly, a specimen of BB-12 with a silver plug will be located.

Striking Periods 2 and 3: Striking Period 3 is the largest group of 1795-dated dollars. Striking Period 3 is related to Striking Period 2 and followed it, but not necessarily within the same time frame. Striking Period 2 probably occurred in 1795. Striking Period 3 could have occurred anytime from mid-1795 through early 1798.

If and when high-grade specimens of certain of the transitional or change-over varieties become available for comparison—namely BB-20, BB-21, and BB-24—it will be possible to determine which of the “either-or” possibilities given below is the correct one.

STRIKING PERIOD 2.

BB-15 (B-8)

BB-16 (B-20)

BB-17 (B-18)

BB-18 (B-7)

BB-19 (B-19)

BB-20 (B-2) At this point, the reverse of BB-20 was either:
(1) Mated with an obverse to create BB-21, continuing a link to BB-22 and BB-23, and then BB-24 and BB-25 Die State I, or (2) Mated with an obverse to create BB-24 and BB-25 Die State I, after which time the dies for BB-25 were removed from the press, and the obverse used to coin BB-20 was mated with a reverse to coin BB-21, then by linkage, BB-22 and BB-23 were coined.

—EITHER continuing to coin the following:

BB-21 (B-1)

BB-22 (B-11)

BB-23 (B-16)

—OR, continuing to coin the following:

BB-24 (B-13)

BB-25 Die State I (B-6)

STRIKING PERIOD 3:

—EITHER:

BB-24 (B-13)

BB-25 Die State I (B-6)

—OR:

BB-21 (B-1)

BB-22 (B-11)

BB-23 (B-16)

Striking Period 4: Striking Period 4 stands by itself. The die pair used to coin BB-25 Die State I was removed from the press. The obverse die was relapped. The reverse was cleaned up, and a piece of foreign matter was removed from one of the leaf recesses below the first S of STATES. Striking Period 4 could have occurred at any time from late summer 1795 through early 1798.

STRIKING PERIOD 4:

BB-25 Die State III (B-6)

BB-26 (B-12)

BB-27 (B-5)

Striking Periods 5 and 6: These can be considered as a pair. I have selected 1795 BB-51 as the first made, for it has the obverse portrait off center to the left. All other Draped Bust portraits from 1795 through 1803 have the portrait centered. It could have been that this die, putatively the first, was viewed as in need of improvement; thus, later dies had the bust placed in a more central position. More importantly, many prooflike Mint State examples of 1795 BB-51 exist, while only a few Mint State coins, not prooflike, are known for BB-52. It seems logical that specimens of BB-51, representing the first use of the design in American coinage, were made for presentation.

The only argument for placing BB-52 as the first and BB-51 as the second, is that the reverse die for BB-51 was used in later years (through 1798). However, there is no indication that it was kept in the press after coining 1795 BB-51. If it had been, this could simply mean that 1795 BB-52 was struck after certain 1796-dated dollars were made from the same reverse (see 1796 section for more information concerning this die).

STRIKING PERIOD 5:

BB-51 (B-14). First 1795 Draped Bust coinage. Probably occurred in late 1795; mintage included prooflike presentation coins.

STRIKING PERIOD 6:

BB-52 (B-15). Second Draped Bust coinage. May have occurred any time from late 1795 to early 1798.

1795 Flowing Hair and Draped Bust:

Summary of Characteristics

Business Strikes:

Enabling legislation: Act of April 2, 1792

Flowing Hair type: Designer: Robert Scot

Draped Bust type: Designer: Robert Scot (after Stuart), model by John Eckstein

Statutory weight: 416 grains; .8924 silver, balance copper; actual fineness used (unauthorized by Congress): .900 silver, .100 copper; this applied to *all* 1795 dollars *actually minted in 1795*, not to any with the 1795 date but minted later; the change back to the legal standard did not occur until Elias Boudinot became director, which took place after the final delivery of silver dollars for the 1795 calendar year.

Melting value (silver bullion value) in year minted: Considered by Mint officials to be on a par with the Spanish dollar, and worth about \$1.00 intrinsically (see discussion under Summary of Characteristics, 1794).

Dies prepared (Flowing Hair obverse, Eagle on Rock reverse): At least 9 obverses and 10 reverses.

Dies prepared (Draped Bust obverse, Small Eagle reverse): At least 2 obverses and 2 reverses for the Draped Bust coinage.

Business strike mintage (combined for all 1795 dollars, Flowing Hair and Draped Bust types), calendar year: 203,033 (not including pieces reserved for the Assay Commission; these are additional and are given in parentheses); Delivery figures by day: May 6: 3,810;¹ May 16: 15,268 (+3 for Assay Commission); June 5: 10,917 (+3); June 5 (same day): 10,430 (+2); June 17: 10,000 (+3); June 20: 5,986 (+3); June 26: 6,000 (+3); June 29: 4,000 (+3); July 2: 5,243 (+3); July 9: 5,000 (+3); July 13: 7,000 (+3); July 17: 4,500 (+3); July 21: 6,000 (+3); July 23: 4,876 (+3); July 30: 1,184 (+3); August 10: 3,500 (+3); August 22: 4,385 (+3); August 29: 6,500 (+3); August 31: 1,106 (+3); Sep-

tember 1: 830 (+3); September 12: 4,260 (+3); September 24: 4,000 (+3); October 3: 15,000 (+3); October 7: 6,000 (+3); October 10: 14,500 (+3); October 17: 23,368 (+3); October 24: 19,370 (+3).

Estimated business strike mintage of 1795 Flowing Hair type (Breen estimates): 160,295 (on the assumption that all deliveries through and including October 10th were of the Flowing Hair type). Walter H. Breen uses the calendar year total as provided by the government as his basis.

Estimated business strike mintage of 1795 Draped Bust type (Breen estimates): 42,738 (on the assumption that the last two deliveries of the year, October 17th and 24th, were of the Draped Bust type). Based upon government figures.

Business strike mintage of 1795-dated dollars (total of Flowing Hair and Draped Bust types) regardless of calendar year of mintage (author's estimate): 390,000 (rounded).

Estimated business strike mintage of 1795 Flowing Hair type (author's estimate): 391,521 x 71% = 280,000 (rounded).

Estimated business strike mintage of 1795 Draped Bust type (author's estimate): 391,521 x 29% = 110,000 (rounded).

Estimated quantity melted: None at any specific time; quantities were exported.

FLOWING HAIR DOLLARS (all die varieties combined)

Approximate population MS-65 or better: 3 to 5 (URS-3)

Approximate population MS-64: 9 to 15 (URS-5)

Approximate population MS-63: 30 to 50 (URS-6)

Approximate population MS-60 to 62: 65 to 110 (URS-8)

tiples)

- **AVERAGE AUCTION APPEARANCE GRADE for all varieties combined:** VF-30.

Characteristics of striking: Striking varies from variety to variety. In general, if weak striking occurs, it is apt to be on the highest points of the hair and/or the eagle's breast. See individual die variety descriptions.

Known hoards of Mint State coins: None

Proofs:

None of official record. However, some examples of 1795 Draped Bust, BB-51, are known with full Proof surfaces and may have been presentation pieces.

Commentary

1795 silver dollars were made in quantity. The Flowing Hair type is at least twice as plentiful as the Draped Bust type and was made in many more die varieties. While some die varieties are very rare, the two major design types are readily available. Most 1795 dollars exist in worn grades from Fine to VF, indicating that they circulated widely.

Additional Information

Dickeson on 1795 Dollars (1859)

The following appeared in Dr. Montroville W. Dickeson's 1859 book, *An American Numismatical Manual*:

"Those [silver dollars] coined in this year, up to September, were of the same design of the preceding year; but in the latter portion of the year, the type was changed. Of the first of these [Flowing Hair type], there are six varieties, and the second [Draped Bust type], four. In the latter, the effigy is presented with a full bust adorned with drapery; the hair is secured by a band, the bow of which is perceptible on the back of the head, and flows gracefully in ringlets below the lower part of the bust. The edge also differs slightly from the former type in the punctuation. On the reverse the eagle is smaller, apparently floating upon clouds, the wings not extending, as in the first type, beyond the circle of the wreath. Not rare, but good specimens are scarce."

Snowden's Commentary (1860)

The Cabinet Collection of the Mint of the United States, by James Ross Snowden, 1860, p. 107, told of the coinage of 1795 dollars:

"In the following year (1795) a change took place in the type of the dollar. Henry Wm. DeSausure [*sic*] was appointed to the Directorship of the Mint on the eleventh of July; and it is probable that the alteration was made soon after. Mr. DeSausure resigned his office on the twenty-eighth of October following, after which date there was no further coinage of dollars during the year; and, as there is no very great difference in the degrees of rarity of the two varieties of this year, we are forced to believe that there was a large emission of the new type, which would place the date of its first coinage early in August.

"The obverse has a full bust of Liberty, adorned with drapery; from beneath the hair appears a ribbon, which is tied in a bow behind. The reverse has an eagle with expanded wings, standing upon clouds, between branches of laurel and lily, crossed. Otherwise it is the same as before."

The Year 1795 in History

Congress passed the Naturalization Act on January 29, 1795, providing that naturalized citizens must first reside in the United States for five years and renounce foreign alle-

giances. One of the first governmental frauds surfaced this year, and involved the sale by the Georgia legislature of 35 million acres of land on the Yazoo River, in areas comprising much of Mississippi and Alabama, for \$500,000 to four companies in which, it was revealed, nearly all (except just one) members of the legislature had financial interests. In 1796 a new legislature endeavored to overturn the sale, but this was not accomplished. Finally, in 1810, the United States Supreme Court decision of *Fletcher vs. Peck* ruled that the sale was effective. Congress appropriated \$8 million to settle claims, but Georgia refused to honor the payment.

Following Indian trails, pioneer explorer Daniel Boone created the Wilderness Road, making it possible for future settlers to move west. The North West Company established Milwaukee as a trading post on Lake Michigan. On Oak Island in Mahone Bay, Nova Scotia, three boys digging beneath a tree found an old shaft leading down to ancient oak flooring, thus alerting the world to the Oak Island treasure; during the next two centuries, millions of dollars would be spent by various individuals and companies seeking treasure believed to have been hidden by pirates.

In Paris, the second part of Thomas Paine's *The Age of Reason* was published. In America, Philip Freneau's *Poems Written Between the Years 1768 and 1794* saw print. Ricketts' Circus, a group of equestrian performers from England, appeared in eastern United States cities. Among those in the audience was President George Washington. A cent-size token or store card was created, probably at the Mint, with inscriptions pertaining to Ricketts. In the Kentucky territory the James B. Beam Distilling Company was founded, and would remain in business through the twentieth century.

David Rittenhouse of Pennsylvania served as director of the Mint from April 1792 to June 1795. Henry William DeSaussure served as director of the Mint from July 1795 to October 27, 1795. Elias Boudinot served from October 28, 1795 to July 1805. The first United States gold coins were struck—\$5 and \$10 pieces.

A short walk from the Mint, William Cobbett, writing under the *nom de plume* "Peter Porcupine," fanned the partisan political fires with his *A Little Plain English Addressed to the People of the United States, on the Treaty Negotiated with His Britannic Majesty*.

1795 Flowing Hair

Mintage

280,000 (author's estimate)

Varieties

1795 Flowing Hair. BB-11

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath I (2 leaves)

**Exists with silver plug at center
(B-3. H-3.)**

• **OBVERSE 1:** Flowing hair in six curls; the third one from the top *turns downward and touches* the fourth curl. Two points of first star touch the lowest curl which ends at star point. The last star or lowest one on the right is mostly under the bust, and a point nearly touches. Close date; outlines from repunching appear at top of 5 and right top of 7 (most visible on early impressions from the die). I closer to L than to B with L slightly low.

Obverse die used to strike 1795 BB-11, BB-12, and BB-13.

• **DIE STATES:**

Die State I: Perfect dies.

• **REVERSE A:** Two leaves under each wing. *The only variety with 16 berries*, eight on each branch of wreath. There are only *two berries* on left branch, between eagle's wing and ribbon bow, both on inside of wreath.

Reverse die used to strike 1795 BB-11 only.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 2, Fine: 4, Very Fine: 6, Extremely Fine: 1, Mint State-60 or better: 3. Total: 17.

• **COLLECTING NOTES:** Between 50 and 75 1795 BB-11 dollars exist, making this one of the more elusive issues of the Flowing Hair type. Not that it makes any difference to its price, for BB-11 sells for not much more than a common issue, but is at least twice as rare as a 1794 dollar. Such comparisons make interesting reading in auction catalogues.

The population of 1795 BB-11 seems to be clustered around the VF level which, of course, covers a fairly wide range (VF-20 to just below EF-40). Specimens are not easy to locate, and often a year will pass on the calendar without a single piece crossing the auction block. Perhaps only one Mint State coin is known.

• **NOTABLE SPECIMENS:**

Doolittle Specimen. MS-63. • Doolittle Collection (Bowers and Ruddy, 1977): Lot 2834. "Choice Uncirculated, bagmarks at a minimum, few trivial adjustment marks visible with a glass around a few border areas, couple of minor planchet defects near the first star in the field and not affect-

ing the design; obverse has complete hair detail and reverse shows eagle's breast feathers; toned a light golden and gray color."

Ostheimer Specimen. EF-45 net. (Mint State, but damaged). • A.J. Ostheimer, 3rd Collection (Lester Merkin, 1968): Lot 226, "Brilliant Uncirculated, pale gold toning here and there, exceptionally sharp strike, all claws in bold relief, almost all breast feathers visible to naked eye, minor planchet defects either side, as almost always; would be of almost gem quality but for initials SEP on obverse, these being visible only at a certain angle; one of only two Mint State examples recorded."

Parsons Specimen. VF-35. • George M. Parsons Collection sale (Henry Chapman, 1914). • M.H. Bolender Collection, 1952, Lot 5. • K. P. Austin. • A.J. Ostheimer, 3rd. • ANA Convention Sale (Superior, 1975): Lot 790, "VF-35, well tarnished, faint iridescent tone and with traces of very old cleaning, well centered with bold hair detail but few tiny center reverse adjustment marks, obverse shows plenty of light handling marks. Condition Census."

Capitol City Specimen. VF-35. • Capitol City Sale (Mid American, 1985): Lot 685, "VF-35/35, actually close to EF with considerable mint lustre, evenly struck with full denticles on either side, toning a very original blend of smoky-gray and khaki-green colors, obverse shows several areas of dark oxidation which are not too distracting."

Boyd Specimen. VF-30. • World's Greatest Collection, F.C.C. Boyd (Numismatic Gallery, 1945): Lot 4, VF.

Starr Specimen. VF-30. • Floyd Starr Collection (Stack's, 1992): Lot 570. Very Fine. "Subdued mint lustre and a splash

of toning, mostly in the central portion on each side. A small rim nick on the reverse."

Davis Graves Specimen. VF-20 net. (EF, damaged). • Davis-Graves (James Davis) Collection (Stack's, 1954): Lot 1268, EF+, "initials in front of and in back of head, but still a choice dollar."

Brilliant-Sieck Specimen. F-15 net. (VF-30, polished). • Brilliant and Sieck Collections (Bowers and Merena, 1992): Lot 1629, "VF-30 or finer, but lightly polished long ago, now retoned in lilac. with areas of glue and gray."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 (URS-1)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 30 to 45 (URS-6)

Approximate population G-4 to F-15: 20 to 30 (URS-6)

Approximate population for all grades combined: 50 to 75 (URS-7)

• CONDITION CENSUS: 63-45-35 (multiples)

1795 Flowing Hair. BB-12.

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath I (2 leaves)

(B-11. H-11.)

• **OBVERSE 1:** See description under BB-11. Now always weakly struck on the right.

Obverse die used to strike 1795 BB-11, BB-12, and BB-13.

• **REVERSE B:** Two leaves under each wing. 19 berries, nine on left branch, 10 on right. *Differs from any other 19-berry reverse, as follows:* Two berries in wreath under A in STATES, the one on inside of wreath under center of A, and the one on outside of wreath under left corner of right foot of A. Only one berry in wreath under OF, and it is on the inside of wreath. Two berries, one inside of wreath, and one

outside, are close together under first S in STATES, and two more close together under first A in AMERICA.

Reverse die used to strike 1795 BB-12 only.

• **DIE STATES:**

Die State I: Perfect dies. Obverse weakly struck on the right side.

• **AUCTION POPULATION SURVEY:** Fine: 1, Very Fine: 4, Extremely Fine: 2. Total: 7.

• **COLLECTING NOTES:** 1795 BB-12 is one of the famous rarities in the 1795 Flowing Hair series. Probably, somewhere between 20 and 35 exist, all of which may be in circulated grades. I am not aware of any Mint State examples, or even an AU. All known specimens of the 1795 BB-12 silver dollar show significant weakness of strike at the right obverse.

My rarity estimate is tenuous for this variety. Douglas Winter suggests a population of six to 10.

Haseltine's specimen was only Good, and scratched in field, the only one he could find. Thus it is no wonder that in his 1881 *Type-Table*, he called it "excessively rare."

• **NOTABLE SPECIMENS:**

Wyatt Specimen. EF-40. • Superior, 1985: 2005. "EF-45, mostly well struck except for some weakness around a portion of the borders (these only affect the denticles); attractive light rainbow tone, surfaces quite lustrous." • H.W. Blevins

Collection, Superior, 1988: 3593, EF-40. • Yolanda Gross Collection.

Willasch Specimen. VF-30. • Superior, H. Roland Willasch Collection, 1990: 449. "Dark sunset toning and well struck along the right side perimeter. A few minor rim marks, both on the obverse and reverse, are the only signs of handling."

Ivy Specimen. VF-25. • Steve Ivy, December 1979: 793

Earle Specimen. VF-20. • The George H. Earle Collection (Henry Chapman, 1912). • M.H. Bolender Collection, Bolender, 1952: 13, VF. • K. P. Austin • A.J. Ostheimer, 3rd. • 1975 ANA Convention Sale, Superior: 806.

Spies Specimen. F-15. Stack's, 1974: 14. "Perfect but for one old small reverse edge ding."

• **POPULATION DISTRIBUTION:**

Approximate population MS-60: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 15 to 25 (URS-5)

Approximate population G-4 to F-15: 5 to 10 (URS-3)

Approximate population for all grades combined: 20 to 35 (URS-6)

• **CONDITION CENSUS:** 45-40-40-30-30-20 (multiples)

1795 Flowing Hair. BB-13.

Obv: Portrait I (Head of '94)
Rev: Eagle I, Wreath I (2 leaves)
Exists with silver plug at center
(B-9. H-9.)

• **OBSERVE 1:** See description under BB-11. Sometimes seen in a late die state showing die clash marks from the wings and wreath behind Miss Liberty's head.

Obverse die used to strike 1795 BB-11, BB-12, and BB-13.

• **REVERSE C:** Two leaves under each wing. 17 berries, nine on left branch, eight on right. A berry is on outside of the wreath midway between S and T of STATES, the only variety in which this occurs; the arrangement is similar to that used on the 1794 dollar.

Reverse die used to strike 1795 BB-13 and BB-14.

• **DIE STATES:**

Die State I: Perfect dies. Obverse without clash marks. The die state usually seen. Specimens are often seen with varying degrees of bifurcation on obverse and reverse, and somewhat indistinct denticles.

Die State II: Clash marks from the wings and the wreath are visible behind Liberty's head. Rare. Gilhousen (Superior, 1973): 1216, "almost VF," was described as from an "obverse die partly flattened and roughened by severe clash marks from reverse, parts of wings and wreath being very plain behind head."

Die State III: With "additional die cracks," as described in the 1945 catalogue of the F.C.C. Boyd Collection ("World's Greatest Collection").

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 6, Fine: 21, Very Fine: 13, Extremely Fine: 12, About Uncirculated: 1, Mint State-60 or better: 2 (considering Atwater coin, see below, as Mint State, per catalogue). Total: 56.

• **COLLECTING NOTES:** I estimate that about 300 to 500 specimens exist of 1795 BB-13, a figure considerably more liberal than the Bolender suggestion of R-5 (31 to 75 coins, if he meant R-5 on the Sheldon Scale), or the 1881 *Type-Table* designation of "very rare."

• **NOTABLE SPECIMENS:**

Rarcoa Specimen. MS-63. • Rarcoa's Auction '90: 760. "Choice Brilliant Uncirculated, boldly struck and superbly centered, displaying rather deep prooflike fields on both obverse and reverse—a possible Presentation specimen! Light adjustment marks are visible on the obverse."

Saunders Specimen. AU-55. • Bowers and Merena, Ebenezer Milton Saunders Collection, 1987: 371, AU-55 (ANACS). "Gorgeous gray surfaces with color evenly distributed, highlighting one of the best strikes on a dollar of this date, every detail quite sharp."

Atwater Specimen. Net AU-50. (MS-60, planchet defect.) Laminated planchet. • Atwater Collection, B. Max Mehl, 1946: 191. • Ostheimer Collection, Lester Merkin, 1968: 231. "Brilliant Uncirculated, needle-sharp strike, full breast feathers, full curls, full claws; unheard-of impression, full frost; severe planchet defect on bust, long sliver-like lamination defect at N of UNITED." • The March Sale (Stack's, 1985): 1227.

"Brilliant Uncirculated with full 'cartwheel' effect but has a number of *natural* defects caused at the mint before or during striking notably rough area at base of neck, a few minor areas as well at the first few stars, reverse displays elongated flake on the N of UNITED and some lighter spots near the eagle's head, surfaces are excellent."

DeCoppet Specimen. EF-45. • James Kelly, 1955. "Choice EF, beautifully toned."

The March Sale Specimen. EF-45. • Stack's March Sale, 1983: 924. "Choice EF, sharply struck, with considerable frosty lustre, gives a cameo effect, russet and pale iridescent toning."

1975 ANA Convention Specimen. EF-40. • Superior, ANA Convention Sale, 1975: 802. "EF-40, heavily toned gray and iridescent, well centered and struck, without harm except for one pin-prick right of the eagle's neck and one above Liberty."

Auction '88 Specimen. EF-40. • Stack's, Auction '88, 1988: 1240. "EF, gray and russet toning over mint lustre, struck from heavily clashed dies, outlines of eagle, wreath, etc. clear on obverse around head."

Bauer Specimen. EF-40. • Lester Merkin, 1968: 382. Ex Bauer Collection. "Advanced obverse clash marks. Basically EF, much mint lustre, weakly struck in centers. Obverse planchet defects as almost always. Very rare, one of two finest for die state."

Brown University Specimen. EF-40. • Pine Tree, 1976: 307. "EF, gray tone, light and dark, central obverse sharper than usual, one minute rim nick and shallow edge dent on either side, fewer bagmarks than usual, light unobtrusive adjustment marks at obverse border."

Dunham Specimen. EF-40. • Dunham Collection, B. Max Mehl, 1941: 1034 • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 613. "EF, hardly bold particularly upon reverse, beautifully mottled and toned, iridescent blue and pink, remarkable in spite of a very few microscopic defects."

Parsons Specimen. EF-40. • Parsons Collection, H. Chapman, 1914. • M.H. Bolender Collection, Bolender, 1952: 10. "EF, even impressions, frosty surface around head."

Carter Specimen. EF-40. • The Amon Carter, Jr. Collection, Stack's, 1984: 211. "EF, iridescent toning mixed with pale golden toning."

Charlotte Specimen. EF-40. • Stack's, Charlotte Collection, 1991: 1632, EF. "Roughly circular planchet lamination on cheek, neck and hair,¹ hints of gold and violet toning, good deal of lustre on both sides."

December Sale Specimen. EF-40. • Stack's, December Sale, 1987: 1519, EF, gray and russet toning over lustre, struck from heavily clashed dies, outlines of eagle, wreath, etc. clear on obverse around head, all details clear.

Shore Specimen. EF-40. • Superior, Shore Collection, 1988: 2181. EF-40. Late die state with strong clash marks on the obverse. Original with dark gray surfaces highlighted by underlying suggestions of iridescence. Well centered and well struck on the obverse; eagle's left wing is weak. Extremely faint adjustment marks at 1:00 and 7:00 on obverse rim."

¹ Undoubtedly a Mint-inserted silver plug.

1795 Flowing Hair. BB-14.

“Hidden Star Obverse.”

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath I (2 leaves)

Exists with silver plug at center

Exists overstruck on a 1794 dollar

(B-4. H-4.)

• **OBVERSE 2:** *Star 15 is “hidden” entirely under the bust, where Miss Liberty cannot “see” even a part of it; the only 1795 obverse with this characteristic. Flowing hair in six curls; lowest curl ends faintly above two points of first star, and close to one point. Close date, figures 9 and 5 closest, and the distance between the 1 and 7 about the same as between the first star and figure 1. The 9 and 5 are lightly repunched. Two center dots; the larger is higher, slightly farther to the right, and closest below ear. Star closer to date than in any other variety, about 1.5 mm.*

Obverse die used to strike 1795 BB-14 only.

• **REVERSE C:** See description under BB-13.

Reverse die used to strike 1795 BB-13 and BB-14.

• **DIE STATES:**

Die State I: Perfect dies. Early impressions may have a small lump under the chin and/or die flaws near the rim opposite stars 10 and 11.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 10, Fine: 15, Very Fine: 27, Extremely Fine: 12, About Uncirculated: 5, Mint State-60 or better: 3. Total: 75.

• **COLLECTING NOTES:** 1795 BB-14 is one of the more readily available issues of the year. An estimated 350 to 550 exist in all grades combined. The specialist will have no trouble acquiring a specimen in just about any grade up to VF. At the EF level, BB-14 becomes somewhat elusive, but a specimen in this grade can usually be acquired easily with less than a year's search. AU coins are rare, and Mint State examples are very rare.

The rims on this issue are higher than most other 1795 dollars, giving them a somewhat more “modern” appearance than the typical variety of this year. Planchet adjustment marks are not often seen on BB-14. A few pieces I have seen have had black car-

bon streaks, the result of improper alloy mixing. Probably a batch of 1795 BB-14 dollars was made from an impure alloy melt.

The only known 1795 dollar overstruck on a previously coined 1794 is of the BB-14 variety and is described at length below. This suggests that 1795 BB-14 was probably included among the first dollars minted in 1795. As such it helps verify the varieties listed in Striking Period 1 were the first struck.

• NOTABLE SPECIMENS:

Parmelee Specimen. MS-63. • Parmelee: 702 (U.S. Coin Co., June 1890), now untraced, appears from the plate to have been a gem.

October Sale Specimen. MS-62 (NGC). • Superior, October Sale, 1990: 3713. "Premium Quality. Glorious lustre, with a whisper of antique toning. Surfaces are pristine."

Carter Specimen. MS-61 (PCGS). • Amon Carter, Jr. Collection Stack's, 1984: 209, "Brilliant Uncirculated, full frosty mint lustre, planchet adjustment marks on the head—mostly in area of temple, slight weakness on the lower portion of the eagle, gray russet and iridescent toning." • Dillard Collection, Heritage, 1990: 969, "AU-58." Now MS-61 (PCGS)

Jenks Specimen. MS-60+. • John Story Jenks Collection, Chapman, 1921. • Superior, Shore Collection, 1988: 2176. "A sharp strike on a large planchet with nearly full hair detail on Liberty and partial detail on eagle's breast. Surfaces are fully lustrous with blue and green-gold toning. Some trivial adjustment marks on the obverse rim from 12:00 to 1:00."

Mills Specimen. MS-60. • The Mills Collection coin (Chapman brothers, April 1904) was catalogued as Uncirculated.

San Diego Sale Specimen. AU-53. • Mid-American, San Diego Sale, 1989: 713, centers are rich gray, some iridescence at edges, considerable luster on surfaces, centers not fully brought up, slight amount of even, gentle wear.

Garrett Specimen. AU-50. • Bowers and Ruddy, 1980: 678. "AU-50, exquisite strike, full borders, usual adjustment marks hardly noticeable, details outstanding, most of original mint frost evident except in certain areas of field and highest parts of design where frost has disappeared, two very small edge marks on obverse rim between sixth and seventh stars, lightly toned, light gray with golden hues around stars and letters of LIBERTY."

"Omnium Gatherum" Specimen. AU-50. • "Omnium Gatherum" Sale, Lester Merkin, 1968: 359, "Borderline Uncirculated. Evidently never in circulation, as fields are full of frost; dull on raised surfaces and with the faintest hint of rubbing on one or two curls only. Faint reverse adjustment marks. Mediocre strike, light bagmarks, faint signs of old cleaning, small stain in reverse wreath."

Terrell Specimen. AU-50. • Bowers and Ruddy, Terrell Collection, 1973: "Lustrous, well-struck, free of weaknesses."

• **UNIQUE OVERSTRIKE on a 1794 dollar.** • Offered by Kagan's Numismatic Auctions, as Lot 3221 in the 1987 ANA Convention Sale, was a coin described as follows:

1795 Unique! Struck over a 1794 dollar. Bolender 4. The only known specimen, and the first time this important coin has been offered at public auction. Discovered by Walter Breen, who first described it to the numismatic community in *The Metropolitan Numismatic Journal*, issue No. 1, May-June 1961.¹ The 1961 description follows:

"On the obverse of the 1795 can be plainly seen the eagle, a wreath, and parts of UNITED. . . . On the reverse of the 1795 are visible the profile and part of the back of Liberty's head. . . . Proof that the undertype is in fact a 1794 is easy. No other dollar reverse of this design except the 1794 has positions of U and final A in AMERICA as shown here. . . . On this, all details that are visible match the 1794 exactly. . . .

"[Breen went on to suggest that the Mint was embarrassed with the weakly struck 1794s, and overstrikes could have been made as] testimony to the Mint's propaganda needs at a time when its detractors were ready to seize on anything available as evidence of its incompetence to make acceptable coins for the young and growing nation."

Pedigree of the 1795/1794 coin: From unidentified West Coast dealer who sold it at the Numismatic Association of Southern California Convention in Los Angeles circa 1960. Walter H. Breen, March 1961. Empire Coin Company, Inc. (Q. David Bowers and James F. Ruddy). Walter H. Breen (again), Central States Numismatic Society Convention, April 1961. Art Kagan. 1987 ANA Convention sale by Kagan's, Lot 3221, bought in. Richter Collection. Julian Leidman, offered for \$50,000 at the ANA Convention, August 1992, but sold to the following for a lesser sum. Bowers and Merena Galleries, 1992.

¹ Breen edited the publication for Paul Weinstein, owner of the short-lived Metropolitan Coin Company (no connection to a later firm of similar name owned by Robert Hughes). The pedigree of the coin was furnished by Jack Collins.

1795 Flowing Hair. BB-15.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)

(B-8. H-8.)

• **OBVERSE 3:** Flowing hair in six prominent curls. The second curl from the bottom points down to an inside ray of star 2. Very prominent shoulder loop. Stars 3 and 4 on the left are slightly closer together than the others. Stars 6 and 7 are slightly wider. On the right, stars 11 and 12 as well as stars 14 and 15 are closer than the rest. Star 1 touches the bottom of the lowest curl; the curl continues to almost completely close a circle. Star 8 is closer to base of L than star 9 is to base of Y. Star 15 is far from the bust, exactly 2 mm. from the bust tip. Wide date with the 1 and 7 wider apart than the other digits. The bust is high in the field, over 2.5 mm. above the 5 and under 1 mm. from LIBERTY at its closest point. LIBERTY is wide with LIB more widely spaced than the letters in BERTY.

This die bears a very close resemblance to the die used to coin BB-21, BB-22, and BB-23; especially with regard to the high position of the head and the relationship of the hair curl to the first star, and was probably created by the same person around the same time.

M.H. Bolender noted that the head is not well-centered, but too high and too far to left; however, this is neither definitive nor unique to the variety.

Obverse die used to strike 1795 BB-15 only.

• **REVERSE D:** Two leaves under each wing of eagle. Nine berries on the left branch, 10 on the right branch. Two berries inside the right branch, at the eagle's tail. No letters of the legend touch any leaf. The T of UNITED touches the eagle's dexter (observer's left) wing, while the R of AMERICA ap-

pears to touch the sinister wing but actually just misses. A berry on the outside of the right branch is below the extreme left foot of the first A in AMERICA. A die scratch extends into the field from a denticle left of the first A in AMERICA.

This is one of just two 1795 reverses with two berries inside the branch near the eagle's tail (the other die is that used to coin 1795 BB-20, BB-21, and BB-24). This reverse die bears a very close relationship with the reverse used to coin 1795 BB-20, BB-21, and BB-24, and another die used to coin 1795 BB-23, and must have been prepared by the same person about the same time.

Reverse die used to strike 1795 BB-15 and BB-16.

• **DIE STATES:**

Die State I: Perfect dies. May not exist with perfect obverse die.

Die State II: Obverse: A vertical crack extends from the hair above the forehead down to the base of the neck, extending through the tip of hair behind the eye, through the ear lobe and along the back of the neck; the crack passes through the right edge of the center dot. No traces of this crack extend beyond the portrait into the fields. Actually, this crack appears more as a change of elevation, with the surface of the portrait to the right of the crack slightly higher than the details of the hair to the left. It is possible that this is an unusual form of internal die crack, perhaps beginning at the center dot. Another possibility is that the portrait hub punch was cracked, and the crack was transferred to this working die. If this was the case, then the obverse of BB-15 would have been the last time this punch was used. The reverse shows no cracks, nor evidence of lapping.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Very Fine: 7, Extremely Fine: 1. Total: 10. However, an examination of the plates reveals that at least four of these were misattributed; hence, there were no more than 6 auction appearances net. Probably some of these were also misattributed

and/or duplicate offerings of the same coin(s).

• **COLLECTING NOTES:** 1795 BB-15 remains a prime rarity, with possibly only four positively identified. M.H. Bolender wrote this in 1950:

In 40 years the author has seen only two specimens! One of these was handled by him four times, but was recognized as the same example. Doubtless a very few others are hidden away in collections, but without any doubts, Bolender-8 is "excessively rare" as stated by Haseltine. His specimen was not in the Haseltine sale catalogue of 1881, having been withdrawn beforehand and sold privately. Rarity 7.

However, Dr. Robert Stark advised that within a two-year period he saw three different specimens offered, one of which was repaired.¹

• **NOTABLE SPECIMENS:**

Boyd Specimen. VF-25. • World's Greatest Collection, F.C.C. Boyd, Numismatic Gallery, 1945: 9. • Numismatic Gallery's 1949 ANA Sale of Adolph Freeman's Collection, Lot 143 • M.H. Bolender Collection, Bolender, 1952: 9. "A little wear on high parts of hair and eagle, but VF and well-centered even impressions." • K.P. Austin. • A.J. Ostheimer, 3rd. • ANA Convention Sale, Superior, 1975: 801. VF-20. • H. Roland Willasch Collection, Superior, 1990: 446. VF-20. "Medium gray toning with faint cleaning lines atop the surfaces. Very well centered and only a few marks, a couple below Liberty's eye and another on the eagle's neck. Faint die line is visible on all examples. The obverse \bar{t} is sharp die crack from Liberty's forehead through her ear, neck and terminating at the top of her shoulder. This crack probably affected the striking as this and the Blevins coin show doubling on some letters of LIBERTY and a few stars." [Referred to here is "machine doubling," caused by die chatter.] • Jim Matthews Collection. (Coin illustrated in the present book; QDB and the present owner grade it as *at least* VF-25)

Reiver Specimen. F-15. • The Jules Reiver Collection coin.

Blevins Specimen. F-12 net. (VF-25, repaired.) • The H.W. Blevins Collection, Superior, 1988: 3590. "VF-25, silvery gray with some light golden orange reverse toning, exceptionally well struck with bold, raised borders, some tooling in the right obverse field which is probably the result of some initials or scratches having been removed, reverse choice and some lustre remains."

Fox Specimen. VG-8 net. (VF-20, damaged.) • Marmaduke Fox Collection, M.H. Bolender, 1951. • Spies Collection, Stack's, 1974: 10. "The head is poorly centered although well executed. VF, but noticeably damaged by some severe dents obverse and reverse." Bolender said he handled this coin four times. • Heritage, Frank M. Stirling Collection, February, 1986: 1321.

Haseltine Specimen. Grade not known. • J.W. Haseltine's specimen was sold private prior to the auction sale of his collection in 1881. Presently untraced.

1795 Flowing Hair. BB-16.

The illustration above is a composite using the obverse photo of BB-18 combined with the reverse of BB-15.

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath I (2 leaves) (B-20.)

• **OBVERSE 4:** Flowing hair in six curls. The lowest curl is very small and perfect, and touches the innermost point of star 1, as it continues to nearly

¹ Letter to the author, January 3, 1993.

complete a loop. Curl end is close to and extends toward innermost point on star 2. Last star partly under bust, but not as far under as BB-11, and not quite as close, but it is near. (Note: In BB-14 the last star is *entirely* under bust.) Wide date, most space between 1 and 7.

Obverse die used to strike 1795 BB-16, BB-17, and BB-18.

• **REVERSE D:** See description under 1795 BB-15. Two leaves under each wing. 19 berries arranged 9x10.

Reverse die used to strike 1795 BB-15 and BB-16.

• **AUCTION POPULATION SURVEY:** Fine: 1. Total: 1.

• **COLLECTING NOTES:** Extremely rare. Just one has been traced. First described in Lester Merkin's sale of February 1972, Lot 299, by Walter H. Breen, as reprinted below.

• **NOTABLE SPECIMEN:**

The Stirling Specimen. F-15. • Lester Merkin, February, 1972: 299. "New muling of known dies. Obverse Bolender-7. Reverse Bolender-8, but finer than Bolender plate coin of that variety. Immediately identified by straight die scratch in field, like part of an extra A, left of first A in AMERICA, pointing

to the nearest berry; recut C in AMERICA. Just about VF, many obv. adjustment marks. Rev. sharper than obv. and fully VF. The Bolender-8 die was formerly known only by two impressions of that variety; the present muling is superior to either of them and in addition represents a discovery linking the Bolender-8 dies with the remainder of the group (Bolender 16, 10, 17, 1, 2, 7, 19, 18, 12, 5 and 6). Identified by Walter Breen, originally obtained merely as a specimen of the date. Unpublished, to date unique." *Described as B-21 by Lester Merkin, this variety was later included in the revised Bolender reference as Bolender-20.* • Frank M. Stirling Collection.

1795 Flowing Hair. BB-17.

The illustration above is a composite using the obverse photo of BB-18 combined with the reverse photo taken directly from the fifth edition of the Bolender book.

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath I (2 leaves)

(B-18.)

• **OBVERSE 4:** See description under 1795 BB-16. Wide date.

Obverse die used to strike 1795 BB-16, BB-17, and BB-18.

• **REVERSE E:** Two leaves under each wing. The only 1795 reverse die with 19 berries arranged 8x11.

No outer berry under A in STATES.

Reverse die used to strike 1795 BB-17 only.

Notes about other die varieties called Bolender-18 in years past:

A "Bolender-18" variety different from that I list as BB-17 here, billed as a new discovery and described in the December 1952 issue of *The Numismatist*, and there called Bolender-18, was later called Bolender-21 by collectors. However, today it is called neither Bolender-18 nor Bolender-21, but an early state of 1795 Bolender-6 (now BB-25), to which refer.

The Spies Collection "Bolender-18" coin (Stack's, 1974): 19, was described as: "Unlisted in Bolender. B-13 obverse, B-12 reverse. EF and wholly prooflike, but a few very faint scratches between the 1 and 7." *This coin is now included among the listings for 1795 BB-25, Die State I, while 1795 BB-17 is a different variety.*

- **AUCTION POPULATION SURVEY:** None.
- **COLLECTING NOTES:** Douglass Winter reports that at least two are known.

• **NOTABLE SPECIMENS:**

Eliasberg Specimen. • The 5th revised edition of the Bolender book, Krause Publications, 1988, p. 21, notes: "Specimen known in Eliasberg Collection."

- **CONDITION CENSUS:** Unknown

1795 Flowing Hair. BB-18.

Obv: Portrait I (Head of '94)

Rev: Eagle I, Wreath II (3 leaves)

Exists with silver plug at center

(B-7. H-7.)

- **OBVERSE 4:** See description under 1795 BB-16. Wide date.

Obverse die used to strike 1795 BB-16, BB-17, and BB-18.

• **REVERSE F:** Three leaves under each wing. *The only 14-berry variety.* Seven berries on each branch. There is *only one* berry on left branch of wreath between eagle's wing and ribbon bow, and it is on the inside of wreath. Two berries below the D in UNITED. Conspicuous die flaws at the end of the left ribbon. E in AMERICA double punched at top.

Reverse die used to strike 1795 BB-18 and BB-19.

• **DIE STATES:**

Die State I: Die flaws or stray marks at the end of the left ribbon; these are in the form of two tiny extensions to the rib-

bon, with the extension on the left being the larger of the two. The state usually seen.

Die State II: As preceding, but the smaller of the two flaws—the one on the right side of the left ribbon end—is now gone, either from die wear or light relapping. Much scarcer than preceding.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 7, Fine: 28, Very Fine: 36, Extremely Fine: 9, About Uncirculated: 6, Mint State-60 or better: 8. Total: 95.

• **COLLECTING NOTES:** 1795 BB-18 is one of the more available varieties of the year, but is hard to find in higher grades. Probably, about 500 to 800 survive. In his 1881 *Type-Table*, J.W. Haseltine called this variety very rare. By 1950, M.H. Bolender played the rarity down to the R-4 level, which, if the Sheldon Scale was intended, meant that Bolender felt that somewhere between 76 and 200 were known. Since then, many more have been identified.

The Photographic Department of Bowers and Merena Galleries had 16 different specimens go through its hands from 1984 to 1992—hardly a situation which bespeaks rarity. Over the years, 1795 BB-18 has been readily available at auction, and many more have been shipped from dealers' inventories.

Inasmuch as a Uncirculated specimen of BB-18 appeared in the Lord St. Oswald Collection as part of a group of coins acquired in America in autumn 1795, it is certain that BB-18 was actually struck in 1795.

• NOTABLE SPECIMENS:

Lord St. Oswald Specimen. MS-63. • Major Lord St. Oswald Sale, Christie's, 1964: 141. • Spink & Son, Ltd. • Lester Merkin, October, 1973: 451. "Irregularly toned prooflike gem, struck from new brilliant polished dies on a brilliantly polished planchet which however does have adjustment marks. Exceptionally sharp impression, many details of curls and feathers visible. Pristine, uncleaned." • Greater New York Numismatic Convention Sale, Jimmy Hayes Collection,¹ Stack's, 1983: 1220, Brilliant Uncirculated. Illustrated in *Walter Breen's Encyclopedia of United States and Colonial Proof Coins* where the author described it as a presentation piece.

Mougey Specimen. MS-63. • Mougey Collection (Thomas L. Elder, September 1910), Choice Unc. • George Clapp. • Louis Eliasberg Collection.

October Sale Specimen. MS-62 (NGC). • Superior, October Sale, 1990: 3714. "Premium Quality. Abundant mint frost graces the central obverse and reverse. All but the eagle's breast feathers are bold."

Bolender Specimen. MS-60. • Bolender Collection, 1952. • W.G. Baldenhofer • A.J. Ostheimer, 3rd. • Gilhousen Collection, Superior, 1973: 1215, "Prooflike Uncirculated, somewhat soft strike, richly toned, light handling marks near lowest curls." • ANA Convention Sale (Superior, 1975): 799 • Davenport Collection, Superior, 1977: 466, MS-60.

The Winsor Specimen. AU-58. • Winsor Collection, S. H. and H. Chapman, 1895: 388. • David S. Wilson Collection, S. H. Chapman, 1907: 366. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 612. "AU, friction on hair above

ear and eagle's breast, feet of eagle and mound not struck up, curious oval planchet defect at centre of obverse,² few trifling obverse handling marks, reverse adjustment lines, cleanly struck, unusually sharp, evenly toned with neatly defined denticles." • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 230. "Really Uncirculated, exceptionally clean surfaces, not fully struck up on curls behind ear or eagle's breast though more than half feathers are visible (and still more would be but for adjustment marks); gray and blue tone, reverse iridescent; obverse slight planchet defects on head, reverse considerably better looking than obverse."

French Specimen. AU-58. • Rarcoa, Auction '84: 1702. • French Family Collection, Stack's, 1989 • James A. Stack, Sr. Collection, Stack's, 1989: 523. "Borderline Uncirculated, prooflike fields, natural blue-gray iridescent color with just a hint of golden toning, small test (file) mark on reverse rim at 11:00, exhibits just the slightest softness in the centers and is actually very boldly struck for the variety and type."

Frontenac Specimen. AU-58 (PCGS). • Bowers and Merena, 1991: 2202. "Superbly struck with nearly all original mint lustre still remaining, no adjustment marks, rim marks or any other effects of note."

• CONDITION CENSUS: 64-63-63-63-63-60 (multiples)

¹ Hayes, a numismatic connoisseur from Louisiana, sold his collection in the 1980s to finance a successful bid for a seat in the U.S. House of Representatives.

² In a letter to the author dated January 12, 1993, Walter Breen stated that he first noted the silver plug phenomenon "early 1956 on the Windsor-D.S. Wilson-Clarke B-7, but *dared* not use the word 'plug' or 'plugged' in the description lest it frighten off buyers!"

1795 Flowing Hair. BB-19.

The illustration above is a composite using the obverse photo of BB-20 combined with the reverse of BB-18.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath II (3 leaves)

(B-19.)

• **OBVERSE 5:** Flowing hair in six prominent curls. The lowest curl is pierced and separated by the innermost point of star 1, and the curl is continued upwards to almost close its loop. Wide date, the 95 closer together than the other figures. The upper left star is 2 mm. distant from L in LIBERTY, and is farther from the L than in any other variety. A diagonal "bar," actually a small die scratch, slightly more than 1.5 mm. long appears raised in the left field close to inner point of 4th star, this bar extending diagonally northwest to southeast. The position of the bar distinguishes it from BB-27, which also has a bar, but close to the 5th star.

Obverse die used to strike 1795 BB-19 and BB-20.

• **REVERSE F:** See description under 1795 BB-18. Three leaves under each wing. 14 berries arranged 7x7.

Reverse die used to strike 1795 BB-18 and BB-19.

• **AUCTION POPULATION SURVEY:** None.

• **COLLECTING NOTES:** This variety, unknown

to Bolender, is extremely rare. Perhaps, just two are known.

• NOTABLE SPECIMENS:

Stirling Specimen. • The 5th revised edition of the Bolender book, Krause Publications, 1988, p. 21, notes: "Specimen reported in the Frank Stirling Collection." The collection of the late Frank M. Stirling was dispersed during his lifetime, and this specimen of BB-19 now resides with another owner.

• **CONDITION CENSUS:** Unknown

1795 Flowing Hair. BB-20.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)

(B-2. H-2.)

• **OBVERSE 5:** See description under 1795 BB-19. Close date.

Obverse die used to strike 1795 BB-19 and BB-20.

• **REVERSE G:** Two leaves under each wing. A leaf ends directly below center of first S in STATES and another leaf ends just under left corner of upright of E in STATES. The wreath is delicate, leaves small, berries large. 19 berries arranged nine left, 10 right. Paired berries opposite I in UNITED, opposite A in STATES, under leaf below O in OF, and opposite I in AMERICA, on both inside and outside of wreath. One of these large berries is below *right* corner of I in UNITED, another below left corner of I in AMERICA. This is one of just two 1795 reverses with two berries inside the branch near the eagle's tail (the other die is that used to coin 1795 BB-15 and BB-16). This reverse die bears a very close relationship with the reverse used to coin 1795 BB-15 and 20, and another die used to coin BB-23, and must have been prepared by the same person about the same time.

Reverse die used to strike 1795 BB-20, BB-21, and BB-24.

• **DIE STATES:**

Die State I: Perfect dies. Not lapped. May not exist.

Die State II: Obverse lapped, making stars (especially on the left side of the coin) somewhat thin and spidery, and separating end of lower curl from its matrix; on all specimens seen, the curl end is discontinuous to the right of the innermost point of star 1. On some specimens, the "bar" is hardly visible.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 10, Fine: 19, Very Fine: 13, Extremely

Fine: 6, About Uncirculated: 4, MS-60 or better: 5. Total: 58.

• **COLLECTING NOTES:** 1795 BB-20 exists to the extent of an estimated 300 to 500 specimens. Thus, the specialist will find acquiring one to be a snap. For reasons unknown today, most are in the range of Fine, rather than VF. For every situation there is an explanation, and perhaps someday it will be learned. Probably, the manner of distribution had something to do with it; examples of 1795 BB-20 were used widely in the channels of commerce, rather than stored by banks or bullion brokers.

The variety is typically encountered in lower grades but is rare above EF. Typically, the rims are quite raised on BB-20; coins are usually well centered, with prominent denticulation on both sides. While higher grade pieces will often show excellent hair detail on the obverse, usually the eagle's breast is somewhat flat.

As it is believed that two specimens in the Lord St. Oswald Collection, sold in 1964, were acquired during a visit to America in autumn 1795, this indicates that this particular variety must have been struck at or before that time. This means that BB-20 would have had a greater opportunity to circulate (i.e., acquire wear) than a 1795-dated dollar struck in a later year such as 1798.

• **NOTABLE SPECIMENS:**

Earle Specimen. MS-65. • George H. Earle Collection sale (Henry Chapman, June 1912). • George Clapp. Sold to the following in 1942. • Louis Eliasberg Collection. (Coin not seen; condition estimated.)

Heifetz Specimen. MS-65. • Heifetz Collection (Superior, 1989): Lot 3815. "MS-65. Superb. A few faint adjustment

marks below eagle's right wing and breast and on Liberty's neck."

Superior Specimen. MS-64. • The August Sale (Superior, 1991): Lot 553, MS-64, exceptionally bold devices that include full hair definition on Liberty, needle-like stars, sharp feathers everywhere on eagle except for central portion of breast, unimprovable wreath, clean, blemish-free fields; gold and silver gray toning."

Anderson-Dupont Specimen. MS-63. • Anderson-Dupont Collection (Stack's, 1954): Lot 2491. "Choice Uncirculated, prooflike surface."

1973 GENA Specimen. MS-63. • 1973 Great Eastern Numismatic Association Sale, Lot 293. • Frank M. Stirling Collection, Heritage, February 1986: 1327. "Vibrant, original lustre accented by light russet peripheries. . . . Numerous surface marks." • Auction '86: 1207,

Lord St. Oswald-Stack Specimen. MS-63. • The Lord St. Oswald Collection (Christie, Manson & Woods, London, 1964) had two specimens: Lot 139 was described as "Planchet marks on both sides and some scratching in obverse field, otherwise in brilliant Mint State, very rare. The coin was sold to Norman Stack for \$1,288, who put it in his personal set of U.S. coins by design types (sold privately through Eric Streiner in 1989). • Eric Streiner.

Lord St. Oswald-Ostheimer Specimen. MS-63. • Lord St. Oswald Collection, Lot 140, "A similar coin, planchet marks on both sides, some scratching on face and in field on obverse, otherwise in Mint State, very rare," went to Alfred J. Ostheimer, 3rd for \$2,520.

French Specimen. MS-60. • French Family Collection (Stack's, 1989): Lot 3, "Choice Brilliant Uncirculated with nearly full original mint lustre and full 'cartwheel' showing beneath mellow golden toning, centers not fully struck up as is typical with some detail lacking in hair and breast feathers, minor bagmarks visible—mainly on head." • James A. Stack, Sr. Collection (Stack's, 1989): Lot 522, "Uncirculated, nearly full original mint lustre. . . ."

Norweb Specimen. AU-58. • Norweb Collection (Bowers

and Merena, 1988): Lot 3742, "AU-58 to MS-60, prooflike, light golden toning blends to gunmetal-blue at the borders with areas of silver and gold in between."

Four Landmark Collections Specimen. AU-55. • Four Landmark Collections (Bowers and Merena, 1989): Lot 1936. "AU-55, pale golden brown, iridescent blue and pale silver gray toning, mint lustre beneath the toning on both sides, strike is sharp, Liberty's hair strands are individually delineated and there is feather detail visible on eagle's breast on reverse."

Pine Tree Specimen. AU-50. • GENA Convention Sale (Pine Tree Auctions, 1974): Lot 1001, "AU+, considerable mint brilliance with golden and warm gray toning, tone deeper on reverse where several tiny spots of cabinet friction show, weak in centers as usual, many areas with full mint sharpness, others weaker suggesting EF, small plain obv. rim dent, handling marks range from microscopic to minute & there are few of them. This is in the Condition Census for the variety."

1795 Flowing Hair. BB-21.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)

Exists with silver plug at center
(B-1. H-1.)

• **OBVERSE 6:** Flowing hair in five prominent curls, with a thin faint additional curl below the third curl from the top. Innermost point of star 1 just touches lowest curl. The curl continues upward to half close the loop. Head high and closer to LIBERTY than on most other obverses. The date is wide, with more space between 1 and 7 than other figures. The 7 in the date was repunched over an erroneous 1, prompting some to catalogue the variety as 1795 over 1195. The erroneous 1 is especially visible on early die states. This die bears a very close resemblance to the die used to coin BB-15; especially with regard to the high position of the head and the relationship of the hair curl to the first star.

As is the case with the obverse used to coin BB-27, the present obverse (also used to coin BB-22 and BB-23) had the head of Miss Liberty deeply impressed into the die, causing it to be in slightly higher relief than most other varieties of the year; because of this, the hair details wore away quickly as the coins circulated.

Obverse die used to strike 1795 BB-21, BB-22, and BB-23.

• **REVERSE G:** See description under BB-20. Two leaves under each wing.

Reverse die used to strike 1795 BB-20, BB-21, and BB-24.

• **DIE STATES:**

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Good: 6, Very Good: 45, Fine: 57, Very Fine: 88, Extremely Fine: 41, About Uncirculated: 23, MS-60 or better: 11. Total: 271.

• **COLLECTING NOTES:** 1795 BB-21 is a very common variety. Indeed, it is second only to BB-27 in terms of its widespread availability. I have handled well over 100 since 1953, and this is without any special effort to acquire the variety. I estimate that about 1,500 to 2,500 exist. Most of these have been bought and sold privately. However, as nearly every specialized collection has had one, many have crossed the auction block over the years.

This variety can be found well struck, with sharp centers to the stars on higher-grade examples.

1795 BB-21 is especially plentiful in lower grades, with the average being in the range of VF-20 to 35. EF specimens, while elusive, are not rare. AU specimens occasionally are seen, and a dozen or more true Mint State coins exist in private hands.

• **NOTABLE SPECIMENS:**

Auction '84 Specimen. MS-64. • Auction '84 (Stack's, 1984): Lot 1180, "Gem Brilliant Uncirculated, perfectly struck but planchet adjustment marks, stars needle-sharp with full radial lines, veins on leaves apparent, considerable prooflike

surface on both sides, obverse rich russet with faint iridescence, reverse pale russet."

Smith Specimen. MS-64. • Harlan P. Smith Sale (Chapman brothers, 1906). • Louis Eliasberg Collection. (Coin grade not verified.)

Boyd Specimen. MS-63. • World's Greatest Collection, F.C.C. Boyd (Numismatic Gallery, 1945): Lot 2, Uncirculated.

Delp Specimen. MS-60. • Winner F. Delp Collection, Stack's, November 17, 1972, Lot 84. • 55th Anniversary Sale (Stack's, 1990): Lot 1658. "Brilliant Uncirculated, fully prooflike. A needle-sharp impression, with bold denticles. Sharp hair and full radial lines to the stars, the eagle's breast weak (more than likely to fill the bold relief of the head). A handsome coin with amber toning, starting to turn russet."

Chapman Specimen. MS-60. • Lot 9 in an early, unidentified S.H. Chapman sale. • The Dr. Jack Adams Collection 1992-05 (Superior, 1992): Lot 2101. "MS-60. Flowing Hair. Original surfaces and delightful aura of toning. Wispy gray toning. Faint laminations extending horizontally across the planchet."

Newman Specimen. AU-55 • Eric P. Newman Numismatic Education Society. Two lumps on the neck, below the ear. A short die scratch is noted on the reverse, from bottom of O to a point just below base of F. The presence (or lack of) these characteristics on other varieties sharing these dies may help to establish the specific emission sequence.

Bareford Specimen. AU-58. • Harold Bareford Collection (Stack's, 1981): Lot 403, "Uncirculated except for slightest rubbing on hair and eagle, some prooflike surface, sharply struck with deep iridescent toning." • Steve Ivy's 1982 ANA Sale. • ANA Convention Sale (Heritage, 1988): Lot 939, "AU-58/58, deeply lustrous, semi-prooflike with only slightest rubbing on high points, sharply defined surfaces display rich aqua and golden-gray iridescence."

DeCoppet Specimen. AU-50. • André DeCoppet Collection (James F. Kelly, 1955). "Practically Uncirculated."

Hollinbeck-Kagin Specimen(s). AU-50. • Hollinbeck-Kagin, June, 1970: Lot 595, "near-Uncirculated, light blue patina." • Hollinbeck-Kagin, September, 1972: Lot 1226, "nearly Uncirculated, only slight friction on highest points, tiny depression on reverse as made during minting process, lovely bluish golden prooflike patina." • Tercentenary Sale, Part II (Kagin's, 1974): Lot 1142, "virtually-Uncirculated, only slightest friction on highest points." • *These three may or may not be the same specimen.*

Herdman Specimen. AU-50. • Herdman Collection (Bowers and Ruddy, 1977): Lot 5808. "About Uncirculated. Sharply struck on both surfaces, except for very center of eagle's breast."

Stirling Specimen. AU-50. • Frank M. Stirling Collection, Heritage, February 1986: 1324. "Pale gray toning."

• **CONDITION CENSUS:** 64-64-63-63-63-63

1795 Flowing Hair. BB-22.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)

(B-10. H-10.)

• **OBVERSE 6:** See description under BB-21.

Obverse die used to strike 1795 BB-21, BB-22, and BB-23.

• **REVERSE H:** Two leaves below each wing. 18 berries arranged nine left and nine right. A berry is on the outside of the wreath opposite C in AMERICA, and only one berry opposite last A in AMERICA, that being on inside of wreath. Two berries on outside of wreath on right between eagle's wing and ribbon bow.

Note: Bolender said this about the reverse in his 1950 book: "10 [berries] on left branch and 9 on right. Capt. Haseltine was in error in calling this the '18-berry variety.' His specimen was a worn one, and even on Fine specimens the 19th berry shows very faintly on the inside of left stem near last single leaf."

Notwithstanding this seemingly definitive statement, I have been unable to find the nineteenth berry on any specimen examined, or on catalogue plates.

Reverse die used to strike 1795 BB-22 only.

• **DIE STATES:**

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Fine: 4, Very Fine: 2, Mint State-60 or better: 3. Total: 9.

• **COLLECTING NOTES:** 1795 BB-22 is a very rare variety of which probably no more than 25 to 50 are known. Virtually all are in lower grades

through VF, a notable exception being the F.C.C. Boyd coin, later appearing on the market in other sales, which is a superb Uncirculated example. Bolender called this variety R-6 (13 to 30, if he was using the Sheldon Scale), which rating is essentially unchanged today.

In his 1881 *Type-Table*, J.W. Haseltine called this variety "excessively rare," which, presumably, means rare to excess, or rarer than it should be! A better word would have been *exceedingly*, but "excessively" seems to have insinuated itself into the American numismatic nomenclature, and over the years many cataloguers have used it (in fact, cataloguers on my staff have done so).

• **NOTABLE SPECIMENS:**

Granberg Specimen. MS-60 or better, prooflike. • H.O. Granberg Collection. • World's Greatest Collection, F.C.C. Boyd, Numismatic Gallery, 1945: 12. Uncirculated. • Bareford Collection, Stack's, 1981: 404. "Brilliant Uncirculated, wholly prooflike, even light gray-golden toning, exceptional strike." • 400th Sale, Stack's, 1988: 1166, "Brilliant Uncirculated and wholly prooflike, even light gray toning; exceptional strike, even the ear is clear without magnification."

Brooks Specimen. VF-30. • Bowers and Merena, Brooks Collection, 1989: 160. "VF-30, surfaces have pearl gray toning with wisps of deeper iridescence around the letters, numerals, and stars; most design details exceptionally sharp for the grade."

Tecumseh Specimen. VF-25. • Steve Ivy, Tecumseh Sale, 1979: 793.

1952 ANA Sale Specimen. VF-20. • 1952 ANA Convention Sale, New Netherlands: 3099 • Mid-American, September, 1985: 514. • H.W. Blevins Collection, Superior, 1988: 3592. "VF-20, exquisite example with superb original color, obverse and reverse deep rich gray which changes to gold in the protected areas, surfaces are virtually perfect with no adjustment marks or abrasions whatsoever; centering and strike are excellent."

1795 Flowing Hair. BB-23.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)

(B-16.)

• **OBVERSE 6:** See description under BB-21.

Obverse die used to strike 1795 BB-21, BB-22, and BB-23.

• **REVERSE I:** Two leaves beneath each wing. 19 berries, nine on left branch, 10 on right. Berries on outside of wreath include those under left side of N in UNITED, under center of first A in AMERICA, and under right side of C. One of the inside berries is below the center of M. No berry opposite either I on outside of wreath. *Point of third leaf on right outside of wreath under center of I in AMERICA.* This die bears a close resemblance to that used to coin 1795 BB-21, BB-20, and BB-24, and another die used to coin BB-15 and BB-16, and was probably made by the same person around the same time.

Reverse die used to strike 1795 BB-23 only.

• **DIE STATES:**

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** About Uncirculated: 1, Mint State-60 or better: 3. Total: 4. These represent duplicate appearances of the same specimen.

• **COLLECTING NOTES:** Bolender said this in 1950: "Unknown to Haseltine, the author's example is a Proof, and the only specimen he has seen or heard of in forty years' collecting. Rarity 8."

The obverse was known to Haseltine in 1881, who listed it as part of his H-1 and H-10 numbers. The reverse was new to the Bolender book.

I am aware of just two specimens of this variety in numismatic hands today.

• **NOTABLE SPECIMENS:**

Elder Specimen. AU-58. • Thomas L. Elder, sold in the 1930s to the following. • M.H. Bolender Collection, Bolender, 1952: 19. "Uncirculated, with Proof surface, a few trivial nicks under a glass. Beautifully toned, and a magnificent example, and one of the rarest of all dollars. Rarity-8, the only specimen known, and I believe it to be unique! Purchased by me at an Elder sale in New York 20 years ago. A

prominent collector who was also in attendance bid against me, and it brought seven times the starting bid, and a new record for a 1795 dollar. The competition was the sensation of the entire auction sale. It is certainly worth more than any other dollar of this date. Plate. (Reverse of this coin was used for plate II in book.)" • K.P. Austin Collection. • A.J. Ostheimer, 3rd Collection. • Gilhousen Sale, Superior, 1973: 1218, Uncirculated. • ANA Convention Sale, Superior, 1975: 811. "Borderline Uncirculated with some faint obverse scratches, numerous reverse adjustment marks and lovely iridescent toning; full breast feathers, though with a small round nick on them." • Davenport Collection, Superior, 1977: 468, almost MS-60.

Reiver Specimen. F-15. • Jules Reiver Collection. F-15. Two light scratches cross on the reverse.

• **CONDITION CENSUS:** 58-15

1795 Flowing Hair. BB-24.

Obv: Portrait II (Head of '95)

Rev: Eagle I, Wreath I (2 leaves)
(B-13. H-13.)

• **OBVERSE 4:** Flowing hair in six curls, 3rd and 4th close together; lowest curl barely misses a point of first star, but continues on to touch and slightly pass a second point of same star. The second curl from bottom turns downward pointing to space between two points of second star. *Wide date, 79 closest.* E in LIBERTY punched over an earlier erroneous R. The Y in LIBERTY is higher than the adjacent T. Foot of R in LIBERTY shortened from a broken punch.

Obverse die used to strike 1795 BB-24 (early state) and BB-25 (early and late states).

• **REVERSE G:** See description under BB-20. Two leaves under each wing.

Reverse die used to strike 1795 BB-20, BB-21, and BB-24.

• **DIE STATES:**

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Fine: 4, Very Fine: 6, Extremely Fine: 7, About Uncirculated: 2, Mint State-60 or better: 4. Total: 23.

• **COLLECTING NOTES:** Bolender wrote this in 1950: "The author's example is probably the Haseltine specimen. Two others are known to the author, and no others have been heard of in 40 years. Rarity 7." Haseltine in 1881 considered his coin to be unique.

I believe that somewhere between 100 and 150 exist, most of which are in relatively high grades for a 1795 issue. In this regard, BB-24 is in sharp contrast to BB-26, the latter of which is usually seen in Fine. Most 1795 BB-24 dollars are in better grades such as VF or EF, or even finer.

The problem of evaluating the rarity of early dollars today in the early 1990s is akin to what large cent researchers were faced with 75 to 100 years ago, before popular references became generally available. Information in print is often contradic-

tory. Common varieties are called rare, and rare varieties are sometimes sold for "common prices." Although the Bolender book is excellent, it has not served as a springboard for research in the silver dollar series to the same extent that Dr. William H. Sheldon's 1949 text, *Early American Cents*, did for large cents 1793-1814. Nor is there a very wide circle of friends of the early silver dollar, while, by contrast, there are at least a couple thousand or more numismatists who seek to acquire early (1793-1814) large cents by die varieties. In doing research for this book, one expert ventured the opinion that about 10 to 15 specimens of 1795 BB-24 existed, while another suggested that 80 to 100 was the correct range. As noted, Bolender knew of only three coins!

All things considered, the 1795 BB-24 dollar is an excellent variety for further research. Why are most specimens in higher grades? How many are known to exist?

• NOTABLE SPECIMENS:

Atwater Specimen. MS-60+. • Atwater Collection, B. Max Mehl, 1946: 187. "Brilliant semi-proof just about equal to a brilliant Proof." \$152.50. Sold to the following. • Louis G. Stirling, who sold it to the following. • Frank M. Stirling Collection, Heritage, Mid-Winter ANA Convention Sale, 1986: 1328. "The surfaces, though lightly hairlined, are vibrantly lustrous and toned a pleasing steel, violet gray, and rustic orange. A few adjustment marks across Liberty's profile." • Four Landmark Collections. Bowers and Merena, 1989: 1942. "MS-60 to 63, prooflike, obverse and reverse surfaces brilliant and prooflike; attractive deep silver-gray toning with faint iridescent purple, blue and golden highlights; strike exceptionally sharp everywhere save on the first and second stars; reverse sharp save for the center of the eagle's breast, which was flatly struck; leaves on reverse show full interior veining and letters of legend sharply outlined; obverse bears numerous horizontal adjustment marks through Liberty's jaw line and hair with traces of other adjustment marks protruding from the rims at the top and lower left; small hidden scratch below final star; mostly well centers; microscopic hairlines on obverse." • Jascha Heifetz Collection, Superior, 1989: 2381. "MS-60+. Prooflike throughout with magnificent toning about the periphery." • Auction '90. Rarcoa, 1990: 760.

"Choice Brilliant Uncirculated." • The May Sale, Superior, 1991: 948, "MS-60+, prooflike throughout with magnificent toning about the periphery."

The Baldenhofer Specimen. AU-50. • W.G. Baldenhofer Collection. • A.J. Ostheimer, 3rd Collection. • ANA Convention Sale Superior, 1975: 810. "AU-50 or better, brilliant obverse with lustrous toned reverse; obverse shows many microscopic handling marks, some minor rubbing and a crescent-like scratch on Liberty's jaw; reverse with many adjustment marks."

The Burghoff Specimen. EF-45. • Superior, 1980: 275. "EF-45, choice prooflike EF specimen without a flaw."

The Wyatt Specimen. EF-40. • Superior, Wyatt Collection, 1985: 2006. "EF-45+, well struck on a planchet which exhibits plenty of semi-reflective mint surfaces; high grade problem-free specimen; attractive golden gray tone." • H.W. Blevins Collection, Superior, 1988: 3565, there called EF-40. • Yolanda Gross Collection.

Rothert Specimen. EF-40. • Matthew Rothert Collection (Bowers and Ruddy 1973): 919. EF.

Spies Specimen. EF-40. • Spies Collection (Stack's, 1974): 18. EF.

Haseltine Specimen. EF-40. • Haseltine Collection sold in 1881. EF.

1795 Flowing Hair. BB-25.

Obv: Portrait II (Head of '95)

Rev: Eagle II, Wreath II (3 leaves)

(B-6 a.k.a. B-21.)

Note: Die State I of BB-25 is a new discovery not known to Haseltine and Bolender, and differs from the traditional or "old" B-6 and H-6 (for which see Die State III below). The present BB-25, Die State I, was earlier called B-18 (in 1952) and B-21 (later). What is now called B-18 is a different variety; and there is no B-21.

• **OBVERSE 7:** See description under 1795 BB-24.

Obverse die used to strike 1795 BB-24 (early state) and BB-25 (early and late states).

• **REVERSE J:** Three leaves under each wing of eagle. 13 berries, seven on left branch, six on right. Two berries under first T in STATES, one on inside and one on outside of wreath. Die State I has three leaves visible below first S of STATES (early state of die, probably with 4th leaf depression in die filled with foreign matter). Die State III with four leaves; also used in its later state to coin BB-26 and BB-27, each of which has four leaves beneath the first S of STATES.

Reverse die used to strike 1795 BB-25 (two states; Die State I with three leaves and Die State III with four leaves under first S in STATES; presumably, one of the leaf recesses in the die was clogged, thus preventing one leaf from striking up), BB-26 (later state with four leaves under first S in

STATES), and BB-27 (later state with four leaves under first S in STATES).

• **DIE STATES:**

Die State I: Dies without cracks. Obverse die unlapped (*i.e.*, in an early state). Three leaves on reverse in the cluster below the first S in STATES. Early state of obverse and reverse dies. This die state was discovered by Frank M. Stirling of Baton Rouge, Louisiana, and was reported by M.H. Bolender in the December 1952 issue of *The Numismatist*. At the time it was considered to be from an entirely new die, and the designation "Bolender-18" was given to it (later, it became known as Bolender-18); all this time it acquired a special aura as a great rarity, until it was realized that it was simply a die state of a standard variety known for many years. It is still very rare, but as a die state, not a separate die variety.¹

Die State II. Clash marks in obverse fields.

Die State III: Obverse die relapped (*i.e.*, in a later state than Die State I). The relapping was especially severe and shortened the curls; lowest curl now ends in a point between two points of star, and is near star. Traces of erroneous R under E of LIBERTY now mostly ground away. An engraving tool was used to strengthen the bottom tail of R. Reverse: A fourth leaf is now seen in the cluster below the first S in STATES on the reverse; presumably, the die became unclogged. This die state used to be catalogued as Bolender-6 and Haseltine-6. Common.

• **AUCTION POPULATION SURVEY:** (Die State III coins) Less than Good: 1, Good: 1, Very Good: 4, Fine: 11, Very Fine: 21, Extremely Fine: 14,

¹ During the preparation of this book, the 3-leaf and 4-leaf situation became a point of discussion when it was realized that conventional wisdom (per 5th edition of the Bolender book, and other writing) was that this reverse die was made with three leaves under the first S of STATES, but in a *later state*, a 4th leaf was added. As Thomas K. DeLorey and Harry Salyards, M.D. pointed out, and as the author and Mark Borckardt had been contemplating, it defied all known Mint practice of the era to add an extra leaf or similar feature to an already work-hardened die. This would have been a complicated process which hardly would have been undertaken to "fix" something as innocuous as a cluster of leaves. Mark Borckardt finally said in a note to the author, "Thou shalt not overlook the obvious"—and proposed that a piece of foreign matter clogged one leaf in the die, a basic situation which has occurred many times throughout American coinage history, and which has caused various design elements, mintmarks, etc., to be weak or to disappear.

About Uncirculated: 5, Mint State-60 or better: 7.
Total: 64.

• **COLLECTING NOTES:**

• **Die State I:** Two specimens are known to the writer. The first is Frank M. Stirling's discovery piece, which from the illustration in *The Numismatist* appears to be EF. The second is that included in Stack's sale of the Spies Collection, December 9-10, 1974, Lot 19, and described as prooflike EF, with a few faint scratches between the 1 and 7 of the date.

• **Die State II:** Transitional state. Not seen by the author.

• **Die State III:** It is believed that 300 to 500 specimens of 1795 BB-25, Die State III, exist, most of which are in lower grades through VF. Thus, 1795 BB-25 is one of the more readily available issues of the year. The variety becomes rare in AU and better preservation.

The rims are usually indistinct in portions, with some areas appearing flattened; weakness is usually seen at the rim beginning about the 8th star and continuing over LIBE, and from the 13th star, the date, to the 1st or 2nd star; on the reverse, the weakness is most often seen at the rim above UNI and OF AME. Most specimens are weak at the obverse center in the area of Miss Liberty's ear (which is usually not visible), and on the eagle's breast.

• **NOTABLE SPECIMENS: (Die State III coins)**

Saunders Specimen. MS-60. • The Saunders Collection. Bowers and Merena, 1987: 370. MS-60. "Uncirculated with glossy, frosty, satinlike surfaces, some evidence of contact on the higher points, coloration mostly brilliant with a suggestion of light gray and golden toning."

Einstein Specimen. MS-60. • The Harry Einstein Collection. Bowers and Merena, 1986: 1727. MS-60, "nearly full natural mint lustre and fields that are reflective, well struck overall with just a bit of weakness at breast feathers of eagle, Liberty's hair strands directly above and behind her ear, most denticles on both sides remarkably bold, though some softly defined directly below date and at the 11:00 to 12:00 positions on obverse, and carry light adjustment marks which do not extend into the field or devices, softness at corresponding positions on reverse noted, hair detail deeply cut, as are all wing feathers of eagle and leaves of the wreath, tiny mint-caused imperfection on obverse rim near 5:00 position, few light hairlines show at the highest points of the design, otherwise surfaces are remarkably attractive (possibly ex Richard Winsor Collection, Chapman brothers, 1895)."

Frontenac Specimen. AU-58 (NGC). • The Frontenac Sale. Bowers and Merena, 1991: 2201. "AU-58, NGC, sea green and lilac toning at center changes to blue and gold at borders, very well struck and very well defined."

Four Landmark Collections Specimen. AU-58. • Four Landmark Collections. Bowers and Merena, 1989: 1942, "AU-

58, obverse and reverse both wreathed in pale iridescent blue, golden brown, and silver-gray shades, while center of reverse is an attractive pale rose, obverse strike is very sharp, and all Liberty's hair strands are individually outlined, reverse similarly well struck, and majority of eagle's feather detail in breast can still be seen, without aid of magnification, reverse rim at top somewhat ragged, but appears as made at the Mint, one hidden scratch in right obverse field near stars."

Austin Specimen. AU-58. • The Austin Collection. Bowers and Ruddy, 1974: 2. "Brilliant Uncirculated, virtually flawless fields, some slight friction on very highest points, well struck. • Bowers and Ruddy, June 1976: 1091, Brilliant Uncirculated with prooflike surfaces. Some friction, limited to higher parts of coin. The fields are frosty." • The Roy Harte Collection. Bowers and Ruddy, 1977: 2779. "Brilliant Uncirculated with prooflike fields and nicely struck, some minor friction on highest points."

Stack's Specimen. AU-55. • The Greater New York Numismatic Convention Sale. Stack's, 1988: 1404, "Choice AU, soft at centers, light cabinet friction, golden toning, frosty surfaces."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin, August 1970: 1071. "Virtually Uncirculated, only barest friction." • Hollinbeck-Kagin, July 1971: 1837. "Very close to Uncirculated, only barest friction on high points."

Blevins Specimen. AU-50+. • The H.W. Blevins Collection. Superior, 1988: 4759, AU-50+. • Jascha Heifetz Sale. Superior, 1989: 2382. "AU-50+. Delightful original lustre. The strike is above-average with each star and hair strand on Liberty sharp. The reverse is also well struck with all feathers visible except for the upper feathers of the breast, thigh and tail of the eagle. Some faint adjustment marks. Reverse starting to tone about periphery."

1795 Flowing Hair. BB-26.

Obv: Portrait II (Head of '95)

Rev: Eagle II, Wreath II (3 leaves)

(B-12. H-12.)

• **OBVERSE 8:** Flowing hair in six curls, the *lowest curl passing through a point of first star*, and continues to right, ending in a sharp point. Second curl from bottom points downward to space between two points of second star. Hair at top is flat and lacks any "wave." Wide date, the 7 and 9 closer than other figures. Letters IB spaced too widely. Letter B leans to right, as do also the T and Y. E in LIBERTY is repunched.

Obverse die used to strike 1795 BB-26 only.

• **REVERSE J:** See description under BB-25. Three leaves under each wing of eagle. With four leaves below first S of STATES (late state of die, used to coin Die State III of BB-25, the present BB-26).

Reverse die used to strike 1795 BB-25 (two states; Die State I with three leaves and Die State III with four leaves under first S in STATES; presumably, one of the leaf recesses in the die was clogged, thus preventing one leaf from striking up), BB-26 (later state with four leaves under first S in STATES), and BB-27 (later state with four leaves under first S in STATES).

• **DIE STATES:**

Die State I: Perfect obverse die. Rare, but the most often seen die state.

Die State II: Bolender's "12a." Vertical break from the bust truncation to the border through the 7. Bolender's specimen was Stickney: 807 (Henry Chapman, 1907), and was the only one known to him. Also see 1975 ANA Convention Sale: 808 and 809.

Die State III: This state shows the die crack more clearly; crack extends from rim through the center, to Miss Liberty's ear. The centers are weak from die failure on some. Cf. Spies (as "Bolender-12-b"); the cataloguer of Gilhousen (Superior, 1973): 1217, VG-Fine, knew of only one other—the Emanuel Taylor coin. An AU-55 coin examined by the author had excellent center detail on obverse and reverse.

Die State IV: This state, sometimes catalogued as "Bolender-12b" shows a heavy lump between the 7 and the bust while the crack extends up to the ear.

• **AUCTION POPULATION SURVEY:** Very Good: 5, Fine: 10, Very Fine: 6, Extremely Fine: 3, About Uncirculated: 1. Total: 25.

• **COLLECTING NOTES:** 1795 BB-26 is believed to exist to the extent of 100 to 150 coins, most of which are in lower grades up to and including VF. Fine grade seems to be about par for this variety, an issue which must have circulated very extensively. The variety is very rare EF and unknown in Mint State. Any specimen which grades EF or higher is Condition Census level.

In his 1881 *Type-Table*, this was one of the varieties J.W. Haseltine designated as "excessively rare."

• NOTABLE SPECIMENS:

Stirling Specimen. EF-45. • Heritage's Midwinter ANA Sale, Frank M. Stirling Collection, 1986: 1322. • Bowers and Merena, 1987: 372 AU-55. • The Brooks Collection, Bowers and Merena, 1989: 161, "EF-40, surfaces largely brilliant with just a faint nuance of golden brown iridescence; fields smooth and quite reflective; most design details boldly rendered, eagle's breast shows details; some light adjustment marks present on obverse; what appear to be tiny rim bumps between 11:00 and 1:00 on reverse were caused by the edge lettering apparatus, the edge evidently being lettered subsequent to striking; Bolender-12a die state." • H. Roland Willasch Collection, Superior, 1990: 450, Bolender-12a. EF-40.

Elder Specimen. EF-40. • Thomas L. Elder Sale, 1924. • M.H. Bolender Collection, 1952: 14. "EF, mint lustre close to letters, stars, and wreath."

Blevins Specimen. VF-20. • H.W. Blevins Collection, Superior, 1988: 3594. "VF-20, medium gray with very pleasing two tone effect on both obverse and reverse, well struck."

Hewitt Specimen. VF-20. • Bowers and Merena, Lee F. Hewitt Collection, 1984: 2284. "VF-20 with some irregularity at extreme left obverse edge, pleasing light gray toning moderated to lilac in areas."

Million Dollar Sale Specimen. VF-20. • Million Dollar Sale, Harmer, Rooke, 1969: 1118 • The Long Beach Convention Sale, Kagin's, February, 1987: 1125. "VF-20, pleasing surfaces with light gray peripheral toning."

The New Netherlands 61st Sale Specimen. VF-20. • June,

1970: 408, VF, partly lustrous, but with much iridescent gray tone; central hair, eagle's breast and dentilations are very soft; one small and two minute reverse rim nicks; other irregularities from edge lettering machine; shows only the most microscopic signs of the "Bolender-12a" die crack.

Rumbel Specimen. F-15. • 1952 ANA Convention Sale, O.K. Rumbel Collection, New Netherlands: 3100. • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 232. "Almost VF, reverse bolder than obverse showing traces of lustre. Claimed to be ex Stickney 807, but that claim is also made for the more worn Bolender, Taylor, Kagin piece."

1795 Flowing Hair. BB-27.

Obv: Portrait II (Head of '95)

Rev: Eagle II, Wreath II (3 leaves)
(B-5. H-5.)

• **OBVERSE 9:** Flowing hair in six curls, the 3rd and 4th close together; the 4th has a tiny curved "tail" extending downward, and visible on higher grade pieces. Lowest curl distant from star. A "bar" over 2 mm. long extends diagonally from close to

top curl toward point of 5th star. Look for the "bar" near uppermost curl. (By contrast, BB-20 has the bar near 4th star.) Wide date, the 1 and 7 farthest apart. First star about as close to 1 as 7 is to 9. Most early die states show striking weakness at the centers.

As is the case with the obverse die used to coin BB-21, BB-22, and BB-23, the present obverse had the head of Miss Liberty deeply impressed into the

die, causing it to be in slightly higher relief than other varieties of the year; because of this, the hair details wore away quickly as the coins circulated.

Obverse die used to strike 1795 BB-27 only.

• **REVERSE J:** Three leaves under each wing. 13 berries, seven on left branch, six on right. Three leaves under each wing of eagle. Two berries under first T in STATES, one on inside and one on outside of wreath. With *four leaves below first S of STATES* (late state of die, also used to coin BB-25, later state, and BB-26; the state used to strike BB-25, early state, has only three leaves).

Note: All specimens of BB-25 and BB-27 examined by Bolender showed a fine die crack from end of left stem downward, in BB-27 extending to border. However, the crack does not appear on some specimens of BB-27, nor in BB-26 nor BB-26a, indicating BB-26 was struck earlier.

Reverse die used to strike 1795 BB-25 (two states; Die State I with three leaves and Die State III with four leaves under first S in STATES; presumably, one of the leaf recesses in the die was clogged, thus preventing one leaf from striking up), BB-26 (later state with four leaves under first S in STATES), and BB-27 (later state with four leaves under first S in STATES).

• DIE STATES:

Die State I: Perfect reverse. None seen by Bolender. However, about one in 20 to 30 1795 BB-27 dollars is of this state. Usually lightly struck at the centers, even on high-grade coins.

Die State II: Crack just beginning from end of the left stem to rim. Cf. Gilhousen (Superior, 1973). Common. Often lightly struck at the centers; even AU and Mint State coins are weak at the centers.

Die State III: The reverse is cracked from the end of the left stem to border; the die crack is not bold. Common. Usually better struck at the centers than Die State II.

Die State IV: Clash marks before the lip and the nose, die roughness in LIBE and at the back of the lower curls. Not seen by the author.

Die State V: Crack from top of 7 to bust. Rare. V. Crack from rim through star 10 to chin. Very scarce. Not seen by the author.

Die State VI: Obverse die buckles from 5:00 to 8:00 at the rim, date weakens. Rare. Not seen by the author.

Die State VII: Obverse die reground; "bar" nearly gone and stars smaller. 1975 ANA Convention Sale (Superior): 793; 1986 ANA: 4708. Very rare. (How does this compare to Die State IV?)

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 16, Very Good: 40, Fine: 101, Very Fine: 140, Extremely Fine: 63, About Uncirculated: 46, Mint State-60 or better: 30. Total: 438.

• **COLLECTING NOTES:** 1795 BB-27 is by far the most common variety of 1795. A couple thou-

sand or more exist; I estimate the population to be 2,500 to 3,500 in all grades combined. However, in his 1881 *Type-Table*, J.W. Haseltine called this variety rare if "strictly Uncirculated." In its day, this die combination may have struck 100,000 or more coins! The die steel must have been especially well tempered.

Due to the depth of the Miss Liberty portrait in the die, the resultant coins were in high relief. Because of this, the hair wore quickly at the center of the obverse, with the result that pieces grading VF or lower usually have little detail still remaining. On some (but not all) higher grade coins, usually Die State III in EF or finer preservation, the hair detail at the center of the obverse and the eagle's breast feathers are well defined. As many as 50 to 100 Mint State coins may exist.

• NOTABLE SPECIMENS:

Montgomery Collection. MS-64. • British collection. • Bowers and Ruddy Galleries. • Bowers and Ruddy, Montgomery Collection, 1976 : 1998. "Gem Uncirculated with flawless surfaces, well struck with superb hair detail, eagle's feathers on reverse nearly complete in detail. Pedigree: Possibly originally struck as a presentation piece, originally obtained by [us] from an overseas source, [we] subsequently sold it to its present owner who consigned it to [us]."

Matlock Specimen. MS-64. • Bowers and Merena, Matlock Collection, 1991: 460. "Fully lustrous, full and unbroken cartwheels seen on both sides, very minor obverse adjustment marks mostly confined to rim, none disfiguring; reverse rim from 10:00 to 1:00 imperfectly struck up, denticles lacking there; all edge lettering fully legible."

1977 ANA Convention Sale Specimen. MS-63. • Kagin's ANA Convention Sale, 1977: 1748. "Splendid iridescent toning, flawless surfaces except for faint light spot on cheek, well struck except at very centers, no bagmarks, well centered, many light adjustment marks near obverse borders, heavier ones near central obverse."

Auction '80 Specimen. MS-63. • Rarcoa, Auction '80, 1980: 1614. "Almost full original mint lustre showing beneath delicate golden toning, obverse hair virtually completely struck up, only slight weakness to denticles below date, light mint planchet adjustment marks visible on obverse, reverse is exceptionally well struck with only very center of breast feathers not full."

Auction '85 Specimen. MS-63. • Stack's, Auction '85, 1985: 1745. "Wholly prooflike obverse and frosty and prooflike reverse, sharply struck except for centers, each star with full radial lines and head cameo-like, beautifully centered and splendid strike, natural olive, steel and blue iridescent toning."

Davenport Specimen. MS-63. • Stack's, Davenport Collection, 1977: 406. "Superb iridescent toning with golden and sea-green overtones, full 'cartwheel' effect, toning lighter on high points no doubt as a result of having been stored in a velvet lined coin cabinet the drawers of which caused light

cabinet friction, sharply struck, virtually all denticles sharp and part of feathers evident on eagle's breast, radial lines on all stars sharp, eye of eagle bold, surfaces immaculate."

Hall Collection. MS-63. • Bowers and Ruddy, Hall Collection, 1978: 1672. "Attractive grayish blue toning over excellent fields, perfectly centered dies, faint adjustment marks—a few across high points of Liberty's hair and some just touching the denticles below the date and on the left side of the obverse, strong strike."

Helfenstein Sale. MS-63. • Lester Merkin, Helfenstein Collection, 1968: 276. "Iridescent rainbow toned choice Uncirculated, prooflike fields, frosty devices, needle sharp everywhere except very centers, some adjustment marks in central curls. Broad and bold borders, all stars sharp."

Robison Specimen. MS-63. • Stack's, Ellis H. Robison Collection, 1982: 1854. "Brilliant Uncirculated, full frosty mint lustre and a 'cartwheel' effect, central portion slightly weak with not all breast feathers showing, not rubbed nor does it have a defect save for a minuscule planchet defect on the edge near the first S of STATES, toned a pale russet and steel with reverse a trifle lighter."

Ebsen Specimen. MS-63. • Superior, Buddy Ebsen Collection, 1987: 1876. "Well struck and wholly prooflike, perfectly centered on a problem-free planchet with no adjustment marks or other deterrents, all denticles on both sides discernible with no central weakness, most breast feathers still present, obverse brilliant with light grayish and pale violet toning, reverse toned with frosty mint surfaces overlaid with violet blending to blue and turquoise iridescence."

Miller Specimen. MS-63. • Superior, Hoagy Carmichael and Wayne Miller collections. 1986: 1174. "Sharply struck but for the exact center, each star has full radial lines, hair curls clearly defined, beautifully centered, excellent strike, toning of deep steel, pale violet, russet and electric blue iridescent."

Turoff Specimen. MS-63. • Bowers and Ruddy, Julius Turoff Collection, 1976: 1028. "Gem Uncirculated, above average striking, deep lilac toning."

Winsor Specimen. MS-60. • Richard Winsor Collection, Chapman brothers, 1895. • William Forrester Dunham Collection, B. Max Mehl, 1941. "Magnificent Uncirculated."

Stirling Specimen. MS-60. • B. Max Mehl, February 1954. • Frank M. Stirling Collection, Heritage, February 1986: 1326. "An alluring golden-gray and iridescent blue toned specimen. . . . A few scattered hairlines and a small dent at the base of Liberty [on neck truncation]."

• **CONDITION CENSUS:** 65-64-64-64-63 (multiples)

APOCRYPHAL VARIETY: Bolender-17.

Notes about the so-called 1795 Bolender-17, now believed to be non-existent:

In 1950, M.H. Bolender described Bolender-17 as the mating of the obverse of Bolender-2 (BB-20) with the reverse of Bolender-10 (BB-22). Further: "This combination is excessively rare. Not known to Haseltine. The only specimen known to the author was in the famous Primus C. Clark Collection, catalogued and sold by Mr. Bolender in 1932. Rarity 8."

"The Extensive Collection of Mr. P.C. Clark of Cleveland, Ohio," as the title page read, was sold on Tuesday, November 29, 1932, to bids submitted to Bolender's Orangeville, Illinois address. Lot 299, not illustrated, was described as follows:

"1795 silver dollar. Newly discovered variety. The obverse is similar to Haseltine 2. The reverse has nineteen berries in the wreath, ten on left branch, nine on right. There are three berries on left side between bow and eagle's wing, two on inside of wreath, and one on outside directly under center of letter I in UNITED. There are four berries on right side between bow and eagle's wing, the two on inside of branch

large, and the two outside small. The tenth berry on left side is on lower side of stem near last single leaf. Fine, minute nicks, a few planchet file marks on reverse. Excessively rare, unpublished variety, and the only one I have ever seen."

If Bolender's notes were accurate, then Bolender-17 existed at one time. However, the coin is unknown to modern scholars, and some have suggested that Bolender misattributed the example he saw. It is unusual that Bolender in 1932 did not state that the reverse die was that of H-10. Instead, he described it as a *new die*, apparently one unknown to Haseltine. The Primus C. Clark coin went to a customer. Apparently, by the time that Bolender published his book in 1950, he had lost track of the coin; it was not in his collection sold in 1952.

If Bolender misattributed it, the Clark coin could have been an H-10 (later known as Bolender-10), which has the same reverse as "Bolender-17," but is paired with a different obverse. The Clark piece was just Fine, not a grade level which permits detailed observation of all features. The jury is still out on Bolender-17.

1795 Draped Bust

Mintage

110,000 (author's estimate)

Coinage Context

New portrait: Conventional numismatic wisdom has it that the new Draped Bust obverse was the pride and joy of Henry William DeSaussure, Mint director since June 1795, who upon taking office stated that he wanted to do two things: circulate gold coins and improve the design of all denominations, particularly silver. Portrait artist Gilbert Stuart (best known today for his depiction of George Washington, unfinished at the bottom familiarly displayed in schoolrooms) was hired, and is said to have prepared a drawing of Mrs. William Bingham, the former Ann Willing. John Eckstein, a Providence, Rhode Island artist of uncertain ability (per Breen), translated the sketches into plaster (probably) models, which may have been Liberty head and eagle device punches, for Mint Engraver Robert Scot.¹ The record shows that on September 9, 1795, Eckstein was paid \$30 for “two models for dollars.”

Vattemare's suggestion: Alexandre Vattemare (November 8, 1796–April 7, 1864), born in Paris, was a showman, impersonator, ventriloquist, numismatist, and sleight-of-hand artist. The Frenchman traveled in the United States in 1838 (appearing in New York City at the Park Theatre beginning October 28, 1839)–1841 and again 1847–1850. He devised an international monetary system in 1838, and proposed it to the United States Congress in 1840 and again in 1847,² and was a founder of the Boston Public Library.

He visited the Mint and various numismatists, and wrote *Collection de Monnaies et Médailles de l'Amérique du Nord de 1652 à 1858*, published in 1861—a wonderfully detailed account of United States coins and, especially, medals, including those of the colonial period. At the Mint he was presented

with Proof sets which he later donated to the Bibliothèque Nationale in Paris. Apparently, Vattemare was viewed by some as being somewhat of a crafty scoundrel. In 1867, Matthew A. Stickney, owner of an 1804 dollar, wrote that he had to be alert when Vattemare visited him in Massachusetts, lest his guest steal the precious coin!³

In the aforementioned *Collection de Monnaies* Vattemare suggested that the second silver dollar design of 1795 featured “the head of Liberty with the traits of Mme. [Martha] Washington.” Probably, this was his own observation, and was not based upon any specific information he obtained from Mint officials.

A masterpiece: Whatever the inspiration for the portrait, and whatever the design process may have been, the obverse and reverse punches for the 1795 Draped Bust dollar far exceeded in quality anything created earlier. If Eckstein did the Draped Bust and Small Eagle device punches, he is certainly deserving of a niche in the Pantheon of numismatic notables, for the Draped Bust motif went on to be used for many years, not only in the silver dollar series, but with other denominations from the half cent to the half dollar. The Small Eagle reverse, too, is a masterpiece of intricate engraving.

The Draped Bust punch, unchanged in detail, was employed through the end of the circulating dollar coinage (which bore the date 1803).

Deliveries: Walter H. Breen suggests that the mintage of 1795 Draped Bust dollars amounted to 42,738 pieces, such being taken by correlating specific deliveries in 1795 to varieties and types known today. The assumption was made that dollars of this design were struck during the last two weeks of October 1795. This figure is based on the further as-

¹ R.W. Julian, letter to the author, December 7, 1992.

² *House Document 50*, 26th Congress, first session; *Senate Misc. Document 46*, 30th Congress first session.

³ Stickney's commentary is given under Additional Information, 1804 silver dollar, narrative of Matthew A. Stickney, 1867.

sumption that design and die changes were made to correspond with deliveries, whereas in actuality a die could have been replaced in the press in the midst of a day's work, and the change of type cannot be ascertained from delivery records.

On October 27, 1795, DeSaussure resigned his directorship due to illness and disaffection with his position. Elias Boudinot was his successor and took office the next day.

In his historical overview of early dollars in the present book, R.W. Julian suggests that the most likely time for the inception of Draped Bust coinage would have been October 1, 1795. If this conjecture equates with reality, and if no dollars except the Draped Bust type were minted from that point through the end of the year, and if no 1795-dated Draped Bust coinage was accomplished in later year(s), this would mean that 78,238 Draped Bust dollars were struck in the remaining days of 1795. However, as R.W. Julian points out, this is pure supposition, and it may be the case that Draped Bust coinage commenced earlier or later, that the balance of dollars coined during calendar year 1795 also included some Flowing Hair coins, and that some 1795-dated coins were made in later years as well.

My estimate, based upon ratios derived from surviving coins, is that 110,000 (within 10%) were coined. If, indeed, the production of 1795-dated Draped Bust dollars was somewhere in this range, specimens must have been struck later than calendar year 1795, for coinage would have had to have begun before autumn if it had all been accomplished in the year appearing on the coins.

With all of these "ifs," one person's guess is as good as another. However, an exposition of this kind points out the imprecise nature of mintage figures correlated to designs or dies of the period.

1795 Draped Bust dollars as a type are about two and one-half times scarcer than those of the Flowing Hair design (based upon several factors, including certification service and auction appearance data), so the mintage figures given here, if not provable as precisely correct, are probably at least proportionately accurate. It is unquestioned that the Draped Bust dollars constituted just a small fraction of the total production of 1795-dated silver dollars.

Numismatic Information

General commentary: All dates of Draped Bust obverse, Small Eagle reverse dollars from 1795 through early 1798 primarily exist in lower grades. Some die varieties are rarities in EF or better.

In catalogues of years ago it was popular to call the obverse design the Fillet Head or Fillet Bust, fillet meaning ribbon and pertaining to the band tying Miss Liberty's hair at the back of her head.

Die preparation: The engraver's work on the obverse die was accomplished in this order: 1. The Draped Bust portrait of Miss Liberty was punched into the center of the blank die made of soft steel. 2. The letters of LIBERTY and 15 stars were added around the border by use of individual punches. 3. The date 1795 was punched one digit at a time below the bust.

The reverse die was made in this order: 1. The new Small Eagle on clouds motif was punched into the center of the blank die. The wreath punch, partially finished, and lacking most olive leaves and all berries and stems, and some palm leaves, was punched into the die. 3. Berries and their stems were added to the wreath, leaves were added to the olive branch and palm branch, details were added to the top of the cloud, leaves were added and/or strengthened on the cloud below the eagle's left (on observer's right) wing, which then appeared to the observer's left on the coin, and the letters of UNITED STATES OF AMERICA were punched in.

The obverse portrait punch is of high quality and is superbly engraved, with a wealth of minute detail. Whoever made it, Robert Scot or John Eckstein, was extremely skilled. The reverse punch of the Small Eagle on billowy clouds is likewise superbly done. The wreath is sophisticated as well. The left side of the wreath, with olive leaves, bears a stylistic resemblance to the WII wreath of 1795 (three leaves beneath each wing), as the individual leaf elements are similar in appearance, with raised or outlined edges.

Availability: As a class, 1795 Draped Bust dollars are considerably scarcer than are Flowing Hair dollars. Neither of the two Draped Bust varieties, BB-51 and BB-52, is a rarity. Both are readily available in middle grade ranges. In AU or better grades, BB-51 is seen much more often than BB-52. It is believed that BB-51 was the first struck.

Varieties

1795 Draped Bust. BB-51

(B-14. H-14)

• **OBVERSE 10:** Bust of Miss Liberty facing right, the hair tied up in a ribbon at back. *The bust was not properly centered in the die work, being placed too far to the left. The highest wave of the hair is under the B of Liberty. Lowest curl is distant from 1 in 1795. Star 1 touches curl.*

Obverse die used to strike 1795 BB-51 only.

• **REVERSE K:** Small Eagle, differently styled than on any of the preceding varieties. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. A short, prominent die scratch extends up to left from tip of right, inside leaf below (observer's) left wing. *Berry under A of STATES; a quick way to identify this reverse.*

This reverse die is one of the most remarkable in all of American numismatics, and was mated with obverse dies bearing four different dates. The features are cut in shallow relief, and the rim is low. Thus, all impressions from the die appear somewhat flat, a situation particularly evident on coins in VF or lower grades. The shallow relief does not materially affect the appearance of higher grade coins, which often have exquisite detail, including a full complement of eagle feathers.

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• **DIE STATES:**

Die State I: Perfect dies. The only state known. The denticulation is often weak at the border, especially below the wreath. Some specimens are ever so slightly struck off center,

due to alignment of the dies in the press (not to the positioning of individual planchets); these typically are weak at the bottom of the reverse, but have long, prominent denticles at the top (the situation is the opposite on the obverse, with weakness at the top border and strength at the bottom); in this situation, from stars 7 through 10 and at LIBERTY; also, as metal movement was less in such areas of light striking, planchet adjustment marks are often seen at the upper obverse.

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 4, Very Good: 11, Fine: 41, Very Fine: 85, Extremely Fine: 45, About Uncirculated: 39, Mint State-60 or better: 35. Total: 262.

• **COLLECTING NOTES:** 1795 BB-51 is one of the most abundant varieties of the 1795 year and runs third only to the BB-27 and BB-21 Flowing Hair varieties. Almost certainly, well over 1,000 specimens exist. I estimate the number to be between 1,400 and 2,000.

I believe the BB-51 to be the earlier of the two Draped Bust varieties dated 1795, as evidenced by the following: 1. The Draped Bust motif on the obverse was placed slightly to the left of where it should have been; this was corrected for the next variety, BB-52, and on all later dates of the type. 2. BB-51 exists in high grades in significantly larger numbers than does BB-52, and most of these are prooflike—indicating that some may have been made as presentation specimens of the new Draped Bust obverse, Small Eagle reverse design. Indicative of the availability of the issue, at the 1993 Florida United Numismatists Convention, dealer Ed Milas had three high-level Mint State coins on display.

The striking of 1795 BB-51 is usually weak at the bottom reverse and top obverse (see details under Die States above); such coins are apt to have stars 7 through 10 weak at the centers, and the word LIBERTY slightly weak. Much rarer (about one in 10 coins) are well-centered pieces with *all* stars sharp, including full centers to stars 8 and 9 flanking LIBERTY; a "price is paid" for this sharpness, for such coins usually have the eagle's head and breast feathers less sharply detailed than on the off-center coins! Mint-caused planchet adjustment marks, when seen, are apt to be more prominent on the obverse, especially at the upper left. For some unexplained reason, more often than not these are oriented in a roughly northwest to southeast direction on the obverse.

In the course of surveying close to 200 photographs of BB-51, I did not encounter any coins with die deterioration. The reverse die, as noted, went on to later use. What happened to the 1795-dated obverse is unknown. Perhaps like the famous one-hoss shay, it performed admirably and then broke apart all at once.

The typically encountered 1795 BB-51 is in the VF range, from VF-20 to 35. Really low-grade coins, such as Fair, Good, or VG, are few and far between. On the other hand, EF coins appear on the market with frequency. As a group, 1795 BB-51 silver dollars are about 30% to 50% more plentiful than BB-52 dollars, and in grades of AU or better, are much more available than BB-52 coins.

Multiple Mint State BB-51 dollars are known. Most of these have virtually full prooflike or Proof surfaces, and are sometimes catalogued as presentation pieces. Probably, these were made upon the occasion of the first striking of the new Draped Bust obverse, Small Eagle reverse, design.

Unquestionably, the average specimen of 1795 BB-51 circulated to a lesser extent than did most of its contemporaries. The reason for this is not known. Quite possibly, many were saved as souvenirs of Gilbert Stuart's Draped Bust design, a novelty at the time, a motif that would not appear elsewhere on coinage until the following year.

• NOTABLE SPECIMENS:

Brand Specimen. MS-66. • Virgil M. Brand estate (probable attribution). • B. G. Johnson. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 614, "Uncirculated gem." • Stack's, September, 1974: 40 • Jascha Heifetz Collection Superior, 1989: 3816. "Drapery is razor-sharp, microscopic signs of handling, particularly two minute border nicks at the lower left reverse. Magnificent blue, pink, lavender and

gold toning; both sides somewhat mirrorlike."

Garrett Specimen. "Proof"-65. • J. Colvin Randall Collection, W. Elliot Woodward, 1885: 12, brilliant Proof. • Garrett Collection, Bowers and Ruddy, 1980: 680. "Choice brilliant Proof, obverse and reverse have full Proof surface including between all the letter spaces and other design details; quality and fabric are just as fine as on any later Proof dollar." • Jimmy Hayes Collection, Stack's, 1985: 73. "Choice Brilliant Proof; presentation piece."

Ostheimer Specimen. MS-65. • Superior, ANA Convention Sale, 1975: 812 "Iridescent gray toned uniformly on the obverse with uneven tones and partially a lighter pearl tone on the reverse; full original mint lustre, well struck, good centering but there are a few tiny nicks on the rims, the most noticeable at 2:00 on the reverse; nearly full breast feathers on the eagle." This sale featured silver dollars from the Ostheimer Collection.

Superior August Sale Specimen. MS-65 (NGC). • Superior, August Sale, 1991: 554. "Frosty mint bloom underneath old-time natural color which includes silvery gray and pinkish gold; adjustment marks are light and exclusively to the reverse; outstanding feathers on eagle's chest, each leaf in branches on either side shows full central stem line to the unaided eye; design perfectly aligned on a blemish-free flan, giving the coin a trim, balanced look."

Four Landmark Collections Specimen. MS-64. • Four Landmark Collections Sale, Bowers and Merena, 1989: 353. "Surely among the finest known; strike needle-sharp on both sides with full feather detail in the eagle's breast and inner portions of its wings; lovely, sharp detail in the palm and olive leaves wreathing the eagle; obverse definition stunning; every strand in Liberty's hair is clearly delineated and the folds in her gown are similarly sharp and distinct; more beautifully toned than almost any we have seen—obverse and reverse are a pale iridescent blue and rose, with delicate shades of golden brown and violet scattered about the surface in a most pleasant arrangement; mint lustre creates a pleasing cartwheel effect around the obverse and reverse peripheries."

Stirling Specimen. MS-64. • Frank M. Stirling Collection, Heritage, February 1986: 1330. MS-65 obverse, MS-63 reverse. With "a few trivial adjustment marks."

Alto Specimen. MS-63. • Stack's, Alto Collection, 1970: 1059. "Brilliant Uncirculated, perfectly centered, nicely struck with characteristic weakness in centers of coin; stars, lettering and denticles are quite sharp; surface is beautiful, prooflike quality, superbly toned with golden and purple iridescence."

Carter Specimen. MS-63 (PCGS). • Amon Carter, Jr. Collection (Stack's, 1984): 212. "Brilliant Uncirculated and wholly prooflike, some tiny marks in the field, exceptionally well struck, with pale russet-iridescent toning."

Aspen Specimen. MS-63. • Bowers and Merena, Nelson Page Aspen, M.D. Collection, 1989: 352. "Both surfaces have light champagne toning; obverse field fully and deeply reflective; reverse largely prooflike with some wisps of satiny lustre at the periphery; motifs are frosty, and most of the design details are sharp including the strands of Miss Liberty's hair, the feathers of the eagle's breast, neck, and wings, and the leaves and berries of the wreath; centering of both sides is fine, with that of the reverse being close to perfection."

Auction '85 Specimen. MS-63. • Stack's, Auction '85, 1985: 1748. "Brilliant Uncirculated, sharply struck, light reverse planchet adjustment marks on the eagle and about the periphery; stars and head boldly struck; splendid deep steel and olive toning." • Stack's, Auction '87, 1987: 777.

Auction '90 Specimen. MS-63. • Superior, 1990: 1145. "Needle-sharp strike throughout with bold hair curls, complete drapery line around the bust, full wreath detail, well struck eagle; no rim nicks; pleasing surfaces and lovely toning."

Brown University Specimen. MS-63. • Pine Tree, Brown University Collection, 1976: 308. "Choice Uncirculated, frosty, glittering, lightly toned, as well struck as this comes; eagle's eye clear, partial neck and leg feathers, more than half breast feathers; two tiny reverse rim nicks; no noticeable field or device bagmarks." • Kagin's, 1977: 1754.

Chalkley Specimen. MS-63. • Superior, Chalkley Collection, 1990: 2829. "Prooflike fields, bold feathers on eagle's breast, only a few of which are not fully struck up. Overlaid with a dusting of silvery gray toning."

Essex Institute Specimen. MS-63. • Stack's, Essex Institute Collection, 1975: 983. "Brilliant Uncirculated, wholly prooflike, touch of friction in the field from the gem category."

Forrest Specimen. MS-63. • S.S. Forrest, Jr. Collection (Stack's, 1972): 977. "Brilliant Uncirculated, superb iridescent toning, just the faintest touch of friction away from the gem category; slight softness of strike on eagle."

Holmes Specimen. MS-63. • Stack's, Milton Holmes Collection, 1960: 2233. "Brilliant Uncirculated, sharply struck, full denticles, light iridescent toning, some adjustment marks on obverse made at the mint to equalize weight."

MANA Convention Sale Specimen. MS-63. • Kagin's, 1973: 1300. "Acquired as Proof, golden blue iridescent prooflike, wire edge sharply struck specimen."

Newport Specimen. MS-63. • Bowers and Ruddy, 1975: 375. "Brilliant Uncirculated, prooflike, sharply struck in all details; all hair strands very bold; eagle on reverse is well struck with the normal flatness of strike being at a minimum; some adjustment marks caused at the Mint during planchet preparation extend into the coin from the upper left obverse and also through the stars on the right; on reverse some negligible adjustment marks near bottom." • Bowers and Merena, 1989: 1943. • Gore and Long Collections, Bowers and Merena, 1990: 345.

Robison Specimen. MS-63. • Ellis H. Robison Collection

(Stack's, 1982): 1855. "Brilliant Uncirculated, a few small contact marks on the head; full frosty lustre; fully struck up, the head especially sharp; exquisite peripheral iridescent toning."

Stack's Specimen. MS-63. • Stack's, May Sale, 1991: 458. "Choice Brilliant Uncirculated, obverse wholly prooflike, faint planchet adjustment marks mostly on head but virtually invisible; reverse prooflike and satiny; stars needle-sharp with full radial lines; milling equally as sharp on both sides; mirror-like surfaces and delicate amber and iridescent toning."

• RESEARCH NOTES:

The letter punches used to impress UNITED STATES OF AMERICA into the reverse die were also used on the Small Letters reverse die of 1795 BB-52, and some (but not all) were used to create the Small Letters reverse die of 1796 BB-65. The E in the punch set used in 1795 is distinctive in that the serif at the end of the crossbar is longer at the top end than at the bottom.

An undersized copper trial piece weighing 100 grains exists and is believed to be unique. Its original purpose is unknown; it was not large enough to serve as a set-up piece for die spacing. Perhaps, it was made as a whimsy. The pedigree includes Stack's May 30, 1975 Sale: 932, earlier the Judd, Boyd, Newcomer, Woodin, and Parmelee collections, and came from W. Elliot Woodward, April 28, 1863. See Judd Appendix B where it is incorrectly designated a mint error.

• CONDITION CENSUS: 65-65-65-65-65-64 (multiples)

1795 Draped Bust. BB-52.

**(B-15. H-15)**

• **OBVERSE 11:** Draped Bust similar to last, but the bust is well-centered in the die. The highest wave of the hair is under the E of Liberty. The obverse often shows a crack, which increased in size as the die was used, at the center. Lowest curl is close to 1 in 1795. Star 1 does not touch curl.

Obverse die used to strike 1795 BB-52 only.

• **REVERSE L:** Similar to BB-51, but with only six berries in the olive branch. Leaf under A of STATES; a quick way to identify this reverse. Small letters. The finishing details of the higher areas of the clouds are quite different from those seen on BB-51, and on the present die are more boldly delineated.

Reverse die used to strike BB-52 only.

• **DIE STATES:**

Die State I: Perfect dies. May not exist.

Die State II: Perfect obverse die. Reverse with small piece out of the die on the palm branch directly below the upright of F in OF; this flaw, appearing as a lump on the coin, has two tiny projections pointed toward the F; on worn coins, these projections are readily seen, although the lump on the leaf has been worn away. I have seen just one coin of this die state, a VF-20. On the reverse there are some scattered, raised die flaws between F in OF and the first A in AMERICA; these intensify as die use progresses.

Die State III: Small die crack or break in the hair on the obverse, to the right of and slightly higher than where the bow joins the head; this appears as a raised, triangular (with the hypotenuse vertically oriented, slightly rounded outward, and facing left) lump visible only on coins grading VF or finer. Reverse as preceding. I have seen just two coins of this die state, an MS-65 PL and an EF-40.

Die State IV: Crack in hair expands considerably and now appears as a jagged, vertically-oriented lump consisting of the triangular lump of Die State III but now with an extension

upward, doubling its vertical dimension (crack visible only on coins grading VF or finer). Reverse rim develops a hairline crack beginning above D in UNITED, barely touching left bottom of first S in STATES, continuing through the branch leaves, and ending under E of STATES. Common.

Die State V: Obverse as preceding. On the reverse, a new hairline crack forms at the top right of R and continues through the tops of the letters in ICA, into the field at right. (Cf. Gilhousen: 1220, EF, there called "probably one of the last ones made, late October 1795"). Common.

Die State VI: The reverse cracks intensify, the obverse shows die rust in the fields. Not seen.

Die State VII: The obverse die crack extends up to over midway between the ribbon and the top of the head. MARCA 5/86: 1. Not seen. Very rare.

Note: The BB-52 die pairing seems to have started to fail early in its life (at least by Die State III, allowing for the possibility that the reverse lump of Die State II may have been in the original die). The vast majority of pieces seen today are from flawed dies.

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 3, Very Good: 14, Fine: 36, Very Fine: 63, Extremely Fine: 39, About Uncirculated: 13, Mint State-60 or better: 24. Total: 194.

• **COLLECTING NOTES:** The population of 1795 BB-52 is, perhaps, about 2/3 that of BB-51, but this means that enough exist that just about any motivated collector can easily acquire one. As is the case with BB-51, most specimens of BB-52 are in the range from about VF-20 to VF-35. Lower grade coins are seldom seen, and pieces in EF-40 or better grade are rare as well.

Most coins are reasonably well centered, with good details in all areas. Adjustment marks are seen much less often on specimens of BB-52, probably because the striking was better (recall that BB-51

coins with adjustment marks were usually also lightly struck in areas), and such marks were obliterated by the metal flow.

It is interesting to note that the obverse die for BB-51, thought to have been struck in larger quantities than BB-52, is known only in a perfect state, while the BB-52 deteriorated almost from the time it was first used. Similarly, the reverse used to coin the more plentiful BB-51 was not damaged in the process, and went on to be mated in later years with five other obverses; in contrast, the reverse die of BB-52 developed cracks. The difference in durability undoubtedly was caused by better hardening or tempering of the steel in the BB-51 dies.

BB-52 is considerably rarer than BB-51 in AU and Mint State categories.

• NOTABLE SPECIMENS:

R. Tettenhorst Specimen. MS-65 PL. • Fully prooflike obverse and reverse, sharply struck with pale gold and brown toning. Early Die State III.

Auction '89 Specimen. MS-64 (NGC). • Superior, Auction '89, 1989: 664. "Denticles on obverse are long and bold while Liberty's hair shows individually defined hair strands; on reverse eagle's feathers are almost entirely complete; both obverse and reverse toned to a rich gray shade with obverse slightly deeper than reverse; underlying surfaces almost entirely unblemished." • Superior, 1990: 2828. "Deep charcoal gray toning and medallion sharp strike." *These two appearances appear to be the same coin.*

The Orlando Specimen. MS-64 (PCGS). • Superior, Orlando Sale, 1992: 173. "Details fully and nicely revealed; surfaces pristine; faint handling marks; halo of golden toning about the rims; some crossing adjustment marks on lower eagle."

Bareford Specimen. MS-63. • Stack's, January, 1958: 316 • Harold Bareford Collection, Stack's, 1981: 406. "Brilliant Uncirculated, needle-sharp strike, gem with prooflike surface, mottled light iridescent toning, mostly in the devices."

Anderson-Dupont Specimen. MS-63. • Stack's, Anderson-Dupont Collection, 1954: 2493. "Choice Uncirculated, prooflike surface."

Fairfield Specimen. MS-63. • Bowers and Ruddy, Fairfield Collection, 1977: 103., "Choice Brilliant Uncirculated, sharply struck and with full mint lustre; fully struck with no adjustment marks."

Carter Specimen. MS-62. • Amon Carter, Jr. Collection, Stack's, 1984: 213. "Brilliant Uncirculated, slightly prooflike, a couple of minuscule reverse rim nicks; well struck, with very attractive peripheral toning." • Auction '85, Superior, 1985:

822. MS-63. • The December Sale, Stack's, 1986: 74. • H. Roland Willasch Collection, Superior, 1990: 456.

DeCoppet Specimen. MS-60. • James Kelly, André DeCoppet Collection, 1955. "Uncirculated. Original mint lustre."

Helfenstein Specimen. MS-60. • Lester Merkin, Helfenstein Collection, 1968: 277. "Really Mint State though not fully struck up in centers. Magnificent original frost all over fields and on devices. Limited areas of weakness are on clouds and parts of eagle but there is no sign of rubbing. Adjustment marks in very center of obverse. Pale gold and slightly dull gray toning mingling with original brilliance. Mark on edge right of final A is a planchet defect, not an injury."

Marks Specimen. MS-60. • Bowers and Ruddy, Robert Marks Collection, 1972: 73. "Brilliant Uncirculated, sharply struck."

More Specimen. MS-60. • Bowers and Ruddy, Philip More Collection, 1978: 451. "Brilliant Uncirculated, nice strike, virtually full lustre, no adjustment marks, exceptionally pleasant, smooth fields."

Davis Specimen. AU-58. • Davis-Graves Sale, Stack's, 1954: 1273, AU. • Frank M. Stirling Collection, Heritage, February 1986: 1329. "AU-55/MS-60. Golden peripheral toning along with an area of iridescent blue above LI in LIBERTY. Moderate adjustment marks cross the cloud and the lower half of the eagle." • Yolanda Gross Collection.

Heritage Specimen. AU-50, double struck. • Heritage, Midwinter ANA, February 1986: 1304, AU-50, was noted as being spectacularly double struck. (This coin was not from the Stirling Collection.)

Coinage Context

Problems of 1796: The estimated mintage of 75,000 1796-dated dollars (of various die varieties combined, each of the Draped Bust type) is less than that of the estimated mintage of 110,000 Draped Bust dollars coined with the date 1795. The estimated mintage of 75,000 is not far different from the official calendar year figure of 79,920.

My estimate of 75,000 1796-dated dollars does not suggest when these dollars were struck. It may have been the case, indeed likely, that many if not most 1796-dated pieces were struck later, in 1798. Much of the calendar year mintage of 75,212 dollars struck in 1796 were probably dated 1795. I believe that mintage during the first part of calendar year 1798 consisted in large part of dollars dated 1795, 1796, and 1797.

The Mint experienced various difficulties in 1796, including a yellow fever epidemic. Coinage was anything but easy.

On June 1, 1796, Tennessee was admitted to the Union as the 16th state. While other denominations reflected this, 16 stars were not used on silver dollars until 1797, which suggests that obverse dies for 1796-dated dollars were made prior to June.

Number of dies used: The number of dies employed to create 1796-dated dollars is as follows:

1796 obverses, 4

1796 reverses, 4 (includes one left over from 1795)

Die use averages: By dividing the number of obverse dies and the number of reverse dies each with the estimated mintage figure of 75,212 coins dated 1796, estimates of the average number of impressions per die can be obtained. In practice, some dies lasted a long time and others broke quickly; the figures here are averages, as noted.

Four 1796 obverses divided into an estimated mintage of 1796-dated dollars of 75,212 = 18,803 coins per obverse die.

Four 1796 reverses divided into an estimated mintage of 1796-dated dollars of 75,212 = 18,803 coins per reverse die (the inclusion of the Small Letters die used earlier in 1795 and used later for coinage dated 1797 and 1798 distorts this figure).

Numismatic Information

Collecting 1796 dollars: The dollars of 1796 are a little world unto themselves. There are but six varieties, four of which are readily available, and two that are exceedingly rare. *Right now* in the marketplace, only a few people in the numismatic world know that 1796 BB-62 (so rare that its very existence is controversial to some) and the 1796 BB-64 (of which just two are known) are among the most elusive die varieties of this era.

Known varieties: Dollars of 1796 are of two main obverse styles, Large Date (BB-65 only) and Small Date (BB-61 to BB-64 and BB-66), and two reverse styles, Large Letters (BB-61 and BB-64) and Small Letters (BB-62, BB-63, BB-65, and BB-66). In all instances, the 6 in the date was made by inverting the 9 punch.

Traditionally, the varieties of 1796 have been collected as follows:

1796 Small Date, Large Letters (BB-61 and BB-64).

1796 Small Date, Small Letters (BB-62, BB-63, and BB-66)

1796 Large Date, Small Letters (BB-65)

Of course, the purist and die variety collector will aspire to obtain all six die varieties, not just the three "major varieties" delineated above.

Dollars of this year are quite easy to attribute, and with the Easy-Finding Guide, you should have no trouble instantly identifying a 1796 die variety, even with one eye closed and one hand behind your back.

Grade possibilities. Although many hundreds, if not a thousand or more Mint State 1796 cents exist (thanks to the Goodhue-Nichols hoard), and many dozens of prooflike Uncirculated 1796 quarters are known, Mint State dollars are few and far between. Apparently, few if any were saved as souvenirs or represented in hoards.

For a 1796 silver dollar, Very Fine is about par for a “nice” coin, although occasionally Extremely Fine and Almost Uncirculated pieces are encountered. Mint State coins, graded by today’s stringent interpretations, are sufficiently rare as to be virtually of legendary status.

Obverse dies, a chronology: There were four obverse dies made with the 1796 date. Three of these are of the so-called Small Date style, and one (BB-65) is of the Large Date. As the Large Date more closely resembles the numerals used on 1797 dollars, I assign this as the last die made.

The four obverse dies can be attributed chronologically by the state of the letter R punch used as part of the LIBERTY inscription. Characteristics follow:

BB-61, BB-62 (Small Date) die: Perfect R punch.

BB-66 (Small Date) die: Perfect R punch.

BB-63, BB-64 (Small Date) die: Lower right tip of R partially broken.

BB-65 (Large Date) die: Lower right tip of R broken.

This order of *manufacture* does not necessarily equate with the order of *use* of the obverse dies. The R on the obverse of the die used to coin 1796 BB-63 and BB-64 is about in the same condition as the obverse of the die used to coin 1795 BB-52. This probably indicates the obverse dies to coin 1796 BB-61, BB-62 and BB-66 were made prior to 1795 BB-52, and were complete except for the date. Obverse dies for 1795 BB-52 and 1796 BB-63, BB-64, complete except for the date, were made next. Finally, the obverse die for 1796 BB-65 was made; this last die could have been made in 1795, but not dated, or could have been made in 1796.

Reverse dies, a chronology: There were two major reverse letter styles used on four dies to coin 1796 dollars. These consisted of the following:

BB-62, BB-63, BB-66 (Small Letters) die left over from 1795.

BB-65 (Small Letters) die. Style of 1795, and probably made in 1795 (but not used until 1796) or in early 1796; in any event, made before the Large Letters dies.

BB-61 (Large Letters) die. New style (style of 1796). Made about the same time as the reverse die for BB-64.

BB-64 (Large letters) die. Made about the same time as the reverse die for BB-61.

The preceding probably gives the order of *manufacture* of the reverse dies, but not necessarily the order of *use*. As can be seen, 1796 BB-65 is struck from the latest-made 1796 obverse die in combination with one of the earliest reverses. The explanation is that when they were made, the dies were put “on the shelf” and not used in any particular sequence. There was no first-in, first-out policy in effect.

Coin production, toward a chronology: Probably, it will never be known exactly when on the calendar the various 1796-dated dollars were made. I believe that some were made in 1796, and that additional pieces were coined in calendar year 1798. Die state evidence helps us to draw some conclusions as follows:

1796 BB-61: The obverse die state on a shared die is earlier than on BB-62.

1796 BB-62: The obverse die state on a shared die is later than on BB-61. Reverse die is left over from 1795 (in early state, not relapped).

1796 BB-63: The obverse die state on a shared die is earlier than on BB-64. Reverse die is left over from 1795 (in early state, not relapped).

1796 BB-64: The obverse die state on a shared die is later than on BB-63.

1796 BB-65: Late obverse die combined with early reverse die. Not linked with any other obverse or reverse dies.

1796 BB-66: Early obverse die mated with left-over 1795 reverse die (with the reverse die now relapped, and in a later state than when used on any other 1796 dollar).

The assumption is made that at least two obverse matings with the left-over die earlier used to coin 1795 BB-51, not yet relapped, were made at the same time (rather than in a later year, such as 1798, when the same 1795 BB-51 reverse was also used, but in a relapped state). The two varieties in question are BB-62 and BB-63.

A problem arises with another mating with the 1795 BB-51 reverse, and that involves 1796 BB-66. This utilizes the left-over die earlier used to coin 1795 BB-51, but with BB-66 it is relapped. Apparently, after the coinage of 1796 BB-62 and BB-63 was completed, the reverse die was taken out of the press and relapped. At some later date it was combined with a hitherto unused obverse die.

At this point, the following chronology can be suggested. Although varieties are combined into the First Striking Period and the Second Striking Period, which of these striking periods actually occurred first is not known.

FIRST STRIKING PERIOD:

Struck first: 1796 BB-61: The obverse die state on a shared die is earlier than on BB-62.

Struck second: 1796 BB-62: The obverse die state on a shared die is later than on BB-61. Reverse die is left over from 1795.

SECOND STRIKING PERIOD:

Struck third: 1796 BB-63: The obverse die state on a shared die is earlier than on BB-64. Reverse die is left over from 1795.

Struck fourth: 1796 BB-64: The obverse die state on a shared die is later than on BB-63.

THIRD STRIKING PERIOD:

Struck fifth: 1796 BB-65: Late obverse die combined with early reverse die. Not linked with any other obverse or reverse dies.

FOURTH STRIKING PERIOD:

Struck sixth: 1796 BB-66: Early obverse die mated with left-over 1795 reverse die (now in a very late, relapped state). I believe this striking period occurred in 1798.

In calendar year 1796, coinage deliveries were as follows, for a total of 72,920 pieces:

January 30: 4,550 (+2; parenthetical numbers are additional pieces for the Assay Commission)

February 13: 390 (+1)

March 30: 2,777 (0)

April 9: 2,222 (+1)

May 9: 6,354 (+3)

May 27: 378 (+1)

June 14: 10,509 (+1)

June 28: 941 (+1)

July 21: 8,750 (+3)

July 29: 1,720 (+3)

August 27: 11,485 (+3)

September 1: 1,580 (+3)

September 14: 8,391 (+3)

October 17: 8,103 (+3)

December 22: 4,770 (+3)

From the foregoing it is seen that deliveries of silver dollars were spread throughout the year. There is no known way of matching the above dates with die usage. All that can be said with certainty is that the dollars delivered were dated either 1795 (from

leftover dies) or 1796.

Whether dies remained fixed in the press (the largest press at the Mint, acquired in spring 1795, was used to strike dollars) probably depended upon whether the press was needed to strike \$10 gold eagles, which were struck on several occasions during the year (as gold deposits warranted).

\$10 EAGLE GOLD COINS DELIVERED IN CALENDAR YEAR 1796:

January 9: 1,181

January 30: 134

March 19: 1,169

March 31: 116

June 2: 2,232

June 21: 960

Interfiling the delivery dates for silver dollars with those of \$10 eagles yields the following:

January 9: 1,181 (\$10 gold eagles)

January 30: 134 (\$10 gold eagles)

January 30: 4,550 (+2)

February 13: 390 (+1)

March 19: 1,169 (\$10 gold eagles)

March 30: 2,777 (0)

March 31: 116 (\$10 gold eagles)

April 9: 2,222 (+1)

May 9: 6,354 (+3)

May 27: 378 (+1)

June 2: 2,232 (\$10 gold eagles)

June 14: 10,509 (+1)

June 21: 960 (\$10 gold eagles)

June 28: 941 (+1)

July 21: 8,750 (+3)

July 29: 1,720 (+3)

August 27: 11,485 (+3)

September 1: 1,580 (+3)

September 14: 8,391 (+3)

October 17: 8,103 (+3)

December 22: 4,770 (+3)

The preceding shows that if the dollar press was used to coin \$10 gold coins, there were several periods in which dollar dies could have remained fixed in the press, between dollar delivery dates. For example, after June 21, dollar dies could have remained in the press continuously.

How the "striking periods" mentioned earlier might have fit into the preceding listing of delivery dates is unknown. There is also the strong possibility that some 1796-dated dollars were struck later. If this is the case, perhaps some of the "striking periods" took place in, say, 1798. Further, as noted un-

der the 1795 die studies, there is a distinct possibility that the dollar press, which was intended for silver dollars and large medals, was not used for \$10

gold coins at all (for these were about the same diameter as the half dollar and were in softer alloy; half dollars were struck on a smaller press).

1796: Summary of Characteristics

(all varieties combined)

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart),
model by John Eckstein

Designer of reverse: Robert Scot, model by John
Eckstein

Statutory weight: 416 grains; .8924 silver, balance
copper

Melting value (silver bullion value) in year minted:
Considered by Mint officials to be on a par with
the Spanish dollar, and worth about \$1.00 intrin-
sically (see discussion under Summary of Charac-
teristics, 1794).

Dies prepared: At least 4 obverse; at least 4 reverse
dies, including one left over from 1795.

Business strike mintage, calendar year: 72,920 (for
all varieties of 1796 combined, not including
pieces reserved for the Assay Commission; these
are given in parentheses); Delivery figures by day:
January 30: 4,550 (+2); February 13: 390 (+1);
March 30: 2,777 (0); April 9: 2,222 (+1); May 9:
6,354 (+3); May 27: 378 (+1); June 14: 10,509 (+1);
June 28: 941 (+1); July 21: 8,750 (+3); July 29:
1,720 (+3); August 27: 11,485 (+3); September 1:
1,580 (+3); September 14: 8,391 (+3); October 17:
8,103 (+3); December 22: 4,770 (+3).

**Estimated business strike mintage of 1796-dated
dollars (author's estimate):** 75,000 (rounded).

Estimated quantity melted: Normal quantities by ex-
port or in the normal course of Mint redemption.

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 10 to 18
(URS-5)

Approximate population AU-50 to 58: 30 to 60
(URS-6)

Approximate population VF-20 to EF-45: 1,500 to
2,600 (URS-12)

Approximate population G-4 to F-15: 750 to 1,400
(URS-11)

Approximate population for all grades combined:
2,300 to 4,100 (URS-13)

• **CONDITION CENSUS:** 63-60 (multiples)

• **AVERAGE AUCTION APPEARANCE GRADE
for all varieties combined:** VF-24.

Characteristics of striking: Varies from variety to
variety. Those with the Small Letters reverse,
lapped die, are always weaker on the obverse than
the reverse.

Known hoards of Mint State coins: None

Proofs:

None, although a few have prooflike surfaces.

Commentary

When seen today, most 1796 dollars show ample
evidence of circulation.

Additional Information

Dickeson on 1796 Dollars (1859)

The following appeared in Dr. Montroville W. Dickeson's
1859 book, *An American Numismatist's Manual*:

"The number coined in this year was 72,920; they are not
considered rare, and may be found in good order."

Trading a 1796 Dollar (1892)

From *The Numismatist*, Volume 4, August 1892, pp. 20-21:

"Echoes from a Coin Dealer's Sanctum: Mr. Henry

Ahlborn, one of the oldest coin dealers in Boston, is about as
keen a man for a bargain as one can find. He tells how one
summer day, trade being unusually dull in his store, he
started on a pick-up trip along the North Shore. Going
through the old towns of Salem, Marblehead, Hamilton, and
Essex, he stopped in all the country stores, and talked with
many an old farmer, always with a view of finding some rare
old coin. He, at last, heard of an old lady who had in her pos-
session a number of fine old cents and silver coins.

"Mr. Ahlborn paid her generous prices for the cents and

some silver and was about to go away when the old lady said that she had another piece, that was a gift from her father and was made in the year he was born, but that she would not part with it for anything. He asked to see it and she brought out the finest 1796 half dollar he had ever seen. His eyes snapped, and he immediately considered how he could get possession of that half dollar.

"A lucky idea struck him. He bethought himself of a fine 1796 *dollar* he had bagged that morning, and taking it out he offered to exchange it with the lady for her half dollar making prominent the fact that this was a whole dollar, while hers was only a half dollar—besides it bore the same date and was equally as good. Convinced by this reasoning, she readily made the exchange, and Mr. A. went on his way satisfied with his day's work.

"He afterwards sold it to Mr. Parmelee for \$150, and I think he holds it today for \$350. It bears but very slight traces of circulation."

Likes 1796 and 1797 Dollars (1930)

Writing in the January 1930 issue of *The Numismatist*, Theodore J. Venn gave some investment predictions, noting that certain coins "should certainly continue to go higher [in price] if the number of collectors increases or even holds its own." Further: "In the dollar issues I favor most the coins of 1796 and 1797, also those of 1795 and 1801 and the 1799 with 5 stars facing."

The Year 1796 in History

On September 17, 1796, President George Washington delivered his Farewell Address, not orally but by publication in the *Philadelphia American Advertiser*. In it he said "it is our true policy to steer clear of permanent alliance with any portion of the foreign world." This established the isolationism that characterized much of American politics during the following century. In December, John Adams of Massachusetts was elected to the presidency on the Federalist ticket, gaining 71 Electoral College votes, as compared to 68 for Thomas Jefferson, 59 for Thomas Pinckney, and 30 for Aaron Burr. Under the provisions effective at the time, Jefferson, with the

second highest number of votes, became vice president.

Tennessee, earlier a part of North Carolina, was admitted to the Union as the 16th state. Possibly because of this, certain coins (but not silver dollars) were made with 16 obverse stars—the highest standard star count to be achieved as part of any obverse design of the era. A public land act passed by the Congress on May 18, 1796 authorized the sale of U.S. government lands in minimum lots of 640 acres each at \$2 per acre with payment to be made under a credit system.

Gilbert Stuart created his famous painting of George Washington, the so-called Athenaeum Head, which became the most popular of all portraits of the president; reproductions appeared in most schoolrooms in the United States. In Philadelphia, experiments with gas lighting were conducted. Billiards were a popular American recreation, particularly in the South. English astronomer Francis Baily toured the United States and reported that Norfolk, Virginia had a dozen parlors devoted to the game. English actor Joseph Jefferson appeared on the New York stage for the first time; decades later, he would become famous for his portrayal of Rip Van Winkle. Robert Burns wrote the poem, "Auld Lang Syne."

France experienced hyper-inflation, and a bushel of flour, worth the equivalent of 40¢ in 1790, rose in price to \$5 (although a direct comparison is not possible, as changes in the value of money, the wage structure, etc., must be considered as well). In England, physician Edward Jenner first used inoculation effectively against smallpox, one of the world's most rampant, devastating afflictions (an improvement, vaccination, would be announced in 1798).

At the Mint, the dime and quarter dollar denominations were struck for the first time. Half cents bearing the 1796 date were made in small numbers and would become recognized as rarities, as would 1796 half dollars. \$2.50 gold pieces, known as quarter eagles, were first minted. David Rittenhouse, late Mint director and president of the American Philosophical Society, died, and was eulogized by would-be Mint director Benjamin Rush in an address at the First Presbyterian Church in High Street, Philadelphia, December 17, 1796 (cf. *Essays, Literary, Moral, and Philosophical*, by Benjamin Rush, M.D., Philadelphia: Thomas and Samuel Bradford, 1798).

1796 Draped Bust/Small Eagle

Varieties

1796 Small Date, Large Letters. BB-61.

(B-4. H-4.)

• **OBVERSE I:** Small, wide date with 96 close and 6 tipped to the left. Raised "dot" die flaw over 1 in date and closest to bust, tiny extra projection or flaw extending from the space at the bottom of star 11 (these flaws are visible on all die states given below). This and the obverse used to strike BB-66 were the first two obverse dies cut in 1796, and have the lower right tip of the R in LIBERTY intact.

Also see description under 1796 BB-62 (which is equivalent to Die State III described for BB-61).

Obverse die used to strike 1796 BB-61 (early state) and BB-62 (late state).

• **REVERSE A:** *Large letters* in legend. Letters AMER crowded and touch at bases. Eight plain berries in wreath. *Berry* under first *T* in STATES. Two leaves beneath eagle's right (to observer's left) wing, these having been added by hand in front of the cloud. Small defect in field attached to two denticles below, and slightly left of, left ribbon end. From the same hub used to create 1795 BB-51 and 52, but on 1796 BB-61 not as strongly impressed, with the result that the eagle's breast feathers are not bold. Bolender mentions a die defect in the wreath extending to the right side of the M in AMERICA and the right wing tip.

Reverse die used to strike 1796 BB-61 only.

• DIE STATES:

Die State I: Early state of the 1796 BB-61 die, described above. Top curl perfect; stars normal. Curl at top of forehead in the form of three or four arcs together. Lower curl nearest date boldly defined. The usually seen obverse die state. Walter Breen, in the *John Reich Journal*, January 1987, stated that most specimens of 1796 BB-61 are of this die state, and that "over 10%" are of Die State II.

Die State II. Intermediate between I and III. Very lightly relapped *at top* of die. Top curl on head weaker, and detached at right. Curl at top of forehead now appears as two arcs, connected only at their tops. Lower curl nearest date boldly defined.

Die State III: Bolender-4a, showing the same die relapping effects as 1796 BB-62. Entire die relapped since Die State II. Curl on top of head defective, now tiny and detached. Curl at top of forehead now just a faint wisp. Some stars on the right smaller, the final two or three appearing spidery. Lower curl nearest date now very weak on side nearest date. In 1950, Bolender noted this: "Extremely rare. The only specimen I have found. From the John T. Reeder Collection. Mr. Reeder purchased it from Henry Chapman's sale of the Gable Collection." Since that time, numerous specimens have come to light. Walter Breen, in the *John Reich Journal*, January 1987, stated that "over 10%" of the specimens he had seen of [BB-61] are of Die State II, and that he had started observing this die state in 1955, and after seeing over 30 coins, he stopped counting. In my experience, at least 25% of 1796 BB-61 dollars are Die State II or, mostly, III.

• **AUCTION POPULATION SURVEY:** Good: 10, Very Good: 16, Fine: 49, Very Fine: 91, Extremely Fine: 53, About Uncirculated: 11, Mint State-60 or better: 13. Total: 243. Probably, the 13 Mint State appearances net to just a few different specimens.

• **COLLECTING NOTES:** The 1796 BB-61 dollar is the most common variety of the year. An estimated 1,250 to 2,000 specimens exist. Most are in middle circulated grades, with VF being the median. EF coins turn up with regularity in dealers' stocks and auctions and make a nice "type" coin. In AU or better grade 1796 BB-61 is very rare. A few prooflike specimens exist, possibly made as presentation coins (cf. Walter H. Breen's Proof coins *Encyclopedia*, p. 35, where he states that he saw two pieces earlier, and "would like to see the pieces again to verify that they have the quality of surface and striking characteristic of actual presentation pieces of the period"). I am not aware of any special occasion in 1796 which would have called for prooflike silver dollars. However, prooflike quarter dollars of this date are often seen.

Due to unsatisfactory impressing of the eagle punch in the working die, specimens of 1796 BB-61 are not as well defined on the reverse as are most others of this general design type. Even AU and Mint State coins are apt to have the feathers appear "fuzzy" or indistinct. In worn grades the lack of detail on the eagle's breast feathers is even more apparent.

• **NOTABLE SPECIMENS:**

Kagin Reference Specimen. MS-63. • The finest known may be a prooflike piece once owned by A.M. and Paul Kagin (as part of a "1796 Proof set") and later advertised by Heritage in *Coin World* in August 1986. During the 1950s and early 1960s, the Kagins displayed the 1796 set as part of the Kagin Reference Collection.

CSNS Convention Sale Specimen. MS-60+. • Kagin's, CSNS Convention Sale, 1979: 357. "Sharply struck Unc.-60++; full stars and hair strands, deep edge denticles, lovely pinkish brown lustre." • Kagin's, 1980: 885. "Choice BU-63."

Aspen Specimen. MS-60+. • Bowers and Merena, Nelson

Page Aspen, M.D. Collection, 1989: 358. "MS-60 to 63. Both sides are nicely centered and are warmly toned in gorgeous, mottled hues of golden brown and electric blue. The fields are smooth and satiny and most of the design details are boldly defined. Some minor contact marks."

Newman Specimen. MS-60. • Attractive surfaces with mottled blue and pale gold peripheral toning. Early state of the dies, equivalent to Die State I, above.

Newcomer Specimen. MS-60. • Waldo C. Newcomer Collection. • Col. E.H.R. Green Collection. • James G. Macallister. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 617. "Choice Uncirculated. Nicely centered and struck; slightly flat upon high points of eagle's head, breast, wings and legs. Pale blue toning with extensive golden lustre."

Alto Specimen. MS-60. • Stack's, Alto Collection Sale, 1970: 1062, Brilliant Uncirculated. Full frosty mint bloom. The coin is well struck, having some light adjustment marks across the eagle's breast, and a thin tarnish streak on cheek.

Kagin's Tercentenary Sale Specimen. MS-60. • Kagin's Tercentenary Sale, 1974: 605. "Bluish Uncirculated, sharper struck than most seen with only a few of the feathers not complete. A glass reveals microscopic handling marks."

Long Beach Sale Specimen. MS-60. • Heritage, Long Beach Sale, 1989: 791. "Cleaned. Dullish silvery-gray surfaces which deepen to a charcoal and pinkish gold color about the devices. Nearly void of adjustment marks or noticeable distractions, with only minor weakness on eagle's breast and leg."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 6 to 10 (URS-4)

Approximate population AU-50 to 58: 15 to 30 (URS-5)

Approximate population VF-20 to EF-45: 800 to 1,300 (URS-11)

Approximate population G-4 to F-15: 400 to 700

Approximate population for all grades combined: 1,250 to 2,000 (URS-12)

• **CONDITION CENSUS:** 63-60 (multiples)

1796 Small Date, Small Letters. BB-62.

The illustration above is a composite using the obverse photo of BB-61 (earlier state) combined with the reverse of BB-63.

(B-3. H-3.)

• **OBVERSE 1: Die State III of 1796 BB-61, to which refer.** The stars are small and the last two or three are spidery. Curl on top of the head defective.

This is a later state, equal to Die State III of 1796 BB-61 as noted, with relapping removing part of Miss Liberty's top curl, and some of the part of the stars in lower relief, making them appear smaller.

Obverse die used to strike 1796 BB-61 (early state) and BB-62 (late state).

• **REVERSE B:** Described under 1795 BB-51, herewith repeated: Small Eagle. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. A short, prominent die scratch extends up to left from tip of right, inside leaf below (observer's) left wing. *Berry under A of STATES*; a quick way to identify this reverse.

Bolender reported that some letters were bifurcated on examples he had seen of 1796 B-3 [BB-62], and thought this meant that the die had been "touched up" (however, bifurcation is an idiosyncrasy of striking, and has nothing to do with the die variety or state).

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• **DIE STATES:**

Die State II: Perfect dies. May not exist. Reverse die not relapped.

Die State I: Obverse die relapped; curl at top of head now defective, some stars appear smaller. Reverse die not relapped. This is the die state usually seen. Obverse die state

equivalent to Die State III of 1796 BB-61. Reverse die state equivalent to 1796 BB-63. 1796 BB-62 was struck before 1796 BB-66 (which I believe to have been struck in 1798). 1796 BB-61 was struck before 1796 BB-62.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Very Fine: 5, About Uncirculated: 1. Total: 8. The yellow flag of caution is out on these listings, as BB-62 has been misattributed many times in the past. Probably, only one, two, or three 1796 BB-62 dollars are actually represented.

• **COLLECTING NOTES:** Bolender wrote this in 1950: "While many 1796 dollars have been listed as [B-3; BB-62], this has been erroneously done. I have purchased a dozen or more [B-3; BB-62], every one of them wrongly attributed. Only three specimens are known to me."

The rarity of 1796 BB-62 approaches legendary proportions. In fact, it has kept out of sight so well that many specialists have never seen an example. The fifth revised edition (1988) of Bolender's *The United States Early Silver Dollars* noted the following: "Most experts now question whether this variety actually exists."

In a conversation, Jules Reiver related that over the years a dozen or more 1796 "Bolender-3" dollars have been offered to him, but without exception they were all misattributed.¹ "I don't believe that B-3 [BB-62] exists," he concluded.

Not having seen a specimen in the flesh, I cannot say whether or not it exists. However, a specimen is listed and clearly illustrated as Lot 2065 of the Philip G. Straus Collection (Stack's, 1959). The catalogue,

¹ Telephone conversation with the author, December 2, 1992.

probably Norman Stack, described it as follows:

1796 B-3 [BB-62]. Small Date, Small Letters. Has diagnostic flaw in hair curl. On reverse, berry centered directly below A of STATES. An excessively rare variety, and only three known according to Bolender. Very Fine to Extremely Fine. After checking some of the outstanding collections of silver dollars, we learned that none have this variety represented. One specialist commented that "This is the only B-3 [BB-62] I have ever seen. Nobody I know has one." Considering the rarity of the coin, we would not be surprised to see it bring a "runaway price." [The coin brought \$500.]

The identical specimen appeared 16 years later as Lot 24 of the W. Earl Spies Collection (Stack's, 1974). The cataloguer noted the following:

1796 B-3 [BB-62]. Small Date, Small Letters. The letters not bifurcated., and the curl at the top of the head imperfect. One of only very few known. Probably a high Rarity-6 or perhaps 7. Very Fine to Extremely Fine. From our Straus Sale in 1959. [Realized \$950.]

The preceding descriptions, particularly that in the Straus Collection sale, indicate that the cataloguer for Stack's was quite certain at one time that a BB-62 existed, and was examined by a specialist.

In recent decades, such notable silver dollar variety collection sales as Ostheimer (1968), Gilhousen (1973), 1975 ANA, and Willasch (1990) have lacked an example of this variety. It is worth noting that Bolender's own collection, auctioned in 1952, was missing the 1796 BB-62.

• NOTABLE SPECIMENS:

Straus Specimen. VF-30. • Straus Collection, Stack's, 1959. • Spies Collection, Stack's, 1974: 24. Letters not bifurcated, and the curl on top of the head imperfect. VF to EF.

The following are of unknown status:

Note: With the exception of the Straus-Spies coin, *all*

"Bolender-3" 1796 dollars listed in our survey fall into one of two categories: 1. The coin was mis-attributed based on plate examination. 2. The coin was not plated in the catalog making verification impossible.

Boyd Specimen. VF-20. • World's Greatest Collection, F.C.C. Boyd, Numismatic Gallery, 1945: 20. Haseltine-3. VF and very scarce. *Not plated.*

Blaauvelt Specimen. VG-10. • Bowers and Ruddy, 1977: 492, About Fine. Some marks on obverse. *Not plated.*

Aaron Specimen. VF-20. • Steve Ivy, 1982: 1070. *Not plated.*

Phoenix Specimen. VF-25. • Steve Ivy, 1982: 998. Die dot in field above 1 in date. Tear-drop die flaws below stars 11 and 13. Non-bifurcated letters in LIBERTY. Even gray surfaces which are very lightly granular. *Not plated.*

Hatie Specimen. VG-8. • Bowers and Merena, 1983: 908, VG-8 or fairly close to it. Some traces of adjustment marks on obverse right field. Light gray coloration. *Not plated.*

• POPULATION DISTRIBUTION:

• CONDITION CENSUS: 30-? (information incomplete)

1796 Small Date, Small Letters. BB-63.

(B-2. H-2.)

• **OBVERSE 2:** *Small wide date*; all of the figures of date *evenly spaced* wide apart. 6 leans to the left. Highest wave of hair under serif at left bottom of E; second highest wave under upright of R. End of hair tress touches *only one (the innermost) point of star 1*. The curly lock closest to the date barely misses the star point to the right of the innermost point of star 1 (magnification may be necessary to tell this; on BB-66, the curly lock touches not only the tip of the innermost point of star 1, but also the point to the right of it). On BB-63, star 1 points to the space between two denticles (on BB-66 it points to a denticle). A point of star 15 points to the middle of the drapery folds (on BB-66 it points to a spot high on the drapery folds). This obverse bears a close resemblance to the obverse of BB-66, and specimens should be compared to it. The R in LIBERTY shows beginning signs of failure at the lower right tip. Of the four 1796 obverses, this die was cut next to the last.

Obverse die used to strike 1796 BB-63 (earlier use) and BB-64 (later use).

• **REVERSE B:** Described under 1795 BB-51, herewith repeated: Small Eagle. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. A short, prominent die scratch extends up to left from tip of right, inside leaf below (observer's) left wing. *Berry under A of STATES*; a quick way to identify this reverse. Weakly detailed at center.

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• **DIE STATES:**

Die State I: Perfect dies. Reverse die state the same as used

on 1795 BB-51; no lapping yet (compare to die states of 1796 BB-66). This is the only die state seen by the author. This is the same reverse die state as used to coin 1796 BB-62.

Die State II: Reverse die relapped, removing some details of the shallowest (lowest) folds in the wreath ribbon and removing about 50% of the lowest left leaf on the wreath (just below the U of UNITED). This die state was also used to coin 1797 BB-72 and 1798 BB-82. May not exist with 1796 BB-63.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Fine: 7, Very Fine: 16, Extremely Fine: 7, About Uncirculated: 3, Mint State-60 or better: 1. Total: 36.

• **COLLECTING NOTES:** An estimated 175 to 300 specimens exist of 1796 BB-63, another variety that is usually seen in lower grades. Above VF, acquisition becomes a challenge. Specimens are scarce if EF and very rare if AU. The typical example of 1796 BB-63 is not as well struck as 1796 BB-66, and is apt to show weakness at the lower center of the reverse at the eagle's tail and feet.

Centering may be irregular, but only slightly so. For example, a coin may be perfectly centered on the reverse, but have the obverse very slightly off center to the top (making the denticles very prominent at the bottom of the obverse, and weak at the top); or, conversely, a specimen may be well centered on the obverse, but have the reverse very slightly off center to the top (making the denticles very prominent at the bottom of the obverse, and weak at the top).

• **NOTABLE SPECIMENS:**

Eastern Specimen. MS-60. • Specimen in a private eastern collection, MS-60 (reported by Douglas Winter).

Newcomer Specimen. AU-55. • Waldo C. Newcomer. • Col. E.H.R. Green. • James G. Macallister. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 616. "AU-55, only a shade from Mint State. Struck a bit off-center, with

border at bottom right reverse entirely off planchet. Attractive pink, blue, lavender and gold patina."

Carter Specimen. AU-50. • Amon Carter, Jr. Collection, Stack's, 1984: 214. "AU and a beauty with some prooflike surface. Lovely pale russet toning with iridescence about the edges."

GENA Convention Specimen. AU-50. • Kagin's, GENA Convention Sale, 1979: 367. "With lovely blue lustre. Sharp strike with center points of stars visible."

Hollinbeck-Kagin Specimen. AU-50. • Hollinbeck-Kagin Sale, June 1970: 599. "Nearly Uncirculated."

Metropolitan Washington Convention Specimen. EF-45. • Kagin's Metropolitan Washington Convention Sale, 1975: 535. "Choice EF, sharp strike with deep dentilation around both edges, glittering bluish golden patina, traces of original lustre."

ANA Convention Sale Specimen. EF-40. • Steve Ivy, ANA Convention Sale, 1982: 710. "Gently cleaned at one time now retoned a natural steel gray."

CSNS Convention Sale Specimen. EF-40. • Kagin's CSNS Convention Sale, 1979: 358. "EF-40, nice strike and original golden grayish color."

DeCoppet Specimen. EF-40. • André DeCoppet Collection, James F. Kelly, 1955. • A.J. Osheimer, 3rd Collection, Lester Merkin, 1968: 238. "EF, central areas weakly and unevenly struck, obverse full of adjustment marks; mint lustre with much iridescent gray and blue toning."

Newcomb Specimen. EF-40. • Howard R. Newcomb Collection. • Dr. Charles Green Collection, B. Max Mehl, 1949: 1978. • Harold Bareford Collection, Stack's, 1981: 407. "EF with some prooflike surface. Struck slightly off center at 6:00. Deep iridescent toning."

The Autumn Sale Specimen. EF-40. • Stack's Autumn Sale, 1986: 4898. "Somewhat softly struck, with plenty of detail. A few old scratches near reverse rim just to right of bow. Surfaces still retain some mint 'flash' and exhibit attractive antique grayish violet toning."

Ullmer Specimen. EF-40. • Ullmer Sale, Stack's, 1974: 226. • March Sale, Stack's, 1983: 926, "EF and a superb specimen. Pale russet-gray toning. Sharply struck, with the slightest wear on the bust and leg of the eagle."

Gross Specimen. EF-40. • Yolanda Gross Collection. Purchased from J.J. Teaparty in June 1985.

1796 Small Date, Large Letters. BB-64.

(B-6.)

• **OBVERSE 2:** See description under 1796 BB-63. Small, wide date.

Obverse die used to strike 1796 BB-63 (earlier use) and BB-64 (later use).

• **REVERSE C:** Large letters. This variety has a reverse, unknown to Bolender, not found on any other dollar of the era. Four berries inside wreath, four berries outside. Lowest outside berry is between the N and I in UNITED. *Berry under right foot*

of A in STATES.

The two specimens known are each in a reverse die state quickly identifiable by a massive vertical die crack from the rim, through the left side of O in OF, through palm branch, wing tip, palm branch again, C, then turning to the left and continuing to border. This crack strongly affects the right side of the reverse. A smaller crack goes from the bow knot, to the right, through left foot of A, bottom of C, to join larger crack. Usually, the area to the left of the crack is weakly struck. Probably, the die failed almost immediately. Discovered by Walter H. Breen in the summer of 1957.

Reverse die used to strike 1796 BB-64 only.

• **DIE STATES:**

Die State I: Perfect obverse die. Perfect reverse die. May not exist with perfect obverse die.

Die State II: Obverse die very slightly relapped. Part of interior of lowest curl gone. Perfect reverse die. May not exist.

Die State III: Obverse die as preceding. Reverse with massive crack and smaller crack as described above. The only two specimens known are of this die state. (Of course, it is possible that intermediate states, perhaps numerous, may have existed at one time between Die State II and III.)

• **AUCTION POPULATION SURVEY:** Not relevant.

• **COLLECTING NOTES:** Two are believed to be known of this variety.

The only coin known to me was in the cabinet of K.P. Austin, of Salisbury, Maryland, leading specialist in the series several decades ago. It then went into the A.J. Ostheimer, 3rd Collection, then to Superior's 1975 ANA Convention sale, where it appeared as Lot 823 and was described as follows:

1796 obverse Bolender-2, but with a semi-unique and unlisted reverse having a long vertical die crack from the denticles at 1:00 passing left edge of O in OF, through wreath, wing tip, wreath, C of AMERICA and curving left slightly to a denticle. Was VF before someone scratched the lines across the diameter of the obverse in a wheel spoke fashion; after which someone else tried improving this piece by lightly burining the entire obverse. Reverse is untouched and shows the unmistakable weakness on the left three quarters of the coin due to the die failure. Damaged, but still semi-unique to date. [\$850]

The coin went to the collection of Jules Reiver,

long-time expert and specialist in early American silver coinage. From a value viewpoint, some have considered to the coin to be net VG-8. The condition of the second piece is not known to me. In a conversation, Jules Reiver related the following:¹

I know of just a single specimen of the 1796 B-6 [BB-64], the one I own. This is a very curious coin. Some time ago I held a class on grading coins for some local schoolchildren. Some of them became quite knowledgeable. The B-6 [BB-64] has a huge die break on the back, and on the left side of the break it is very weak and worn-appearing, and on the right side it looks AU and is sharp. I would cover over the sharp part of the coin and ask a student to grade it. One of them said it was Good to Very Good, which was about right. I would then cover over that part, and resubmit the coin with the sharper part of the reverse showing, and the same person graded it as AU, which was also right.

We then had a discussion as to why a coin could be Good in one section of the surface and AU in another. The obverse of the coin is scratched up and somewhat defaced. The same student suggested that after this coin was struck, someone at the Mint examined it and saw the effects of the broken die, and said it was unfit to be released into circulation. This Mint employee then scratched it, so it wouldn't be given out, but, somehow, it escaped. That theory sounded good to me.

• **NOTABLE SPECIMENS:**

Austin Specimen. VG-8. • K.P. Austin. • A.J. Ostheimer, 3rd. • Superior's 1975 ANA Convention Sale: 823. • Jules Reiver Collection.

Untraced Specimen. Another specimen, untraced, details not known to the author.

Note: The coin listed as Lot 23 of the World's Greatest Collection was incorrectly attributed and is a late die state of BB-65.

¹ Commentary "transcribed" from my memory, a few minutes after my telephone conversation with Jules Reiver, December 2, 1992.

1796 Large Date, Small Letters. BB-65

(B-5. H-5.)

• **OBVERSE 3:** Large date. The “large” size of the date is not immediately obvious, but upon study, the digits are indeed slightly larger, and are in the numeral size used the following year, 1797. The 6 in date plainly shows it was double punched; this is visible at the underside of the top of the 6 and the upper inside of the bottom loop. Stars at right are very closely spaced and touch or nearly touch their neighboring stars. Highest wave of hair is below upright of E and is very indistinct, probably due to very light relapping.

As the numerals bear a close relationship to those used in 1797, this obverse die was probably the final die cut in the 1796 year. Further, the lower right tip of R in LIBERTY is broken; the latest state of any of the four 1796 obverses.

Obverse die used to strike 1796 BB-65 only.

• **REVERSE D:** *Small letters. Leaf under A of STATES.* Seven large berries in wreath, and a very small 8th berry is made to show on inside stem of lowest sprig of leaves on left. Three leaves beneath eagle’s right (to observer’s left) wing, these having been added by hand in front of the cloud. Eagle punch impressed deeply and strongly into the working die; thus, coins from this die have much better breast feather definition than on BB-61. Wreath differs from any other variety, *several leaves touching* letters of legend. *Quickly identifiable by a lump at right top of I in AMERICA;* this lump *does not touch C* in the earlier state of the dies.

Note: This is the third and final Small Letters reverse die in the series. The others were the long-lived die first used to strike 1795 BB-51, later 1796 BB-62, BB-63, and BB-66 now relapped, 1797 BB-72, and 1798 BB-82, and another die used to strike 1795 BB-52. The obverse of BB-65 is believed to be the

latest die made bearing the 1796 date, but the reverse, the Small Letters style, is the style of 1795 and, possibly, early 1796, and was probably the first 1796 reverse cut (before the two Large Letters dies).

The reverse of BB-65 could have been made in 1795 but not used then.

Reverse die used to strike 1796 BB-65 only.

• **DIE STATES:**

Die State I: Perfect dies; obverse not relapped; reverse without lump at I in AMERICA on reverse. May not exist.

Die State II: Obverse lightly relapped, with highest wave of hair incomplete. Obverse is cracked from the 6th denticle right of numeral 6, extending vertically toward bust but not quite reaching bottom of drapery. Reverse: Prominent lump caused by piece out of the die at the upper right outside of I in AMERICA, extending upward toward the denticles and rightward toward C, but touching neither denticles nor C. The field of the coin is bulged outward in a small area below the lump (discernible only on higher grade coins). Letters I and C are joined by a short crack from a point just below the center of each letter. The noted bulge is between this crack and the lump. It is likely that this short crack establishes a lower limit for the “internal die break” or lump. Stars 2 and 3 are weak and are not defined at their centers, due to metal flow into the lump at I, which was opposite stars 2 and 3 when the dies were in the press. Most specimens seen are of this die state.

Die State III: As above, but the lump at I in AMERICA is now slightly larger and lightly touches the adjacent C. Scarcer than the preceding.

Die State IV. As III, but now the lump extends along the curve of the C closest to the I, and also has enlarged to the left, covering the vertical shaft of the I at one point. Scarcer than either II or III.

Die State V: Bolender-5a. The lump joins IC and extends past C. Rare.

Die State VI: The lump extends further, and there is noticeable die rust at ER in AMERICA (cf. Bowers and Merena 3/89: 1951 and others).

Note: There is really no end to the theoretical number of intermediary states. For this reason, most numismatists are content with but a single specimen of a given variety of a spe-

cific Bolender number. Collecting by die states has attracted a few numismatists over the years, primarily because Bolender gave much space to them. Today, interest in minute die state differences is minimal.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 18, Fine: 21, Very Fine: 62, Extremely Fine: 38, About Uncirculated: 11, Mint State-60 or better: 6. Total: 159.

• **COLLECTING NOTES:** 1796 BB-65 is the second most available (after BB-61) of the die varieties of the 1796 date. I estimate that 800 to 1,400 survive. While it is common in the middle circulated grades, BB-65 becomes a rarity in AU or finer.

Most specimens show light striking at stars 2 and 3 (due to metal requirements to fill the defect at I opposite in the dies in the press). A few have weak striking at first T in STATES on reverse.

• **NOTABLE SPECIMENS:**

Newman Specimen. MS-61. • Eric P. Newman Collection. Toned in gold, brown and green. Die State II.

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 601. Uncirculated with attractive patina.

Alto Specimen. MS-60. • Stack's, Alto Collection, 1970: 1063. Brilliant Uncirculated, with a prooflike surface. Perfectly centered, and very sharply struck. A superbly toned specimen, with splashes of golden and blue iridescence which enhances the overall beauty of this coin. Minute planchet defect on reverse edge. Full eagle's eye is seen. • S.S. Forrest, Jr. Collection, Stack's, 1972: 978. • Metropolitan New York Convention Sale, Stack's, 1975: 154.

DeCoppet Specimen. AU-55. James Kelly, André DeCoppet Collection, 1955. "Practically Uncirculated, a beautiful sharp specimen."

New Netherlands 54th Sale Specimen. AU-55. • New Netherlands 54th Sale, 1960: 1010. "Uncirculated. Weakly

struck in centers as usual. Considerable original mint frost. Slight peripheral tarnish." • Don Corrado Romano Collection, Stack's, 1987: 746. "Light steel and russet toning, the border of denticles complete on both sides."

Four Landmark Collections Specimen. AU-55. • Bowers and Merena, Four Landmark Collections sale, 1989: 1951. "Very sharply struck, Beautifully toned in shades of pale gray and iridescent golden brown. Several obverse die breaks can be seen, as made. A lovely, sharply struck specimen, with full and separate definition in Liberty's hair strands and folds in her gown on the obverse, and nearly complete feathering detail in eagle on reverse."

Flip-strike mint error. • Concerning a flip-strike specimen of Die State V, grade not stated, Bolender noted this in 1950: "Another specimen of this variety is a curious overstrike. The reverse is struck over the obverse of this variety, the date and stars showing plainly on the reverse."

1796 Small Date, Small Letters. BB-66.

(B-1. H-1.)

• **OBVERSE 4:** *Small date*; the 9 and 6 closer to-

gether than other figures. Highest wave of hair under upright of E; second highest wave under and

slightly to the right of the middle of R. End of hair tress touches innermost point of star 1 on its right, and continues slightly past it. The curly lock closest to the date barely touches the star point to the right of the innermost point of star 1 (magnification may be necessary to tell this; on BB-63 the curly lock clearly misses this star point). On BB-66, star 1 points at a denticle (on BB-63 it points to the space between two denticles). A point of star 15 points to a spot high on the drapery folds (on BB-63, it points to the middle of the drapery folds).

This obverse bears a close resemblance with that of BB-63, and specimens should be compared to it. This and the obverse die used to strike BB-61 and BB-62 were the first two obverse dies cut in 1796, and have the lower right tip of the R in LIBERTY intact.

Obverse die used to strike 1796 BB-66 only. I believe this obverse, although it was one of the first obverses made in 1796, was first used for coinage in calendar year 1798.

• **REVERSE B:** Described under 1795 BB-51, herewith repeated: Small Eagle. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. A short, prominent die scratch extends up to left from tip of right, inside leaf below (observer's) left wing. *Berry under A of STATES*; a quick way to identify this reverse.

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• **DIE STATES:**

Die State I: Perfect dies. Reverse die state the same as used on 1795 BB-51; no lapping yet (compare to die states of 1796 BB-63). May not exist with 1796 BB-66.

Die State II: Reverse die relapped, removing some details of the shallowest (lowest) folds in the wreath ribbon and removing about 50% of the lowest left leaf on the wreath (just below the U of UNITED). In the process, the border denticles were made smaller, and the rim, low to begin with, was nearly reduced to insignificance. This die state was also used to coin 1797 BB-72 and 1798 BB-82. As there was no longer much in the way of a protective rim on the reverse, this side of the coin wore away quickly in circulation. This is the only die state of 1796 BB-66 seen by the author. Thus, 1796 BB-66 was coined after 1796 BB-62 and BB-63. I consider it to be a strong possibility that 1796 BB-66 was coined in 1798, at or near the same time 1797 BB-72 and 1798 BB-81 were struck.

• **AUCTION POPULATION SURVEY:** Very Good: 8, Fine: 13, Very Fine: 16, Extremely Fine: 4, About Uncirculated: 2. Total: 43.

• **COLLECTING NOTES:** I estimate that 1796 BB-66 exists to the extent of 200 to 350 pieces, most of which are in grades from well worn to VF, with a very occasional EF and an even more infrequent

AU. No Mint State coins have been reported. The builders of other great collections were fortunate if they had a VF coin. Bolender's personal coin was VF, ex Primus C. Clark, 1932.

The typical 1796 BB-66 silver dollar is well centered and, if high grade, has excellent striking detail at the center of both sides. On worn specimens, the reverse details are typically less well defined than the obverse, as the reverse, lacking a satisfactory protective rim, wore away quickly. For this reason, grading of the variety is by the obverse only.

Another mystery involving early dollars is that surrounding the distribution pattern of 1796 BB-66. Why are most in lower grades as compared to, for example, 1795 BB-51?

• **NOTABLE SPECIMENS:**

Newman Specimen. MS-60/62. • Eric Newman Collection. Surfaces with pale gold, brown, and blue patina. Die State II.

Davis Specimen. AU-50. • R. Coulton Davis. • W.G. Baldenhofer; Stack's Farish-Baldenhofer Sale: 432. • A.J. Ostheimer, 3rd. • Gilhousen Collection, Superior, 1973: 1221. "Practically Uncirculated, deeply toned but with much mint lustre, light cabinet friction in very center of reverse, many central obverse adjustment marks." • Superior, 1975: 821.

Higgins Specimen. EF-40. • Bowers and Merena, Lloyd M. Higgins, M.D. Collection, 1988: 2209. Spectacular iridescent blue toning wreaths the obverse periphery, while its center is a bright golden brown. Even gray toning on the reverse, with undertones of pale gold.

Herdegen Specimen. Net VF-20 (EF-40, scratched). • Schulman, Herdegen Collection, 1973. EF, two scratches near wing, initials "H F" scratched on reverse below wreath. Toned.

Turoff Specimen. Net VF-20 (EF-40, retooled). • Bowers and Ruddy, Julius Turoff Collection, 1976: 1079. "EF and apparently well struck, but actually reinforced by some skillful retooling on Liberty's face. Excellent rims, edges and surfaces, graced by a light gray toning."

BB-72	B-2	H-2	URS-9	VF-21
BB-73	B-1	H-1	URS-12	VF-24

Coinage Context (all 1797 Varieties)

An extensive coinage: In 1797 the number of stars on the silver dollar was increased to 16. The coinage is said by government reports to be the lowest of any year from 1795 to 1803, although now it is believed that the numbers given are incorrect. I believe that most or all of the mintage of 7,776 coins reported for the calendar year may have been of earlier dates, and that most coins struck from dies dated 1797 were actually made in early 1798.

It is a virtual certainty that *many more* than 7,776 silver dollars were struck with the 1797 date. I estimate the number to be 60,000 (within about 10%). As noted earlier in the present text, numerous numismatic data suggest that the mintage of 1797 must have been about on a par with that of 1796, or not significantly different. (I estimate the mintage of 1796 to have been 75,000, not far from the official government figure for the calendar year of 79,920; however, some 1796 dollars may have been struck later as well, and part of the 79,920 number may have consisted of *1795-dated* dollars.)

As the estimated 60,000 1797-dated silver dollars could not have been struck earlier than 1797, and the quantity made is almost certainly far greater than 7,776, the only remaining possibility is that they were struck later, with the calendar year 1798 being the most likely candidate.

In 1797, production problems continued at the Mint. Sporadic coinage runs for silver dollars occurred in February, late May to late June, and in August. The Mint was closed from late August to late November, due to a yellow fever outbreak. Thus, the mintage for the calendar year was very small.

Numismatic Information

Rarity: Only two obverse dies and three reverse dies were employed for silver dollar coinage bearing the 1797 date. In his 1881 *Type-Table*, J.W. Haseltine called H-1 (equal to BB-73 today) rare, H-2 (BB-72), very rare, and said nothing about the rarity of H-3 (BB-71).

As a class, 1797 dollars are slightly more elusive than are those dated 1796, although auction data belie this (but only slightly). Mark Borckardt's survey of auction appearances yielded 490 listings for 1796-dated dollars and 552 for those of 1797.

Striking quality: Among extant 1797 dollars, striking quality is often irregular. The rims are often very boldly defined (the reverse rim of BB-72 being an exception), and yet the center of the obverse and the eagle on the reverse may be weak.

Number of dies used: The number of dies employed to create 1797-dated dollars is as follows:

1797 obverses, 2

1797 reverses, 3 (including one left over from 1795-6)

Die use averages: By dividing the number of obverse dies and the number of reverse dies each with the estimated mintage figure of 60,805 coins dated 1797, estimates of the average number of impressions per die can be obtained. In practice, one die might last a long time and another might break quickly; the figures here are averages, as noted.

Two 1797 obverses divided into an estimated mintage of 1797-dated dollars of 60,805 = 30,402 coins per obverse die.

Three 1797 reverses divided into an estimated mintage of

1797-dated dollars of 60,805 = 20,268 coins per reverse die (the inclusion of the long-lived BB-72 die, used also for later-dated coinage, distorts this figure).

Collecting 1797 dollars: A complete "set" of 1797 die varieties consists of but three coins, 1797 Stars 9x7, Large Letters (BB-73); 1797 Stars 9x7, Small Letters (BB-72), and 1797 Stars 10x6, Large Letters (BB-71). The total population of all 1797 dollar varieties combined is only slightly more than that for a single variety of 1795 dollar, the BB-27.

While as a class 1797 dollars are scarce, none of the three varieties is an impossible rarity. The toughest is the BB-72, but enough of these are around that an example can be found with relatively little looking. Some have suggested that it is rarer than a 1794

dollar, but I believe it to be more available.

Dollars of this date are a study in contrast. Rather than differing by some minor feature, each is almost a "type." Thus, acquiring one each of the three will be an especially fascinating pursuit. The quest is not advised for the buyer who is conditioned to want Mint State coins, or even AU pieces. Better, he turn attention to something such as Morgan or Peace dollars, where there is hope of fulfillment. A splendid goal for a set of 1797 dollars would be Extremely Fine, and Very Fine is closer to reality.

Among collectors seeking early silver dollars have been several to whom money was not a question. Even so, their collections were more likely to average below the EF grade than above it.

Summary of Characteristics: 1797

(All varieties)

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart),
model by John Eckstein

Designer of reverse: Robert Scot, model by John
Eckstein

Statutory weight: 416 grains; .8924 silver, balance
copper

Melting value (silver bullion value) in year minted:
Considered by Mint officials to be on a par with
the Spanish dollar, and worth about \$1.00 intrin-
sically (see discussion under Summary of Charac-
teristics, 1794).

Dies prepared: At least 2 obverse dies, at least 3 re-
verse dies (including one left over from 1795)

Business strike mintage, calendar year: 7,776 (for
all varieties of 1797 combined, not including
pieces reserved for the Assay Commission; for
1797 the number of assay coins is not known);
Delivery figures by day: February 28: 342; May 26:
1,060; June 30: 3,881; August 13: 2,071; August
28: 422.

**Estimated business strike mintage of 1797-dated
dollars (author's estimate):** (60,000).

Estimated quantity melted: As part of exports or
normal Mint redemptions.

Approximate population MS-65 or better: 0 (URS-
0)

Approximate population MS-64: 1 or 2 (URS-1)

Approximate population MS-63: 5 to 9 (URS-4)

Approximate population MS-60 to 62: 15 to 30
(URS-5)

Approximate population AU-50 to 58: 60 to 90
(URS-7)

Approximate population VF-20 to EF-45: 1,900 to
3,250 (URS-12)

Approximate population G-4 to F-15: 725 to 1,050
(URS-11)

Approximate population for all grades combined:
2,750 to 4,500 (URS-13)

• **CONDITION CENSUS:** 64-63-63-63-63-63

• **AVERAGE AUCTION APPEARANCE GRADE
for all varieties combined:** VF-24.

Characteristics of striking: Striking is irregular on
1797 dollars. Those with Small Letters reverse
(BB-72) always have a weak reverse.

Known hoards of Mint State coins: None

Proofs:

None

Commentary

Silver dollars of 1797 are nearly always encoun-
tered in low grades. The 1797 9x7, Small Letters re-
verse, is one of the most famous of all early dollars.

Additional Information

Dickeson on 1797 Dollars (1859)

The following appeared in Dr. Montroville W. Dickeson's 1859 book, *An American Numismatical Manual*:

"It is stated that the reverse was changed in this year, and a few trial pieces struck off. We have never met with them."

This commentary is enigmatic, and apart from the standard "Small Eagle" reverse, no distinctive design is known to modern numismatists, nor has any anomalous reverse been reported in numismatic literature after Dickeson's book.

Snowden's Commentary (1860)

The Cabinet Collection of the Mint of the United States, by James Ross Snowden, 1860, p. 108, told of the coinage of 1797:

"The silver coins of 1797 have *sixteen* stars—one star for each state. Tennessee, the sixteenth state, was admitted into the Union in the latter part of the preceding year."

The Year 1797 in History

John Adams was inaugurated president on March 4, 1797. Adams was to become the first president to occupy the White House (in 1800), and also the longest-lived chief executive; he died at the age of 90. What became known as the XYZ Affair came about when France declared that Jay's Treaty of 1794 amounted to American support for the British, who were enemies of France. Adams sent a delegation (Charles Cotesworth Pinckney, of South Carolina; John Marshall, of Virginia; and Elbridge Gerry, of Massachusetts) to Paris to

smooth over the situation, only to learn that three members of the French Directoire, known only as X, Y, and Z, attempted to extort money from the Americans. Pinckney and Marshall came back to report the incident, and Congress was outraged. Many members called for war, but President Adams acted as pacifist and quieted the outrage. The XYZ Affair gave rise to a slogan first used by Robert Goodloe Harper as a toast at a banquet the following year, June 18, 1798 and later used on many Hard Times (circa 1837) and Civil War (circa 1862) tokens: "Millions for defense, but not one cent for tribute."

In a 1797 meeting of the American Philosophical Society, Dr. Benjamin Rush argued that black people had skin of that color because of a disease like leprosy, and used as his "evidence" the case of a Virginia black man, Henry Moss, whose skin had lightened in color after he had moved to the North. In Philadelphia, a central water supply using water from the Schuylkill River went into operation, becoming the first such municipal system in America. (An improvement, the Philadelphia aqueduct, opened on October 19, 1801.) In the same city in 1797, an epidemic of yellow fever drove many to the countryside; at the time, the cause of the scourge was not known. Eli Terry obtained the first United States patent for a clock; it was assembled from wooden components. Charles Newbold was granted the first American patent for a plow.

In England, the Soho Mint, operated by Boulton & Watt, issued large-size copper coins, including the famous "cart-wheel" twopence. The steam-powered coinage devices in use in England were far more sophisticated than anything employed at the Philadelphia Mint at the time.

1797 Draped Bust/Small Eagle

Varieties

1797 Stars 10x6, Large Letters. BB-71

(B-3. H-3.)

• **OBVERSE 1:** 16 stars, *only six at right* facing bust. A die dot close to the bottom right of the second digit makes the date read 17.97 (some imagination is required); the last 7 is high. The star arrangement of 10 stars to the left and six to the right is unique in the dollar series.

Obverse die used to strike 1797 BB-71 only.

• **REVERSE A:** Large letters in legend. 8 berries in left branch. *Leaf ends under middle of E in STATES.* Lowest berry near ribbon bow is on *outside* of wreath. Large planchet. A leaf is almost below the T in UNITED, a berry is under the center of the first T in STATES, another leaf is past the O in OF and another leaf is very close to the R in AMERICA. Three leaves below eagle's right (observer's left) wing.

Reverse die used to strike 1797 BB-71 only.

• DIE STATES:

Die State I: Obverse and reverse die perfect; neither relapped. Obverse shows the highest wave of hair fully impressed in the die, stars perfect. May not exist.

Die State II: Obverse die relapped. Highest wave of hair, under upright of B, is incomplete. Stars appear spidery and imperfect. Stars 9 and 10 have the innermost points short-

ened. Slightly scarcer than the following.

Die State III: Obverse die relapped as above. Reverse relapped, removing the right edges of several palm leaves on the right side of the branch. The die state usually seen.

Die State IV: Die crack develops on and just below right foot of first A in AMERICA, and on right edge of palm leaf under center of that A. Very rare.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 7, Very Good: 21, Fine: 50, Very Fine: 82, Extremely Fine: 40, About Uncirculated: 17, Mint State-60 or better: 19. Total: 237. In my opinion, most of the Uncirculated coins, which primarily date from before 1986 when grading interpretations became stricter, would not merit the Mint State designation today.

• **COLLECTING NOTES:** 1797 BB-71 is about tied with BB-73 in terms of availability. I estimate that 1,250 to 2,000 are known. If anything, BB-71 is very slightly scarcer than BB-73.

As is the case with dollars of the two other varieties of this year, examples of 1797 BB-71 are usually seen in lower grades. However, several have been called Uncirculated over the years. Undoubtedly, most would not merit the grade by today's stricter interpretations of standards. However, any 1797

dollar that is a candidate for being in this grade is apt to be of the BB-71 variety. In October 1990, Superior sold a coin certified as NGC MS-64, which may be the finest known.

Specimens are seen on large or slightly smaller planchets. The large-planchet coins have the obverse denticles especially boldly defined. Those on smaller planchets have narrower rims.

• NOTABLE SPECIMENS:

October Sale Specimen. MS-64 (NGC). • Superior, October Sale, 1990: 3715. "Outstanding strike, surfaces, lustre and color. All stars are complete around Liberty, while all but the central detail on her rolling curls are as keen as a knife edge. Drapery around her frontal prominence is also nearly completely defined, showing clear separation from shoulder to curve. On the reverse, the wreath is complete throughout, and is so sharply defined. Every feather on the eagle is razor-sharp, and shows silvery lustre on top and within."

Newman Specimen, MS-63. • Eric P. Newman Numismatic Education Society. Brilliant lustre with pale blue and gold peripheral toning.

Auction '86 Specimen. MS-63. • Rarcoa, Auction '86, 1986: 727. "Well struck Choice Brilliant Uncirculated, with surfaced enhanced by the lightest essence of pale golden toning."

Austin Specimen. MS-63. • Bowers and Ruddy, 1974: 16. "Choice Brilliant Uncirculated. A few normal adjustment marks. Simply fantastic." • Kensington Collection, Bowers and Ruddy, 1975: 1214.

Carnegie Institute Specimen. MS-63. • Spink's Carnegie Institute Sale, 1982. The London firm of Spink & Son, Ltd. handled the Carnegie Institute (Pittsburgh) coins on the advice of their advisor, Lester Merkin. • Jascha Heifetz Collection, Superior, 1989: 2390. "Irregular toning of midnight blue, gold, and russet about obverse and reverse. The dies were well worn when this coin was struck making the reeding weak in areas. The eagle's breast feathers are almost complete, thigh feathers are a bit flat. Minor adjustment marks noted about reverse rim."

Baldenhofer Specimen. MS-60+. • W.G. Baldenhofer Collection; Farish-Baldenhofer Sale, Stack's. • A.J. Osheimer, 3rd Collection. • Gilhousen Collection, Superior, 1973: 1227. "Warmly toned Uncirculated, a number of reverse scratches on eagle. Well struck, frosty and beautiful." • ANA Convention Sale, Superior, 1975: 843. • Auction '85, Superior, 1985: 823. MS-60+.

Cleneay Specimen. MS-60. • Thomas Cleneay (Chapman brothers, 1890), Uncirculated.

Mills Specimen. MS-60. • John G. Mills (Chapman brothers, 1904), Uncirculated.

Gable Specimen. MS-60. • William F. Gable (S.H. Chapman, 1914), Uncirculated.

Golding Specimen. MS-60. • Golding Collection, Stack's, 1952: 221. • Harold Bareford Collection, Stack's, 1981: 410. "Brilliant Uncirculated, frosty lustre. A touch of friction on high points. An unusually bold strike with full hair detail. Light toning about the periphery."

DeCoppet Specimen. MS-60. • James Kelly, André DeCoppet Collection, 1955. "Strictly Uncirculated, original lustre and beautifully toned."

Robison Specimen. MS-60. • Ellis H. Robison Collection, Part II, Stack's, 1982: 823. "Brilliant Uncirculated, the usual soft strike in central portion but very nearly full feathers. Frosty mint lustre with a soft satiny surface. Delicate russet and iridescent toning."

Spies Specimen. MS-60. • Stack's, W. Earl Spies Collection, 1974: 36. "Uncirculated, full frosty mint lustre. Natural sea green, golden and iridescent toning, just a touch of friction on the cheek."

Wolfson Specimen. MS-60. • Stack's, Louis Wolfson Collection, 1963: 1374. "Brilliant Uncirculated, full mint bloom, superb iridescent steel blue toning. Usual weak strike in center of coin."

Smith Specimen. AU-58. • Elliot Smith Collection, J.C. Morgenthau & Co. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 620. "Only a hair's breadth from full Uncirculated. Not fully struck up at center upon either side; Liberty's drapery at shoulder and bust point weak, not rubbed, and eagle weak except at wings. Nicely centered, dulled lustre and blue-brown tarnish." • A.J. Osheimer, 3rd Collection, Lester Merkin, 1968: 243. "Blue and brown toned choice Uncirculated. Parts of face, drapery and eagle not well struck up but showing mint frost, the remainder needle sharp. Tiny spots and streaks, evidently in planchet before striking; minute bagmarks."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 1 (URS-1)

Approximate population MS-63: 4 to 7 (URS-3)

Approximate population MS-60 to 62: 10 to 20 (URS-5)

• CONDITION CENSUS: 64-63-63-63-63-60 (multiples)

1797 Stars 9x7, Small Letters. BB-72

(B-2. H-2.)

• **OBVERSE 2:** 16 stars, arranged 9 to the left and 7 to the right. Highest wave of hair, below upright of E, is lightly defined, probably due to insufficient depth of punching of the Draped Bust motif into the die (and not due to relapping). Prominent lump in field below star 9. Heavy die file lines in front of neck. One is vertical with several others slanting down to right.

Obverse die used to strike 1797 BB-72 (earlier) and BB-73 (later).

• **REVERSE B:** Described under 1795 BB-51, herewith repeated: Small Eagle. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. A short, prominent die scratch extends up to left from tip of right, inside leaf below (observer's) left wing. *Berry under A of STATES*; a quick way to identify this reverse.

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• DIE STATES:

Die State I: Perfect dies (no cracks). Earliest state of the obverse; equivalent to 1797 BB-73 Die State I. Reverse die relapped, equivalent to 1796 BB-63 Die State II.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 2, Very Good: 7, Fine: 21, Very Fine: 22, Extremely Fine: 15, About Uncirculated: 1. Total: 68.

• **ABOUT MINTAGE AND RARITY:** How many exist? 1797 BB-72 has been subjected to widely varying estimates of rarity over the years, with some observers stating that only about 20 are known, and others ranking the population at Sheldon's Rarity-4 (76 to 200). The latter is probably closer to the truth. I believe that 200 to 300 exist today, and believe that this figure is conservative (I wouldn't bet against someone who suggested that even more than 300

could be traced). At a convention a few years ago, I purchased four specimens for stock—something that one usually can't do if only 20 are known. At that rate, one would see a 1797 BB-72 dollar only about as frequently as an 1876-CC 20-cent piece (of which I believe about 20 are known)—but that isn't the case.

In reality, the fame of the 1797 BB-72 has been larger than reality. However, the BB-72 is still eminently desirable. It is just that quite a few more than 20 are known. In trying to track down why the issue has been listed as a *major* rarity, I concluded that the culprit is the low mintage of just 7,776 for the calendar year 1797. If only 7,776 were minted, and if 1797 BB-72 is the rarest variety of the year (which it is), then the mintage of BB-72 must have been some tiny fraction of 7,776. What might the mintage be? From that point, it was a short step to the inspection of the calendar year 1797 delivery figures by day: February 28: 342; May 26: 1,060; June 30: 3,881; August 13: 2,071; August 28: 422. The lowest figure, 342, fit the bill exactly; *q.v.*, 1797 BB-72 dollars were all delivered on February 28, 1797, and the mintage was 342. Neat idea. However, it doesn't square with the fact that nearly that many are known to exist today.

Robert P. Hilt III, in *Die Varieties of Early United States Coins*, 1980, stated that the mintage of Bolender-2 (BB-72) was not 342, but composed the entire production of 7,776 for the 1797 calendar year. He went on to suggest that if the survival rate of the issue was 1.45% of the mintage, 112 coins would exist today. He further stated that the other two varieties, Bolender-1 (BB-73) and Bolender-3 (BB-71), were struck in 1798. While I do not agree with all of the numbers, the Hilt theory comes far closer to what I consider to be the truth, than anything else I have seen in print. (I believe the mintage

of 1797 BB-72 to have been in the range of 4,000 to 4,500 coins, also probably minted in 1798; I, too, believe that BB-73 and BB-71 were minted in 1798, or at least a majority of each were.)

• **COLLECTING NOTES:** Of all 1797 varieties, the BB-72 is at once the rarest, best known, and most sought after. This issue occupies its own niche in numismatic literature, where it has been showcased as a rarity in some instances and ignored in others. Doubtless, it is the best known die variety of the 1796-1797 years combined. Indeed, it may well be the most famous variety after 1794 and before 1804.

While various cataloguers over the years have ascribed great rarity to 1797 BB-72, I believe that about 200 to 300 exist today, as explained in detail above.

In this die combination, the obverse shows very prominent and bold denticulation and excellent relief. The reverse, not deeply punched to begin with, and since relapped, always appears to be shallow and weak in comparison to the obverse, as the relapping largely destroyed what protective rim there was initially. Part of each reverse rim denticle has been ground away. Because of the low rim, a coin whose obverse grades VF, may have a reverse grading only VG. Typically, if a single grade is given, the grading is by the obverse only, although in the past there has been no consistency in this regard. A split grade such as VF/Fine or Fine/VG is more informative.

This Small Letters reverse die is famous in its own right, as already noted, and was mated with obverses dated 1795, 1796, and 1798, in addition to 1797.

Nearly all known specimens of 1797 BB-72 are in grades from VG to EF, with VF being most often seen. True EF coins are rarer than auction or other data suggest, as often grading has been on the liberal side for this rare variety. AU coins are virtually unheard of, the only one coming to my attention being the Carter specimen. Whoever carried it away for \$6,600 scored a real coup, in my opinion.

• NOTABLE SPECIMENS:

Newman Specimen. MS-62. • Eric P. Newman Numismatic Education Society. Die State I. Frosty lustre with lovely peripheral toning. Examined and graded by the author, March 1993.

Carter Specimen. AU-50. • Amon Carter, Jr. Collection, Stack's, 1984: 218. AU, frosty lustre.

Ebsen Specimen. EF-45. • Superior, Buddy Ebsen Collection, 1987: 1887. "Somewhat shallow strike, perfectly centered on a problem-free planchet. Surfaces still retain a good deal of lustre, particularly in the protected areas of devices. Attractively toned grayish violet highlighted by light golden and deepening to iridescence about the stars, date, etc."

Chalkley Specimen. EF-45. • Superior, Chalkley Collec-

tion, 1990: 2839. "Cloudy, old cabinet toning with blue highlights clinging to devices. A single rim bump below 1 of date has been partially repaired. Blunt reverse strike. Early die state with two points of recut star visible below star 9 on obverse."

Aspen Specimen. EF-45/40. • Bowers and Merena, Nelson Page Aspen, M.D. Collection, 1989: 361. "Traces of mint lustre noted around stars. Centering of obverse gives the coin a very pleasing cameo appearance, and both sides have rich golden, rose and gunmetal-blue coloration. Exceedingly faint tooling above Liberty's head, and there is evidence of removal of a spot in front of her mouth."

Austin Specimen. EF-40. • Bowers and Ruddy, Austin Collection, 1974: 14. "Choice EF. Exceptional strike [on obverse]. Reverse characteristically weakly struck." • Montgomery Collection, Bowers and Ruddy, 1976: 1426. EF, exceptional strike. Reverse weakly struck. • March Sale, Stack's, 1983: 930. EF. Exquisite orange-russet over gray.

French Specimen. EF-40. • Stack's, French Family Collection, 1989: 546. "Natural light gray with pink overtones."

H. Roland Willasch Specimen. EF-40 (ANACS). • Superior, H. Roland Willasch Collection, 1990: 465. "Deep blue and gold toning on obverse, even deeper gray color on reverse. Numerous tiny contact marks, and some planchet roughness. Early obverse die state with file lines connecting Liberty's neck to her chest and both points of the recut star visible in the field below ninth star."

Gross Specimen. EF-40. • J.J. Teaparty, June 1985. Sold to the following. • Yolanda Gross Collection.

Hollinbeck-Kagin Specimens. EF-40 • June, 1970: 603. "LIBERTY and outer portions of bust are quite sharp (grading EF to nearly Uncirculated), the legend, wreath, and outer portions of eagle also grade EF to nearly Uncirculated." • 21st MANA Convention Sale, Kagin's, 1973: 1301. "About EF with sharpest struck eagle we can recall seeing! Nominal even wear and without any nicks, scratches and other abrasions. Attractive bluish golden patina." • 50th Anniversary Sale, Kagin's, 1978: 808. "EF with attractive even toning. Remarkable sharp strike, stars and denticles full. Minute handling marks." • Atlanta Sale, Kagin's, 1987: 3224. "Very sharply struck EF-40 or better. Light mark in right obverse field and an old scratch on reverse running from edge below U and down to right. Faint adjustment marks visible below eagle's wing to right. Lovely light gray color with a touch of beautiful, iridescent blue toning on obverse and lustre beneath suggesting a higher grade."

Green Specimen. VF-30. • Col. E.H.R. Green Collection. • Davis-Graves (James Davis) Collection, Stack's, 1954: 1278 • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 242. "Nearly EF, with considerable mint lustre, weak in centers as usual, reverse exceptionally well struck for variety, wing feathers clear and part of breast feathers visible, claws and all leaves plain. Mint lustre around letters; gray tone, clean surfaces."

Herdegen Specimen. VF-30. • Schulman, Herdegen Collection, 1973. "Strong VF, with some light scratches."

Miller Specimen. VF-35/20. • Warren Miller Collection. Double struck.

• **CONDITION CENSUS:** 50-45-45-45-40 (multiples)

1797 Stars 9x7, Large Letters. BB-73

(B-1. H-1.)

• **OBVERSE 2:** See description under 1797 BB-72. Latest state of the die; struck after BB-72.

Obverse die used to strike 1797 BB-72 (earlier) and BB-73 (later).

• **REVERSE C:** Large Letters style. 8 berries in left branch. *Leaf ends under center of upright of E in STATES.* Lowest berry near ribbon bow is on *inside* of wreath. E of STATES lightly repunched. All of the A's in the legend show a curious defect at their upper left corners. A leaf points to the left corner of the I in UNITED, another leaf points to the left corner of the first T in STATES while another leaf points to the very end of the O in OF. Another leaf is positioned away from the R in AMERICA.

Note: Immediately after 1797 BB-73 Die State IV was coined, the reverse die was mated with a 1798 obverse and used to coin specimens of 1798 BB-82, Die State I. The die cracks advanced slightly during the coinage. When coinage of 1798 BB-82 was completed, the dies were re-mated with this 1797 obverse, and additional specimens of 1797 BB-73 were struck, with the reverse being in the same state as used to coin 1798 BB-82. It is likely that all specimens of 1797 BB-73 were struck at the Mint in calendar year 1798.

Reverse die used to strike 1797 BB-73 and 1798 BB-82.

• **DIE STATES:**

Die State I: Perfect dies (no cracks or clash marks). Ob-

verse die with pellet-shaped raised die flaw in field below innermost point of star 9, and about 40% of the distance from the star point to the hair. Some die roughness, probably as made, between star 1 and date. Die file marks in front of neck, described under BB-72, are present however not as strong. Most plentiful die state.

Die State II: Obverse die has been lightly relapped, removing most of pellet flaw below star 9. No obverse or reverse cracks yet. A plentiful die state.

Die State III: Bolender-1a. **OBVERSE:** A few delicate traces of arc-like clash marks are in the field before Miss Liberty's face and are so subtle that only high-grade coins show them; these are from the curved palm leaves on the reverse. The die has developed hairline cracks as follows: From denticle upward to outermost point of star 4, continuing through a point of star 5 to ribbon; crack from ribbon downward through hair curl, hair, bottom curl, to border. Minute crack from denticle downward to star 5. Crack from denticle through two bottom points of star 7 to ribbon. From bottom of 97 of date through bust drapery to star 15, minutely continuing through the centers of stars 14 and 13. From denticle toward (but not touching) star 15. Stars on right develop distended points toward the denticles. **REVERSE:** No cracks.

Die State IV: Bolender-1b. **OBVERSE:** As III. **REVERSE:** Cracks as follows: Crack in the field from the border above the upper left of D to the border above upper right of first T in STATES. Irregular vertical crack between branch and side of eagle's right (observer's left) wing. Light crack connects denticle with upper part of second T in STATES and continues downward to branch.

Die State V: Bolender-1c. Dies have clashed again. Now with severe clash marks in field front of Miss Liberty's face, especially from her nose to chin, and under ribbon behind head. Die cracks as IV, plus new cracks: From denticle through bottom of star 2 to hair; from 9th star downward to

ribbon. Crack from denticle toward star 15 now touches star 15. REVERSE: Additional cracks as follows: Crack from left base of N in UNITED through leaf tip to connect with separate crack from right base of I to branch. Crack from center of E through D continuing through S, curving upward to border through T. Crack connecting denticle with upper part of second T in STATES and continuing downward to branch is now much heavier from denticle to top of T. Crack from same T through ES to topmost palm leaf. Crack from tops of OF through center of AM.

Note: Specimens of 1798 BB-82 were struck from a die state intermediate between IV and V (crack later from the center of E through D, etc., now only from E onward; no crack from left base of N in UNITED). Specimens were also struck from Die State V (most usual die state for 1798 BB-82).

Die State VI: Die cracks advanced further from Die State V. Gilhousen (Superior, 1973): 1225 may be this state, there called "Bolender-1e," was described as "shattered and bulged;" ex Baldenhofer and Ostheimer collections.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 5, Very Good: 17, Fine: 47, Very Fine: 106, Extremely Fine: 52, About Uncirculated: 8, Mint State-60 or better: 10. Total: 246. Probably by today's standards, only a few (at best) of the 10 coins called Uncirculated in the past would be graded that high today; every one of these 10 citations dates before the 1986 "grading revolution."

• **COLLECTING NOTES:** The 1797 BB-73 dollar is usually seen with broad borders, a feature particularly noticeable on the obverse, where the denticles are prominently featured, but also to an extent on the reverse. The reverse is usually not as well defined as the obverse, due to the relatively low relief of the eagle motif. However, the breast feathers and other reverse details are usually excellent in higher grade specimens of earlier die states. Together with BB-71, the BB-73 is one of the two most available varieties of the year; both BB-73 and BB-71 are much more plentiful than BB-72.

Over 1,000 1797 BB-73 dollars are believed to exist; I estimate the population to be from 1,300 to 2,100. This variety is the most plentiful of the year, beating 1797 BB-71 by a tiny margin. Most examples of BB-73 are in the VF category, although quite a few EF pieces are known, and come on the market frequently. Coins realistically graded AU are rare—more so than conventional wisdom allows. True Mint State pieces are exceedingly—dare I say "excessively"?—rare. Although BB-71 is slightly scarcer than BB-73 in terms of all grades combined, in AU and Mint State, BB-71 is somewhat more available than BB-73.

• **NOTABLE SPECIMENS:**

Auction '83 Specimen. MS-63. • Stack's, Auction '83,

1983: 720. "Uncirculated and choice. Frosty lustre with extraordinary beautiful russet and iridescent toning. Usually very poorly struck, this specimen exhibits nearly full breast feathers and excellent hair detail."

Newman Specimen. MS-60. • Eric P. Newman Numismatic Education Society. Brilliant lustre with pale amber and green toning around the obverse periphery. Small burnished area on reverse below ribbon ends. Die State I.

Miles Specimen. MS-60. • R.L. Miles, Jr. Collection. • Stack's May 1974 Sale: 228. "Brilliant Uncirculated."

Stack's Spring Sale Specimen. MS-60+. • Stack's Spring 1978: 716, MS-60+.

Bergen Specimen. MS-60. • Herbert M. Bergen sale, Quality Sales, October 1979: 1346. • Auction '84, Paramount, 1984: 729. "Uncirculated-60. Lustrous surfaces, an exceptional strike and broad serrated borders. The obverse is frosty and the reverse is semi-prooflike with a few light planchet driftmarks. Light golden tone with some multicolored toning near the border."

Blauvelt Specimen. AU-58. • Bowers and Ruddy, Harold Blauvelt Collection, 1977: 493. "Sharply struck and lustrous borderline Uncirculated."

Harte Specimen. AU-58. • Bowers and Ruddy, Roy Harte Collection, 1977: 2784. "Borderline Uncirculated, small mark at top on the obverse. Quite lustrous."

Hollinbeck-Kagin Specimens. AU-55. • January 1970: 780. "Virtually Uncirculated with only slight friction." • Hollinbeck-Kagin, June 1970: 602. "Uncirculated golden." • Hollinbeck-Kagin, August 1970: 1075. "Virtually Uncirculated, only barest friction, pinpoint nick." • Hollinbeck-Kagin, September 1972: 1229. "Nearly Uncirculated, traces of lustre." • Tercentenary Sale, Part II, Kagin's, 1974: 606, Bolender-1b variety. "Nearly Uncirculated with superb golden patina, only slight friction." • *These may represent some duplicate listings.*

Bullowa Specimen. AU-55. • David M. Bullowa, sold to the following in 1953. • Norweb Collection, Bowers and Merena, 1988: 3750 was catalogued as AU-55 with bright, brilliant surfaces

Coinage Context

Designs used: The year 1798 saw the number of obverse stars decreased from 16 (used in 1797) to 13, the number that remained in effect throughout the remainder of the series. An exception is provided by BB-81, with 15 stars, an anachronism created by using a leftover undated die prepared in

1795 or early 1796 (before the 16-star format became standard following the admission of Tennessee to the Union), and dating it 1798.

Two reverse designs were employed: the older Small Eagle type (1798 BB-81 and BB-82) and the new Heraldic Eagle motif (all other 1798 varieties BB-91 to BB-125). The vast majority of 1798 dollars minted were of the Heraldic Eagle type.

As the obverses for BB-81 and BB-82 (which have old-style Small Eagle reverses) were made early in the year, and as these each have a knob to the bottom of the 9 in the date (Knob 9), it is presumed that the with-knob numeral style was also used earlier in the year for obverse dies that were mated with Heraldic Eagle reverses. Conversely, the Pointed Tail 9 issue dies are believed to have been made later.

As a date, 1798 dollars are fairly plentiful. Examples are encountered in all grades, although those in AU and Mint State must be deemed rare.

Mintage figures: Government mintage figures give 327,536 as the number of coins struck during calendar year 1798, and this is undoubtedly true. However, I suggest that about 140,000 to 150,000 of these bore earlier dates, including 1795, 1796, and 1797. I believe that much if not all of the silver dollar production from January through early May bore dates prior to 1798. This was an economy move, for it was known that once the 13-star Draped Bust obverse and the Heraldic Eagle reverse became standard, all earlier dies would become obsolete.

Similarly, I believe that the two 1798-dated varieties with Small Eagle reverse (BB-81 and BB-82) were struck during the first part of the year, quite possibly in May. After that point, with decks cleared and all obsolete dies of earlier dates and types used, the minting of 1798-dated dollars with Heraldic Eagle reverse began in earnest. By that time, at least 140,000 (estimated) earlier-dated dollars had been struck. Some 1798-dated dollars were probably struck later, some in 1799 and others in 1800. At the time, the Mint was not at all concerned with using dies during the year stamped on them.

I estimate that about 235,000 silver dollars (within about 10%) were struck bearing the 1798 date. I believe that about 35,000 were of the Small Eagle reverse type (1798 BB-81 and BB-82) and 200,000 were of the Heraldic Eagle type (all others). Coinage of these 1798-dated coins probably commenced in May 1798 and continued to 1799 and/or 1800.

Delivery dates: The delivery dates for silver dollars in calendar year 1798 are given below. Gold \$10 eagles may have used the same press, but this is not at all certain. It is possible that \$10 pieces were struck on a smaller press used to strike half dollars of similar diameter. The \$10 delivery dates, when known, are interspersed among the dollar delivery dates below.

Causes for the removal of a pair of dollar dies from the press would have included the following: 1. Need to use the press to coin \$10 pieces. 2. Need to remove a broken die. 3. Need to remove a die for relapping. 4. Closing of the Mint, as for the periodic yellow fever epidemics (at intervals 1797-1799), when dies were taken to a bank vault.

The removal of two dies at once—to make way for the coining of \$10 pieces in the press, or when the Mint was closed—would have ended one striking period (see later commentary concerning striking periods). Upon re-insertion of the dollar dies, another striking period would commence.

The 327,536 dollars (bearing various dates) minted in the calendar year 1798 were delivered as follows: (not including pieces reserved for the Assay Commission; these are given in parentheses). The annotations such as “production of” represent my opinion, not proven fact:

The delivery dates are given here, with \$10 gold delivery dates interspersed in *italic* type:

January 5: 30,372 (+3 for the Assay Commission) Production of 1795-1797 era dollars?

January 11: 1,648 gold \$10.

January 18: 8,770 (+3) Production of 1795-1797 era dollars?

January 20: 1,097 gold \$10.

January 23: 1,464 gold \$10.

January 27: 4,694 (+3) Production of 1795-1797 era dollars?

January 30: 2,023 gold \$10.

February 16: 25,500 (+3) Production of 1795-1797 era dollars?

February 17: 900 gold \$10.

February 28: 842 gold \$10.

March 23: 22,000 (+3) Production of 1795-1797 era dollars?

April 4: 35,500 (+3) Production of 1795-1797 era dollars?

April 14: 3,000 (+3) Production of 1795-1797 era dollars?

May 4: 39,000 (+3) Production of 1795-1797 era dollars(?) and some 1798 BB-81 and/or BB-82.

May 24: 10,000 (+3) Production of 1798 BB-81 and/or BB-82 Small Eagle reverse dollars.

June 11: 37,000 (+3) Some production of 1798 BB-81 and/or BB-82. Plus initial Heraldic Eagle dollars.

June 22: 15,000 (+3) Production of 1798-dated Heraldic Eagle dollars.

June 30: 7,370 (+3) Production of 1798-dated Heraldic Eagle dollars.

July 23: 3,000 (+1) Production of 1798-dated Heraldic Eagle dollars.

August 15: 32,720 (+3) Production of 1798-dated Heraldic Eagle dollars.

December 31: 44,610 (+3) Production of 1798-dated Heraldic Eagle dollars.

Numismatic Information

Die making: Working dies for 1798 dollars were probably prepared as follows:

Obverse: The bust of Miss Liberty was punched into the die, after which the letters of LIBERTY, the stars, and the digits in 1798 were all added with individual punches. In some instances, dies may have been made in advance with just the digits 179, with the final digit (8 or 9) to be added in the year it was used.

Reverse (Heraldic Eagle type): First, the Heraldic Eagle motif punch itself was made by an intaglio cutting of the eagle, shield, and ribbon design, after which a transfer master die or punch was raised (in relief), and the letters E PLURIBUS UNUM were individually punched in the ribbon. The master Heraldic Eagle punch included the eagle, clouds above the eagle, branch, leaves, and some rudiments of the lower parts of the arrows. This master punch, in relief, was punched into the center of the working die. Added separately to the working die were the letters of UNITED STATES OF AMERICA, the stars above the eagle, the olive branch, berries, the tops of the arrows, the arrowheads, and details of the lower parts of the arrows.

Attribution points for Heraldic Eagle reverse dollars: The elements on the obverse and reverse dies that were punched separately differ minutely in their placement from one another, and are a guide to attribution. The attribution points given below can be used for all varieties of the Draped Bust obverse, Heraldic Eagle reverse type dated from 1798 through 1804. Key points to check for differences include these:

KEYS TO ATTRIBUTING DRAPED BUST OBERSE DIES:

The stars are numbered beginning to the left of the date. On the standard 13-star obverse, star 1 is to the left of the date, and star 7 is next to the L in LIBERTY. Star 8 is adjacent to the Y in Liberty, and star 13 is near the bust. With this in mind, star positions of importance include these:

- Distance of star 1 from the date and/or the lowest curl.
- Distance of star 7 from the L in LIBERTY.
- Distance of star 8 from the Y in LIBERTY.
- Distance of star 13 from the bust.

Often, a comparison can be made, such as "star 7 is closer to the L than star 8 is from the Y or star 13 is from the bust," etc.

The positions of the stars in relation to each other are important. For example, among stars 1 to 7 on the left, an examination may reveal that one or two pairs are very close, and another pair or two are unusually widely separated. Similarly, stars 8 through 13 on the right will usually have noticeable positional differences.

The word LIBERTY can be examined for broken letter segments, and for the spacing between letters, although such spacing differences are often hard to discern.

The highest wave of Miss Liberty's hair in relation to the letters in LIBERTY is a useful guidepost. Usually, it is under the upright of the E, but sometimes it is more under the center of the E, or, very occasionally, toward the right. If a die has been relapped, often the highest wave of Miss Liberty's hair is indistinct or missing.

The date has several features, including the style of the numerals (Knob 9 or Pointed 9 among 1798 dollars), the shape of the 7, the distance of the numerals from each other and their alignment in relation to each other, and their distance from the lowest curl, the neck truncation, and the denticles.

KEYS TO ATTRIBUTING HERALDIC EAGLE REVERSE DIES:

Large Letters (used only in early 1798) or Small Letters (used later in 1798 and in all later years of dollars dated through 1804).

Placement of the letters in STATES OF in relation to the clouds below.

The leftmost one or two arrows and their position in relation to the UN of UNITED.

The arrow shafts, the arrowheads, and the arrow feathers, with regard to their placement, size, and appearance (note: if a die has been relapped or ground down, the arrow shafts will become thinner, and the arrowheads may be disconnected; this does not constitute a separate variety, just a separate die state).

The berries and their placement on the branch.

The end of the branch—its length, formation, and the direction in which it points.

The position of leaf tips in relation to the letters ICA in AMERICA.

The position of the first A in AMERICA in relation to the eagle's wing feathers (such differences are often minor, however).

The stars above the eagle, including the position of star point(s) in relation to the eagle's beak, the eight clouds, and to other stars. The star points in relation to the letters IBU in PLURIBUS are often used as points of differentiation.

The pattern of arrangement of the stars—arc or line.

The letters in E PLURIBUS UNUM.

ADDITIONAL ATTRIBUTION GUIDES (OBERSE AND REVERSE):

The following additional key points can be used if needed, but are not as popular as those already mentioned.

The relationship of star points, letters, or numerals to denticles can be used to differentiate dies, but is not usually employed when more obvious differences can be found.

By means of an optical measuring device, distances and relationships of letters, stars, motifs, etc., can be measured in millimeters. To date, this has not been a popular discipline.

DIE STATES AS AN ATTRIBUTION GUIDE:

Often, a particular die variety usually or always (so far as is known) is seen with a distinctive die crack. These can be used as attribution guides. A problem develops if a coin is of an unlisted die state, without the usual die crack, or if it has a die crack which has not been recorded in the literature. I suggest that die cracks be used to verify a variety and, of course, to help determine a die state. However, in all instances other points of difference should be examined to be sure that a given variety has correct positional relationships of stars, letters, etc.

EDGE LETTERING:

Each silver dollar of this era has the edge lettered HUNDRED CENTS ONE DOLLAR OR UNIT (plus ornamentation). As photographs do not usually include edge lettering, and as the edges of coins sealed in holders cannot be examined easily (if at all), it is not easy for a scholar to gain information. In the Washington token, half cent, large cent, half dollar, and pattern coin series, edge lettering has been studied in detail, but thus far, virtually no research has been done on business strike dollars of the 1794-1803 dates.

Russell J. Logan has written the following:¹

"As you are well aware, the sequence in which the working dies were made is not necessarily the same as they were used. . . . The life of the Castaing edge lettering machine dies used for the *half* dollars [a denomination studied by Logan in detail] was approximately three times longer than either the obverse or reverse dies; consequently, the information derived from studying their emission sequence is paramount in establishing the emission order of the coins. Identifying each silver dollar edge die by its own diagnostic features and then sorting by die wear is required for a striking emission sequence of this series."

Numeral styles: There are two basic styles of 9 on the 1798 obverse dies.

Knob 9: The first and earlier numeral style is the Knob 9, which is found on 1798 BB-81 and BB-82 (the Small Eagle reverse dollars made early in the year) as well as Heraldic Eagle reverse varieties BB-91 through BB-96.

Pointed Tail 9. The second and later numeral style is the Pointed Tail 9, used on all other varieties from 1798 BB-101 to BB-125.

The underside of the curved upper part of the Pointed Tail 9 has a little "spur" or metal burr extending downward to the left, from a defect on the number punch. In 1950, M.H. Bolender noted that he had seen the spur plainly on the varieties known today as BB-104, BB-105, BB-108, BB-109, BB-112,

BB-120, BB-122, and BB-123. As this spur is weak on some varieties and stronger on others, attribution should not be based upon this feature. Pointed Tail 9s, including many with spurs, are seen on all dollars dated 1799 as well.

The following commentary is by Walter H. Breen:²

It is known that Thomas Bingham cut a new 8 punch (small 8 for the Pointed 9 obverse coins), and that Mint Director Elias Boudinot paid him 50 cents for it on February 1, 1798; no one knows when obverses bearing it were used.

Type fonts/shield element lines: The Large Letters type punch font, first used on 1796 Draped Bust/Small Eagle dollars with Large Letters reverse, and distinguished by having slightly larger letters than used later in 1798, and in later years through 1803, was employed on two 1798 Heraldic Eagle reverse dies. These two dies each produced two varieties: 1798 BB-91 and BB-92 (from the first die) and BB-96 and BB-101 (from the other). It seems a virtual certainty that these were the first Heraldic Eagle reverse dies made in 1798, after which the Large Letters punches were abandoned in favor of the new Small Letters punches. This chronology is further borne out by their use (except BB-101) with Knob 9 obverses. BB-101—a Large Letters reverse mated with a Pointed Tail 9 obverse—indicates that dies were not always employed in the order in which they were made; this variety was struck later in the year.

Inspection will show that certain letters in the Large Letters font can be quickly recognized. The A in the Large Letters font has a larger interior space in the top than does the later Small Letters font, and is beveled at the upper left top of the letter. The S in the Large Letters font is more open, the C is larger and more open, and certain other letters display minor differences.

The two Large Letters reverses have another distinguishing feature, further strengthening the claim that they were the first made of the Heraldic Eagle type: Each vertical element in the shield is composed of *five* lines, whereas on all other 1798 reverses, and all other Heraldic Eagle reverses through the end of the early dollar series, each vertical element has just four lines.³

Among other features, the Small Letters font has a lopsided T, with the left serif shorter than the

¹ Excerpted and lightly edited from a letter to the author, January 11, 1993.

² Breen commentaries are those either created especially for this book or are from *Walter Breen's Complete Encyclopedia of U.S. and Colonial Coins*.

³ This five-lines characteristic was first pointed out to the author by Thomas K. DeLorey, letter dated January 13, 1993.

right. This Small Letters set of punches remained on hand at the Mint for many years, and in the 1830s it was used to create two Heraldic Eagle reverse dies as well as Draped Bust obverse dies dated 1802, 1803, and 1804 (details are given in chapters 5 and 6).

E PLURIBUS UNUM letters: The letters in E PLURIBUS UNUM vary in their apparent size (caused by different sizes of letter punches or the depth they were punched into the ribbon) and placement on certain varieties. Points of difference include the shapes and proportions of such letters as P, R, S, and U. Placement differences to note are the position of the U and S in PLURIBUS with regard to the edge of the eagle's neck on the left, and the placement of the N in UNUM in relation to the edge of the eagle's neck on the right. In general, letters in the motto were smaller in 1798 and 1799, and larger from 1800 onward. A challenge for the future is to catalogue the Heraldic Eagle punches using this and other features.

Reverse star patterns: The arrangement of the 13 stars above the eagle's head on the reverse can be divided into two separate styles for 1798:

- **Arc star pattern:** The stars are arranged in arcs, the topmost having six stars arranged in an arc and being closest to the clouds, the second having five stars arranged in an arc concentric below the first, and the two extra stars being one to the left of the eagle's head and the other to the right. The arc pattern dies were cut earlier than the line pattern dies, it would seem from their general use in earlier die combinations. In nearly all instances, the arc patterns were punched into the die in a pleasing manner. An exception is the reverse of 1798 BB-121, which has the leftmost star in the second arc too high and out of place. The arc pattern was the standard for certain silver and gold denominations through the year 1807. On silver dollars, the arc pattern was used on some 1798 dies, as noted here, all 1799 dies except one (1799 BB-182, the reverse of which was coined from a 1798 line star-pattern die used to coin 1798 BB-123 and 1798 BB-124), and all issues from 1800 onward.

The following 1798-dated silver dollar varieties have the arc pattern to the stars:

1798 BB-94, BB-95, BB-102 to BB-113, BB-116 to BB-118, BB-121, and BB-125.

- **Line star pattern:** This "line" pattern arrangement is called the "cross" pattern by Robert P. Hilt III and Walter H. Breen. The stars above the eagle are arranged in lines that are more or less straight,

with the star directly over the eagle's head being the center of a flattened X.

I recognize the line star pattern as three stars in a straight line beneath the clouds on the left, no star directly under cloud 4, and three more stars in a straight line beneath the clouds on the right; the straight lines are parallel to the cloud bottoms and are at an angle to each other. Below this pair of angled straight lines is a "peak" formed of five stars, peaking at the center (the star directly over the eagle's head). The two extra stars are arranged to the left of the eagle's head and the other to the right (as also on the arc style).

The line pattern of star arrangement appears on a few silver dollars dated 1798 and one dated 1799 (from a leftover 1798 reverse die) and on certain other denominations. Apparently, this arrangement was found to be unsatisfactory, for it was soon discontinued. To my eye, the line pattern is not as pleasing as the arc pattern. Breen notes that the 14-star "line pattern" dies used on the 1804 quarter eagles and the 1804-1805 dimes have the same letter punches of those of 1798, suggesting they were left over. The following 1798-dated silver dollar varieties have the line pattern to the stars:

1798 BB-91 to BB-93, BB-96, BB-101, BB-114, BB-115, BB-119, BB-120, BB-122 to BB-124.

1799 BB-182 also has the line star pattern and was struck from the reverse die used to coin 1798 BB-123 and BB-124; all other 1799 dollars have the arc star pattern.

Arrows styles: The arrows held by the eagle on the reverse can be grouped into two major categories as follows:

- **Early style arrows:** The four highest arrows on the right consist of, left to right, a fully developed arrow, a partially developed arrow or sometimes just a stick, and then two fully developed arrows. The three leftmost arrows consist of a stick or poorly developed arrow (which is the longest of the three), then two progressively shorter, fully developed arrows to the left. 1798 dollars with early style arrows include these:

1798 BB-91 to BB-96, BB-101, BB-102, BB-107, BB-108, BB-121, and BB-125.

- **Late style arrows:** The four highest arrows on the right have their arrowhead tips arranged in a gentle arc sloping downward to the right. These arrowheads are close together. The three leftmost arrows are progressively shorter, with the very leftmost arrow being significantly shorter than the

two to its immediate right. 1798 dollars with late style arrows include these:

1798 BB-103 to BB-106, BB-109 to BB-115, BB-116 (with some characteristics of early style arrows), BB-117 to BB-120, BB-122, BB-123, and BB-124.

Sequences: Among 1798-dated Draped Bust obverse, Heraldic Eagle reverse silver dollars, there are two sequences that can be followed. The first is of the time of die manufacture, and the second is of the time of die use. Each follows a different progression.

In general, it seems that the Knob 9 obverse dies were made first, as the Knob 9 numeral is found on 1797 dies (the year before). In contrast, the Pointed 9 obverses follow the style of 1799 and later years. Among Pointed 9 obverses, those with the numerals closer together may have been made earlier.

Among the Heraldic Eagle reverses, the two dies with large letters were probably made first, as the punches are from the 1796-1797 Large Letters font. Those with arc star patterns were made earliest (and incorporate the Large Letters font in two dies) and also latest. The line star-pattern reverses were made sometime in between.

A problem arises in that when 1798 silver dollars were struck, the use of the dies was not in the order in which the dies were made. As an example, the Large Letters reverse used to coin 1798 BB-94 and BB-95, both from early Knob 9 obverses, was also combined with a later Pointed 9 obverse to coin 1798 BB-102. Similarly, the other Large Letters reverse was used to coin 1798 BB-121, which employs a later Pointed 9 obverse.

Using the obverses as starting points, and employing die linkage, the following "striking periods" are observed:

STRIKING PERIOD 1.

1798 BB-81. Small Eagle, Small Letters reverse die of 1795.

STRIKING PERIOD 2.

1798 BB-82. Knob 9 obverse. Small Eagle, Large Letters reverse die of 1797. This striking marked the end of the era of the Small Eagle reverse, which had begun in late 1795.

1798 BB-91. Knob 9 obverse. Heraldic Eagle reverse type (as are all following). Large Letters on reverse.

1798 BB-92. Knob 9 obverse. Large Letters on reverse.

1798 BB-93. Knob 9 obverse. Small Letters on reverse.

1798 BB-94. Knob 9 obverse. Small Letters on reverse.

1798 BB-95. Knob 9 obverse. Small Letters on reverse.

1798 BB-96. Knob 9 obverse. Large Letters on reverse.

This striking probably marked the end of the use of dies with Knob 9.

1798 BB-101. Pointed 9 obverse. Large Letters on reverse. Probably, the first use of the Pointed 9 obverse.

STRIKING PERIOD 3.

Striking time indeterminate, but after Striking Period 2. This striking period could have been at any later time; it is not necessarily contiguous to Striking Period 2.

1798 BB-102. Pointed 9 obverse (as are all following). Small Letters on reverse (as are all following). To coin BB-102, the reverse die used to coin BB-94 and then BB-95 (after which it was removed from the press) was put back in the press and combined with a hitherto unused obverse.

1798 BB-103.

1798 BB-104.

1798 BB-105.

1798 BB-106.

STRIKING PERIOD 4.

Striking time indeterminate, but after Striking Period 2. This striking period could have been at any later time; it is not necessarily contiguous to Striking Period 2.

1798 BB-107. To coin BB-107, the obverse die used to coin BB-102 and then BB-103 (after which it was removed from the press) was put back in the press and combined with a hitherto unused reverse.

1798 BB-108.

1798 BB-109. Dies were removed from the press, and then used again (see next striking period, which may not have been contiguous). Perhaps the press had to be used for other purposes in the interim.

STRIKING PERIOD 5.

1798 BB-108. Additional coinage from this die pair.

STRIKING PERIOD 6.

This large interrelated group was struck at an unknown time after Striking Period 2.

1798 BB-110.

1798 BB-111.

1798 BB-112.

1798 BB-113.

1798 BB-114.

1798 BB-115.

1798 BB-116.

1798 BB-117.

1798 BB-118.

1798 BB-119.

1798 BB-120.

STRIKING PERIOD 7.

A stand-alone striking, not die linked to any other.

1798 BB-120.

STRIKING PERIOD 8.

A stand-alone striking, not die linked to any other.
1798 BB-121.

STRIKING PERIOD 9.

A stand-alone striking, not die linked to any other.
1798 BB-122.

STRIKING PERIOD 10.

Striking time unknown, but these varieties are candidates

for having been struck in 1799 or 1800.

1798 BB-123.

1798 BB-124.

1799 BB-182, which was used in a separate series of inter-related 1799 dollars, not *continuously* punch-linked to the 1798 group.

STRIKING PERIOD 11.

A stand-alone striking, not die linked to any other.

1798 BB-125.

Summary of Characteristics

1798 Small Eagle and Heraldic Eagle

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse (Small Eagle): Robert Scot, model by John Eckstein

Designer of reverse (Heraldic Eagle): Robert Scot (from the Great Seal)

Statutory weight: 416 grains; .8924 silver, balance copper

Melting value (silver bullion value) in year minted: Considered by Mint officials to be on a par with the Spanish dollar, and worth about \$1.00 intrinsically (see discussion under Summary of Characteristics, 1794).

Dies prepared (Draped Bust obverse, Small Eagle reverse): Obverse: At least 2; Reverse: At least 2 (1 left over from 1795)

Dies prepared (Draped Bust obverse, Heraldic Eagle reverse): Obverse: At least 17; Reverse: At least 19.

Business strike mintage, calendar year: 327,536 (for all 1798 varieties combined, not including pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: January 5: 30,372 (+3); January 18: 8,770 (+3); January 27: 4,694 (+3); February 16: 25,500 (+3); March 23: 22,000 (+3); April 4: 35,500 (+3); April 14: 3,000 (+3); May 4: 39,000 (+3); May 24: 19,000 (+3); June 11: 37,000 (+3); June 22: 15,000 (+3); June 30: 7,370 (+3); July 23: 3,000 (+1); August 15: 32,720 (+3); December 31: 44,610 (+3).

Estimated business strike mintage of 1798-dated dollars (author's estimate): 235,000 (rounded).

Estimated quantity melted: Normal melting and export.

DRAPED BUST OBVERSE; SMALL EAGLE REVERSE

(BB-81 and BB-82)

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 1 or 2 (URS-1)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 8 to 16 (URS-4)

Approximate population VF-20 to EF-45: 850 to 1,500 (URS-11)

Approximate population G-4 to F-15: 350 to 600 (URS-10)

Approximate population for all grades combined: 1,200 to 2,500 (URS-12)

• **CONDITION CENSUS:** 64-60-60-55-55-55

• **AVERAGE AUCTION APPEARANCE GRADE for both varieties combined:** VF-26.

Characteristics of striking: Varies. BB-81 always has the reverse weakly struck, due to the die characteristics.

Known hoards of Mint State coins: None

DRAPED BUST OBVERSE; HERALDIC EAGLE REVERSE

(BB-91 through BB-125)

Approximate population MS-65 or better: 1 or 2 (URS-1)

Approximate population MS-64: 2 or 3 (URS-2)

Approximate population MS-63: 8 to 12 (URS-4)

Approximate population MS-60 to 62: 30 to 65 (URS-6)

Approximate population AU-50 to 58: 175 to 350 (URS-9)

Approximate population VF-20 to EF-45: 5,000 to 9,000 (URS-14)

Approximate population G-4 to F-15: 2,000 to 4,000 (URS-13)

Approximate population for all grades combined:
7,000 to 14,000 (URS-14)

- **CONDITION CENSUS:** 65-64-64-63 (multiples)
- **AVERAGE AUCTION APPEARANCE GRADE for all varieties combined:** VF-25.

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

None

Commentary

1798 silver dollars exist with two major reverse types, Small Eagle and Heraldic Eagle, of which the former is much the scarcer.

Additional Information

Snowden's Commentary (1860)

The Cabinet Collection of the Mint of the United States, by James Ross Snowden, 1860, p. 108, told of the coinage of 1798 dollars:

"In 1798. . .the number of stars was reduced to thirteen, being emblematic of the original thirteen states. The reverses of the dollar and dime, which were the only silver pieces coined in this year, underwent an entire change, as follows: An eagle with raised wings, bearing the United States shield upon its breast. From its beak floats a scroll, inscribed 'E PLURIBUS UNUM.' In the right talon it grasps a bundle of thirteen arrows, and in the left, an olive branch. Above are clouds and thirteen stars. Legend. 'UNITED STATES OF AMERICA.' "

The Year 1798 in History

American resentment against France remained intense.¹ Over the objections of Vice President Jefferson, the first of four pieces of legislation known collectively as the Alien and Sedition Act, amending the Naturalization Act of 1795, was adopted, mandating 14 years of residence and a declaration of American allegiance five years before becoming a citizen. The second part of the act enabled the president to deport for a two-year period any alien considered to be dangerous to the nation. The third made it possible to arrest and deport any male aliens who were citizens or subjects of any country hostile to America. The fourth and most blatantly offensive to human rights provided for the arrest and imprisonment of anyone who attempted to disrupt the proper processes of the

government, to foment civil unrest, or to write, publish, or speak any false statement about the government, Congress, or the president. These acts were mainly the result of anti-French sentiment and a fear held by the Federalist Party that the strength of the opposing Democratic-Republican Party was increasing. Ultimately, the Alien and Sedition Act led to the dissolution of the Federalist Party.

Georgia forbade the further importation of slaves. At the time, the slave trade flourished, with many ships coming from Africa and the West Indies.

In 1798, Eli Whitney, under a government contract, used interchangeable parts to make firearms, becoming one of the first large-scale manufacturers to adopt a system of uniformity. By contrast, up to this time many machines and devices were made on an individual basis by fitting parts especially to them.

At the Park Theatre in New York, the play *Female Patriotism, or the Death of Joan de Arc* was staged. Joseph Hopkinson's play, *Hail, Columbia* was published. Among popular plays was *Speed the Plough*, by English playwright Thomas Morton; the chief character was Mrs. Grundy.

England had a poor wheat crop, and prices climbed to £12 per ton; few could afford the price, and there was widespread hunger. The "Essay on the Principles of Population," by Englishman Thomas Robert Malthus, posited that population increases geometrically while food production increases only arithmetically, a situation bound to cause starvation as the world population increases. Aloys Senefelder, a Bavarian printer, invented lithography.

¹ Harry E. Salyards, M.D. has furnished to the author a pamphlet titled *An Oration Spoken at Hartford...July 4th, 1798*, by Theodore Dwight. The atrocities being committed in France were outlined by Dwight, who also questioned Jefferson's patriotism.

1798 Draped Bust/Small Eagle

Varieties

1798 15 Stars; Small Eagle, Small Letters. BB-81.

(B-2. H-2.)

• **OBVERSE 1:** *15 stars.* The only 1798 dollar with 15 stars. Undoubtedly, this die was made in 1795 or before June 1796, during which time 15 stars were standard; the die was complete except for the date. In 1798 the uncompleted die had the date added and was used to coin this variety. (Alternatively and less likely, it could have been a die cutting error similar to the 1817 15-stars cent.)

The highest wave of hair is incomplete, probably from relapping, which also caused certain lower hair curls to be incomplete. B and R in LIBERTY each tilted slightly right.

Wide numeral 8 in date; with top interior space of 8 a horizontal oval and the bottom a circle; a punch unique to this obverse, not used elsewhere in the early dollar series (not for the 8 on later dates such as 1800, 1801, etc., which have vertical oval spaces within the 8). This distinctive 8 punch was regularly used on 1798 \$10 gold coins. It is possible that the obverse die was made circa 1795 but with just the first three date digits, 179, punched in; the final 8 could have been added in 1798 by selecting a punch from the wrong font. Squared-off bottom to 7.

Obverse die used to strike 1798 BB-81 only.

• **REVERSE A:** Described under 1795 BB-51, herewith repeated: Small Eagle. Small Letters in legend. Eagle stands on clouds. Wreath is composed of a palm branch (right) and olive branch (left), the latter with seven berries. *Berry under A of STATES*; a quick way to identify this reverse.

This identical die, now relapped (as it had been since the coinages of 1796), was used in combination with six obverses during its life. The definition on the reverse is weak, due to the lapping of an already shallow cut die.

Reverse die used to strike 1795 BB-51; 1796 BB-62, BB-63, and BB-66 (now relapped); 1797 BB-72; and 1798 BB-81.

• DIE STATES:

Die State I: Early state without obverse relapping; highest wave of hair boldly defined. May not exist.¹

Die State II: Lapped obverse die; without obverse die cracks. This is the state typically encountered.

Die State III: Obverse crack from under chin to border below star 15. Described by Warren Miller from his collection and not seen by the author.

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 3, Very Good: 6, Fine: 23, Very

¹ Mark Borckardt, in a note to the author, stated "One could speculate that this die was lapped before striking coins. If the die was made c. 1795 without the final digit, lapping may have served the purpose of removing small rust pits or other defects before use."

Fine: 43, Extremely Fine: 16, About Uncirculated: 13, Mint State-60 or better: 7. Total: 113. (Average grade: VF-26)

• **COLLECTING NOTES:** Of the two 1798 dollars with Small Eagle reverse (BB-81 and BB-82), BB-81 is the rarer by a slight amount. An estimated 500 to 800 exist. Most examples of BB-81 are seen in lower grades. VF is about par, even in some of the finest collections.

The 15-star count on the obverse (the type of '95 and '96) makes the 1795 BB-81 variety especially desirable as a major type. All other 1798 obverses, regardless of reverse type, have the standard 13 stars. The use of the much-mated Small Letters reverse die with this unusual obverse lends further interest. Here, indeed, is one of the most desirable varieties among early dollars.

Most if not all specimens of 1798 BB-81 have light striking at the centers of the topmost obverse stars. The bottom stars—especially 1, 2, 13, 14, and 15—are usually sharp. The reverse is always weaker than the obverse (an identical situation to that of 1797 BB-72), with the result that grading is by the obverse only. A coin with a VF-30 obverse typically has a reverse grading F-15 to VF-20.

• **NOTABLE SPECIMENS:**

Auction '87 Specimen. MS-60. • Superior, Auction '87, 1987: 1812. "The obverse is much sharper than the reverse. The surfaces are very lustrous and give no indication of rubbing or friction. Both sides are overlaid with rich tan gold toning; the obverse shows a number of adjustment marks at its center."

Clarke Specimen. MS-60. • James G. Macallister. • T. James Clarke Collection, New Netherlands 48th Sale, 1956: 621. "Strictly Uncirculated. The obverse, perfectly centered with bold denticles, is just about pristine. The reverse, off-center toward the bottom, shows the customary flatness at eagle's neck, breast and left leg, plus a very few infinitesimal marks. Delicate pink and blue iridescent toning."

FUN Convention Sale Specimen. MS-60. • Mid American, Florida United Numismatists. Convention Sale, 1987: 687. "Blue gray with some iridescent rose and silver at rims, adjustment marks across face; eagle's breast not fully struck."

San Diego Sale Specimen. MS-60. • Mid American, San Diego Sale, 1989: 715. "Surfaces are a bit dull. This piece may have been exposed to heat or, less likely, it may have been in sea water for a period of time."

Grand Central Convention Sale Specimen. AU-58. • Lester Merkin, Grand Central Convention, 1965: 301. "Better than AU; really an unworn coin with touches of cabinet friction on cheek, shoulder and eagle's breast. Mint lustre blends pleasingly with iridescent toning varying from char-treuse to pearl gray."

Shore Specimen. AU-58. • Superior, Shore Collection, 1988: 2197. "Shows no wear, just some rubbing on the high spots. Strike is exceedingly sharp with unusually strong definition on reverse. The obverse has a rich rose overtone which is accentuated by bursts of antique olive gold; the reverse is rose with faint lilac and gold undertones."

Anderson-Dupont Specimen. AU-55. • Stack's Anderson-Dupont Collection, 1954: 2500. "Uncirculated, full mint lustre, but weakly struck on center obverse and reverse. Faintly streaked planchet." • Harold Bareford Collection, Stack's, 1981: 412. "About Uncirculated with full frosty lustre." • Yolanda Gross Collection.

Hollinbeck-Kagin Specimens. AU-55. • June, 1970: 606. "Nearly Uncirculated with lustre." • 21st MANA Convention Sale, Kagin's, 1973: 1302. "Nearly Uncirculated with lovely blue and gray patina, some original mint lustre. Sharply struck with full edge dentilation around both sides!"

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 6 to 12 (URS-4)

Approximate population AU-50 to 58: 15 to 30 (URS-5)

Approximate population VF-20 to EF-45: 300 to 525 (URS-10)

Approximate population G-4 to F-15: 200 to 350 (URS-9)

Approximate population for all grades combined: 500 to 900 (URS-11)

• **CONDITION CENSUS: 60-60-60-60-60-60**

1798 13 Stars obverse, Small Eagle reverse, Large Letters. BB-82.

**(B-1. H-1.)**

• **OBVERSE 2:** 13 Stars (standard star count of the year), arranged 7 left and 6 right. Close date, knob 9, figures 98 close. Squared-off bottom to 7. The space between stars 6 and 7 is wider than the spaces between any stars 1 through 6. On the right, the space between stars 10 and 11 is wider than the spaces between any stars 8 through 13. Ray of star 13 points at junction of bosom and drapery.

Obverse die used to strike 1798 BB-82 (earlier use) and BB-91 (later use).

• **REVERSE B:** Small Eagle, Large Letters style. Struck from the same die used to strike 1797 BB-73. Eight berries in left branch. Lowest berry near ribbon bow is on *inside* of wreath. E of STATES lightly repunched. A leaf points to the left corner of the I in UNITED, another leaf points to the left corner of the first T in STATES while another leaf points to the very end of the O in OF. Another leaf is positioned away from the R in AMERICA.

This reverse die was used earlier to strike 1797 BB-73 dollars, Die States I through IV, then removed from the press and used to strike 1798 BB-82 Die State I (with cracks slightly advanced from 1797 Die State IV) and Die State II (equivalent to 1797 BB-73 Die State V), then the striking of 1798 BB-82 dollars was discontinued, and the reverse die was re-mated with the same 1797 obverse, and additional 1797 BB-73 dollars were struck.

Reverse die used to strike 1797 BB-73 and 1798 BB-82.

• **DIE STATES:**

Die State I: Obverse perfect (not relapped). Reverse as preceding. May not exist.

Die State II: Obverse die relapped. Highest wave of hair not fully defined. Lowest curl, near date, is incomplete. Stars

somewhat spidery. REVERSE: Crack in the field from the border above the upper left of D to the border above upper right of first T in STATES. Irregular vertical crack between branch and side of eagle's right (observer's left) wing. Light crack connects denticle with upper part of second T in STATES and continues downward to branch. Crack from right base of I (in AMERICA) to branch. Crack from center of E through D continuing through S, curving upward to border through T. Crack from same T through ES to topmost palm leaf. Crack from tops of OF through center of AM. (Equivalent to die state intermediate between 1797 Die State IV and V)

Die State III: Bolender-1a. (Equivalent to 1797 BB-73 Die State V) Obverse as preceding. Reverse with die cracks slightly advanced. Crack connecting denticle with upper part of second T in STATES and continuing downward to branch is now much heavier from denticle to top of T. Crack develops from left base of N in UNITED and goes through leaf tip to connect with earlier crack from right base of I to branch. Cf. Bowers and Merena, Somerset Collection, 1992, Lot 1318.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 4, Fine: 21, Very Fine: 55, Extremely Fine: 38, About Uncirculated: 7, Mint State-60 or better: 4. Total: 132. (Average grade: VF-27)

• **COLLECTING NOTES:** Of the two 1798 die varieties with Small Eagle reverse (BB-81 and BB-82), 1798 BB-82 is the more plentiful, but only by a slight margin. 1798 BB-82 is the only 1798-dated dollar with 13 obverse stars in combination with the Small Eagle reverse; all others are mated with the Heraldic Eagle reverse.

An estimated 700 to 1,000 1798 BB-82 silver dollars exist. Several hundred specimens exist, most of which are VF. EF examples are quite scarce, and any coin in better grade is rare. True Mint State coins are great rarities. I am not aware of any Mint State coin sold in recent years. The Thomas Cleneay listing below is "ancient history" numismatically.

• NOTABLE SPECIMENS:

Cleneay Specimen. MS-64. • The Thomas Cleneay Collection gem (Chapman brothers, 1890) may be the only truly Mint State example known and is arbitrarily designated as MS-64 in the Population Distribution below.

Farouk Specimen. AU-55. • King Farouk Collection, Palace Collections, Sotheby's, Cairo, Egypt, 1953. • A.J. Osheimer, 3rd Collection, Lester Merkin, 1968: 244. "Practically Uncirculated. Unworn, but showing signs of old cleaning, nowhere serious; much original mint frost; not too well struck up in centers, though more than half of breast feathers and part of leg feathers remain visible."

Kagin Specimen. AU-55. • Metropolitan Washington Convention Sale, Kagin's, 1980: 708. "Choice AU-55. Excellent sharpness of bust detail and stars with some faint 'Mint equalization' marks noted. Usual softly struck eagle on reverse but wreath is exceptionally bold and well defined. Lovely deep lavender on obverse with splashes of green and red." • GENA Convention Sale, Kagin's, 1981: 1336. • GENA Convention Sale, Kagin's, 1982: 456.

Stirling Specimen. AU-50+. • Mid-Winter ANA Auction, Heritage, 1986 • Warren Miller Collection.

DeCoppet Specimen. AU-50. • James Kelly, 1955. "Practically Uncirculated with some mint lustre."

Hollinbeck-Kagin Specimen. AU-50. • September, 1970: 884. "Nearly Uncirculated with lovely bluish golden color."

George III Counterstamp. • Octagonal counterstamp with portrait of George III, impressed by the Bank of England, to use the silver dollar as one of many substitutes for

British five-shilling pieces, which at the time were scarce in circulation. Howard D. Gibbs Collection, Hans M.F. Schulman, 1960: 100. Host coin EF. "There is one other specimen known, U.S. dollar 1798 in the British Museum." Oval (earlier) and octagonal (later) counterstamps were applied by the Bank of England on Spanish eight reales pieces (primarily) bearing the portrait of King Charles. Numerous counterfeit counterstamp punches were made by unauthorized parties. An oval stamp is known on a Flowing Hair 1795 dollar.¹

¹ Certain of this information is from Dr. Robert Stark, letter to the author, January 1, 1993.

1798 Heraldic Eagle

Varieties

1798 Knob 9; Heraldic Eagle. BB-91.

Line star pattern on reverse.

Large Letters reverse, 5 lines in each shield element.

(B-32.)

• **OBVERSE 2:** See description under 1798 BB-82. 13 stars.

Obverse die used to strike 1798 BB-82 (earlier use) and BB-91 (later use).

• **REVERSE C:** Large Letters reverse from 1796 type font (larger interior space in A, open S, etc.); 5 lines in each vertical shield element. This was one of the first Heraldic Eagle reverse dies cut in early 1798. Upper part of eagle's beak touches ray of star slightly in from its tip; star points to upper left serif of U in PLURIBUS. Line star pattern. Three stars on left between eagle's beak and clouds are more in a slightly curved line than in form of a triangle. Leftmost star is puny and undersized. Two eagle claw nails show within talons. Leaf points close to left corner of I in AMERICA, and 4th outside leaf tip is under right base of R in AMERICA. *Tip of branch points to tip of rightmost tail feather* (compare to reverses of BB-117 and BB-118, the only other 1798

reverses in which this is the case). Berry fairly close to right side of serif of left foot of A. Only 10 perfect arrows, one faint arrow, and two sticks (one of which extends to below center of I in UNITED). Three rightmost perfect arrows each have other arrows on top of them, with arrowheads visible part way down shafts. Raised die defects at AT in STATES.

Reverse die used to strike 1798 BB-91 (earlier use) and BB-92 (later use).

• **DIE STATES:**

Die State I: Obverse: Earlier state of the preceding. May not exist.

Die State II: Obverse: With failure at stars 6 and 7 and at base of L in LIBERTY. Faint die crack from ribbon to rim, between 3rd and 4th stars, another minute crack just left of 8 in date, from rim to bust, and another farther to the right, near the drapery end, from the center of a denticle.

• **AUCTION POPULATION SURVEY:** Good: 1, Fine: 4, Very Fine: 4, Extremely Fine: 2. Total: 11. (Average grade: F-19)

• **COLLECTING NOTES:** I estimate that about 10 to 20 exist of the variety here described as BB-91. The record is not clear on these, for over the years

the appellation "Bolender-32," equivalent to BB-91, has been assigned to a number of different unusual and/or otherwise unlisted issues.

This obverse was earlier mated with a Small Eagle reverse (style of 1795-1798) to create BB-82, a variety minted early in 1798. Accordingly, BB-91 was probably one of the earliest varieties struck with the Heraldic Eagle reverse.

• NOTABLE SPECIMENS:

Kagin Specimen. EF-40. • Kagin's, ANA Convention Sale, 1983: 2671. "EF-40 with light even wear and light shades of gray toning with traces of golden highlights. Slightly weak at 1:00. It appears some foreign substance was struck with the planchet resulting in a narrow, somewhat vertical, incuse area in hair of Liberty. Accompanied with ANACS certificate grading EF-40/40 and a description as having a Bolender-1 obverse, Bolender-4 reverse." • Yolanda Gross Collection.

Boyd Specimen. VF-20. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 59. "Haseltine-32. A reverse die crack extends from cloud under OF through 2 stars below it to right wing of eagle. VF."

Brooks Specimen. VF-20. • Bowers and Merena Galleries, Brooks Collection, 1989: 218. "VF-20. Toned in a pleasing pearl gray shade with light champagne and lilac highlights. On the obverse the 6th and 7th stars and the L in LIBERTY are lightly struck, a feature which is entirely due to the failure of the obverse die in the area behind Miss Liberty's head."

Baldenhofer Specimen. F-15. • W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A. J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 853. "Unlisted. Rev. of Bolender-4; obverse similar to Bolender-1. Minor die failure at sixth and seventh stars and L of LIBERTY. A curious tiny die crack from point of farthest ribbon, extending left, crossing lower right point of the fourth star, and ending up through the two upper left points of the third star. There also appears to be two even more minute cracks, one just right of the 8, from the bust to the denticles; and another, farther away, near bust point, extending to the center of a denticle. F-15, clean, but with the usual amount of handling marks."

MacFarland Specimen. F-15. • Bowers and Ruddy Galleries, MacFarland Collection, 1981: 1555. "Reverse of Bolender-4. Obverse of Bolender-1. More or less VF-20, with some local weaknesses at the top left stars from advanced die failure. Faint traces of lustre around the date, and the piece has a nice steel-gray tone. A few scratches in both obverse

fields, as illustrated. Faint die crack from ribbon to rim, between 3rd and 4th stars, another minute crack just left of 8 in date, from rim to bust. Minutely sharper than the ANA coin (1975). Blank area at upper left stars is more advanced and extensive, and L is practically obliterated." • Rarcoa, Auction '86, 1986: 728. • Superior Galleries, H.W. Blevins Collection, 1988: 3697. "F-12. Dark, somewhat irregular golden gray toning with some blue and violet color forming at the left reverses. A few old scratches in the obverse fields and another scratch which bisects the reverse shield. The hair appears to be expertly and lightly tooled." • Superior Galleries, H. Roland Willasch Collection, 1990: 515. "Bolender-1 obverse and Bolender-4 reverse. The obverse die bulged and buckled from the sixth star to the L of LIBERTY obliterating those devices. Planchets of this variety always appear to be out of round, rather oval in shape. The reverse die is always misaligned with the obverse so the right side of the denticles are weak. A few minor surface scratches on the obverse, as well as one under the left wing of the eagle on the reverse. Late die state with bulge at star six through the L obliterating these devices."

Connecticut Historical Society Specimen. F-12. • Bowers and Merena Galleries, 1983: 2047. "F-12 or better, with some areas of light striking. Attractive light gray surfaces."

Note: The Spies Specimen, Lot 110, EF-40, was described as obverse of Bolender-6 and reverse of Bolender-17. Since Bolender-6 and Bolender-17 shared the same reverse die, this would translate to obverse of Bolender-6 and reverse of Bolender-6 which, of course, would simply be Bolender-6, which is now BB-96.

1798 Knob 9; Heraldic Eagle. BB-92.

Line star pattern on reverse.

Large Letters reverse, 5 lines in each shield element.

(B-4. H-4.)

• **OBVERSE 3:** Knob 9. 13 stars, as are all the following. Squared-off bottom to 7 (seen only on BB-81 through BB-96; used with the Knob 9). Highest wave of hair incomplete at left (see note below). Upper left star near L, but upper right star is over 1.5 mm. distant from Y. Bottom two rays on star 4 are undersized. Stars 4 and 5 more widely separated than any other stars on the left; stars 8 and 9 most widely separated and stars 9 and 10 closest of any stars on the right. Digits 7 and 9 closest in date. The 1 in date is near curl but does not touch it. Curl open for a small distance at its top. Two die "dots" appear under E in LIBERTY, and two more on bust just above drapery, showing on all Fine or better specimens. Base of R above bases of adjacent E and T. Earliest die state.

Obverse die used to strike 1798 BB-92 (earliest state; more detail to highest wave of hair than on BB-93 or BB-94), BB-93, and BB-94 (top left of 1 in date is "lumpy"; possibly the latest state). Striking order probably BB-92, BB-93, BB-94.

• **REVERSE C:** See description under 1798 BB-91. Large Letters; 5 lines in each vertical shield element.

Reverse die used to strike 1798 BB-91 (earlier use) and BB-92 (later use).

• DIE STATES:

Die State I: Normal dies as described above. Presumably, there are intermediate die states between this and II described below.

Die State II: A late reverse die state has a crack at the rim through the right top of the second T in STATES down through its stand, the clouds, the stars and the right

(observer's left) wing to the N in UNITED and the rim below.

• **AUCTION POPULATION SURVEY:** Very Good: 1, Fine: 3, Very Fine: 16, Extremely Fine: 14. Total: 34. (Average grade: VF-27)

• **COLLECTING NOTES:** 1798 BB-92 is somewhat elusive. I estimate that about 200 to 350 are known, only a few of which have appeared in auctions over the years. Most specimens are in VF and EF grades. Some examples are lightly struck at the centers, while others are sharply defined.

• NOTABLE SPECIMENS:

1983 ANA Convention Sale Specimen. EF-45. • Kagin's ANA Convention Sale, 1983: 2664. "Sharply struck with full hair, wing and tail feather details. Pleasing deep gray and olive toning. Tiny rim nick on reverse but surfaces are exceptionally clean."

Chalkley Specimen. EF-45. • Superior, Chalkley Collection, 1990: 2847. "Boldly struck with superb centering and color. The fields boast the lovely gray with blue color that is found on original, uncleaned specimens. Only the highest curls of Liberty and the eagle's feathers show traces of circulation."

Emery-Nichols Specimen. EF-45. • Bowers and Merena, Emery-Nichols Collection, 1984: 928. "Sharply struck. Pleasing surfaces. Mottled iridescence glimmers vividly over lustrous surfaces."

GNA Convention Sale Specimen. EF-45. • Mid American, Georgia Numismatic Association Convention, 1989: 1414. "Bright silver toning, with additional reds and steel blue colors scattered over the surfaces."

Spies Specimen. EF-45. • Stack's, W. Earl Spies Collection, 1974: 43. EF to AU.

1981 ANA Convention Sale Specimen. EF-40. • Bowers and Ruddy, 1981 ANA Convention Sale: 2016. Rim nick above last letter of LIBERTY. Medium gray surfaces.

Lighthouse Specimen. EF-40. • J.C. Lighthouse Collection. • Bolender Collection, 1952: 41. "Reverse shows adjust-

ment marks done at Mint.” • W.G. Baldenhofer Collection to Stack’s Farish-Baldenhofer Sale. • A.J. Ostheimer, 3rd Collection • ANA Convention Sale, Superior, 1975: 851. “EF-40, beautiful iridescent bluish and sunset hues on the obverse, lustrous golden gray reverse. A bold strike, though not perfectly centered on the obverse. Faint reverse adjustment marks, as well as identifiable dent at D where the letter was hit with a blunt object.”

GENA Convention Sale Specimen. EF-40. • Kagin’s GENA Convention Sale, 1979: 371. Steel-blue patina.

Hollinbeck-Kagin Specimen. EF-40. • June 1970 Hollinbeck-Kagin Sale: 607. “EF and sharp with lovely patina, tiny nick.”

New Netherlands 57th Sale Specimen. EF-40. • December 1963: 1056. EF, usual center weakness.

Sears Specimen. EF-40. • Elmer Sears. Sold to the following in 1909. • Albert Fairchild Holden Collection. • Bowers and Merena, Norweb Collection, 1988: 3755. “Mottled light gray toning. Some darker streaks of toning are seen on the obverse and reverse and may have been the result of a rubber band coming into contact with the surface at one time. At the center of the obverse some Mint-caused adjustment marks can be seen. The piece is well centered and exceptionally well struck.”

Ostheimer Specimen. EF-40. • Lester Merkin, Ostheimer

Collection, 1968: 247. EF, centers stronger than usual though still somewhat indefinite.

New Netherlands Specimen. EF-40. • New Netherlands 57th Sale, 1963: 1056; EF-40, weak at the centers. • Superior, Dr. Charles Ruby Collection Part I, 1974: 1462. Strictly Extra Fine, very bold, lustrous, lightly toned.

Beymer-Gross Specimen. EF-40. • Jack Beymer, May 1985. Sold to the following. • Yolanda Gross Collection.

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 175 to 300

Approximate population G-4 to F-15: 25 to 50

Approximate population for all grades combined: 200 to 350 (URS-9)

• **CONDITION CENSUS:** 45 (multiples)

1798 Knob 9; Heraldic Eagle. BB-93.

Line star pattern on reverse.

(B-5. H-5.)

• **OBVERSE 3:** See description under 1798 BB-92. The top of the 1 in date is straight in BB-93, as in BB-92.

Obverse die used to strike 1798 BB-92 (earliest state; more detail to highest wave of hair than on BB-93 or BB-94), BB-93, and BB-94 (top left of 1 in date is “lumpy”; possibly the latest state). Striking order probably BB-92, BB-93, BB-94.

• **REVERSE D:** This variety is usually instantly identifiable by the heavy reverse vertical die crack

which runs from rim to rim on *most* known specimens. Because of this crack, all examples seen are weak at the center of the reverse, but somewhat stronger in the area to the right of the crack. Line star pattern. Star is very close to the outside of point of upper part of eagle’s beak; star ray points to right side of left upright of B in PLURIBUS. Right serif on foot of first T in STATES lower than left foot of adjacent A; right serif on foot of second lower than adjacent serif of E. Bases of letters AME and RI closer than ER. Berry below and distant from left

side of serif of right foot of A. Only 10 arrows, and three heads additional without sticks.

Reverse die used to strike 1798 BB-93 only.

• **DIE STATES:**

Die State I: Perfect dies without cracks. May not exist.

Die State II: Obverse die with tiny crack from rim to upper right serif of T in LIBERTY. "Virtually no breaks" on reverse. Cf. Spies Collection (Stack's, 1974), VF, there called "probably unique."

Die State III: Obverse as above. Reverse with die crack along right side of shield entirely across reverse, as described by Bolender. Crack from bottom of left upright of M in AMERICA, under M, to partly under E. Crack from border past second S of STATES (between S and bisecting crack). Die cracks up between lower right of tail and where bisecting crack reaches bottom border. The usually seen die state.

• **AUCTION POPULATION SURVEY:** Fine: 5, Very Fine: 7, Mint State-60 or better: 1. Total: 13. (Average grade: VF-20)

• **COLLECTING NOTES:** Despite the inclusion of three specimens in the 1975 ANA Convention sale (Superior), the BB-93 variety is quite rare today. I believe that only 30 to 50 exist. In 1950, the situation was far different when Bolender wrote this: "Haseltine had found but a single specimen (Fair), and I have seen but one. Excessively rare. Rarity 7." This is the old story again: A specimen is considered rare, then collectors search for it, and additional coins come to light.

• **NOTABLE SPECIMENS:**

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 608. "A choice virtually Uncirculated specimen showing only barest friction."

Willasch Specimen. VF-35. • Superior, H. Roland Willasch Collection, 1990: 476. VF-35. "Cleaned long ago with toning starting to form about the periphery."

Everson and Faught Specimen. VF-35. • Bowers and Merena, Everson and Faught Collections, 1988: 2219. VF-30 to EF-40. "A beautiful specimen with rich, glossy surfaces and splendid coppery, violet, and rose toning. Most design features are bold. 75% or more of Miss Liberty's hair details are

sharp, and most of the eagle's wing feathers are strongly defined. All stars, letters, and numerals on the obverse are exceptionally bold. Mint-caused adjustment marks are present on the obverse."

Four Landmark Collections Specimen. VF-30/20. • Bowers and Merena, Four Landmark Collections Sale, 1989: 1955. "Obverse toned a pale silver gray, while reverse is a lighter shade of gray. Split grading is accounted for by the extremely late state of the reverse, the die having cracked longitudinally from 12:00 to 6:00. Clearly, the advanced state of the die accounts for the rarity of the combination. While the obverse strike appears to have been sharp, the reverse is indeterminate because of the advanced state of the break."

Austin Specimen. VF-20. • K. P. Austin Collection. • A.J. Ostheimer, 3rd Collection • Superior, 1975: 854. Reverse with vertical die break along right side of shield entirely across reverse. "VF-20, clean, with a touch of gold."

Green Specimen. VF-20. • Col. E.H.R. Green Collection. • M.H. Bolender Collection. • A.J. Ostheimer, 3rd Collection. Lester Merkin, 1968: 248. "VF, clean, pale gold tone, tiny rim planchet defect."

December Sale Specimen. VF-20. • Stack's December Sale, 1987: 1520. "Light scratches, largely concealed by gray violet toning."

Spies Specimen. VF-20. • Stack's, W. Earl Spies Collection, 1974: 46. VF.

• **POPULATION DISTRIBUTION:**

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 1 or 2 (URS-1)

Approximate population VF-20 to EF-45: 18 to 25 (URS-6)

Approximate population G-4 to F-15: 12 to 20 (URS-5)

Approximate population for all grades combined: 30 to 50 (URS-6)

• **CONDITION CENSUS:** 55-40-35 (multiples)

1798 Knob 9; Heraldic Eagle. BB-94.

**Arc star pattern on reverse.****(B-3. H-3.)**

• **OBVERSE 3:** Knob 9. See description under BB-92.

Obverse die used to strike 1798 BB-92 (earliest state; more detail to highest wave of hair than on BB-93 or BB-94), BB-93, and BB-94 (top left of 1 in date is "lumpy"; possibly the latest state). Striking order probably BB-92, BB-93, BB-94.

• **REVERSE E:** Star distant from eagle's beak; ray of that star points to I in PLURIBUS. Arc star pattern. Three stars on left between eagle's beak and clouds form a right triangle with the hypotenuse parallel (more or less) to the top of the eagle's wing. Leaf points to space between I and R in AMERICA. Berry distant from and under left foot of A. Stem of branch curves outward.

Reverse die used to strike 1798 BB-94 (earliest state), BB-95 (intermediate state), and BB-102 (final state).

• DIE STATES:

Die State I: Perfect obverse die. Straight top to 1. May not exist.

Die State II: Upper left of 1 in date is "lumpy" and somewhat distended, apparently a die break. Most examples are of this die state.

Die State III: Die crack begins on rim, goes between stars 2 and 3, and ends at a ray of star 2. The two 1798 BB-94 coins in the Spies Collection (Stack's, 1974) were of this die state, as was Lot 363 in the Bowers and Merena 1989 sale of the Dr. Nelson Page Aspen Collection.

Note: Examples with bifurcated letters sometimes have ED of UNITED appear broken at top and the bottom points of many stars above the eagle are weak (due to lack of metal completely filling the voids); these are not separate die states.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 2, Fine: 6, Very Fine: 9,

Extremely Fine: 4, About Uncirculated: 1, Mint State-60 or better: 1. Total: 24. (Average grade: VF-23)

• **COLLECTING NOTES:** In the context of 1798 Heraldic Eagle dollars, BB-94 is one of the rarer varieties. Probably, somewhat over 150 are known, most of which are in lower grades up through Very Fine. At the EF level, BB-94 is rare, and higher grade pieces are rarer still. The only Uncirculated piece I have encountered in the literature is that in the Bolender Collection, 1952, since untraced; the grade equivalent of this coin today is not known.

• NOTABLE SPECIMENS:

Bolender Specimen. MS-60. • Bolender Collection, 1952: 40. "Uncirculated, except for a few tiny spots, and minute nicks visible under a glass, and the reverse die was worn making UNUM weak in motto. Beautiful sharp impressions, mint lustre on obverse, and full Proof surface on reverse."

Carter Specimen. EF-45. • Stack's, Amon Carter, Jr. Family Collection, 1984: 222. "EF and choice. Splendid gray and iridescent toning."

Blevins Specimen. EF-40. • Superior, H.W. Blevins Collection, 1988: 3641. "Obverse die crack between stars 2 and 3. EF-40. Beautiful natural violet-gray color. Exceptionally sharp strike with all details up and bold; including unusually well impressed denticles on the obverse."

Long Beach Sale Specimen. EF-40. • Heritage, Long Beach Sale, 1989: 798. "Natural golden-gray example with generous amounts of underlying mint lustre. Two small reverse rim bruises and a few adjustment marks on the same side."

Spies Specimen. EF-40. Double Struck. • Stack's, W. Earl Spies Collection, 1974: 41. "Freak specimen that was double struck. Stars are undersized because of the double strike, giving a coin a most curious appearance. EF."

Willasch Specimen. VF-35. • Superior, H. Roland

Willasch Collection, 1990: 474. "Deep gray fields with lighter devices. Well struck throughout, with each device fully brought up."

Ostheimer Specimen. VF-30. • Schulman Sale, October 1953. • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 246. "Classical VF grade, clean surfaces suggesting EF, edge planchet defect above I of LIBERTY."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 (URS-1)

Approximate population AU-50 to 58: 1 or 2 (URS-1)

Approximate population VF-20 to EF-45: 90 to 140 (URS-8)

Approximate population G-4 to F-15: 60 to 110 (URS-7)

Approximate population for all grades combined: 150 to 250 (URS-9)

• **CONDITION CENSUS:** 60-50-45-40 (multiples)

1798 Knob 9; Heraldic Eagle. BB-95.

Arc star pattern on reverse.

(B-7. H-7.)

• **OBVERSE 4:** Knob 9. 13 stars. Point of 1 touches curl. The 8 is high and very nearly touches bust. Squared-off bottom to 7 (seen only on BB-81 through BB-96; used with the Knob 9). Upper right star is slightly closer to Y than upper left star is to L. Die flaw about like a comma after date. The stars on the right are thinner than those on the left. On the left, stars 1-2 and 3-4 are closer than any others. On the right, stars 10 and 11 are closer together than any others. BB-95 is usually (always?) lightly struck at LIBERTY.

Obverse die used to strike 1798 BB-95 (early state only) and BB-96 (early state and late state).

• **REVERSE E:** See description under 1798 BB-94.

Reverse die used to strike 1798 BB-94 (earliest state), BB-95 (intermediate state), and BB-102 (final state).

• **DIE STATES:**

Die State I: Perfect obverse die. Perfect reverse die. The

usual state seen.

Die State II: Perfect obverse die. Reverse die with die crack from wing to I of AMERICA to border. Faint clash mark from bust is through OF.

Die State III: Obverse with crack as in BB-96. May not exist with BB-95.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 3, Fine: 6, Very Fine: 9, Extremely Fine: 2, About Uncirculated: 2. Total: 23. (Average grade: VF-20)

• **COLLECTING NOTES:** 1798 BB-95 is one of the scarcer varieties of the year. Probably, about 100 to 150 survive—a far cry from the situation in 1950, when M.H. Bolender wrote the following: "This combination is extremely rare, and I have found but two specimens. Rarity 6."

• **NOTABLE SPECIMENS:**

Auction '87 Specimen. AU-50. • Stack's, 1987: 778. "AU, superb light iridescent toning. The entire portion softly struck due to reuse of the die."

Walter Specimen. AU-50. • J.C. Morgenthau & Co. Sale, June, 1942: 140, Uncirculated. • Major Alfred Walter. • New

Netherlands 60th Sale, 1968: 547, "AU. A magnificently lustrous coin that displays much mint frost in combination with iridescent pale sky blue and gold tone. Unevenly struck up. Hints of what would ordinarily be called cabinet friction on either side."

Chalkley Specimen. EF-40 (NGC). • Superior, 1990: 2849. "A touch of weakness in the central shield lines, the balance being well struck."

H.W. Blevins Specimen. VF-35. • Superior, 1988: 4761. "Almost EF-40. Quite sharply struck, with the centers showing extremely good definition. The obverse and reverse both are toned to a rich natural smoky gray color with gold undertones. The surfaces are quite clean with a minimal number of abrasions; we note a few adjustment marks at the central obverse which are mostly hidden by the toning."

June Sale Specimen. VF-30. • Stack's, 1986: 210. "A strong VF, excellent surfaces, pale golden gray toning."

Long Beach Exposition Sale Specimen. VF-30. • Heritage, 1988: 960. "Medium gray, tinges of gold surrounding outer devices. Heavy adjustment marks across the obverse."

NASC Convention Sale Specimen. VF-30/25. • Kagin's, 1981: 550. "Nice sharp obverse with typical dished reverse

(eagle's neck and part of motto not fully struck up) with outer portions quite sharp and small portion of center less sharp."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 2 to 4 (URS-2)

Approximate population VF-20 to EF-45: 55 to 85 (URS-7)

Approximate population G-4 to F-15: 45 to 65 (URS-7)

Approximate population for all grades combined: 100 to 150 (URS-8)

• **CONDITION CENSUS:** 50-50-40-40-40-35 (multiples)

1798 Knob 9; Heraldic Eagle. BB-96.

Line star pattern on reverse.

Large Letters reverse, 5 lines in each shield element.

(B-6. H-6.)

• **OBVERSE 4:** Knob 9. 13 stars. See description under 1798 BB-95.

Obverse die used to strike 1798 BB-95 (early state only) and BB-96 (early state and late state).

• **REVERSE F:** Large Letters reverse from 1796 type font (larger interior space in A, open S, etc.); 5 lines in each vertical shield element. This was one of the first Heraldic Eagle reverse dies cut in early 1798. Ray of star is near center of space between two

parts of eagle's beak, but does not touch; star ray points to between B and U. Line star pattern. Leaf points to center of I in AMERICA. Only 10 perfect arrows, and two sticks (one stick is located between the 2nd and 3rd arrow shaft from the left and the other is between the 2nd and 3rd from the right). Often found with very heavy denticles and weakness of strike at the centers. The base of the first A in AMERICA is joined solid. This is an early state of the reverse die used to coin 1798 BB-101 (when BB-101 was coined, the two sticks were no longer present). The two rightmost arrow shafts on this die state each have two heads (and thus count as four arrows), the

third arrow shaft from the right is ghostlike (this style was used on other dies as well). This is the die state known to and described by Bolender.

Once relapped, the reverse die (as Die State V, described below) was used to coin some specimens of 1798 BB-101. If Die States VI and VII exist (I have not seen them), then the reverse was re-mated with the obverse of BB-96 and used to coin additional pieces.

Reverse die used to strike 1798 BB-96 (early and late states), BB-101 (latest state).

• DIE STATES:

Die State I: With perfect obverse and reverse dies, without cracks or relapping. May not exist.

Die State II: With perfect obverse and reverse dies without cracks, but with obverse die relapped; highest wave of hair incomplete, and stars spidery, as a result. Somewhat scarce, this die state seems to constitute about 20% to 30% of the population of BB-96.

Die State III: With obverse die crack from field below hair ribbon through star 1 toward 1 of date, but is interrupted with another crack below lowest curl going from crack to border; crack continues under 1, through bottom of 7, middle of 9. Reverse die still with 10 arrows and two sticks (not yet relapped). This is the most plentiful die state of BB-96.

Die State IV: As III, but crack develops on reverse at denticle over I of AMERICA. Enlarges slightly, and develops a spur extending toward R (there are several minor progressive variations of this crack under Die State IV). Reverse die not yet relapped.

Die State V: Bolender-6b. With obverse die crack now from hair ribbon through star 1 toward 1 of date, but is interrupted with another crack below lowest curl going from crack to border; crack continues under 1, through bottom of 7, middle of 9, to center of 8; advanced state of preceding. Additional hairline crack goes upward from border to bottom curl. Reverse die relapped; now with 10 arrows, but with two sticks ground away; 3rd shaft from left is discontinuous. Crack over I, with spur toward R, still visible. Perhaps 15% to 20% of BB-96 are of this die state. This die state was also used to coin 1798 BB-101.

Die State VI: Bolender-6a. Obverse crack heavier and more extended; continues from ribbon into hair curls. A crack has developed on the reverse through the arrows and N of UNITED. Constitutes a minor percentage of BB-96. Not seen by the author.

• **AUCTION POPULATION SURVEY:** Very Good: 6, Fine: 10, Very Fine: 33, Extremely Fine: 19, About Uncirculated: 6, Mint State-60 or better: 4. Total: 78. (Average grade: VF-27)

• **COLLECTING NOTES:** 1798 BB-96 is of medium scarcity within the context of varieties of this date, with an estimated population of 500 to 800 pieces. As is true of most other dollars of this era, the VF category is the most populous. EF examples

are in the distinct minority, and AU coins are rarer yet. Mint State records are for coins sold prior to the grading interpretation renaissance in 1986.

• NOTABLE SPECIMENS:

Alto Specimen. MS-63. • Stack's, Alto Collection, 1970: 1064. "Brilliant Uncirculated, full mint lustre. Attractively toned with light golden and blue iridescence. The surfaces are virtually flawless."

Robison Specimen. MS-60. • Stack's, Ellis H. Robison Collection, 1982: 1867. Brilliant Uncirculated, light golden iridescence. Full mint lustre. Struck slightly off-center at 1:00. Clear, sharp impression, wire edge on lower portion of coin.

Forrest Specimen. MS-60. • Stack's, S.S. Forrest, Jr. Collection, 1972: 981. "Deep serrated borders on most of the coin. Brilliant Uncirculated. Lustrous mint bloom. Deep blue-purple iridescence further enhances the beauty of this specimen."

Willasch Specimen. AU-55. • Superior, H. Roland Willasch Collection, 1990: 478. "Choice for the grade with hints of lustre in the fields graced with delicate golden toning."

Adams Specimen. AU-50 PCGS. • Superior, Adams Collection, 1992: 2110. "Medium gray color on obverse and reverse, evenly balanced and choice. Little evidence of lustre except very close to lettering and devices. Well struck except very center of horizontal shield lines. Struck from lapped dies, but the recutting on star five is still visible."

Ebsen Specimen. AU-50. • Superior, Buddy Ebsen Collection, 1987: 1894. "Very boldly struck and well centered on a perfect, problem-free planchet. The impression is quite strong with excellent center detail throughout Liberty. The peripheries are also bold with nice strong denticle definition, particularly on the obverse. The lustrous surfaces are overlaid with grayish violet and golden sunset toning on the obverse, while the reverse is mostly brilliant with some silvery gray overtones."

DeCoppet Specimen. AU-50. • James Kelly, André DeCoppet Collection, 1955. "Practically Uncirculated, stars and all details sharply struck."

First National Bank of Denver Specimen. AU-50. • Bowers and Merena, First National Bank of Denver Collection, 1987: 2221. "A very well struck specimen exhibits needle-sharp detail even under magnification. Light gray and golden toning." • Lloyd M. Higgins, M.D. Collection, Bowers and Merena, 1988: 2306.

Gross Specimen. AU-50. • Yolanda Gross Collection. Purchased from Heritage, Douglas Winter, in March 1984.

Spies Specimen. AU-50. Double Struck. • Stack's, W. Earl Spies Collection, 1974: 49. "Double struck with a double row of denticles, etc. Displays all of the cracks listed as Bolender-6a. AU, delicate iridescent toning."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 6 to 12 (URS-4)

Approximate population VF-20 to EF-45: 400 to 650 (URS-10)

Approximate population G-4 to F-15: 100 to 150 (URS-8)

Approximate population for all grades combined: 500 to 800 (URS-10)

• **CONDITION CENSUS:** 63-60-60-55-50 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-101.

Line star pattern on reverse.

Large Letters reverse, 5 lines in each shield element.

(B-17. H-17.)

• **OBVERSE 5:** Wide date, the 8 just touching bust. Date is over 11.5 mm. across at bottom widest part. Upper star on left very close to L, and upper star on right is near Y. Second star ray points slightly right of denticle. The denticles to left of date are irregular.

Obverse die used to strike 1798 BB-101 only.

• **REVERSE F:** See description under 1798 BB-96. Large Letters reverse, 5 lines in each vertical shield element. BB-101 is from an later state (Die State V as described under BB-96). On the BB-101 variety some berries appear without stems. Only 10 arrows, the two sticks seen on BB-96 having now been removed.

The reverse die was used to coin BB-96 dollars, reground and used to coin BB-101 Die State I dollars.

Reverse die used to strike 1798 BB-96 (early and late states), BB-101 (latest state).

• DIE STATES:

Die State I: Perfect obverse die without injuries. The Spies

Collection (Stack's, 1974), "Bolender-17a" from "finished dies" without obverse defects, may be Die State I. Walter Breen suggests (in his *Encyclopedia*, Breen-5379) that only one specimen may be known of this die state.

Die State II: Most known specimens have a readily visible die injury at Miss Liberty's left shoulder and another at the reverse field area near the stars. This is the state known to Bolender. Die crack just beginning over I of AMERICA. Equivalent to Die State V of 1798 BB-96. This is the usual die state of BB-101 seen.

Die State III: As preceding, but obverse die cracks along leftmost star rays (stars 2 to 5) and denticles on left side. Cf. Blevins Collection (Superior, 1988): 3680.

Die State IV: As preceding, but reverse crack now extends through letter R and into the field at the lower left of the letter. Cf. 1975 ANA (Superior): 876.

Die State V: On the latest die state, the die swells at the left obverse field and at the corresponding area of the reverse.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 4, Fine: 6, Very Fine: 7, Extremely Fine: 4. Total: 22. (Average grade: F-19)

• **COLLECTING NOTES:** 1798 BB-101 is another rare variety. Probably about 70 to 120 are known, most of which are well circulated. The average grade of F-19 is one of just a few to dip below the VF category. An AU or Mint State coin, if such could be found, would be regarded as a landmark item.

Haseltine's was only Good, the only one he ever found. In his 1881 *Type-Table*, he used his favorite adjective, "excessively," which he used excessively, to describe the rarity of this variety. Bolender only ever saw one, the VF coin that landed in his collection. The fact that numerous specimens have appeared since then, is testimony to the potential "out there" for locating still more examples of erstwhile and present rarities. Only a small number of 1798-dated dollars in numismatic circles have ever been attributed to Bolender numbers.

• NOTABLE SPECIMENS:

Miller Specimen. EF-45. • Warren Miller Collection. Die State III.

Smith Specimen. EF-40. • H.P. Smith. • Col. E.H.R. Green Collection. • O. K. Rumbel Collection. • ANA Convention Sale, New Netherlands 38th Sale, 1952: 3133. About EF. "A beautifully toned coin with considerable lustre, believed to be one of the three finest known specimens." • Bolender, April 1953: 277. • A. J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 259. "EF, much frosty lustre, delicate pastel toning."

Hollinbeck-Kagin Specimen. EF-40. • Hollinbeck-Kagin Sale, June 1970: 612. "EF with lustre, lovely patina."

Boyd Specimen. EF-40. • F.C.C. Boyd Collection, 1945. • Bolender Collection, 1952. • Dr. Charles Ruby Collection.¹ • Gilhousen Collection, Superior, 1973: 1236. "EF, lustrous, iridescently toned."

Higgins Specimen. EF-40. • Bowers and Merena, Lloyd M. Higgins, M.D. Collection, 1988: 2216, VF-35 to EF-40 (ANACS 40/40). "Condition Census, even medium silver gray toning on both surfaces. Nice detailing visible on Liberty's hair on the obverse and the eagle's wings and shield lines on the reverse. Obverse die sinking, bulge beneath Liberty's breast and behind her head. Pronounced crack visible running from above the first star to the rim above the seventh, accounting for the rarity of the variety. Plainly, the crack and bulging was severe enough to retire the die from service soon after its initial use."

Stirling Specimen. VF-30. • Frank M. Stirling Collection, Heritage, February 1986: 1335. "Pleasing russet brown toning scattered throughout."

Blevins Specimen. VF-30. • Superior, H.W. Blevins Collection, 1988: 3670. "Medium gunmetal gray with some faint golden undertones at the centers. Very well struck for the variety with full hair detail and sharp feathers; there is a bit of weakness at the right side of the shield. Die injury at Liberty's shoulder which has made the left obverse (and the corresponding reverse) fields appear quite swollen."

Willasch Specimen. VF-25. • Superior, H. Roland Willasch Collection, 1990: 493. "Steel gray and original with a single small mark above the bow of Liberty. Excellent rims and fields otherwise and truly a charming example of this scarce variety. Late obverse die state with cracks visible at the outer left star points and the dentils heavily lapped down. The reverse has a small crack from rim to I of AMERICA."

Baldenhofer Specimen. VF-20. • W.G. Baldenhofer. • Lester Merkin's Ostheimer Collection Sale, 1968. • Stack's, W. Earl Spies Collection, 1974: 80. "EF, mint lustre and delicate iridescent toning." • 1975 ANA Convention Sale, Superior. • Yolanda Gross Collection.

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 35 to 60 (URS-7)

Approximate population G-4 to F-15: 35 to 60 (URS-7)

Approximate population for all grades combined: 70 to 120 (URS-7)

• CONDITION CENSUS: 45-45-40-40-40 (multiples)

¹ Dr. Charles Ruby, a college professor in southern California, collected quantity, not quality, although this specimen of 1798 BB-101 is certainly an exception. His pride and joy was his extensive holding of 1793 cents, which he showed to me when Kenneth W. Rendell and I were guests in his home in August 1958.

1798 Pointed Tail 9; Heraldic Eagle. BB-102.

**Arc star pattern on reverse.**

(B-20. H-20.)

• **OBVERSE 6:** Wide date, 11 mm. across at widest part. 1 close to curl, 8 near bust but does not touch. Two upper stars near L and Y. First star nearly 4 mm. from hair. Ray of last star points to lower edge of a denticle. The obverse displays a prominent die chip between the left side of the 9 and the bust. The bottom stand of the T in LIBERTY is repunched.

Obverse die used to strike 1798 BB-102, BB-103, and BB-107.

• **REVERSE E:** See description under 1798 BB-94. From same die used to strike BB-94 and BB-95. The die crack that developed on BB-95 from right wing down through I in AMERICA to border has now become heavier. Another crack is below ER in AMERICA. The BB-102 reverse also has a number of die dots in and around the second cloud from the right plus a small crack from the O to the F in OF, to the lower part of the first S in STATES. Incused denticles (clash marks from the obverse) are often visible above ES and OF. Faint clash mark from bust is seen through OF.

Reverse die used to strike 1798 BB-94 (earliest state), BB-95 (intermediate state), and BB-102 (final state).

• **DIE STATES:**

Die State I: Die state as described above for BB-102.

Die State II. Rim crack below eagle's tail just beginning.

Die State III: Later state with a heavy rim break (which in its early development is often mistaken for a bruise or a nick) below the eagle's tail, extending to the last A in AMERICA.

Die State IV: The obverse die lump midway between center of date and bust becomes heavier. Reverse rim break enlarges.

Die State V: The reverse has an extended reverse break

which travels through ICA in AMERICA and nearly touches the eagle's tail. Die State V is extremely rare in any grade.

• **AUCTION POPULATION SURVEY:** Very Good: 4, Fine: 6, Very Fine: 10, Extremely Fine: 1, About Uncirculated: 2. Total: 23. (Average grade: F-19)

• **COLLECTING NOTES:** BB-102 is in the medium range of scarcity among silver dollars of 1798. Probably somewhere around 75 to 125 are known. The variety is one of only a few with an average grade below the VF level. A review of auction appearances demonstrates that here is a variety for which EF and AU are remarkable grades.

Exactly why 1798 BB-102 should be so elusive in any grade above VF is one of those mysteries that makes collecting early dollars so interesting. The answer probably lies in the method of distribution. I have no way of knowing, but perhaps most specimens were sent away from urban centers and saw hard use in the American hinterlands, which in the 1790s included just about everywhere except the eastern coastal cities.

• **NOTABLE SPECIMENS:**

Boyd Specimen. AU-50. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 45. "Barely circulated. Cabinet friction on high spots."

Kagin Specimen. AU-50. • Kagin's, CSNS Convention Sale, 1979: 362. "Unlisted die break on edge below eagle's tail. AU-50 with traces of lustre, nice strike."

Miller Specimen. EF-40. • Warren Miller Collection. Weak reverse with adjustment marks in shield.

Fairbanks Specimen. EF-40. • Stack's, Fairbanks Collection (formed by Ben Koenig), 1960: 545. "EF choice. Mint lustre."

Ruby Specimen. VF-25. • M.H. Bolender • Dr. Charles Ruby • Superior Galleries, ANA Convention Sale, 1975: 879.

"Reverse rim break below eagle's tail. Pearl gray tone and partly iridescent reverse. Weakly struck up in the centers as usual and slightly off center. Unlisted die state."

Willasch Specimen. VF-25. • Superior Galleries, H. Roland Willasch Collection, 1990: 496. "Medium steel color and well struck but for the central devices. Some minor adjustment marks in the central reverse contribute to the weakness. A heavy rim cud has developed below the eagle's tail to the A in AMERICA. One area on the rim near Liberty's bust may have been worked on, as the rim pulls in at that point on the obverse and reverse. Rare die state. The break from the rim through the I of AMERICA extends to the tip of the scroll and another parallels it along the base of E and through R."

Baldenhofer Specimen. F-15 net. (VF-25, edge damaged).
• W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955
• A. J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 880. "Rainbow toned, and very decent, but someone shaved a small piece off the edge above D of UNITED."

Approximate population for all grades combined: 75 to 125 (URS-8)

• **CONDITION CENSUS:** 50-50-45-45-35 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-103.

Arc star pattern on reverse.

(B-18. H-18.)

• **OBVERSE 6:** See description under BB-102.

Obverse die used to strike 1798 BB-102, BB-103, and BB-107.

• **REVERSE G:** Branch with five medium sized berries, the two top ones closest together. Leaf point below lower left corner of I in AMERICA. Star distant from eagle's beak. Arc star pattern. 13 arrows.

In 1950, Bolender wrote this: "Die break from milling down through right part of E in STATES to clouds. This break has been seen on all specimens examined. Die breaks through last S in STATES and top of OF. Light die crack from top of N to base of D in UNITED."

However, it seems that Haseltine (see below) knew of at least two coins with perfect reverse (and

knew of none with die cracks). Some specimens of BB-103 were struck from this die in perfect condition, then the reverse die was combined with another obverse to create BB-104, some specimens were struck, then a crack developed through the E, during which state most specimens of BB-104 were made. Then the crack advanced to the shield, some specimens were struck, then the reverse was recombined with the first obverse die to create additional specimens of BB-103, the reverse die by now having sustained additional cracks.

Reverse die used to strike 1798 BB-103 (early and late states) and BB-104 (intermediate states).

• **DIE STATES:**

Die State I: Perfect reverse die. Unknown to Bolender. Spies: 80 is this state. This die state is also known on 1798 BB-104. Rare die state for BB-103.

Die State II: Reverse die cracked through E of STATES.

Known on 1798 BB-104. May not exist on 1798 BB-103.

Die State III: As II, but die crack now extending to shield. Known on 1798 BB-104. May not exist on 1798 BB-103.

Die State IV: Reverse with die crack from border down through right part of E in STATES to clouds. This crack has been seen on all specimens examined by Bolender. Die cracks through last S in STATES and top of OF. Light die crack from top of N to base of D in UNITED. The usual die state for BB-103.

• **AUCTION POPULATION SURVEY:** Very Good: 4, Very Fine: 1. Total: 5. (Average grade: VG-10)

• **COLLECTING NOTES:** The 1798 BB-103 dollar is an extreme rarity and shares honors with BB-117 as one of the two most elusive die combinations of the year. Apparently, only five to 10 are known, with the population most likely being toward the low end of that range. BB-103 has the lowest average auction grade of any 1798 dollar (a distinction based upon an admittedly small population).

This high rarity seems anomalous, when one considers that the progressively failing reverse die used to coin 1798 BB-103 went on to strike many examples of 1798 BB-104, and the still usable obverse later was employed to strike a large number of 1798 BB-107 dollars. If the rarity observations are accurate (and not just due to the lack of attribution of sufficient early dollars), the die marriage used to create 1798 BB-103 must have been interrupted on a whim.¹

In writing of this variety, Bolender said the following (*italics ours*) in reference to the die crack on the reverse: "This break has been seen on *all* specimens examined." Usually, Bolender erred on the side of rarity; many specimens later proved to be not as rare as he said. The term *all* seems to indicate that he saw more than one with a reverse die crack. He designates BB-103 as Rarity-8 (presumably, on the Sheldon Scale, but Bolender never said what his rarity ratings meant); if so, he felt that two or three specimens of BB-103 existed with the die crack.

J.W. Haseltine designated H-18 (now, BB-103) as "excessively rare" in his pioneering 1881 monograph on early silver dollars. Apparently, he saw multiple specimens, none of which had the reverse

die crack (for he mentions under BB-104 that in this later use, the reverse die was broken through the letter E in STATES). Had he seen just one, he probably would have said so (as in the case of 1795 H-13, for example, of which he noted this: "Probably unique, as I have never seen or heard of another of this variety"). Based on this, it would seem that Haseltine had seen multiple specimens of 1798 H-18 (BB-103) without the crack.

• NOTABLE SPECIMENS:

Boyd Specimen. VF-20. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 43. "VF with slight edge dent."

Haines Specimen. VG-8. • S. H. and H. Chapman, Ferguson Haines Collection, 1888: 233. "VG. Shows file marks in planchet." Possibly one of the above.

Spies Specimen. VG-8. • Stack's, W. Earl Spies Collection, 1974: 82. "Reverse struck with unknown perfect dies. VG, with central portion very weak." • Superior Galleries, H.W. Blevins Collection, 1988: 3671. "VG-8. Even, natural gun-metal-gray coloring. The obverse shows some weakness of strike in the center; the reverse is extremely weak at the center; this is probably the result of die failure, and is probably the reason why this variety is so rare. The surfaces are extremely clean with no flaws that are not Mint-made; there are some adjustment marks at the center of the reverse."

Willasch Specimen. G-4 net. • Superior Galleries, H. Roland Willasch Collection, 1990: 494. "VG-10. Heavy scratches in the left field and another on Liberty's hair which have been buffed down. Some adjustment marks are visible in the center of the obverse. Cleaned and starting to tone to a medium gray. Early die state without the crack at the E of STATES on the reverse, unknown to Bolender."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

• **CONDITION CENSUS:** 20-10-8-8-8

¹ Information in this paragraph suggested by Harry E. Salyards, M.D., letter to the author, January 19, 1993.

1798 Pointed Tail 9; Heraldic Eagle. BB-104.

**Arc star pattern on reverse.****(B-22. H-22.)**

• **OBVERSE 7:** Wide date, the 8 firmly united with bust. This die is similar to BB-101, but the upper stars, while near L and Y, are not as close to them as in BB-101; on this the 7th star points directly at the lower left serif end of L, while on BB-101 the star points slightly above the serif end. Second star points to a space between two denticles, third to left part of a denticle. Flaw on star 4. Slight die crack under Y and 8th and 9th stars, shows on some specimens.

Obverse die used to strike 1798 BB-104 (early state) and BB-105 (early and late states).

• **REVERSE G:** See description under 1798 BB-103. Bolender said nothing about the die state of the reverse in the mating that created BB-104, except that BB-104 was struck "from same die as Bolender-18" (equivalent to BB-103). However, Haseltine in 1881 stated that the reverse had a die crack from the rim through the E of STATES, but said nothing about any other cracks. Some specimens of BB-103 were struck from this die in perfect condition, then the reverse die was combined with another obverse to create BB-104, some specimens were struck, then a crack developed through the E, during which state most specimens of BB-104 were made. Then the crack advanced to the shield, some specimens were struck, then the reverse was recombined with the first obverse die to create additional specimens of BB-103, the reverse die by now having sustained additional cracks.

Reverse die used to strike 1798 BB-103 (early and late states) and BB-104 (intermediate states).

**• DIE STATES:**

Die State I: Perfect reverse die. Cf. W. Earl Spies Collection (Stack's, 1974), which had two perfect-die coins, one with regular letters and the other with bifurcated letters (which do not constitute two different die states). This state was used to coin early specimens of 1798 BB-103.

Die State II: Reverse die crack through E of STATES just beginning. Gilhousen's (Superior, 1973) is VF-35.

Die State III: Reverse die cracked through E of STATES only. The die state mentioned by Haseltine as normal for this issue. The variety usually seen.

Die State IV: As II, but now with die crack extending to shield. Cf. Spies Collection coin (Stack's, 1974), VF. Very rare.

Die State V: With the additional cracks mentioned by Bolender for BB-103; may not exist on BB-104.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 6, Fine: 5, Very Fine: 19, Extremely Fine: 10. Total: 41. (Average grade: VF-22)

• **COLLECTING NOTES:** 1798 BB-104 is in the middle range of availability among dollar varieties of this date. Several hundred are believed to exist, an estimated 225 to 400. Most are in lower grade ranges, but enough EF coins exist that a purchase opportunity will occur every few years on the auction market, and perhaps even more often privately. Above EF, specimens are very rare. The variety may be unknown in Mint State.

• NOTABLE SPECIMENS:

Herdegen Specimen. AU-50. • Hans M. F. Schulman, R.T. Herdegen Collection, 1973. "AU, showing faint wear on rather weakly struck center. Prooflike surface, but very likely a first strike."

Wyatt Specimen. EF-45+. • Superior Galleries, Russell and Eudora Bell Wyatt Collection, 1985: 2028. "Uniformly struck on a problem-free planchet. A trifle off-centered with wonderful frosty mint lustre throughout. All is overlaid with

a film of pale grayish-violet."

New Netherlands Specimen. EF-45. • New Netherlands 57th Sale, 1963: 1065. "Identical central weaknesses as shown by the Bolender plate coin, hence, inherent in striking. With a few of the usual bagmarks."

Saunders Specimen. EF-45. • Bowers and Merena Galleries, Ebenezer Milton Saunders Collection, 1987: 3511. "EF-45, with Mint-caused adjustment marks across shield on reverse. Lilac and medium gray toning. A particularly sharp specimen with excellent definition of detail."

Four Landmark Collections Specimen. EF-45. • Bowers and Merena Galleries, Four Landmark Collections, 1989: 1957. "EF-45 to AU-50. Pleasing, pale golden toning may be seen on both sides. The surfaces are mostly clear and free from handling marks, save for a few minor scattered nicks on the obverse."

DeCoppet Specimen. EF-40. • James Kelly, André DeCoppet Collection, 1955. "Does not show die break on obverse."

Springfield Specimen. EF-40. • Bowers and Ruddy Galleries, 1981: 240. "Faint crack through E in STATES. EF-40, dark steel toning."

Arnold and Romisa Collections Specimen. EF-40. • Bowers and Merena Galleries, Arnold and Romisa Collections,

1984: 2902. "The fields are toned in medium shades of smoky gray over boldly defined engraved devices. the rims are remarkably clean, though a single minute nick is present at 12:00 on the obverse." • Bowers and Merena Galleries, Frederick Taylor Collection, 1987: 779.

• **POPULATION DISTRIBUTION:**

• **CONDITION CENSUS: 50-45 (multiples)**

1798 Pointed Tail 9; Heraldic Eagle. BB-105.

Arc star pattern on reverse.

(B-23. H-23.)

• **OBVERSE 7:** See description under 1798 BB-104. Usually lightly struck at the centers.

Obverse die used to strike 1798 BB-104 (early state) and BB-105 (early and late states).

• **REVERSE H:** Several die flaws, one between ST, another between TE, another at right of E in STATES. Curved die flaw above third upper right star on reverse. 5 small berries, the two above closest together. Leaf point is under left foot of I in

AMERICA. Star distant from eagle's beak. Arc star pattern; star ray points to center of B in PLURIBUS. 13 arrows.

Reverse die used to strike 1798 BB-105 (late state) and BB-106 (early state).

• **DIE STATES:**

Die State I: With reverse die in early state as used for BB-106. May not exist.

Die State II: Reverse die ever so slightly relapped in comparison to BB-106; now some details of cloud 3 are gone. Additional die flaws between ST, TE and the right side of the E in STATES. The usual state seen.

Die State III: Bolender-23a. As above, but obverse die now relapped, with highest wave of hair mostly gone, both bottom curls with parts missing, and stars 1 and two appearing spidery. About 20% to 30% of specimens of BB-105 are of this die state. Examples of Die State III include New Netherlands 48th Sale: 624, described as MS-60.

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 2, Very Good: 5, Fine: 11, Very Fine: 35, Extremely Fine: 25, About Uncirculated: 11, Mint State-60 or better: 10. Total: 101. (Average grade: VF-30)

• **COLLECTING NOTES:** 1798 BB-105 shares honors with BB-125 as one of the two most common varieties of the year and, indeed, one of the most common early dollars of any date. An estimated 850 to 1,500 are believed to exist. Most are in lower grades. In AU and Mint State grades it is rare.

• **NOTABLE SPECIMENS:**

Fairbanks Specimen. MS-63. • Stack's, Fairbanks Collection (Ben Koenig), 1960: 548. "A superb Uncirculated specimen, full mint lustre. A trifle weak in the center." • Lester Merkin, A. J. Ostheimer, 3rd Collection, 1968: 264. "Pale golden toned Uncirculated. Struck sharply except in centers, surfaces splendid though with a few hardly visible bagmarks on hair, not disturbing the color. Planchet lightly streaked as made."

Brand Specimen. MS-60. • Virgil M. Brand (presumed pedigree). • Burdette G. Johnson. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 624. "Strictly Uncirculated, but not quite in the 'gem' class as claimed by Mr. Clarke. With delicate iridescent toning; microscopic abrasion nicks, almost entirely upon the obverse." Pedigreed to Virgil M. Brand through B.G. Johnson, who with Henry Chapman was one of two early appraisers of the Brand estate.

Hollinbeck-Kagin Specimen. MS-60. • June 1970: 614. "Uncirculated, sharp strike, perfectly centered, lovely bluish golden patina!"

Terrell Specimen. MS-60. • Bowers and Ruddy Galleries, Terrell Collection, 1973: 901. • Bowers and Ruddy Galleries, Austin Collection, 1974:19. "Uncirculated. With light mottled iridescent toning. Some minor marks visible with a glass."

Harte Specimen. MS-60. • Bowers and Ruddy Galleries, Roy Harte Collection, 1977: 2785. "Brilliant Uncirculated, lightly toned. Exceptionally well struck, particularly on the 13 stars on the obverse."

Long Beach Sale Specimen. MS-60. • Heritage, 1988: 963. "Minor edge defect, as struck, just enters the second T in STATES. Lustrous surfaces blanketed in a pleasing layer of mottled gray, rose and pastel green. A bold striking which shows softness only in the very centers."

Chalkley Specimen. MS-60. • Superior Galleries, Chalkley Collection, 1990: 2846. "Deep, charcoal gray toning throughout with hints of lustre about the devices. The surfaces are very clean and reveal only the faintest contact marks under close scrutiny with a glass. Well struck, with all devices, stars, curls and wing feathers bold."

Davis Specimen. AU-58. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1290. "Full mint lustre. Just a shade from Uncirculated, although struck weak in center."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Uncirculated, Very slight adjustment marks."

• **CONDITION CENSUS:** 63-63-60 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-106.

Arc star pattern on reverse.

(B-19. H-19.)

• **OBVERSE 8:** Wide date, distant from bust. Upper left star near L. Upper and lower right stars equidistant from Y and bust. First star points to lower edge of a denticle. On the left, stars are about equally spaced. On the right, stars 12 and 13 are slightly farther apart than are other stars, which are fairly evenly spaced. Vertical die crack down through stand of E in LIBERTY, across bust through 1 of date to border.

Obverse die used to strike 1798 BB-106 only.

• **REVERSE H:** See description under 1798 BB-105, actually the later state of the die.

Reverse die used to strike 1798 BB-105 (later state) and BB-106 (early state).

• DIE STATES:

Die State I: Perfect obverse die. May not exist.

Die State II: Obverse die break just beginning. Cf. Blevins: 3672, described as "With the obverse crack barely visible on Liberty's hair and not yet reaching the bottom of the E in LIBERTY."¹

Die State III: On Die State III there is the familiar bisecting crack on the obverse which runs vertically from the E in LIBERTY to the 1 in the date. The die state usually seen.

Die State IV: On State IV there is a lump below the 1 in addition to the vertical crack described above. The left side of E is beginning to crumble. The Spies coin (Stack's, 1974) is VG-Fine.

Die State V: This die state shows further progress of the cracks described under IV, and the obverse is beginning to

bulge. Vertical die crack on head below highest hair wave.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 2, Fine: 9, Very Fine: 17, Extremely Fine: 7, About Uncirculated: 2, Mint State-60 or better: 1. Total: 39. (Average grade: VF-23)

• **COLLECTING NOTES:** 1798 BB-106 is one of the rarer varieties of the year. An estimated 80 to 140 exist, a comfortable population large enough to assure one for the cabinet of every specialist. Most examples are in the VF range. EF coins are elusive, and AU or finer pieces are exceedingly rare.

In his 1881, J.W. Haseltine called this variety very rare.

• NOTABLE SPECIMENS:

Superior Sale Specimen. MS-63. • Superior's September 1987 Sale: 2299. MS-63.

Hatie Specimen. AU-55. • Bowers and Merena Galleries, George D. Hatie Collection, 1983: 916. "Very wide date, distant from bust. With vertical break through E of LIBERTY, across bust, through 1 of date to border. Sharply struck. Choice AU-55 if not full MS-60. Some prooflike surface."

Cohen Specimen. EF-45. • Bowers and Merena Galleries, Milton G. Cohen Collection, 1985: 523. "The obverse displays a vertical die break, probably accounting for the rarity of this die combination. Choice EF-45. Sharply struck, finely detailed, and superb in all respects. Medium gray toning."

First National Bank of Denver Specimen. EF-45. • Bowers and Merena Galleries, 1987: 1211. "Very light grayish lavender iridescence. Well struck and attractive. There is a tiny obverse rim nick at 1:00."

Bareford Specimen. EF-40. • B. Max Mehl, George W. Curtis Collection, January 1942: 134 • Stack's, Harold S.

¹ Comment by Harry E. Salyards, M.D., letter to the author, January 19, 1993: "If accurate, this is interesting in that the die break apparently began in the middle (deepest recesses) of the die, and then extended to the periphery—more commonly, it is the other way around."

Bareford Collection, 1981: 413. "Slight vertical crack through E of LIBERTY to the hair. EF. Even pale golden-gray toning with considerable lustre."

Ostheimer Specimen. EF-40. • Lester Merkin, A. J. Ostheimer, 3rd Collection, 1968: 260. "Bisecting break, EF, weak in upper central obverse, around the break as always (cf. the much inferior Bolender plate coin, with the identical striking quality). Iridescent steel toning, reverse with much mint lustre; lovely surfaces." Ex Richard Picker.

Spies Specimen. EF-40. • Stack's, W. Earl Spies Collection, 1974: 83. "Vertical break which bisects the coin from E to I is quite obvious. EF, lustrous and slightly prooflike."

Ivy Specimen. EF-40. • Steve Ivy sold an EF coin in 1983. (Reported by Douglas Winter.)

Blevins Specimen. EF-40. • Superior Galleries, H.W. Blevins Collection, 1988: 3672. "Exceptionally attractive violet-gray coloring which changes to antique gold in the protected areas. Very well struck with sharp hair and feathers, plus very well defined denticles. The surfaces are quite clean with the exception of some very light scratches on Liberty's cheek and in the field before her chin and mouth. Very early die state with the obverse crack, as described by Bolender, barely visible on Liberty's hair and not yet reaching the bottom of the E in LIBERTY." • Yolanda Gross Collection.

October Sale Specimen. EF-40 net. (AU-50, cleaned and retoned). • Superior Galleries, 1990: 1195. "AU-50. Cleaned and retoned to a charcoal black. No significant handling marks, a tiny depression below Liberty's bow. Trivial rim marks about upper obverse fail to detract. Early die state with a light crack vertically bisecting the obverse."

Baldenhofer Specimen. VF-20 net. (EF-40, processed.) • W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A. J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 878. "The bisecting break. Early strike. EF-40, but processed. While the obverse shows many handling marks, none are really serious. Not quite perfect centering, but well struck considering the state of the dies."

Green Specimen. VF-20. • M.H. Bolender's personal coin was graded VF and was from the Col. E.H.R. Green Collection,¹ as were many of Bolender's other pieces.

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

• CONDITION CENSUS: 65-55-45-45-45-45

1798 Pointed Tail 9; Heraldic Eagle. BB-107.

Arc star pattern on reverse.
(B-21. H-21.)

• OBVERSE 6: See description under 1798 BB-102. Die lump between center of date and bust.

¹ Col. Green was the son of millionairess Hetty Green (known as "The Witch of Wall Street," her life was chronicled in the book, *The Day They Shook the Plum Tree*). He was a colorful, free-spending individual, and shortly after his mother died, he married his red-haired mistress. Among his more notable possessions were the only known 100-pane sheet of 1918 24¢ airmail "Jenny" invert stamps and all five of the five known 1913 Liberty Head nickels, although, in a way, a railroad his mother bought for him in Texas could be considered a hobby item, too.

Obverse die used to strike 1798 BB-102, BB-103, and BB-107.

• **REVERSE I:** Only 10 arrows plus a stick (headless arrow) between the 2nd and 3rd shafts from the right. Five small berries, two top ones closest together. Point of leaf under left lower tip of I in AMERICA. Star distant from eagle's beak. Arc star pattern. Die crack along right wing tip, top of AM to border above E. In the later state of this reverse (used to coin 1798 BB-108), this reverse die was relapped, and just 10 arrows are visible, but no headless stick. 1798 BB-107 was struck before 1798 BB-108.

Reverse die used to strike BB-107 (earlier state) and 1798 BB-108 (later state, lightly relapped).

• DIE STATES:

Die State I: Perfect obverse die without lump. Perfect reverse die, not relapped, and *without die cracks*. May not exist.

Die State II: Obverse die lump between center of date and bust. Reverse not yet relapped, and with headless stick visible among 10 arrows. With die crack along right wing tip, top of AM, to border above E. The usual state.

Our photo shows what appears to be a crack from obverse denticles at 5:00 to the bust and faintly across Miss Liberty's neck. Another faint crack, from denticles just left of this other crack, through bottom of dates. A short crack appears to extend left from the lump above date.

• **AUCTION POPULATION SURVEY:** Very Good: 1, Fine: 8, Very Fine: 8, Extremely Fine: 14, About Uncirculated: 8, Mint State-60 or better: 5. Total: 44. (Average grade: VF-35)

• **COLLECTING NOTES:** 1798 BB-107 falls in the scarce category among dollars of this date. About 250 to 450 are known. As is the case with any other dollar variety of this date, the potential exists for more to be discovered.

In his 1881 *Type-Table*, J.W. Haseltine called this variety very scarce. He also considered that the extra "arrow" was created simply by the die being more deeply impressed when striking specimens of BB-107, as compared to BB-108. In 1881 when Haseltine wrote his compendium, indeed even in 1950 when Bolender created his opus, very little was known in numismatic circles about die preparation and use during the era of 1794-1804 dollars.

• NOTABLE SPECIMENS:

Montgomery Specimen. MS-63. • Bowers and Ruddy Galleries, Montgomery Collection, 1976:1428. "Brilliant Uncirculated. Nearly if not completely in the *Choice* category. The fields possess full mint lustre. There is some minor friction on the higher points, due no doubt to contact with other dollars in a mint bag. A tiny planchet mark behind the head is mentioned for accuracy. Superb striking, a wealth of design detail."

New Netherlands Specimen. AU-58 net. (MS-60 with some scratches). • New Netherlands 57th Sale, 1963: 1064. "Uncirculated; some light scratches, mostly on the reverse."

Hollinbeck-Kagin Specimen. AU-55. • June 1970: 613. "Near Uncirculated, only barest friction, lovely patina."

Bolender Specimen. AU-55. • M.H. Bolender Collection, 1952. • Superior Galleries, Gilhousen Collection, 1973: 1238 • Superior Galleries, Neggen Collection Sale, 1976: 658. "Too many planchet adjustment marks in central obverse to qualify as Mint State. Frosty, with beautiful iridescent toning."

Turoff Specimen. AU-55. • Bowers and Ruddy Galleries, Julius Turoff Collection, 1976: 439. "Borderline Uncirculated. A nearly fully lustrous coin with faint wear on the highest points. Rather average strike but centered. The planchet has some typical rolling imperfections but is, in all, above average for the period."

Superior Auction '80 Specimen. AU-55. • Superior Galleries, Auction '80, 1980: 232. "Light steel toning on both sides."

1982 ANA Convention Sale Specimen. AU-55. • Steve Ivy, 1982: 721. "Lustrous with attractive aqua and sea green pastel coloration. Very well struck except for the usual flatness on the eagle's head and the central shield. Unusually high obverse rim."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 (URS-1)

Approximate population MS-60 to 62: 3 to 6 (URS-3)

Approximate population AU-50 to 58: 25 to 50 (URS-6)

Approximate population VF-20 to EF-45: 175 to 300 (URS-9)

Approximate population G-4 to F-15: 60 to 100 (URS-7)

Approximate population for all grades combined: 250 to 450 (URS-10)

• **CONDITION CENSUS:** 63-60-60-60-55-55 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-108.

Arc star pattern on reverse.

(B-13. H-13.)

• **OBVERSE 9:** Medium wide date, 10.5 mm. across at bottom widest place. Die crack upward from right portion of L in LIBERTY. Easily identifiable by a die flaw between ray of last star and bust. Among stars on the left, 1-2, 2-3, and 5-6 are more widely separated than other stars. On the right stars 8-9 are noticeably wider apart than are any others. A short crack, or flaw, extends into the field from a dentil opposite bust tip.

The use of this obverse die is especially interesting in that it was interrupted. This die was used first to strike examples of 1798 BB-108, then BB-109 dollars were struck, then additional BB-108 dollars were coined. Die state progressions provide the telltale evidence.

Obverse die used to strike BB-108 (early and late states) and 1798 BB-109 (intermediate state; 1798 BB-109, Die State III).

• **REVERSE I:** Only 10 arrows. 5 small berries, 2 top ones closest together. Point of leaf under left lower tip of I in AMERICA. Star distant from eagle's beak. Arc star pattern. Die crack along right wing tip, top of AM to border above E. This is a later state of the reverse that used to have 10 arrows and a headless stick (used to coin 1798 BB-107). For the production of 1798 BB-108, the reverse die was relapped, removing the headless stick.

Reverse die used to strike 1798 BB-107 (earlier state) and BB-108 (later state, lightly relapped).

• DIE STATES:

Die State I: Perfect obverse and reverse dies, not relapped. May not exist.

Die State II: Obverse crack toward border from right side of L in LIBERTY. Reverse with die relapped; headless stick no

longer visible. With die crack along right wing tip, top of AM to border above E. The die state usually seen.

Die State III: Obverse now with crack from border below 17, left toward star 1. This is the die state used to coin 1798 BB-109. May not exist with BB-108.

Die State IV: Obverse now with crack from border below 17, left, now progressing through stars 1 to 5, very faint by star 5. About 20% to 30% of BB-108 dollars are of this die state.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 3, Very Good: 13, Fine: 19, Very Fine: 18, Extremely Fine: 15, About Uncirculated: 10, Mint State-60 or better: 3. Total: 82. (Average grade: VF-24)

• **COLLECTING NOTES:** 1798 BB-108 is one of the commoner varieties of the year. I estimate that 500 to 800 survive, most of which are in grades through EF. However, AU coins come on the market with regularity. Mint State specimens are exceedingly rare.

• NOTABLE SPECIMENS:

Willasch Specimen. MS-63. • Superior, H. Roland Willasch, 1990: 487. Consigned by another individual to the Willasch Sale. "Frosty and untuned with no surface impairments. the only mark readily visible is a minute planchet flaw above the N of UNITED on the reverse. Further scrutiny finds a tiny rim mark above the A of STATES. Boldly struck."

Beebe's MS-60. • *Numismatist* advertisement, May 1953. Brilliant Uncirculated.

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, January 1970: 782. Uncirculated bluish golden.

1976 ANA Specimen. AU-58. • Stack's, 1976 ANA Convention Sale: 1332. • Boyd, Brand and Ryder Collections, Bowers and Merena, 1990: 2454. "AU-58. Satiny and largely brilliant with some blushes of pale champagne iridescence and splashes of faint blue toning. Close inspection reveals a faint, scarcely noticeable, hairline scratch on the reverse running across the eagle's shield and banner."

Boyd, Brand and Ryder Specimen. AU-58. • Bowers and Merena, Boyd, Brand, and Ryder Collections, 1990: 2453. "AU-58 to MS-60. A lovely, lustrous example displaying blushes of rich coppery golden and lilac coloration on both surfaces. Pleasing gunmetal-gray and electric blue iridescence enhance the extreme rims."

Gore and Long Specimen. AU-58. • Bowers and Merena, Gore and Long Collections, 1990: 357. "AU-58 to MS-60. Sharply struck with virtually all of Miss Liberty's hair details boldly delineated. Most of the eagle's feathers are sharp, including those along the top row of the breast. The fields are smooth and lustrous, toned in rich hues of lilac-gray, gunmetal-blue, and gold. A tiny lamination flaw can be seen at the reverse rim at 7:00, and is mentioned for accuracy although it doesn't measurable detract from the aesthetic appeal of the piece."

Kissel and Victoria Specimen. AU-58+. • Bowers and Merena, Kissel and Victoria Collections, 1989: 389. "AU-58/MS-60. A pleasing, lustrous example faintly toned in pastel hues of gold, gray, lilac, and blue. Most of Miss Liberty's hair details are fully delineated, and nearly all of the eagle's wing and tail feathers can be seen. The eagle's breast is a bit softly defined overall, but even here the upper row of feathers is quite clear."

Blevins Specimen. AU-55. • Superior, H.W. Blevins Collection, 1988: 4763. "Late die state with all of the cracks described by Bolender as well as numerous additional die flaws and areas of roughness on both the obverse and reverse. Very sharply struck and displaying a minimal amount of wear but

with irregular toning on both sides." • Yolanda Gross Collection.

Hirt and Bolt Specimen. AU-55. • Pine Tree Auctions, Hirt and Bolt Collections, 1975: 754. "Brilliant, frosty, with rich golden toning, this is at most a thin hair's breadth short of full Uncirculated. Obverse die flaw up to border from toe of L, others through base of Y and many stars on right."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: (URS-0)

Approximate population MS-64: (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 20 to 40 (URS-3)

Approximate population VF-20 to EF-45: 250 to 400 (URS-10)

Approximate population G-4 to F-15: 225 to 350 (URS-9)

Approximate population for all grades combined: 500 to 800 (URS-11)

• **CONDITION CENSUS:** 63-60-60-60-60-55 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-109.

Arc star pattern on reverse.
(B-10. H-10.)

• **OBVERSE 9:** See description under 1798 BB-108.

Obverse die used to strike BB-108 (early and late states) and 1798 BB-109 (intermediate state; 1798 BB-109, Die State III).

• **REVERSE J:** Five small berries, the two uppermost being closest together. Arc star pattern. Star slightly distant from eagle's beak; star ray points to center of B of PLURIBUS. 13 perfect arrows, some formed better than others. Leaf points to just left of center of upright of I in AMERICA. A die flaw (chip out of die) under end of stem. *Berry under right foot*

of *A in AMERICA* (compare to the reverse of BB-111, with the berry under the left foot). All specimens seen are lightly struck on the eagle.

Note: As the obverse was used later to coin more 1798 BB-108s, one wonders what happened to this reverse die. Why was its use interrupted. Perhaps, somewhere "out there" is a BB-109 exhibiting a sudden, massive reverse die failure.¹

Reverse die used to strike 1798 BB-109 only.

• DIE STATES:

Die State I: Obverse die without crack from right side of L in LIBERTY. May not exist.

Die State II: Obverse die with crack from right side of L in LIBERTY; without lower obverse cracks. This die state was used to coin early examples of 1798 BB-108; may not exist with BB-109.

Die State III: Obverse with die crack upward from right portion of L in LIBERTY. Light die crack from border under 7 of date to left through several stars. Centers weak. The die state usually seen.

Die State IV: Centers even weaker than the preceding. Die cracks more advanced. Not seen.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 5, Fine: 3, Very Fine: 12, About Uncirculated: 2, Mint State-60 or better: 2. Total: 26. (Average grade: VF-21)

• **COLLECTING NOTES:** 1798 BB-109 is another scarce issue. I estimate that 75 to 125 exist, nearly all of which are in lower grades. Opinions concerning the rarity of this variety have been the subject of debate. Bolender suggested Rarity-4 (76 to 200 known, if he used the Sheldon Scale), which may be correct at the rarer end of the spread. Others have suggested that fewer than 30 exist. BB-109 is always weakly struck on the eagle and at the center of the bust.

• NOTABLE SPECIMENS:

Boyd Specimen. AU-55. • World's Greatest Collection, F.C.C. Boyd, Numismatic Gallery, 1945: 35. "The die shows slight wear on reverse. A splendid Uncirculated example."

1976 ANA Convention Sale Specimen. AU-55. • Stack's, ANA Convention Sale, 1976: 1332. "AU and choice. Full

frosty mint lustre. Actually the cataloguer feels that the coin never saw circulation, but the slightly convex shape makes the centers higher than the rims and some rubbing occurred."

Earle Specimen. AU-50. • George H. Earle Collection, Henry Chapman, 1912. • Col. E.H.R. Green Collection. • M.H. Bolender Collection, Bolender, 1952: 51." Obverse practically Uncirculated, beautiful impression. Reverse EF. Mint lustre."

Von Stetten-Buchenbach Specimen. VF-35. • Bowers and Merena, 1986: 1949. "VF-35 to EF-40, cleaned, but not in a detracting manner. A sharp and bright piece with gray toning in protected areas."

Baldenhofer Specimen. VF-30. • W.G. Baldenhofer, to Stack's Farish-Baldenhofer Sale. • A.J. Ostheimer, 3rd Collection. • ANA Convention Sale, Superior, 1975: 862. "Die break upward from right portion of L in LIBERTY. VF-30 where struck up. Dull gray and iridescent tone and clean, except for some edge bruises and nicks above LIBERTY."

Saunders Specimen. VF-30. • Bowers and Merena, 1987: 3510. "Value of VF-30, but actually EF-40 from a technical wear viewpoint. Some mint lustre still remains in protected areas. The coin is struck ever so slightly off-center, with the result that the denticles and protective rims on the reverse are very well pronounced at the top but are absent at the bottom. A same situation is true for the obverse, but to a lesser extent."

• POPULATION DISTRIBUTION:

Approximate population VF-20 to EF-45: 40 to 70 (URS-7)

Approximate population G-4 to F-15: 35 to 50 (URS-7)

Approximate population for all grades combined: 75 to 125 (URS-8)

• **CONDITION CENSUS:** 60-58-50-50-45 (multiples)

¹ This note is per the observation of Harry E. Salyards, M.D., letter to the author, January 19, 1993.

1798 Pointed Tail 9; Heraldic Eagle. BB-110.

**Arc star pattern on reverse.****(B-16. H-16.)**

• **OBVERSE 10:** Wide date, the most space between 9 and 8. Star 8 is slightly closer to Y than star 13 is to bust. Star 7 distant from L, and star 1 a trifle farther from curl.

In 1950, Bolender noted this: "The die broke early and so badly that very few pieces were struck, possibly not over two, as no others are known to the author. A number of pieces formerly attributed as H-16 in various catalogues and examined by the author, turned out to be incorrectly attributed. The die crack is heavy and extends from border on left near first star to right through base of lowest curl and top of 179 of date. There is a spur downward from a denticle above right part of E in LIBERTY."

Today, a perfect die coin is also known.

Obverse die used to strike 1798 BB-110 only.

• **REVERSE K:** Five small berries, the two upper ones closest together. The third berry from top is attached to a leaf point. *Berry under left foot of A in AMERICA.* A leaf points to space between R and I in AMERICA. Arc star pattern. Star is distant from eagle's beak; ray points toward center of B in PLURIBUS. 13 perfect arrows, an unusually well developed cluster. A plain die mark is always present in the back of the two highest clouds on the reverse. The first two reverse stars on the left both touch clouds. A small flaw or clash mark is present below the right ribbon.

Reverse die used to strike 1798 BB-110 (1st use), BB-111 (2nd use), BB-112 (3rd use), and BB-113 (4th and final use).

Discussion of the states of the reverse die used to strike, in this order, BB-110, BB-111, BB-112, and BB-113:

BB-110: Flaws below wing tip on the left, and under D of UNITED.

BB-111: As preceding, plus tiny crack or clash mark from left shield tip to ribbon above.

BB-112: As preceding, plus beginning of crack from branch stem end down to border.

BB-113: As preceding, plus extensive crack along border from above final S in STATES, through OF, wing tip, to border just above first A in AMERICA,

• **DIE STATES:**

Die State I: Perfect obverse die. The 1975 ANA Convention Sale (Superior): 874, Ostheimer, Blanchard specimen, Yolanda Gross Collection. VF-20.

Die State II: Obverse die with cracks as described by Bolender, quoted above. The usual state seen.

Die State III: Die state later than II with advanced obverse cracks. Not seen.

• **AUCTION POPULATION SURVEY:** Very Good: 1, Fine: 2, Very Fine: 5, Extremely Fine: 3, About Uncirculated: 1, Mint State-60 or better: 1. Total: 13. (Average grade: VF-28)

• **COLLECTING NOTES:** 1798 BB-110 is one of the great rarities of the year 1798. Probably, no more than 30 to 50 are known. Estimates of the surviving population have varied widely, to as low as six to 12 coins. In his 1881 *Type-Table*, J.W. Haseltine called this variety very rare.

• **NOTABLE SPECIMENS:**

Willasch Specimen. AU-58. • Superior, H. Roland Willasch Collection, 1990: 492. "Deep blue and russet toning throughout atop semi-prooflike fields. Struck from the latest die state known, in fact, a heavy cud has formed below the first star to the area below the curl. The fields show faint evidence of cleaning, but have fully toned over. Only a touch of rubbing on the high points and minor handling marks in the fields keep this from a Mint State grade. Tiny pin prick below

T of LIBERTY and a minor rim bump just past the D of UNITED on reverse." Currently graded MS-63 (PCGS).

? **Specimen. AU-53 (PCGS).** Reported by Warren Miller.

Numismatic Gallery Specimen. EF-40. • Numismatic Gallery, 1950. • M.H. Bolender Collection, 1952: 63. "The die broke early and so badly that very few pieces were struck, possibly not more than two, as no others are known to me. The die break is heavy and extends from border on left near first star to right through base of lowest curl and top of 179 of date. EF." • ANA Convention Sale, Superior, 1975: 875. "EF-40, lovely even natural toning, very clean, with a well centered obverse. Reverse struck slightly off towards the top. There are a few microscopic edge nicks, the most noticeable between ES of STATES."

Spies Specimen. EF-40. • Stack's, W. Earl Spies Collection, 1974: 79. "The break from the edge below the first star across the top of 179 is massive indeed. Spur over E very clear. Fully EF or better with mint lustre and prooflike surface."

Four Memorable Collections Specimen. VF-30. • Bowers and Merena, Four Memorable Collections Sale, 1985: 2010. "Natural smoky gray toning. A few rim bumps typical of these large heavy coins. A heavy die break extends from the border just below the first star to the right, through the base of the lowest curl, and across the tops of the numerals 179 of the date. No other obverse die has this trait." • Westchester Collection Sale, Bowers and Merena, 1987: 602.

Blevins Specimen. VF-25. • H.W. Blevins Collection. Superior, 1988.

Blanchard Specimen. VF-20. Rare Die State I. • From a Mr. Blanchard in March 1953. • K.P. Austin Collection. • A.J. Ostheimer, 3rd Collection. • 1975 ANA Convention Sale, Superior. • Yolanda Gross Collection.

1798 Pointed Tail 9; Heraldic Eagle. BB-111.

(B-11. H-11.)

Arc star pattern on reverse.

• **OBVERSE 11:** Medium wide date, 10 mm. across at bottom widest place. First star about as far from curl as upper right star is from Y. The upper left star is closer to L in LIBERTY and about the same distance as last star is from bust. On the left, stars 2-3, 3-4, and 6-7 are spaced wider apart than are the others. On the right, stars 8, 9, 10, and 11 are spaced farther from each other than are stars 11-12 and 12-13. A small clash mark shows just beneath ribbon bow along two highest curls at back of head.

Obverse die used to strike 1798 BB-111 only.

• **REVERSE K:** See description under 1798 BB-110.

Reverse die used to strike 1798 BB-110 (1st use), BB-111 (2nd use), BB-112 (3rd use), and BB-113 (4th and final use). See discussion of die states under 1798 BB-110.

• **DIE STATES:**

Die State I: Obverse: Dies with clash mark as described above, but without cracks. Reverse: Unknown to Haseltine. Cf. Davis-Graves Sale: 1285 (Stack's, 1954) VG-8. Rare.

Die State II: As above, but with mound developing below chin.

Die State III: As above, but the mound is more obvious, but hasn't yet developed into a crack.

Die State IV: Bolender-11a. With die crack under chin across three points of last star to border.

Die State V: As above, but now with another die crack across hair above ear. Scarce.

Die State VI: With the die cracks as listed by Bolender but now the upper crack is more prominent than the lower crack.

Die State VII: Bolender-11b. As last, but the die crack across hair continues across cheek, mouth, and upper ray of last star to border. This die state is always weak at the obverse center.

Die State VIII: As VII, but now with the cracks extended across the head into the field beyond, toward the L of LIBERTY.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 6, Fine: 12, Very Fine: 19, Extremely Fine: 7. Total: 45. (Average grade: F-19)

• **COLLECTING NOTES:** 1798 BB-111 is in the medium range of scarcity among dollars of this date. An estimated 250 to 450 exist. A perusal of auction data dramatically reveals that VF is a high grade for this issue, and that an EF specimen is noteworthy. The average grade of F-19 is one of the lower figures among 1798 silver dollars. This issue circulated extensively, to say the least. Does even a full AU coin exist?

• **NOTABLE SPECIMENS:**

Auction '86 Specimen. EF-45. • Rarcoa, Auction '86, 1986: 729. "Bold EF to AU, with underlying lustre and attractive tone. Perfect die state."

Brilliant and Sieck Specimen. EF-45. • Bowers and Merena, Brilliant and Sieck Collections, 1992: 1268. "Deep silver gray on both sides, highly attractive, with some areas of lighter gray on the extreme high points. Rare die state, the obverse severely broken and buckled diagonally across from 10:00 to 4:00, with one very deep linear break extending from the center of Liberty's head to the rim above the 13th star. Clearly, this die would not have struck very many more coins before it shattered into two separate pieces."

MacFarland Specimen. EF-45. • Bowers and Ruddy, MacFarland Collection, 1981: 1558. "Choice EF-45, nicely

toned in shades of gray, greenish gold and blue; considerable underlying mint lustre, especially about the rims. Choice defect-free surfaces, and the piece is well struck up. Perfect die state."

Lighthouse Specimen. EF-40. • J.C. Lighthouse Collection. • Bolender, 1952: 53.

Boyd Specimen. EF-40. • World's Greatest Collection, F.C.C. Boyd, Numismatic Gallery, 1945: 36.

Stirling Specimen. EF-40. • Frank M. Stirling Collection, Heritage, February 1986: 1337. "Gorgeous gold overtones complement lustrous light gray surfaces."

Lee and Shaffer Specimen. EF-40. • Superior, Lee and Shaffer Collections, 1988: 3140. "Sharpness of EF-40 or better, but with a number of small but noticeable marks on the obverse; these marks are clustered above and below LIBERTY and there is a shallow but noticeable scratch in the left obverse field. Some marks on reverse hidden within stars."

Ostheimer Specimen. VF-35. • Lester Merkin, 1968: 253. "Nearly EF, considerable mint frost; iridescent sunset toning, clean surfaces, centers weak as usual. Probably ex Boyd."

Spies Specimens. • The W. Earl Spies Collection (Stack's, 1974) featured seven progressively different die states, graded VG, VF, VF, VG, VG, VF, and VG (these formed the basis of the die state information given above).

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 150 to 275 (URS-9)

Approximate population G-4 to F-15: 100 to 175 (URS-8)

Approximate population for all grades combined: 250 to 450 (URS-10)

• **CONDITION CENSUS:** 45-45-45-40 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-112.

Arc star pattern on reverse.
(B-15. H-15.)

• **OBVERSE 12:** Wide date, 11 mm. across at bottom widest part. 7th star very close to L, slightly closer than figure 1 of date from curl. Last star slightly nearer bust than figure 8 is from bust. Lowest right star ray points to a space between two denotives. The L and I in LIBERTY are distant while a spike protrudes from the hair below the point of the upper curl. Interior of lower curl is shaded. On the left, space between stars 5 and 6 is greater than between other stars. On the right, star 13 is smaller than any others.

Obverse die used to strike 1798 BB-112 only.

• **REVERSE K:** See description under 1798 BB-110.

Reverse die used to strike 1798 BB-110 (1st use), BB-111 (2nd use), BB-112 (3rd use), and BB-113 (4th and final use).

• **DIE STATES:**

Die State I: Obverse: Die perfect and not yet relapped. Reverse: Without cracks. See discussion of die states under 1798 BB-110. May not exist.

Die State II: Dies as usually seen; described above. Relapped obverse. Star 13 appears smaller than the others.

Die State III: Bolender-15a. Obverse as above. In 1950, Bolender said this: "From same dies as Bolender-15, but the stars appear smaller. Struck before the die was finished." However, today it is considered to be a later state of the dies than the regular (Die State II) BB-112 issue. This variety is always weakly struck, with the centers especially so. Reverse with a crack from the left shield point to the ribbon.

Die State IV: As preceding, but now with additional reverse crack from the right top of the first T in STATES down to the second cloud (counting from the left).

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 5, Fine: 11, Very Fine: 12, Extremely

Fine: 10, About Uncirculated: 4, Mint State-60 or better: 2. Total: 45. (Average grade: VF-25)

• **COLLECTING NOTES:** Several hundred specimens of 1798 BB-112 exist, probably about 250 to 450, placing it in the medium range of rarity among varieties of this date. Most specimens are in grades up through VF and EF. AU or finer pieces are very rare.

• **NOTABLE SPECIMENS:**

Gettys Specimen. MS-60. • Loyd Gettys Collection. • Bolender Collection, 1952. • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 257. "Golden and dull violet toned Uncirculated, weak strike, the weakness in centers as usual. Early die state, the spine left of curl point plain."

Auction '87 Specimen. AU-50. • Superior, 1987: 1814. "Obverse sharply struck with some lustre noted below pale rose toning; the reverse was struck well off-center and, as a result, the tops of UNITED and barely on the flan. It is lustrous and has nice light rose toning."

Boyd Specimen. AU-50. • World's Greatest Collection, F.C.C. Boyd Numismatic Gallery, 1945: 40. "Barely circulated with nice lustre." • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 258. "Bolender-15a. Obverse drastically lapped, spine left of curl point gone, stars much smaller especially lower ones at left and right, curl near date hollow, etc.; looks like a different obverse. AU plus, golden toning concealing traces of old cleaning; much original mint frost."

Fairbanks Specimen. AU-50. • Stack's, Fairbanks Collection, 1960: 544. "AU with beautiful surfaces."

Newport Specimen. AU-50. • Bowers and Ruddy, Newport Collection, 1975: 382. "Beautiful AU with much original lustre. Lightly struck at upper center of reverse; otherwise quite sharp."

Kagin's 1961 Sale Specimen. EF-45. • Kagin's September 18, 1961 sale, Lot 1095 as "Unc." • A.J. Ostheimer, 3rd. • Superior, 1975 ANA Convention Sale: 873. "EF-45 obverse, but there are just too many obverse handling marks to qualify for AU; reverse fully AU-50. Well centered, struck, and lustrous."

Approximate population G-4 to F-15: 115 to 170 (URS-8)

Approximate population for all grades combined: 250 to 400 (URS-10)

• **CONDITION CENSUS:** 60-60-55-55-50 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-113.

Arc star pattern on reverse.

(B-27. H-27.)

• **OBVERSE 13:** Close date, about 9.5 mm. at widest part. *The 8 much too high*, and out of position, top leaning to right. Identifiable by the presence of a tiny horizontal obverse die flaw at the inner point of star 12 (visible only on higher grade specimens); tinier similar flaw at star 11. Highest wave of hair incomplete, probably from a lapped die (although I have never seen an impression from an earlier, unlapped state). This same obverse die was used for numerous other varieties.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE K:** See description under 1798 BB-110. In this combination, a light die crack extends above S, through tops of OF, right wing tip, to border above first A in AMERICA.

Reverse die used to strike 1798 BB-110 (1st use), BB-111 (2nd use), BB-112 (3rd use), and BB-113 (4th and final use). See discussion of die states under 1798 BB-110.

• **DIE STATES:**

Die State I: Obverse: Perfect die, not relapped. Reverse:

Perfect die. May not exist.

Die State II: Obverse: With a faint crack from denticles toward center of 9 to bust. Reverse: With a light die crack above S, through tops of OF, right wing tip, to border above first A in AMERICA. Cf. Norweb: 3756. The die state usually seen.

Die State III: Obverse: With a faint crack from denticles toward center of 9 to bust. Reverse dies as II, but now with additional cracks from arrowhead through the wing to STA. The Spies Collection (Stack's, 1974) had a VF example.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Fine: 8, Very Fine: 23, Extremely Fine: 19, About Uncirculated: 11, Mint State-60 or better: 18. Total: 81. (Average grade: VF-37)

• **COLLECTING NOTES:** The 1798 BB-113 is of medium availability. I estimate that 500 to 800 exist. This is one variety of 1798 for which numerous AU and Mint State coins are known, the latter grading up through and including MS-65.

• **NOTABLE SPECIMENS:**

Garrett Specimen. MS-65. • Bowers and Ruddy Galleries, Garrett Collection, 1980: 689. "Choice Brilliant Uncirculated, MS-65. Well centered, well struck, and nearly full brilliant. This piece is virtually in the same condition as when it was struck. A very faint nuance of golden color."

Norweb Specimen. MS-60+. • B. Max Mehl, November 1954: 10. • Bowers and Merena Galleries, Norweb Collection, 1988: 3756. "MS-60 to 63. Gorgeous bright silver surfaces, accented on the obverse by splashes of light gold. Exceedingly sharply struck and well detailed."

Earle Specimen. MS-60. • Henry Chapman, George H. Earle Collection, 1912. • Schuyler Collection. • M.H. Bolender, Bolender Collection, 1952: 78. "Perfect dies. Uncirculated, sharp impressions." • Lester Merkin, A.J. Ostheimer, 3rd Specimen, 1968: 268. "Perfect dies. Frosty, lightly toned Uncirculated, light bagmarks."

1953 NENA Convention Specimen. MS-60. • 1953 New England Numismatic Association Convention • K. P. Austin Collection • A. J. Ostheimer, 3rd Collection • Superior Galleries, Gilhousen Collection, 1973: 1243. "Very deeply toned Uncirculated, sharply struck." • Superior Galleries, ANA Convention Sale, 1975: 896. "Reverse cracked. Very deeply toned Uncirculated, sharply struck. The toning is partly iridescent, and conceals full, nearly flawless mint surface. A good strike, the silhouette of Liberty's chin, lips, and nose is outstanding. Not perfectly centered, obverse and reverse." • Pine Tree, Brown Library Sale, 1976: 312. "Frosty, sharply struck choice Uncirculated, deeply toned, mostly in shades of blue and gunmetal." • Pine Tree, 1977 FUN Convention Sale, : 450 • Pine Tree, Breen III Sale, 1978: 602. "Deeply toned Uncirculated. A needle-sharp impression except in centers on both sides, so that paradoxically eagle's breast and head are not full. Blue and gunmetal overlying mint frost."

Anderson-Dupont Specimen. MS-60. • Stack's, Anderson-Dupont Collection, 1954: 2501. "Uncirculated. Weakly struck on reverse borders; one very small flaw near ribbon."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin June 1970: 616. "Uncirculated with lovely bluish golden patina, sharp stars & denticles at edge!" • Hollinbeck-Kagin, November 1971: 1333. "Uncirculated with attractive patina, sharp struck!"

Marks Specimen. MS-60. • Bowers and Ruddy Galleries, Robert Marks Collection, 1972: 75 • Bowers and Ruddy Galleries, Austin Collection, 1974: 18. "Brilliant Uncirculated, sharply struck." • Stack's, Greater New York Convention Sale, 1987: 869. "Brilliant Uncirculated. Full hair detail and all stars sharp to centers. Full cartwheel lustre, with light golden

toning on the reverse. Die break at upper right reverse, and a thin break from curl across throat."

Tercentenary Sale Specimen. MS-60. • Kagin's Tercentenary Sale 1974: 1149. "Uncirculated with glittering golden lustre, close examination reveals spot on collar not completely full."

Stack's Specimen. MS-60. • Stack's, ANA Convention Sale 1976: 1334. "Brilliant Uncirculated, nicely struck and centered. A touch of friction in the centers."

Heifetz Specimen. MS-60. • Superior Galleries, Jascha Heifetz Collection, 1989: 2392. "Deeply toned with irregular midnight blue at the centers, lighter iridescent blue at the rims. A few marks are noted about the fields and devices."

Willasch Specimen. MS-60. • Superior Galleries, H. Roland Willasch Collection, 1990: 506. "Dark irregular toning, perhaps from an artificial source, on both sides. Deep blue color about the periphery and original mint bloom ooze up from flawless fields. Rims are clean, boldly struck. Middle die state with reverse crack along rim above S OF A in STATES OF AMERICA sharp."

• CONDITION CENSUS: 65-64-63-60 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-114.

**Line star pattern on reverse.****(B-26. H-26.)**

• **OBVERSE 13:** See description under 1798 BB-113. On the BB-114 variety, a light die crack starts at border under 9 through two inner points of first star ending in field.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE L:** Point of star touches point of upper part of eagle's beak; star points to left side of U. Line star pattern. 12 arrows and a stick. One of these arrows, the nearest one to N, has a very small head. (Haseltine called this the 11-arrows variety.) There are five small berries, the two at top closest together. Claw close to A but not touching it. Point of leaf under center of I in AMERICA. Die crack from shield to border below, passes through end of stem. Light die crack through top of ES, base of O, right cloud, right wing and ribbon, outer leaves of branch, lower part of A and stem end, thence through eagle's tail. The two upper center stars touch clouds.

Reverse die used to strike 1798 BB-114 only.

• DIE STATES:

Die State I: Obverse: Faint crack from denticles through center of 9 to bust. Additional crack up through inner points of star 1 and into field toward hair ribbons. An additional crack, very faint, from denticles, adjoining first two cracks, extends through denticles to right, curving up to bust. Reverse: Perfect die without cracks. May not exist with perfect reverse die.

Die State II: Obverse: As described for Die State I (the last-mentioned faint crack will be visible only on high-grade examples; cf. Bowers and Merena, Florida United Numismatists Convention Sale, 1993: 516). Reverse: Die crack from shield

to border below, passes through end of stem. Light die crack through top of ES, base of O, cloud 8, right wing and ribbon, outer leaves of branch, lower part of A and stem end, thence through eagle's tail.

Die State III: Obverse: As preceding. Reverse: Now with a heavy die crack on the reverse from the upper right top of the second T in STATES into the rim.

Die State IV: Obverse: As preceding. Reverse: Later state with additional crack from top of cloud 1, down through eagle's wing, to arrows, through tail, to stem end, joining earlier crack there. Additional crack through bottom of tail.

Die State V: Obverse: As preceding. Reverse: Still later state with crack from top of E in STATES, through top of S, bottom of O, through cloud 8, wing, right side of branch, and final A in AMERICA, joining earlier cracks at stem end. Additional crack from rim above wing tip, through tops of AM of AMERICA, to border above E. Other cracks as Die State IV. The reverse die could not have functioned much beyond this point.

• **AUCTION POPULATION SURVEY:** Fine: 4, Very Fine: 8, Extremely Fine: 4. Total: 16. (Average grade: VF-23)

• **COLLECTING NOTES:** 1798 BB-114 exists to the extent of 35 to 60 pieces, if indeed even that many, and is one of the classic rarities of the year. All or nearly all specimens are in grades from EF downward. I am not aware of any AU or Mint State coins.

• NOTABLE SPECIMENS:

Kagin Specimen. EF45. • Kagin's, 1983 ANA Convention Sale, 1983: 2667. "Pleasing warm even gray enhanced by splashes of peripheral gold tones. A few minor planchet defects visible (as made). Reverse trifle flat about eagle's head and with a couple of tiny rim nicks at left."

1993 FUN Convention Sale Specimen. EF45. • Bowers and Merena Galleries, Florida United Numismatists Convention Sale, 1993: 516. "EF45 to AU-50. Mottled iridescent and silver golden toning, possibly artificially applied, but if so, not

particularly relevant-as the coin is very attractive overall."

DeCoppet Specimen. EF-40. • James Kelly, André DeCoppet Collection, 1955. "Die break on reverse not distinct. EF, well struck."

River Oaks Specimen. EF-40. • Bowers and Ruddy Galleries, River Oaks Collection (Glenn Davidson), 1976: 698. "EF. Reverse center a bit weak as struck."

Seller Specimen. EF-40. • Bowers and Ruddy Galleries, Seller Collection, 1980: 3280. "Lovely gray and gold toning. A thread adhered to the reverse die when this was struck, leaving an impression on the coin."

Austin Specimen. VF-30. • K. P. Austin via Liberty Coin Co., June 1954 • A. J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 895. "Poorly struck up at centers, but relatively clean and attractive."

Willasch Specimen. VF-25. • Superior Galleries, H. Roland Willasch Collection, 1990: 505. "Cleaned to a bright white on the obverse and reverse, with a hint of toning starting to form on the reverse, the obverse suffering with cleaning lines on the surface. Late die state, similar to the 1975 ANA Sale coin, Lot 895, with another reverse break from stem to tail, arrows, E in scroll, wing, and out the rim passing

through TAT of STATES. A few other lesser cracks can be seen, which contribute to the poor striking on the stars above the eagle's head."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population for all grades combined: 35 to 50 (URS-7)

• CONDITION CENSUS: 45-45-45-40-40 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-115.

Line star pattern on reverse

(B-31.)

• **OBVERSE 13:** See description under 1798 BB-113.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE M:** Star close to both upper and lower points of eagle's beak but does not touch; ray points to upper outside right of B of PLURIBUS. Line star pattern. Leaf points near center of upright of I in AMERICA. Five small berries, the two upper ones closest together. Slight die crack along upper side of

right wing tip. The berries are small but the one at the top right appears slightly smaller than the others. 13 arrows, with the one overlapping the third shaft from the right having a tiny head.

This reverse die, first described by Bolender in 1950, was not known to J.W. Haseltine when he wrote his *Type-Table* in 1881.

Reverse die used to strike 1798 BB-115 only.

• DIE STATES:

Die State I: Obverse: Die cracks as seen on BB-116, but in a slightly earlier state. The chip on the denticle below 9 is not quite as advanced as BB-116. Sawtooth line of denticle clash marks not visible on BB-115. Perfect reverse die. May not ex-

ist with perfect reverse die.

Die State II: Obverse: As preceding. Reverse: Slight die crack along upper side of eagle's right wing tip (on left side of coin). Tiny arc line (possibly used by the engraver as a guide for punching letters) near border between S and O in OF. Slightly scarcer than Die State IV.

Die State III: Intermediate state between II and IV, not otherwise described. New Netherlands Sale 48: 55, VF-20, was called superior to the Ralph Lathrop specimen in the 1952 ANA Convention sale. The Spies Collection coin (Stack's, 1974) was catalogued as Fine-VF.

Die State IV: Bolender-31a. Now with extensive die cracks on reverse. Heavy crack from border down through right side of 0 to cloud; another crack from border to top of F to wing, down to cloud below, from border at right wing tip through A under MERICA across claw, stem, and tail; continuing under UNI, across bottom of TED, left wing tip, center of STA. Also four curved die cracks down from TES through stars. All seen are very weak above the eagle's head and at the corresponding obverse. The die could not have been used much longer than this die state. Slightly more plentiful than Die State II.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 3, Fine: 6, Very Fine: 21, Extremely Fine: 13, Mint State-60 or Better: 1. Total: 45. (Average grade: VF-24)

• **COLLECTING NOTES:** 1798 BB-115 is known to the extent of about 175 to 300 coins, and is one of the more elusive issues of the year. Most are of Die State IV. Most are in lower grades. The auction listing for an Uncirculated piece is several decades old, and in the absence of contradictory information, I call it EF-45 in the Condition Census.

It is a small wonder that even as many as 175 or so coins are known, considering that Haseltine in 1881 did not know of the variety. It was a rarity in M.H. Bolender's eyes, and in 1950 he estimated that no more than a dozen existed of each of the two die states of which he was aware. Since then, dozens more have been discovered.

• NOTABLE SPECIMENS:

Gross Specimen. AU-55. • Country Store, Inc., New Brighton, MN, January 1983, sold to the following. • Yolanda Gross Collection.

Hollinbeck-Kagin Specimen. AU-50. • Hollinbeck-Kagin, June 1970: 617. "Struck from broken dies resulting in lower portion of collar of bust and opposite portion of reverse (top right star) not being fully struck up, near Uncirculated with lustre."

DeCoppet Specimen. EF-45. • James Kelly, André DeCoppet Collection, 1955. "Choice EF, stars and clouds on reverse weakly struck."

Baldenhofer Specimen. EF-45. • W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A. J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 905. "Reverse die cracks. EF-45, lightly toned obverse, with a darker gray tone on the reverse. Reverse weakly struck up above eagle's head as usual. Minimal signs of handling, but well rubbed on the high spots. Not perfectly centered."

Ostheimer Specimen. EF-45. • W. Earl Spies Collection • Lester Merkin, A. J. Ostheimer, 3rd Collection, 1968: 271. "EF-AU, mint lustre, obverse exceptionally sharply struck, reverse weak above eagle's head as always on the broken die states but elsewhere bold. Traces of old cleaning."

Higgins Specimen. EF-45. • Bowers and Merena Galleries, Lloyd M. Higgins, M.D. Collection, 1988: 2310. "EF-45 to AU-50. Pink, lilac and golden toning highlights smooth gray surfaces. Most details are well defined, and original mint lustre is present in the upper right field of the reverse."

Willasch Specimen. EF-45. • Superior Galleries, H. Roland Willasch Collection, 1990. "Glossy with golden toning gracing clean devices and fields. A minor planchet flaw across star 12 will assist in tracing the pedigree of this rare coin. Faint scratches are visible above eagle's head."

Gilhausen Specimen. EF-40. • Superior Galleries, Gilhausen Collection, 1973: 1245. "Extremely rare shattered die. EF, the reverse seemingly VF but its weakness is definitely from die failure. Unusually broad border. Mint lustre and iridescent toning. Bolender plate coin."

Willasch Specimen. EF-40. • Superior Galleries, H. Roland Willasch Collection, 1990: 514. "Medium gray toning with hints of lustre in the fields peeking out. Well struck and defect-free. This scarce die pairing coupled with the familiar obverse die with the three die cracks through the date with a new reverse die, which quickly cracked. The reverse cracks weaken the upper stars and cloud above the eagle. Late die state with several cracks mentioned by Bolender."

• POPULATION DISTRIBUTION:

Approximate population G-4 to F-15: 35 to 50 (URS-7)

Approximate population for all grades combined: 175 to 300 (URS-9)

• **CONDITION CENSUS:** 55-50-50-45 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-116.

**Arc star pattern on reverse.****(B-30. H-30.)**

• **OBVERSE 13:** See description under 1798 BB-113.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE N:** The upper stars on reverse are all very *distant from clouds*. Leaf points to space between R and I in AMERICA. Arc star pattern. Point of star barely touches upper part of eagle's beak (only three arc-pattern reverse dies, those used to coin BB-116, BB-117, and BB-125 have the ray at beak); ray of star points to upper outside right of B in PLURIBUS, while another ray points to the I. 13 arrows, two being faint. Five small berries, two at top nearest together.

Reverse die used to strike 1798 BB-116 only.

• DIE STATES:

Die State I: Obverse: Cracks described under BB-115 are now bolder and more advanced. Crack through 9 bold and extends into bust. Small chip on denticle below this crack. A sawtooth-like line, probably clash marks from reverse denticles, is noted from top of LIBERTY through outer points of stars 8 and 9. Cf. Bowers and Merena, Frontenac Sale, 1991: 2209. Perfect reverse die.

Die State II: Obverse as preceding. Reverse with crack from right arm of T, through ED, to eagle's wing.

Die State III: Obverse as preceding. Reverse crack continues through clouds 1-3 to base of TE, bottom half of S, to rim just left of O. Reverse with additional crack from wing on left, above first U in PLURIBUS, through star on left to cloud 2.

Die State IV: Obverse as preceding. Reverse with additional cracks: Inside of border from right of D of UNITED, along border, through tip of wing, through tops of S and T, to above A. Light crack from rim through first A of

AMERICA to feather. Crack from upper right of R through ICA, faintly to stem.

Die State V: On reverse, crack continues from stem end to rim. Crack from arrow feathers, middle of U of UNITED and bases of NITE. Short crack from center of eagle's tail feathers to denticles.

Die State VI: Bolender-30a. Reverse with crack at first A in AMERICA expanded to create a blob from top of A to border. Curiously, Bolender noted that he knew of just one coin, the VG specimen in his collection, but he called it R-6, implying that over a dozen exist.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 5, Fine: 7, Very Fine: 11, Extremely Fine: 8, About Uncirculated: 5, Mint State-60 or better: 3. Total: 40. (Average grade: VF-27)

• **COLLECTING NOTES:** 1798 BB-116 is one of the scarcer varieties of the year. About 150 to 250 are believed to be known. Most coins are in VF or so grade. EF specimens are quite rare, and anything better is very rare.

In his 1881 *Type-Table*, Haseltine called this variety very rare.

• NOTABLE SPECIMENS:

Newcomer Specimen. MS-60. • Waldo C. Newcomer Collection • B. Max Mehl. • Col. E.H.R. Green Collection. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 625. "Pronounced obverse die breaks emanating at border directly below 9 of date. Rev. All upper stars distant from clouds. Uncirculated. Neatly defined borders; comparatively well struck. Minute obverse rim bruise at right; reverse field nick (in stars) near eagle's head. Lightly toned, rose-blue iridescence. An intermediate die state, reverse crack through TED to wing described by Bolender under his Bolender-30a, but lacks the other characteristics."

Krugjohann Specimen. AU-58. • Bowers and Ruddy Galleries, C. W. Krugjohann Collection, 1976: 613. "BU with a touch of cabinet friction but absolutely no evidence of circu-

lation. Full original lustre. Well struck. Lovely fields. Numerous die breaks (shattered dies)."

Emery-Nichols Specimen. AU-55. • Bowers and Merena Galleries, Emery and Nichols Collections, 1984: 935. "Iridescent toning on obverse commences at the periphery in shades of pale gold, turning to hues of blue and violet toward the center. Reverse toning is not quite as vivid, though multicolored shades do highlight the sharply struck and notably clean surfaces."

Rusbar Specimen. AU-55. • Bowers and Merena Galleries, Robert W. Rusbar Collection, 1990: 348. "A lovely satiny example toned in delightful pastel shades of gold and lilac gray. Most of the obverse design features are bold."

Baldenhofer Specimen. AU-50. • W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A. J. Ostheimer, 3rd Collection • Superior Galleries, Gilhousen Sale, 1973: 1244. "Fine double profile. Rainbow toned Uncirculated, lustrous and sharp." • Superior Galleries, ANA Convention Sale, 1975: 902. "Fine double profile. AU-50, slight rainbow toning, lustrous, sharp. Tiny rim bruise opposite 10th stars is mentioned mainly for identification purposes. Fairly well centered and has some signs of obverse handling."

Stack's Specimen. AU-50. • Stack's, ANA Convention Sale, 1976: 3451. "AU and lustrous. Purchased by the owner as Uncirculated, but there is too much of a rub on the eagle's breast and on the cheek to call it Mint State. Natural golden and iridescent toning." • Yolanda Gross Collection.

Frontenac Specimen. AU-50. • Numismatic Auctions of Florida, November, 1985: 330. • Bowers and Merena Galleries, Frontenac Collection, 1991: 2209. "Particularly deeply struck, with the denticles and rims especially pronounced in most areas, most prominently around 2/3 of the reverse. Light gray and lilac toning."

• **CONDITION CENSUS:** 60-60-58-55 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-117.

Arc star pattern on reverse.

(B-33.)

• **OBVERSE 13:** See description under 1798 BB-113. On this variety the highest hair curl is very weak and indistinct. The horizontal die flaws in the right field inside stars 10 and 12 are bold. A horizontal die scratch is just above the back of the head, below IB of LIBERTY.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE O:** Arc star pattern. Point of star almost touches upper beak (only three arc-pattern reverse dies, those used to coin BB-116, BB-117, and BB-125 have the ray at beak); ray points to right side of B in PLURIBUS. No stars touch clouds, although the last is very close. 13 perfect arrows. Lowest arrow extends just past right edge of left upright of N in UNITED. Top left berry is the smallest of 5 berries; the top right is the largest. The lowest berry is directly below the left tip of the right foot of final A. Final A does not touch claw. The first A in

AMERICA does not touch either the third or fourth feather. Point of leaf below left side of upright of I in AMERICA. From claws, branch stem angles down to the right, then back toward the left, pointing toward the tail feathers. Left base of E in UNITED higher than the base of T. Left base of E in STATES higher than base of T. Letters in AMER very close at their bases. A short die scratch extends just over 1 mm. from the right top of the shield.

Reverse die used to strike 1798 BB-117 only.

• DIE STATES:

Die State I: Obverse: Cracks in about the same state as BB-116. Sawtooth-type clash marks not visible (relapped?). Perfect reverse die. May not exist with perfect reverse die.

Die State II: Obverse: As preceding. Reverse: Crack from denticles through right arm of T in UNITED, into field below left ribbon end. Another crack from denticles, connecting left serifs of M to right ribbon. The die is bulged between and joining these two cracks. Presumably, these cracks eventually joined to form Die State III. Cf. Spies Collection (Stack's, 1974): 111.

Die State III: Obverse: As preceding. Reverse: Heavy die crack bisects the reverse from 8 o'clock to 3 o'clock. Rust pits in shield. Cf. Spies Collection (Stack's, 1974): 112.

• **AUCTION POPULATION SURVEY:** Fine: 1, Extremely Fine: 4. Total: 5.

• **COLLECTING NOTES:** 1798 BB-117, unknown to Haseltine and Bolender, shares honors with BB-103 as one of the two rarest varieties of the year. The number of specimens known is a matter of conjecture. The W. Earl Spies Collection (Stack's, 1974) had two, both EF, and both of a different die state.

• NOTABLE SPECIMENS:

Blevins Specimen. EF-45. • Superior Galleries, H.W. Blevins Collection, 1988: 3699. "Both the obverse and reverse posses a lovely, rich, deep gray color punctuated by golden

undertones on the obverse. The obverse is extremely well impressed and shows a most unusual doubled profile; the reverse has extremely good detail with most of the feathers defined." • James Matthews Collection. (Coin illustrated in the present book.)

Spies Specimen. EF-40. • Stack's, W. Earl Spies Collection, 1974: 111. "Unknown to either Bolender or Haseltine. Obverse Bolender-26, reverse is new. A tiny engraver's scratch from upper right point of the shield. A massive crack starts at the rim through the right part of 'T' and terminates in a large 'mound' at juncture of left wing of eagle. Fully EF and lustrous."

Spies Specimen (another). EF-40. • Stack's, W. Earl Spies Collection, 1974: 112. "Reverse die crack has totally bisected the reverse from 'T' to 'M' in what must be the terminal state of the dies. R-8 in the Spies Collection. EF with pale pink and iridescent toning." • Superior Galleries; H. Roland Willasch Collection, 1990: 516. "Boldly struck with original gray and pink toning throughout. Obverse is well struck even though a massive die crack appeared on the reverse which often renders the obverse strike weak. Reverse terminal die state—a pronounced die crack spans the reverse from the T in UNITED to the M of AMERICA. In the field below the left wing of the eagle the crack is really just a large area of swelling."

Approximate population for all grades combined: 5 to 10 (URS-4)

• **CONDITION CENSUS:** 40-40-40-40-12

1798 Pointed Tail 9; Heraldic Eagle. BB-118.

**Arc star pattern on reverse.****(B-28. H-28.)**

• **OBVERSE 13:** See description under 1798 BB-113.

Obverse die used to strike BB-113 (1st use), 1798 BB-114 (2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE P:** Leaf point is slightly right of center of I in AMERICA. *Tip of branch points to tip of rightmost tail feather* (compare to reverse shared by BB-92 and BB-91, and to the reverse of BB-117, the only other 1798 reverses in which this is the case). Star distant from eagle's beak; star ray points to just left of B in PLURIBUS. Arc star pattern. 13 perfect arrows. Five medium-sized berries, the two at top closest together. A die crack begins at border above last S in STATES, and passes through center of OF, right wing, bottom of AME, up through RIC. Short crack from last A to border, another from lower outside leaf of branch past claw to stem end. Heavy crack from lower left part of shield down through claw and arrow butts. Another die crack through U and left wing. Another crack through NITE up through TA. The left upright of N is clearly punched over a previous erroneous I.¹

Reverse die used to strike 1798 BB-118 only.

• **DIE STATES:** ²

Die State I: Obverse with cracks slightly advanced from those on BB-117. Reverse die perfect. Not listed by Bolender;

Stark Bolender-28a. Scarce. Auction appearances, which may include duplication, include DeCoppet (1955) VF-35, Ostheimer (1968) VF-EF, Spies (1974) VF, and 1975 ANA VF-30 dull.

Die State II: Obverse: As preceding. Reverse: Two reverse die cracks, approximately parallel, immediately to the left of the eagle's tail. Stark Bolender-28b.

Die State III: Intermediate stage(s) between II and IV; not detailed by Dr. Stark, but probably made.

Die State IV: As II, but with additional cracks from rim through U to N to arrow to second feather; rim over U through NITE to wing to STA; O through F to AMERICA to rim; rim below stem to nearest A; stem to claw to leaf. Small piece of die missing in area of two approximately parallel cracks immediately to the left of the eagle's tail. The approximate die state described by Bolender for Bolender-28; Stark Bolender-28c.

Die State V: As IV, but now with larger piece of die missing to left of eagle's tail. Stark Bolender-28d. The Spies Collection coin (Stack's, 1974), F-12, damaged, had the reverse off center, indicating axial misalignment of dies; this coin may have been of this approximate die state.

Die State VI: As V, but now with entire section of die missing from area earlier within two approximately parallel cracks to the left of the eagle's tail. Crack from tip of center arrow to the 4th feather. An earlier crack, first seen on Die State II, and extending to the ribbon there, has now crossed the ribbon at P, passing through the leftmost star and extending to the 2nd cloud from the left. By this time, on the obverse clash marks are visible between the bust and the final three stars on the right. Stark Bolender-28e.

• **AUCTION POPULATION SURVEY:** Very Good: 5, Fine: 11, Very Fine: 16, Extremely Fine: 7, About Uncirculated: 5, Mint State-60 or better: 6.

¹ This characteristic discovered by Thomas K. DeLorey, October 2, 1992.

² Robert M. Stark's article, "Die Deterioration of a 1798 Dollar (Bolender-28 Reverse)," in the *John Reich Journal*, August 1992, was used in the compilation of this information. However, Dr. Stark designates the first state, with no defects, as B-28a. I follow a different numbering sequence.

Total: 50. (Average: VF-28)

• **COLLECTING NOTES:** The 1798 BB-118 is of medium rarity among die varieties of the year. I estimate that 275 to 450 exist. Most of these are in lower grades through VF, although EF pieces are occasionally seen. AU or finer coins are rare.

• **NOTABLE SPECIMENS:**

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 54. "A very choice piece, in Uncirculated condition."

Hollinbeck-Kagin Specimen. MS-60. August 1970: 1082. "Uncirculated golden with just the barest trace of rubbing to mar its beauty, several interesting die breaks causing center portion of reverse not to be fully struck up."

French Specimen. MS-60. • Stack's, French Family Collection, 1989: 547. "Brilliant Uncirculated, full mint lustre. A trifle weak in the very centers. The obverse breaks are present as are the reverse breaks except for the one from NITE up through TA. Delicate golden russet toning."

Stack Specimen. MS-60. • Stack's, James A. Stack Collection, 1989: 527. "Brilliant Uncirculated, typical softness above the eagle's head. Gray tan laced with silver on the obverse; the reverse deeper gray violet. Die breaks well advanced. The reverse is a bit off center, with broad denticles at the left."

Fairbanks Specimen. AU-55. • Stack's, Fairbanks Collection, 1960: 550. "The early strike before the reverse die cracked, as described by Bolender. Softly struck, just a shade from Uncirculated, full mint frost."

Spies Specimen. AU-50. • Stack's, W. Earl Spies Collection, 1974: 103. "Reverse with most of the breaks mentioned by Bolender. Struck slightly off center, but really a beautiful specimen. AU, with considerable lustre. Light golden and iridescent toning."

Willasch Specimen. AU-50. • Superior Galleries, H. Roland Willasch Collection, 1990: 509. "Lovely mottled color throughout, the centers glowing yellow, the periphery ranging from light green to blue. The central reverse has all detail visible, although not sharp. Lustre still resides in the fields. Dies are both cracked, obverse with the familiar crack through and below the date, the reverse from the shield, arrow butts to the rim with another heavy crack through the U of UNITED, wing to clouds above eagle."

Auction '90 Specimen. AU-50. • Stack's, 1990: 255. "AU, full hair detail. Deep gray and silver with touches of red. Good detail on the devices. Well developed die breaks."

March 1991 Sale Specimen. AU-50. • Stack's, 1991: 1633. "Rich gold and lighter russet toning. All die breaks clear." • Yolanda Gross Collection.

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 (URS-1)

Approximate population MS-60 to 62: 6 to 10 (URS-4)

Approximate population AU-50 to 58: 15 to 25 (URS-5)

Approximate population VF-20 to EF-45: 160 to 250 (URS-9)

Approximate population G-4 to F-15: 100 to 160 (URS-8)

Approximate population for all grades combined: 275 to 450 (URS-10)

• **CONDITION CENSUS:** 63-60-60-60-60-60

1798 Pointed Tail 9; Heraldic Eagle. BB-119.

Line star pattern on reverse.

(B-29. H-29.)

• **OBVERSE 14:** See description under 1798 BB-113.

Obverse die used to strike BB-113 (1st use), 1798 BB-114

(2nd use), BB-115 (3rd use), BB-116 (4th use), BB-117 (5th use), BB-118 (6th use), BB-119 (7th and final use).

• **REVERSE Q:** Star touches lower part of eagle's beak; ray points to just left of U in PLURIBUS. Line star pattern. Five small berries, two above closest

together. Leaf points under right edge of upright of I in AMERICA. 13 perfect arrows, an unusual situation.

Reverse die used to strike 1798 BB-119 (earlier state) and BB-120 (later state).

• DIE STATES:

Die State I: Obverse: Die cracks similar to those on BB-118 but more advanced, now extending across bust into right field. Two short cracks from bust to last star. Additional crack from outside first star through next 3 stars and passing under the 5th, 6th, and 7th stars. The crack splits in two at this point, and both branches continue to the hair. This variety was struck shortly after BB-118. Reverse from perfect die. The variety usually seen. An AU specimen in the 1975 ANA Convention sale (Superior) had the obverse poorly centered, indicating axial misalignment.

Die State II: Obverse as preceding. Reverse with die crack through UNITED, two leftmost wing tip feathers, and ST, continuing to the top of A and above T. The die state used to strike BB-120.

• **AUCTION POPULATION SURVEY:** Less than Good: 2, Good: 2, Very Good: 7, Fine: 5, Very Fine: 10, Extremely Fine: 7, About Uncirculated: 2, Mint State-60 or better: 1. Total: 36. (Average: VF-21)

• **COLLECTING NOTES:** 1798 BB-119 is scarce. Probably about 200 to 350 exist, most of which are in lower grades through VF. EF coins are quite rare, and AU specimens are extremely rare. No Mint State coin has been seen. The one listed was sold in 1970, and may not grade as Uncirculated today.

• NOTABLE SPECIMENS:

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin, January 1970: 783. "Uncirculated golden."

Holmes Specimen. AU-55. • Stack's, Milton A. Holmes Collection, 1960: 2243. "AU, choice. Full mint lustre and the barest signs of friction on the high points."

Baldenhofer Specimen. AU-50. • W.G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 901. "Superficially AU-50, but rubbed on the high points of the obverse. Bluish toning around part of the edges, clean, and partly lustrous. Obverse very poorly centered."

Saunders Specimen. EF-45. • Bowers and Merena Galleries, Ebenezer Milton Saunders Collection, 1987: 3514. "EF-45 or finer. An area of light striking is seen at the upper right of the reverse among the stars and clouds. Mottled medium gray toning."

Lee and Shaffer Collections Specimen. EF-45. • Superior Galleries, Lee and Shaffer Collections, 1988: 3148. "Extremely late obverse die state with heavy cracks and conspicuous weakness of strike at the left border. Sharpness of EF-45, but attractively toned. A few small marks."

Four Landmark Collections Specimen. EF-45. • Bowers and Merena Galleries, Four Landmark Collections, 1989: 1961. "EF-45 to AU-50. Pale silver gray and darker mottled gray on the obverse, dark gray and mottled golden brown on the reverse. Mint lustre may be seen across much of the obverse surface, and beneath the toning on the reverse. Rather later state of the obverse die than that usually seen, with the trident-shaped cracks rising from below the date here enlarged and strong, together with numerous subsidiary cracks at the top and right portion of the die. Clearly, this obverse could not long have continued in use before completely failing."

Boyd Specimen. EF-40. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 56. "EF."

GENA Convention Sale Specimen. EF-40. • Lester Merkin, 1972: 850. "Mostly well struck, developing warm gray tone."

• POPULATION DISTRIBUTION:

• **CONDITION CENSUS:** 60-55-50-50-45 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-120.

Line star pattern on reverse.

(B-12. H-12.)

• **OBVERSE 14:** 17 of date close together, other figures wider apart. The date measures slightly more than 10 mm. across at the bottom widest part. Star 1 distant 3.5 mm. from curl. In date, 1 is near curl, 8 far from bust. Lips of Liberty open. On the left, stars quite evenly spaced, but the space between stars 6-7 is very slightly wider. On the right, stars 10-11 most widely spaced. Star 13 points to center of a denticle.

Obverse die used to strike 1798 BB-120 only.

• **REVERSE Q:** See description under 1798 BB-119.

Reverse die used to strike 1798 BB-119 (earlier state) and BB-120 (later state).

• DIE STATES:

Die State I: Perfect dies; no crack on reverse. May not exist. (This die state and Die State II were used to coin BB-119).

Die State II: Die crack through UNITED, two leftmost wing tip feathers, and ST, continuing to the top of A and above T. The die state usually seen.

Die State III: Obverse now shows a crack from a denticle between the 7 and the 9 to the drapery as well as other cracks from the border upward and slightly left, through the innermost rays of star 1, to the field opposite the ribbons. Another crack connects stars 11 to 13.

Die State IV: Obverse crack on right now goes from star 13 to 11 (as before), through innermost ray of star 10, to field opposite forehead. Curved arc crack from bust through bottom ray of star 15 curving to border. Additional crack from border up to drapery on right. Additional crack from border to second lowest curl on left. On reverse, new crack develops from left stand of M in AMERICA, under M and under E. A VG specimen in the Gross Collection was obtained from Jules Reiver, March 1983.

Die State V: The very rare terminal die state (cf. Gilhausen: 1233, VF) shows die failure at the drapery and the

corresponding reverse plus a crack at ES OF AM.

• **AUCTION POPULATION SURVEY:** Very Good: 3, Fine: 13, Very Fine: 14, Extremely Fine: 8, About Uncirculated: 2. Total: 40. (Average: VF-22)

• **COLLECTING NOTES:** 1798 BB-120 is of medium scarcity. I estimate that about 225 to 425 exist, most of which are in circulated grades through VF. At the EF or better level BB-120 is rare.

• NOTABLE SPECIMENS:

Somerset Specimen. AU-55. • Bowers and Merena, Somerset Collection, 1992: 1321. "Lightly cleaned at one time, but still very attractive. Mostly bright silver surfaces with mottled light gray and lilac toning, particularly on the reverse."

Tuttle Specimen. AU-50. • Bowers and Ruddy, Tuttle Collection, 1981: 2980. "Sharply struck in most areas, well-defined with some original mint lustre. A few scattered marks here and there."

Auction '84 Specimen. EF-45. • Superior, Auction '84, 1984: 168. "Well struck on a smooth problem-free planchet and quite lustrous with pleasing pale lilac and golden highlights."

Baldenhofer Specimen. EF-45. • W.G. Baldenhofer Collection, to Stack's Farish-Baldenhofer Sale. • A.J. Ostheimer, 3rd Collection. • ANA Convention Sale, Superior, 1975: 866. "EF-45 or better, but cleaned. Well centered and struck, except for the center portion of the reverse."

A. M. Smith Specimen. EF-40. • A.M. Smith Collection, Bolender, 1935. • M.H. Bolender Collection, Bolender, 1952: 55. "EF, but a few stars on reverse are always weakly struck in this rare variety, because of high relief of bust."

Ebsen Specimen. EF-40. • Superior, Buddy Ebsen Collection, 1987: 1896. "Evenly struck on a problem-free planchet with nice clean fields and rims. Traces of mint lustre are still adhering to the protected areas of the devices, with light wear spread evenly on the highest points. Attractive antique toning comprised of grayish violet with golden and turquoise iridescent highlights."

New Netherlands 57th Sale Specimen. EF-40. • 1963: 1059. "Nearly EF where struck-up, but due to die collapse, this coin is very flat in the centers. Highly lustrous, with a lovely peripheral iridescence."

Ostheimer Specimen. EF-40. • Lester Merkin, 1968: 254. "Marked EF, this is nearly that level in sharpness, with surfaces showing mint lustre and some streaky gray tone."

Gilhousen Specimen. VF-30. • Superior, 1973: 1233. "Unpublished shattered die, 'Bolender-12a,' obverse cracked between 79 up to drapery, from rim through first star, and from rim at lower right stars. Reverse crack described for Bolender-12 now extends through dentils over ES OF AM; an obverse crack through drapery has occasioned massive die failure, weakening drapery and rendering opposite stars (behind eagle's head) illegible. Better than VF for coin."

Westchester Specimen. VF-20. • Bowers and Merena, 1987: 601. "Value of VF-20, but actually Choice EF-45. There is a planchet defect on the rim near the 4:30 position. Deeply toned in blue, violet, and shades of gold."

• POPULATION DISTRIBUTION:

Approximate population for all grades combined: 225 to 350 (URS-9)

• CONDITION CENSUS: 50-50-50-45 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-121.

"Amateur Diecutter's Reverse"

Arc star pattern

(B-9. H-9.)

• **OBVERSE 15:** Compact date, 8 close to bust, being a little nearer than 1 is to curl. Upper left star close to L and lowest right star very close to bust. On the left, stars 1 and 2, and 2 and 3, are more widely spaced than are the other stars. On the right, stars 10-11 and 11-12 are more widely spaced than are the other stars. Curl close to date is complete but is formed very delicately.

Obverse die used to strike 1798 BB-121 only.

• **REVERSE R:** "Amateur Diecutter's Reverse." Star distant from eagle's beak. Arc star pattern, but amateurishly executed, with the first star in the second row out of place and too high. This is the only

1798 reverse with this "sloppy" die work. Star distant from beak. Star ray points to top of I in PLURIBUS. Five small berries, the second and third from top are closest together. Bottom end of olive branch is long and needle-like. Leaf points to lower right point of R in AMERICA. Either 12 or 13 arrows are present; two are very weak and appear to hold another stick between them; the two rightmost arrow shafts each have two heads (and thus count as four arrows), the third arrow shaft from the right is ghostlike (the three rightmost shafts are quite similar to those on the reverse used to coin BB-96, BB-101 and certain other reverses of the era).

Reverse die used to strike 1798 BB-121 only.

• DIE STATES:

Die State I: Die state as described above; perfect dies.

Die State II: Perfect dies, except for tiny vertical crack on reverse from O in OF to rim. Raised die rust marks between lowest curl and border (visible on higher grade pieces). Most BB-121 dollars are of this die state.

Die State III: Bolender-9a. Now with die cracks as follows: A crack on obverse from border up through 17 to bust. Another crack from border through two lower rays of second star. Other cracks from third to sixth stars. Reverse shows light crack through STATES OF AM. Another crack from border down through M to ribbon. Some specimens have the vertical elements of letters in LIBERTY bifurcated, or (on the reverse) even the horizontal members of the letters such as E and D in UNITED missing due to bifurcation, but this idiosyncrasy does not determine a separate die state.

Die State IV: Die cracks more advanced than preceding. Dies show rust. Cf. Spies "Bolender-9b" and possibly the Gilhousen VF coin.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 6, Fine: 9, Very Fine: 18, Extremely Fine: 12, About Uncirculated: 2, Mint State-60 or better: 2. Total: 50. (Average grade: VF-24)

• **COLLECTING NOTES:** 1798 BB-121 has an estimated population of 300 to 500 pieces, enough that the specialist can find one with some searching, and probably will have to pay no more than a "type" price. Most specimens of BB-121 are seen in lower grade levels. The variety becomes a rarity in AU grade and may be unknown in full Mint State, if today's strict grading interpretations are used.

• **NOTABLE SPECIMENS:**

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Uncirculated and well struck, beautifully toned."

Mason-Dixon Specimen. AU-50. • Mason-Dixon Sale, May 1957. • Alfred J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 251. "AU, rather weakly struck up on face and very center on either side, as usual, but more curl details than on Bolender's plate coin. Edge irregularity under point of bust. Deeply toned, iridescent and frosty."

Spring Quartette Sale Specimen. AU-50. • Bowers and

Merena, Spring Quartette Sale, 1992: 2578. "Struck lightly off center on both sides, with AMERICA to edge of coin on reverse. A rich medium gray specimen with splashes of gold and pale blue toning highlights on both surfaces. Some faint, old planchet adjustment marks are noted on the obverse at Liberty's portrait."

Bauer Specimen. EF-45. • Lester Merkin, Bauer Collection, 1968: 389. "All breaks listed by Bolender, additional break through O. EF+. Deeply toned, nearly full mint lustre, minor adjustment marks."

Brilliant and Sieck Collections Specimen. EF-45. • Bowers and Merena, Brilliant and Sieck Collections, 1992: 1267. "Once dipped long ago, now beginning to retone. Very sharp and appealing, with full detail in Liberty's hair strands, the folds of her bodice, the eagle's breast and tail feathers. Typically soft on the lower left feathers of the eagle's right wing."

Everson and Faught Collections Specimen. EF-45. • Bowers and Merena, Everson and Faught Collections, 1988: 216. "Pale iridescent rose toning. Attractive detailing may be seen on the obverse, with the majority of Liberty's hair strands separate and bold. The majority of the eagle's breast feathers may also be seen. A few minor edge bumps."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 3 to 6 (URS-3)

Approximate population VF-20 to EF-45: 200 to 350 (URS-9)

Approximate population G-4 to F-15: 100 to 150 (URS-8)

Approximate population for all grades combined: 300 to 500 (URS-10)

• **CONDITION CENSUS:** 55-50-50-45 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-122.

Line star pattern on reverse.

(B-14. H-14.)

• **OBVERSE 16:** Medium wide date, 10.25 mm. across at bottom widest part. The 1 in date close to hair, 8 close to bust. Stars about equidistant from curl, L, Y, and bust, except that upper left star is a little closer to L. Ray of star 1 points to slightly left of center of a denticle. On the left there is more space between stars 6 and 7 than the other stars. On the right stars 8 and 9 have a smaller space between them than do any other stars. The highest curl on head is solid and is centered under upright of E. Some lines (die clash marks) show in field between curl and first two stars. Interior of loop on lowest curl "shaded" with hair details.

NOTE. This obverse die closely resembles BB-124, to which refer. BB-122 is distinguishable by the fact that it has the 8 closer to the bust than does BB-124, and that the 11th and 12th stars on BB-122 are much closer together than on BB-124.

Obverse die used to strike 1798 BB-122 only.

• **REVERSE S:** *Claw touches A* in AMERICA; the only 1798 reverse with this feature. Five small berries, two top ones closest together. Point of leaf under left lower point of I in AMERICA. Star just misses touching point of upper part of eagle's beak, and in worn specimens appears to touch; star ray points to center of B in PLURIBUS. Line star pattern. 13 perfect arrows. Four rightmost shafts each have two arrowheads (total of eight arrowheads there); third shaft from left is thinner than normal; fourth shaft from left is much too thick.

Reverse die used to strike 1798 BB-122 only.

• **DIE STATES:**

Die State I: Perfect dies. No obverse clash mark. May not exist.

Die State II: Dies as described above for BB-122. Clash marks on obverse. Clash marks on reverse below two rightmost clouds. Raised die roughness at E of UNITED.

Die State III: Obverse die begins to fail; crack develops connecting innermost rays of stars 2 through 5. Slightly scarcer than following.

Die State IV: As above, but tiny crack now connects stars 4 and 5 near their centers. The most plentiful die state.

Die State V: As above, but reverse die now relapped, thinning and damaging some of the arrows, lightening the raised die roughness at E of UNITED, and obliterating much of the leaf under C of AMERICA. Slightly scarcer than preceding.

Die State VI: Bolender-14a. Obverse crack extends down to star 1 and up to star 7. Star 7 and L of LIBERTY weaken. Reverse die as above. Rarer than preceding.

Die State VII: Bolender-14b. With same die cracks as State VI, but the die crack on obverse is now heavier, nearly obliterating the star 7 and part of L. Bolender mentions a crack on reverse through right part of O. Rare.

Die State VIII: Latest die state shows the obverse star 7 and the L in LIBERTY entirely removed by a heavy die crack.

• **AUCTION POPULATION SURVEY:** Very Good: 5, Fine: 12, Very Fine: 33, Extremely Fine: 8, About Uncirculated: 2, Mint State-60 or better: 1. Total: 61. (Average grade: VF-22)

• **COLLECTING NOTES:** Somewhere in the range of 350 to 550 1798 BB-122 dollars are believed to exist. The variety is very rare above EF and may be unknown in Mint State. The distribution of available specimens is heavily weighted toward the low end of the Very Fine category.

• **NOTABLE SPECIMENS:**

Garrett Specimen. AU-50. • Bowers and Ruddy, Garrett

Collection, 1980: 688. "Traces of original mint lustre remain in the protected areas of the surface. An exceptionally sharp strike."

Gross Specimen. AU-50. • Stack's, September 1988. Sold to the following. • Yolanda Gross Collection.

Hollinbeck-Kagin Specimen. AU-50. • Hollinbeck-Kagin Sale, June 1970: 611. "Nearly Uncirculated."

Brooks Specimen. EF-45. Bowers and Merena, Brooks Collection, 1989: 206. "Sharply struck with rich, mottled gold and gray toning. Miss Liberty's hair strands and the eagle's wing feathers are nearly all nicely delineated. A trivial mint-caused rim flaw is present at 5:00 on the obverse."

Ebsen Specimen. EF-45. • Superior, Buddy Ebsen Collection, 1987: 1897. "Somewhat of a shallow but even strike, perfectly centered on a problem-free planchet. Enough detail and mint lustre is still present to easily justify this high grade. Some light wear is spread along the highest points and it is free of discernible marks in either the fields or on the rims. Attractive antique toning, light silvery gray with some lustrous highlights."

Blevins Specimen. EF-40. • Superior, H.W. Blevins Collection, 1988: 3662. "Splashes of rich violet and russet gold toning highlight the obverse; the reverse is a light gray with pale golden blue undertones. The strike is absolutely exceptional, with the hair and feathers fully defined and the borders showing broad, sharp beading."

Overton Specimen. EF-40. • Al C. Overton, May 1954. • A.J. Ostheimer, 3rd Collection, Lester Merkin, 1968: 256. "Really EF, lustrous, but weakly struck from injured, buckled and lapped dies. Beautiful mint frost with natural iridescent toning."

Clark Specimen. EF-40. • Primus C. Clark Collection, M.H. Bolender, 1932. • M.H. Bolender Collection, Bolender, 1952: 58. "Perfect dies. Diagonal lines in field between first two stars and curls. Reverse: EF, struck a little bit off center to right."

Kissel and Victoria Collections Specimen. VF-35. • Bowers and Merena, Kissel and Victoria Collections, 1989: 391.

"Quite nicely centered on both the obverse and reverse. Pleasing, mottled hues of blue and lilac enhance the surfaces. Two or three minor rim dings can be seen, as is consistent for the grade, and a few trivial marks are noted on Miss Liberty's cheek and neck."

Gilhousen Specimen. VF-35. • Superior, Gilhousen Sale, 1973: 1235. "Better than VF, some areas suggest EF, mint lustre. Iridescent tone."

New Netherlands Specimen. VF-35. • New Netherlands Coin Company's 57th Sale, 1963. VF-EF.

Blevins Specimen (another). Net VF-35. (EF-40, unattractive). • Superior, H.W. Blevins Collection, 1988: 3663. "Sharpness of EF-40 or better, but with somewhat unsavory, splotchy coloring which is, in all probability, artificial. Extremely well struck and centered with virtually full detail noted on Liberty's hair and feathers. Die roughness inside of the first six stars and an unusual 'tail' between the fourth and fifth stars."

• POPULATION DISTRIBUTION:

• CONDITION CENSUS: 55-55-50-45-45-40 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-123.

"Blundered Stars Reverse."

Line star pattern (placed too high).

(B-25. H-25.)

• **OBVERSE 17:** Close date, only 9.5 mm. across

at widest part. "Whisker" on chin. *Die dot* in field under chin, about one-third of the distance between neck and star 12. 1 very close to curl. Last star near bust, upper right star distant from Y, upper left star still farther from L, and first star farthest from curl.

Obverse die used to strike 1798 BB-123 only.

• **REVERSE T:** "Blundered Stars Reverse" with blundered star placement; some stars overlap clouds. Perhaps, the engraver had too much rum (or "ayle," per National Archives records) while cutting this die! Two uppermost stars in center partly in clouds. Cloud 4 has two rays of a star superimposed on it at lower left; clouds 5 and 6, which overlap, are with the top ray of a star touching cloud 5, the ray to the left of it barely touching the cloud, and the ray to the right slightly overlapping cloud 6. A star touches point of upper part of eagle's beak; star ray points to right side of B in PLURIBUS. Line star pattern. *Die crack from stem* down to milling. *Small die flaws* in E of STATES, between E and S, and under S. *Die crack from cloud* under last S of STATES through top of O and down to base of F.

Reverse die used to strike 1798 BB-123 (earliest state), BB-124 (intermediate state, now relapped); and 1799 BB-152 (latest state).

• DIE STATES:

Die State I: Bolender-25a. No cracks on obverse. On the reverse, the crack from stem end has not yet developed. Die flaws as three raised lumps extending down to the right from rays of star beneath cloud 7. Quite scarce; about 10% or so of extant BB-123 dollars are of this die state.

Die State II: Obverse still without cracks. On reverse, a tiny crack has just developed on the right side of the stem to the border, up the branch slightly from the stem end. Die cracks at star beneath cloud 7 lengthen. Only one seen.

Die State III: Obverse develops cracks completely around the border through or adjacent to stars, letters, and date. Additional crack from 1 in date to rim. Whisper of additional die crack to right of star 7. On the reverse, the die crack on the stem forms a blob at the stem end. Die cracks at star beneath cloud 7 are still larger, appear as two raised streaks, and extend to near the star beneath cloud 8. This is the usually seen die state.

Die State IV: Bolender-25b. Obverse cracks intensify. Large crack from border through two rays of star 7 to field, where another crack develops. Reverse with stem crack heavier to border. Scarcer than Die State III.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 4, Fine: 13, Very Fine: 21, Extremely Fine: 9, About Uncirculated: 4, Mint State-60 or better: 1. Total: 54. (Average grade: VF-23)

• **COLLECTING NOTES:** I believe that 300 to 500 examples are known of 1798 BB-123, making it in the middle range of availability. Nearly all are in

lower grades through EF. AU coins are very rare.

• NOTABLE SPECIMENS:

Robertson Specimen. MS-60. • J. Douglas Robertson Collection, San Diego Sale, Mid-American, 1989: 716. "Struck very slightly out of collar resulting in little or no denticulation at the lower obverse and the corresponding reverse. A marvelous coin with more lustre than on any example of this date that we have seen in years. Lustre especially strong on the obverse and is enhanced by lovely natural toning at the borders from storage in an old album. Both sides are sharp."

Romano Specimen. AU-55. • Stack's, Don Corrado Romano Collection, 1987: 753. "Choice AU, deep blue and lighter lavender with a broad splash of gold on the reverse; nice frosted surfaces, a curly lint mark around the arrowheads as made." Romano was for many years the proprietor of the Worthy Coin Company, Boston.

Essex Institute Specimen. AU-50. • Stack's, 1975: 991. "AU, frosty mint lustre. Delicate russet toning."

First National Bank of Denver Specimen. AU-50. • Bowers and Merena Galleries, First National Bank of Denver Collection, 1987: 419. "Sharply struck, light rubbing, well concealed amid shades of gray and pale gold."

Higgins Specimen. AU-50. • Bowers and Merena Galleries, Lloyd M. Higgins, M.D. Collection, 1988: 2308. "Sharply struck. Light rubbing, well concealed amid shades of gray and pale gold."

1981 ANA Convention Sale Specimen. EF-45. • Bowers and Ruddy Galleries, 1981 ANA Convention Sale: 732. "Choice EF-45, lightly polished long ago, since retuned a gray and iridescent color. Extremely sharp."

Auction '86 Specimen. EF-45. • Stack's, Auction '86, 1986: 290. "Choice EF, deep golden toning. Somewhat softly struck at end of bust and matching area near OF on reverse."

Brooks Specimen. EF-45. • Bowers and Merena Galleries, Brooks Collection, 1989: 214. "Coppery golden toning with splashes and blushes of lilac and bluish gray coloration. Most of Miss Liberty's hair strands are clearly delineated. The only notable softness on the reverse is by the letter O in OF, a feature typical for the variety."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

• **CONDITION CENSUS:** 60-55-55-50-50-50

1798 Pointed Tail 9; Heraldic Eagle. BB-124.

**“Blundered Stars Reverse.”**

Line star pattern (placed too high).

(B-24. H-24.)

• **OBVERSE 18:** This die resembles the obverse of BB-122 more than any other and, in fact, in 1881 was confused with it by Capt. J.W. Haseltine in his *Type-Table*. In BB-122 the 8 in date is about twice as close to bust as in BB-124. In BB-124 the 11th and 12th stars are much farther apart than in BB-122. In BB-124 the first two stars at lower left, point to the center of denticles. In BB-122 the second star points to left edge of a denticle. Also in BB-122 the highest curl on head is solid and under upright of E, while in BB-124 this curl is sketchy and defective and a little more centered under E. The BB-124 obverse has three die file marks to the right of the date. This obverse was first described by M.H. Bolender in 1950.

Obverse die used to strike 1798 BB-124 only.

• **REVERSE T:** See description under 1798 BB-123.

Reverse die used to strike 1798 BB-123 (earliest state), BB-124 (intermediate state, now relapped); and 1799 BB-152 (latest state).

• **DIE STATES:**

Die State I: Perfect obverse die, without lapping. May not exist.

Die State II: Dies as described above. Obverse die relapped; highest wave of hair imperfect. No obverse die cracks. Reverse die relapped since use on BB-123; some arrows faint, leaf below C partially missing. Somewhat scarce; perhaps 20% of BB-124 dollars are of this die state. Usually seen with stars on reverse fairly well struck. May also exist with reverse die crack lighter, as in BB-124.

Die State III: As above, but with die crack just beginning at star 12; hairline crack extends to border; crack inward a short distance into the field. On the reverse, the stars above and to the right of the eagle's head are always weakly struck,

due to damage and bulging at the corresponding part of the obverse; this weakness continues on all later die states. Only a few BB-124 dollars are of this state.

Die State III: Bolender-24a. Later state with die crack from neck through right field, star 12, to border. Another crack through lower 4 stars on right to bust. Another crack from lowest curl through top of 798 to border under point of bust. Small crack from border down to B. Die state usually seen.

Die State IV: Additional obverse crack develops from star 1 down along border to below numerals 17 in date. Another crack begins at 9, goes through upper part of 8, to border near bust. A skein of minor cracks develops between the rim and star 4. Hairline crack along border from star 1 to star 4. A few BB-124 dollars are of this die state.

Die State V: The lower right obverse eventually shatters; coins from this late state may have been struck in 1799.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 6, Fine: 13, Very Fine: 40, Extremely Fine: 13, About Uncirculated: 10, Mint State-60 or better: 4. Total: 87. (Average grade: VF-26)

• **COLLECTING NOTES:** BB-124 is one of the most common varieties of the year. The population is estimated to be in the range of 600 to 1,100 pieces. Specimens are plentiful from worn grades through AU. Mint State coins are very rare. Probably, some called Uncirculated years ago would merit the AU grade today.

The EF coin in the Bolender Collection (sold in 1952), earlier in the Loyd B. Gettys and Col. E.H.R. Green collections, had the reverse off center to the right; apparently, the obverse was centered; this indicates the dies were misaligned axially.

• **NOTABLE SPECIMENS:**

Robertson Specimen. MS-63. • J. Douglas Robertson Collection, San Diego Sale, Mid-American Rare Coin Auctions, September 1989, Uncirculated.

Kagin Specimen. MS-63. • Kagin's Metropolitan Wash-

ington Convention Sale, 1980: 710. "Choice BU-63, die cracks at right leading to die failure at shoulder before hair strands and corresponding portion of reverse, short mark at top right reverse. Sharp stars and hair strands. Lovely lustrous gray bluish golden lustre."

Newport Specimen. MS-60. • Bowers and Ruddy Galleries, Newport Collection, 1975: 1044. "Beautiful Uncirculated, with dusky mottled brown and gray toning. Pristine, uncleaned. Some very minor adjustment marks are visible with a glass on the reverse."

Hollinbeck-Kagin Specimen(s). AU-58. • Hollinbeck-Kagin, June 1970: 615. "Die failure causing some of reverse stars not to be fully struck up, virtually Uncirculated, only barest rubbing on high points. Sometimes called 'AMERICA' variety due to heavy vertical die break after final A in AMERICA." • Hollinbeck-Kagin, August 1970: 1081. "Uncirculated golden, however, the die break (obverse). . . resulted in three stars of reverse not being fully struck up; a lovely specimen with only the barest trace of rubbing (the old-time 'cabinet friction')." *These may or may not be the same specimen.*

Pine Tree Specimen. AU-55. • Pine Tree, Suburban Washington Convention Sale, 1975: 242. "Obverse shattered at lower right, though without the severe bulges [of a later state]; reverse extensively cracked and rusted. Borderline Uncirculated, brilliant and pale gold tone, not well struck up on drapery or corresponding area of stars and clouds."

Hirt and Bolt Specimen. AU-55. • Pine Tree, Hirt and Bolt Collections, 1975: 759. "Better than AU, mint brilliance blending with pale gold tone. Weakly struck on drapery and corresponding area of stars and clouds, elsewhere bolder,

faint signs of rub on breast feathers and hair above temple, tiny reverse rim nicks, small obverse rim planchet defect superficially looking like a nick."

Van Cleave Specimen. AU-55. • Kagin's, 1986: 3406. "Sharp squared denticles on the obverse and stars which are virtually fully struck. Some lustre remains on periphery and both sides exhibit nice original color. A few very small marks on Miss Liberty's cheek and neck but otherwise essentially as struck."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population for all grades combined: 600 to 1,100 (URS-11)

• **CONDITION CENSUS:** 63-60-60-55 (multiples)

1798 Pointed Tail 9; Heraldic Eagle. BB-125.

"Misoriented Star Reverse."

Arc star pattern on reverse.

(B-8. H-8.)

• **OBVERSE 19:** Stars on right very close to Y and bust. Long vertical die flaw in center of left obverse field (best seen on strong VF or better pieces). Rounded-off bottom to 7. Die "dot" near edge between two

denticles above left part of T in LIBERTY. 9 shows slight doubling at top. A crack from lower right part of E to hair. On the left, more space between stars 5 and 6 than between any others. On the right, more space between stars 8 and 9 than between any others. The obverse stars at the left gradually weaken from die failure, and examples can be found appear-

ing to have only 12, 11-1/2, 11, 10-1/2, 10, or 9 stars.¹ Such pieces are sometimes sold as damaged coins as they appear, to the untrained eye, to have been plugged.

Obverse die used to strike 1798 BB-125 only.

• **REVERSE U:** *Only four berries*, and these are large. The only four-berried reverse of the year. Arc star pattern. Star ray at eagle's lower beak (only three arc-pattern reverse dies, those used to coin BB-116, BB-117, and BB-125 have the ray at beak); another ray of same star points to between B and U, closer to U. *Rightmost star is misoriented and has two rays toward the top of the coin, instead of the normal vertical orientation of one ray pointing straight up and the other straight down*, the only such skewing of a star on the reverse of a 1798 dollar. Nearby star under cloud 7 is considerably tilted. 12 arrows plus one detached head; two rightmost arrows are overlaid with other arrows, with heads part way down each shaft, as is another arrow near the middle; fifth arrow from right (on the third shaft from right, considering the doubling-up of the two rightmost arrows) is tiny and misformed. Light crack from border through upper left part of E in STATES. Point of leaf under left upright of I in AMERICA. The reverse is often weak, especially at the lower part of TED and at the right corner of the ribbon.

Reverse die used to strike 1798 BB-125 only.

• DIE STATES:

Die State I: Perfect dies. May not exist.

Die State II: With die cracks as described by Bolender. Stars are weak on the obverse, and on the reverse N and E of UNITED are very weak. Most BB-125 dollars are of this state.

Die State III: Bolender-8a: With die cracks as follows: Die crack on obverse through L to ribbon. Die crack lump on lower curl to left of date. Clash marks slightly above bust line and parallel to it. Reverse: The reverse die is now shattered with numerous cracks. A crack through top of UNIT down through ED, top of S, above TA, top of TES. Cracks through both top and bottom of OF, continue to AM, and top of ER. Another crack down through C and branch to shield. Another crack through arrow butts, eagle's tail, and stem to right. About 25% of surviving BB-125 dollars are of this state.

Die State IV: Later die state than III. On the obverse, star 5 cannot be seen, and star 7 is barely visible, due to die failure. One reverse crack starts at the lower right part of the M in AMERICA and runs to the ribbon, right shield top and the U in UNUM. A second crack begins at the top of the eagle's head and runs to the fourth cloud (counting from left to right.) UNITED is very weak, due to die buckling.

Die State V: State later than the following, with reverse die shattered and exhibiting over a dozen different cracks. Hall: 1675 had the most advanced cracks of any example seen. Spies' "Bolender-8e" was described as from a "badly shattered" reverse; "there must be 15 different die breaks."

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 10, Fine: 18, Very Fine: 47, Extremely Fine: 18, About Uncirculated: 6. Total: 101. (Average grade: VF-22)

• **COLLECTING NOTES:** 1798 BB-125 shares honors with BB-105 as one of the two most common varieties of the year and, indeed, one of the most common early dollars of *any* date. Close to 1,000 are known, and the actual number may be over that. Most specimens are in lower states of preservation from VG to VF, although EF coins are scattered throughout auction history, as are a few AU pieces. No Mint State coins are known to the author.

The F.C.C. Boyd ("World's Greatest Collection," 1945) and Bolender Collection (1952) specimens were each only VF. The W. Earl Spies Collection (Stack's, 1974) was notable for having five different die states of BB-125. This variety is surprisingly rare in higher grades; there must be some special story concerning how they were distributed.

• NOTABLE SPECIMENS:

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. Choice AU.

Cohen Specimen. AU-53. • Bowers and Merena, Cohen Collection, 1985: 301. "Well struck. Light smoky gray toning overlays frosty mint brilliance. The surfaces are immaculate. An interesting vertical die break is in the left obverse field."

Auction '87 Specimen. AU-50. • Superior, Auction '87. 1987: 1813. "The surfaces are lustrous and lightly marked. Some unusual colorful toning of an unknown origin is visible on the obverse and reverse."

Hall Specimen. AU-50. • Bowers and Ruddy, Hall Collection, 1978: 1675. "AU-50 and still quite lustrous. Struck from shattered dies, resulting in a characteristic weakness in a few places and in some interesting die breaks."

Newport Specimen. AU-50. • Bowers and Ruddy, Newport Collection, 1975: 1041. "Lustrous AU with a pleasing golden tone. Full mint lustre, except for the very highest parts of the coin, is visible under the beautiful patina."

Ross Specimen. AU-50. • Stack's, Ross Collection, 1990: 401. "AU, bold strike, pale russet centers, a band of neon blue and sea green around the obverse periphery."

ANA Convention Sale Specimen. EF-45. • Heritage, ANA Convention Sale, 1988: 948. "Advanced die state with numerous reverse breaks and weakness through the centers. Steel-gray surfaces which retain much underlying lustre. Splashes

¹ *The Numismatist*, May 1966, printed an article by H.N. Shepherd, "New Variety 1798 Silver Dollar?" in which the author opined that his specimen of B-8 [BB-125], with just 12 stars (the 5th obverse star was missing) might be a new variety. Further: "If it is unique, it is more rare than the fabulous 1804 dollars. [The ownership of the coin is] the thrill of my life."

of brownish-violet and vivid aqua coloration on either side. Small obverse edge bump at 9:00."

Ebsen Specimen. EF-45. • Superior, Buddy Ebsen Collection, 1987: 1895. "EF-45. Well struck and perfectly centered on a problem-free planchet."

New Netherlands Specimen. EF-45. • New Netherlands Coin Company's 57th Sale, 1963, offered a specimen catalogued as better than EF (say, EF-45).

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Coinage Context (For all 1799 varieties)

Record mintage: During calendar year 1799, the quantity of silver dollars minted reached an unprecedented 423,515. I believe many of these were dated 1798. At the time, little attention was paid to the use of dies in the year they were dated. The net coinage of 1799-dated dollars amounted to an estimated 395,000 (within 10%). Some of these may have been minted in calendar year 1800.

Among the production of 1799-dated dollars were some coined from an obverse die overdated 1799/8, although these were not the first struck.

Die making: Working dies for 1799 dollars were prepared as follows:

Obverse dies: The bust of Miss Liberty was punched into the die, after which the letters of LIBERTY, the stars, and the digits in 1799 were all added with individual punches. There were two sets of numeral punches used, each with Pointed 9:

Early style with narrow 7 and with spur at bottom of top curve of 9. Used on most obverses of 1798. Used on these 1799 varieties: BB-141, BB-142, BB-143, BB-154, BB-155, BB-156, BB-157, BB-159, BB-160, BB-161, BB-162, BB-163, BB-164, BB-166, BB-167, BB-168, BB-169.

Later style with wider 7 and without spur at bottom of top curve of 9. Space in opening at top of 9 slightly larger than on preceding. Used sparingly on 1798 varieties. Used on these 1799 varieties: BB-151, BB-152, BB-153, BB-158, BB-165.

Reverse dies: The Heraldic Eagle motif was punched into the master die. The master die included the eagle, clouds above the eagle, the upper part of the olive branch, olive leaves, and arrows. (Earlier, arrow details were added by hand, but in 1799 they were punched as a group, and are thus similar from coin to coin, unlike the situation in 1798). Working dies were copied from this master

die. Added separately to the working die were the letters of UNITED STATES OF AMERICA, the stars above the eagle, the lower part of the olive branch, and the berries.¹

The elements on obverse and reverse that were punched in separately differ minutely in their placement from one another, and are a guide to attribution. On 1799 dies, the workmanship was of a higher order than previously. Star spacing, letter alignment, and other variables are less obvious, and the attribution of certain varieties becomes more difficult.

The letters in E PLURIBUS UNUM vary in their apparent size (caused by different sizes of letter punches or the depth they were punched into the ribbon) and placement on certain varieties. Points of difference include the shapes and proportions of such letters as P, R, S, and U. Placement differences to note are the position of the U and S in PLURIBUS with regard to the edge of the eagle's neck on the left, and the placement of the N in UNUM in relation to the edge of the eagle's neck on the right. In general, letters were smaller in 1798 and 1799, and larger from 1800 onward.

The letters in E PLURIBUS UNUM seem larger and for some letters differently proportioned on the reverses of 1799 BB-162 and BB-164, in comparison to the other reverses of the year.

Numismatic Information

The 1799/8 overdate: The overdate, from a common obverse die, occurs in three varieties created through the combination with as many different reverse dies, known as BB-141, BB-142, and BB-143. Specimens are known in all grade levels, including Mint State, but higher grade examples are elusive.

The overdate was created from a previously unused 1798 obverse die.

Unusual dies: The curious 15-star reverse, used on BB-141 and BB-153, represents a die cutting error of the first order. The engraver punched in arc-shaped rows of stars, with seven stars in the top row (instead of six), six in the second row (instead of five), and the standard one star to each side of the eagle's head. One can imagine his wonderment when he took a wax impression of the new reverse and found it had 15 bold stars instead of 13. As by

this time the die had taken much effort to create, he elected to mask his error by vastly enlarging clouds 1 and 8 to cover the leftmost and rightmost stars in the top row of seven. The job was not quite perfect, and today coins struck from this die show remnants of star points beneath the clouds,

Another interesting variety is BB-159, with the obverse stars arranged 8x5, instead of the usual 7x6.

Reverse die differences: Most Heraldic Eagle reverse dies of 1798 have the A in STATES over the junction of clouds 2 and 3, while most reverse dies of 1799 have the A over cloud 3. Exceptions among 1799 dies are those that have the "Reverse of '98" with the A over the junction between clouds 2 and 3: The 15-stars die used to coin 1799 BB-141 and BB-153; the line star-pattern die used to coin BB-152, which was also used to coin 1798 dollars; the die used to coin 1799 BB-162; and the die used to coin 1799 BB-168. It is presumed that these dies were made earlier in the year, closer to 1798, than the others. However, their use seems to have been scattered among other dies.

Striking sequence: 1799/8 and 1799 dollars were produced in several striking periods, two of which contain over a half dozen varieties each, and the others of which comprise one, two, or three varieties. The following striking periods are apparent.

STRIKING PERIOD 1.

The overdates were produced in this period, but were not the first varieties struck.

1799 BB-151 Possibly the first variety struck bearing the 1799 date.

1799 BB-152 Line star-pattern reverse of 1798.

1799 BB-153

1799/8 BB-141 (1799/8 overdate)

1799/8 BB-142 (1799/8 overdate)

1799/8 BB-143 (1799/8 overdate)

1799 BB-154

1799 BB-155

STRIKING PERIOD 2.

1799 BB-156

1799 BB-157 (after striking, obverse removed from press for relapping)

STRIKING PERIOD 3.

1799 BB-158 (1st use)

¹ The manner in which the motto, E PLURIBUS UNUM, was introduced to the die is uncertain. Possibilities include the letters being individually punched in the master die or a complete ribbon punch containing the letters being added directly to the working die. This is an area for further research.

STRIKING PERIOD 4.

1799 BB-158 (2nd use)

1799 BB-159

1799 BB-158 (3rd use)

1799 BB-160

1799 BB-161 (relapped obverse; last preceding use was with 1799 BB-157)

1799 BB-162

1799 BB-163

1799 BB-164

STRIKING PERIOD 5.

Stand alone die pair not linked with any other. Striking time or sequence not determinable.

1799 BB-165.

STRIKING PERIOD 6.

Stand alone die pair not linked with any other. Striking time or sequence not determinable.

1799 BB-166.

STRIKING PERIODS 7 AND 8

A problem arises with the three remaining coins in the 1799 series, the BB-167, BB-168, and BB-169. There are two possibilities for striking periods. First, here are data concerning each: BB-167: Obverse die in earlier state than on BB-168; reverse in earlier state than on BB-169. BB-168: Obverse in later state than on BB-167; reverse not relevant as it was used only on BB-168. BB-169: Reverse in later state than on BB-167; obverse not relevant as it was used only on BB-169. Thus, BB-167 was struck earlier than BB-168, as the obverse of BB-167 is from an earlier die state. BB-167 was also struck earlier than BB-169, as the reverse of BB-167 is in an earlier die state. Thus, the striking of the three varieties could not have been continuous. There are two possibilities:

POSSIBILITY 1

STRIKING PERIOD 7:

BB-167 was struck first.

BB-168 was struck next, at which time the reverse die used to strike B-167 was taken out of the press, and a new reverse

was employed. Both BB-167 and BB-168 use the same obverse.

STRIKING PERIOD 8:

BB-169 was struck next, by placing the reverse die used to coin BB-167 back in the press, and combining it with a new obverse.

POSSIBILITY 2

STRIKING PERIOD 7:

BB-167 was struck first.

BB-169 was struck next, at which time the obverse die used to strike B-167 was taken out of the press, and a new obverse was employed. Both BB-167 and BB-169 use the same reverse.

STRIKING PERIOD 8:

BB-168 was struck next, by placing the obverse die used to coin BB-167 back in the press, and combining it with a new reverse.

1799/8 and 1799 Dollars

(General Information)

Relationship of Far Right Edge of A to Cloud(s) Below:

Far right edge of A over cloud 3: (BB-141), (BB-152), (BB-153), (BB-154), (BB-156), (BB-162), (BB-163), (BB-166), (BB-168).

Far right edge of A over junction between clouds 3 and 4: (BB-141), (BB-142), (BB-143), (BB-151), (BB-155), (BB-157), (BB-158), (BB-159), (BB-160), (BB-161), (BB-164), (BB-165), (BB-167).

APOCRYPHAL VARIETY: The Boyd Collection ("World's Greatest Collection," Numismatic Gallery, 1945): Lot 70 coin was described as: "(Haseltine 9a) Not listed by Haseltine. Obverse of No. 9 and reverse of No. 5." Such a variety is not known today, nor did Bolender, who attended the Boyd sale, list it in his 1950 book. This would be the equivalent of the obverse of BB-166 and the reverse of BB-157 today. Until proven otherwise, the "H-9a" is considered to be a misattribution, not a new variety.

Summary of Characteristics: 1799 (All Varieties)

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Weight and composition: 416 grains; .8924 silver, balance copper

Melting value (silver bullion value) in year minted: Considered by Mint officials to be on a par with the Spanish dollar, and worth about \$1.00 intrinsically (see discussion under Summary of Characteristics, 1794).

Dies prepared: Obverse: At least 11; Reverse: At least 16 (includes one die previously mated with a 1798-dated obverse).

Business strike mintage, calendar year: 423,515 (for all varieties of 1799 combined, not including pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: February 1: 40,195 (+3); February 25: 7,000 (+3); March 14: 51,500 (+3); March 28: 33,100 (+3); April 26: 26,890 (+3); May 23: 11,000 (+3); June 4: 36,500 (+3); June 28: 51,000 (+3); July 17: 32,900 (+3); August 23: 50,000 (+3); August 31: 31,330 (+3); December 6: 52,100 (+3).

Estimated business strike mintage of 1799-dated dollars (author's estimate): 395,000 (rounded).

Estimated quantity melted: Unknown

Approximate population MS-65 or better: 2 to 5 (URS-2)

Approximate population MS-64: 7 to 12 (URS-4)

Approximate population MS-63: 30 to 50 (URS-6)

Approximate population MS-60 to 62: 110 to 200 (URS-8)

Approximate population AU-50 to 58: 300 to 550 (URS-10)

Approximate population VF-20 to EF-45: 7,000 to 12,000 (URS-14)

Approximate population G-4 to F-15: 3,250 to 5,250 (URS-13)

Approximate population for all grades combined: 11,000 to 18,000 (URS-15)

• **CONDITION CENSUS:** 65-65-64 (multiples)

• **AVERAGE AUCTION APPEARANCE GRADE** for all varieties combined: VF-27.

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

None

Commentary

Many different die varieties exist for 1799, including three with the overdate 1799/8, the curious 15-stars blundered reverse die, and a variety with the obverse stars arranged 8 on the left and 5 on the right, instead of the normal 7x6 configuration.

Additional Information

The Year 1799 in History

On December 14, 1799, George Washington died at Mount Vernon, his Virginia home. Four days later the news reached Philadelphia. In a speech before Congress, Henry Lee described the deceased as "First in war, first in peace, and first in the hearts of his countrymen." Early the following year, speeches, eulogies, and parades were given in Washington's honor, and medallic remembrances were produced, the most famous being the varieties of cent-sized tokens made in copper, white metal, silver, and gold by Jacob Perkins of Newburyport, Massachusetts, and bearing the inscription, HE IS IN GLORY, THE WORLD IN TEARS. The memory of the first president would endure, and as one medal noted, "time increases his fame."

A census conducted by Spanish authorities in lower Louisiana revealed that there were 42,375 inhabitants, two-thirds of whom were of European extraction. The *Baltimore American* became the first publication to record congressional debates and speeches in detail. In Dalton, Massachusetts, the Crane paper mill was established; it would later furnish sheets for the printing of bank notes and currency.

In England, chemist Humphry Davy inhaled nitrous oxide, or laughing gas, and reported that it made him insensitive to pain; the gas later came into use as an anesthetic. The first British income tax passed Parliament. In Egypt, Champollion discovered the Rosetta Stone, which had been carved with inscriptions in three different languages; when deciphered, it became the key to decoding ancient Egyptian writing.

1799/8 and 1799 Heraldic Eagle

Varieties

1799/8 Overdate. BB-141.

15 stars on reverse.

(B-3. H-3.)

• **OBVERSE 1:** 1799, last 9 punched over previous 8, and definitive as such; the only overdate die of the year. Last 9 of date very close to bust. Stars very close together. Letters of LIBERTY are widely spaced. Die flaws at left base of E, under RT, and above R. The same obverse die was shared to coin BB-141, BB-142, and BB-143. This die was not used to strike 1798 dollars before it was overdated.

Obverse die used to strike BB-141 (1st use), BB-142 (2nd use), and BB-143 (relapped; 3rd use).

• **REVERSE A:** 15 stars on reverse; this is definitive, although to the uninitiated the two extra stars are not readily seen, at least at first. The two supernumerary stars are nearly lost in cloud 1 and cloud 8, and just the points show. The one protruding from the bottom of cloud 1 is the most easily seen. The result is a blundered arc pattern of stars with five (instead of six) stars in the top row, six (instead of five) in the second row, and the usual one to each side of the eagle's head, plus the superfluous star points peeking out from the bottoms of clouds 1 and 8.

The process was accomplished as follows: The engraver first punched seven stars in the top row, six

in the second row, and the normal single stars to each side of the eagle's head. He then took count and realized that he had one too many stars in the top row, and one too many stars in the second row, for a total of 15. To disguise his blunder, he enlarged clouds 1 and 8, making them greatly oversized to cover up the first and last stars in the top row, reducing the count to an abnormal five (instead of the normal six), so that the abnormal six (instead of five) in the second row would not have to be altered. The normal star arrangement, top to bottom, is: 6-5-2. Before alteration, this reverse die was 7-6-2. After alteration, it was 5-6-2.

Leaf point under left upright of I in America. Die crack near border above ATES. Another crack above OF AM. The D in UNITED is repunched and there are die flaws in the right side of this letter. Far right edge of A is over cloud 3. Reverse usually not fully struck up at the center, due to sinking of the die.

Note: Die state progressions reveal that the 1799/8 overdates, which are die linked to regular 1799 dollars, were struck after certain regular or perfect date (non-overdate) pieces were made. The overdates are listed first here, following numismatic tradition.

Reverse die used to strike 1799 BB-141 (later use with 1799/8 overdate obverse) and 1799 BB-153 (earlier use with non-overdated obverse).

• **DIE STATES:**

Die State I: Perfect dies. Reverse without cracks. May not exist.

Die State II: Early state of obverse later used to coin BB-142 and BB-143. Tiny flaw or crack above R in LIBERTY does not extend to left beyond R. Minute raised flaw at left base of E. Several raised flaws below RT. Three or four small raised areas starting to develop behind hair and above ribbon. Very tiny flaw between ray of star 7 and the bottom left of L. Reverse die with cracks as described above under BB-141.

Die State III: Obverse as preceding. Reverse with additional crack from right ribbon through AMERIC.

Die State IV: As preceding, but on reverse, a tiny additional crack develops below left upright of M to wing.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 7, Fine: 11, Very Fine: 35, Extremely Fine: 42, About Uncirculated: 17, Mint State-60 or better: 22. Total: 136. Average grade: VF-35.

• **COLLECTING NOTES:** In terms of availability among overdates of this year, 1799/8 BB-141 is the most plentiful, edging out BB-142 by a healthy margin. It seems likely that about 700 to 1,200 are known today of this variety. This is nice, as it makes the interesting combination of the overdate obverse and the blundered die reverse available to all.

Examples exist in all grades through Mint State, and in terms of early dollars, is actually plentiful in the latter grade! Perhaps someone found a cache of a few dozen of them many years ago. Whatever the reason might be, it has not been recorded.

• **NOTABLE SPECIMENS:**

Rarcoa Specimen. MS-64. • Rarcoa, Auction '83, 1983: 1162. "Superb gem brilliant Unc. Blazing, frosty surfaces and totally full, complete strike makes this specimen truly incredible." • Rarcoa, Auction '85, 1985: 264. "Superb gem brilliant Unc. Blazing, frosty surfaces and totally full, complete strike makes this specimen truly incredible." • Rarcoa, Auction '86, 1986: 731. "Superb gem brilliant Unc. Blazing, frosty surfaces and totally full, complete strike makes this specimen truly incredible."

Austin Specimen. MS-63. • Bowers and Ruddy Galleries, Austin Collection, 1974: 25. "Choice Brilliant Unc. Some microscopic marks are visible with a glass."

Stack's Auction '83 Specimen. MS-63. • Stack's, 1983: 721. "Unc. and choice. Full frosty lustre with exquisite gray, russet, and seagreen toning."

June Sale Specimen. MS-63. • Stack's, June Sale, 1990: 400. "Choice Brilliant Unc. 'Chalk-white' frosty lustre indicative of a completely natural, untouched coin. Delicate amber russet toning."

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 63. "A superb Unc.

coin. Also the 1799 over 98 variety."

Davis Specimen. MS-60. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1296. "Unc., with almost full mint bloom."

Anderson-Dupont Specimen. MS-60. • Stack's, Anderson-Dupont Collection, 1954: 2502. "Unc., full mint lustre."

Baldenhofer Specimen. MS-60. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A.J. Ostheimer, 3rd Collection • Superior Galleries, Gilhousen Collection, 1973: 1248. "Very deeply toned Unc., faintest suggestion of cabinet friction in one or two tiny places on reverse." • Superior Galleries, ANA Convention Sale, 1975: 912. "Very deeply toned Unc., faintest suggestion of cabinet friction in one or two tiny places on reverse."

New Netherlands Specimen. MS-60. • New Netherlands 51st Sale, 1958: 696. "Far advanced and unlisted die injuries. Brilliant Unc., with some golden tone and some light tarnish."

Wolfson Specimen. MS-60. • Stack's, Samuel W. Wolfson Collection, 1963: 1381. "Lustrous, lightly toned, nicely struck. Unc., fairly well centered."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, January 1970: 785. "Unc. with glittering bluish golden patina, sharp denticles obverse and reverse." • Hollinbeck-Kagin Sale, June 1970: 619. "Unc. with lovely prooflike patina, struck from slightly swelled reverse die resulting in some of the eagle's wing feathers not being fully struck up." • Hollinbeck-Kagin Sale, August 1970: 1084. "Unc. golden, sharp struck."

Davenport Specimen. MS-60. • Eastern collection. • Superior Galleries, ANA Convention Sale, 1975: 911. "MS-60 or so, frosty with a touch of golden about the devices, and lustrous. Excellent surfaces with minimal handling marks. Not fully struck up in the center portions of the reverse as usual for this variety. Pedigree: From a famous eastern collection." • Superior Galleries, Davenport Collection, 1977: 476. "MS-60 or so, frosty with a touch of golden about the devices, and lustrous. Excellent surfaces with minimal handling marks. Not fully struck up in center portions of the reverse." • Superior Galleries, February 1981: 650. "MS-60. Frosty, with a touch of golden about the devices, and lustrous. Excellent surfaces with minimal handling marks. Not fully struck up in center portions of the reverse."

Robison Specimen. MS-60. • Stack's, Ellis H. Robison Collection, 1982: 1869. "Brilliant Unc. Lovely pale russet gray with faint iridescent overtones."

Heifetz Specimen. MS-60. • Superior Galleries, Jascha Heifetz Collection, 1989: 2393. "MS-60. Lovely silvery gray toning on the obverse and reverse with touches of lilac in the fields. Sharply struck, especially about the periphery with all of the obverse stars boldly struck up. The reverse is also well struck with each star visible above the eagle's head in the field. Late die state with some weakness in the central curls of Liberty and heavily clashed on the obverse and reverse. Additionally, the milling is clashed below the bust."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 or 1 (URS-0)

Approximate population MS-64: 2 or 3 (URS-2)

Approximate population MS-63: 3 to 6 (URS-3)

Approximate population MS-60 to 62: 20 to 35 (URS-4)

Approximate population AU-50 to 58: 50 to 100 (URS-7)

Approximate population VF-20 to EF-45: 600 to 875 (URS-11)

Approximate population G-4 to F-15: 125 to 200 (URS-9)

Approximate population for all grades combined: 800 to 1,200 (URS-11)

• **CONDITION CENSUS:** 64-64-63-63-63-60 (multiples)

1799/8 Overdate. BB-142.

(B-1. H-1.)

• **OBVERSE 1:** See description under 1799/8 BB-141.

Obverse die used to strike BB-141 (1st use), BB-142 (2nd use), and BB-143 (relapped; 3rd use).

• **REVERSE B:** 13 stars above eagle. Leaf points to center of I in AMERICA. Star touches point of lower part of eagle's beak; ray points to the left outside of the U in PLURIBUS; U is usually weakly struck. Far right edge of A is over junction of clouds 3 and 4. First A in AMERICA touches 3rd feather, and rests on fourth. Die cracked and scaled between R and I in AMERICA, above same I, and above right part of first T in STATES. Slight die crack sometimes shows through bottom of ES up to top of O, another through lower part of OF.

Reverse die used to strike 1799 BB-142 only.

• **DIE STATES:**

Die State I: Intermediate state of obverse used earlier to coin BB-141 and later to coin BB-143. Tiny flaw or crack above R in LIBERTY now extends slightly to left beyond R. Flaw at left base of E about 50% larger than on BB-141. Several raised flaws below RT are about the same as on BB-141. Numerous small raised areas in field from area between star 7 and L, extending toward close to hair above ribbon. Very

tiny flaw between ray of star 7 and the bottom left of L. Reverse die without cracks. May not exist with perfect reverse die.

Die State II: Obverse as above. Reverse die as described by Bolender, with crack between R and I of AMERICA and above I; crack above right part of first T in STATES; slight die crack through bottom of ES of STATES to top of O in OF; another crack through lower part of OF.

Die State III: Die flaws advanced at I of AMERICA; die cracked at ATES OF, wing to ribbon, and at AME. Crack from denticles to left side of O, on to junction of clouds 6 and 7. Cracks around much of the border; die shattered. New Netherlands 48th Sale: 626. MS-60, ex Waldo C. Newcomer, Col. E.H.R. Green, James G. Macallister. This is the die state most usually seen.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 3, Fine: 8, Very Fine: 27, Extremely Fine: 22, About Uncirculated: 9, Mint State-60 or better: 15. Total: 85. Average grade: VF-34.

• **COLLECTING NOTES:** 1799/8 BB-142 is in the middle, rarity-wise, of the three overdate varieties of this year. I estimate that 350 to 600 are known today of this variety.

While most examples are in grades up to and including EF, a number of AU and Mint State coins have crossed the auction block. Of course, some

pieces graded as Uncirculated years ago would fall into the AU category today. Interestingly, 1799/8 BB-142 is the rarest of the three overdate varieties in grades below Fine. Apparently, few ever spent an extended amount of time in circulation.

This, BB-141, and BB-143 are in especially great demand as overdates, by date collectors; the demand from variety collectors is additional. In his 1881 *Type-Table*, J.W. Haseltine called this variety very scarce.

• NOTABLE SPECIMENS:

Carter Specimen. MS-63. • Stack's, Amon Carter, Jr. Collection, 1984: 224. "Die cracks at T and RI on the reverse. Brilliant Unc. and choice. A prooflike specimen with exquisite golden and pale iridescent toning."

Chalkley Specimen. MS-60+. • Superior, 1990: 2860. "MS-60+. Sharply struck with each of the obverse stars displaying their five radial lines. Central reverse has minute weakness in shield. Several die chips and flakes are noted, especially on the reverse. The I of AMERICA has a large area of sinking, characteristic of this variety."

Aspen Specimen. MS-60. • Bowers and Merena, Dr. Nelson Page Aspen Collection, ANA Convention Sale, 1989: 369. "MS-60 to 63. Lustrous surfaces with pleasing blushes of mottled golden brown and gunmetal-blue iridescence. Most of the design details are well struck except at the extreme centers."

Auction '84 Specimen. MS-60. • Stack's, 1984: 1185. "Brilliant Unc., frosty lustre with rich natural sea green and pink iridescent toning. The reverse showing signs of die crumbling at I of AMERICA."

Clarke Specimen. MS-60. • Waldo C. Newcomer Collection • Col. E.H.R. Green Collection • James G. Macallister to T. James Clarke Collection • New Netherlands 48th Sale,

1956: 626. "Die flaws above and to left of I in AMERICA. Lustrous, iridescent Unc. Rather weak at the inevitable obverse high points; the reverse weak at eagle's head and shoulders, motto, stars at upper r. Evenly centered, the boldness about the perimeter. The reverse die flaws are advanced; the die cracked at ATES OF, wing to ribbon, and at AME."

Wolfson Specimen. MS-60. • Stack's, Samuel W. Wolfson Collection, 1963: 1380. "Brilliant Unc., sharply struck. Full mint bloom, deep serrated borders."

French Family Specimen. MS-60. • Stack's, French Family Collection, 1989: 10. "Brilliant Unc., frosty lustre with rich natural sea green and pink iridescent toning. The reverse showing signs of die crumbling at I of AMERICA. Very late die state, die rust at upper obverse and scattered across the reverse. Several die breaks at the upper reverse as well."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 4 to 8 (URS-3)

Approximate population AU-50 to 58: 10 to 20 (URS-5)

Approximate population VF-20 to EF-45: 400 to 725 (URS-10)

Approximate population G-4 to F-15: 80 to 150 (URS-8)

Approximate population for all grades combined: 500 to 900 (URS-11)

• CONDITION CENSUS: 63-62-60-60-60-55 (multiples)

1799/8 Overdate. BB-143.

(B-2. H-2.)

• **OBVERSE 1:** See description under 1799/8 BB-141; overdate die. Die flaws as on BB-141, plus

some new die flaws in and around the date and between star seven and the L in LIBERTY extending to the hair above the ribbon.

Obverse die used to strike BB-141 (1st use), BB-142 (2nd use), and BB-143 (relapped; 3rd use).

• **REVERSE C:** 13 stars above eagle. Die crack from border down through *curved part of D* and showing at base. Leaf point is below left side of upright of I in AMERICA. Star touches lower part of eagle's beak and *just enters the mouth; ray points to right side of left upright of U* in PLURIBUS. A in AMERICA touches 4th feather, but not the 3rd. Readily distinguishable from BB-142 by its reverse crack through the curve of the D in UNITED. There is a bar, on the reverse, in the clouds below the E in STATES which may be the remnants of a mispunched letter. Die flaw between left base of N and arrowhead, next to arrowhead. Far right edge of A is over junction of clouds 3 and 4.

Reverse die used to strike 1799 BB-143 (late state) and BB-155 (early state).

• DIE STATES:

Die State I: Obverse die relapped in effort to remove flaws. Lowest curl (to left of 1 in date) now partly missing and with open center. Just a trace of second curl remains as two tiny, isolated curved lines in field. Flaws below E and RT, and in field behind head are now larger than on BB-142. Reverse with crack from rim to right side of D in UNITED. Additional hairline crack from S through OF to top of wing. Die roughness at ER in AMERICA. (Slightly advanced from last die state described under 1799 BB-155.)

Die State II: Obverse as preceding. Reverse with hairline crack expanded, now through ATES, OF, wing, and top part of AME; crack becomes multiple between wing and A.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 5, Very Good: 9, Fine: 11, Very Fine: 9, Extremely Fine: 3, About Uncirculated: 4, Mint State-60 or better: 4. Total: 46. Average grade: VF-21.

• **COLLECTING NOTES:** 1799/8 BB-143 is the scarcest of the three overdate die varieties of the year. I believe that 250 to 450 of this variety exist. This estimate, if accurate, makes BB-143 at least twice as elusive as BB-142 and about three times harder to find than BB-141. Equally important, unlike BB-142, the 1799/8 BB-143 variety is usually seen in lower grades. Most are VF or less. Why this is so is a mystery.

As is the case with BB-141 and BB-142, the demand for this variety is increased by the overdate feature.

• NOTABLE SPECIMENS:

Fairfield Specimen. MS-63. • Bowers and Ruddy, Fairfield Collection, 1977: 1032. "Choice Unc. with attractive gray and light golden toning."

Einstein Specimen. MS-63. • Bowers and Merena, Harry

Einstein Collection, 1986: 1730 "MS-63. Sharply struck, with all stars on the obverse except star one having full centers. Light smoky gray iridescence blends with pale gold and lilac upon reflection in the light. Only a few contact marks on the obverse."

Miles Specimen. MS-60. • R.L. Miles, Jr. (Stack's, 1969): 1544. "Brilliant Uncirculated."

Scanlon Specimen. MS-60. • Scanlon Collection, Stack's: 1719. "Brilliant Uncirculated." • Stack's April 1974 Sale.

Green Specimen. AU-50. • Col. E.H.R. Green Collection. • K.P. Austin Collection. • A.J. Osheimer, 3rd Collection • Superior, ANA Convention Sale, 1975: 910. "AU-50 or so, the reverse nicer than the obverse and with a fully lustrous cart-wheel effect. Obverse rubbed on forelock and has many small handling marks."

Aspen Specimen. AU-50. • Bowers and Merena, Dr. Nelson Page Aspen Collection, 1989: 370 "AU-50. Brilliant in the central areas with tinges of faint golden coloration at the peripheries. Wisps of frosty mint lustre can be seen at the borders and around the design elements. The surfaces appear to be entirely free of adjustment marks."

Heifetz Specimen. AU-50. • Superior Galleries, Jascha Heifetz Collection, 1989: 2395. "AU-50. Superb iridescent toning throughout with hints of green and gold when tilted in the light. The only area of weakness is on the left wing of the eagle but this is minor."

Clarke Specimen. EF-45. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 628. "Reverse die break through D, plus several other light cracks. About EF and choice. Weak towards the center of the reverse; small edge dent above TA of STATES." • Lester Merkin, A.J. Osheimer, 3rd Collection, 1968: 273. "Unpublished advanced die cracks. AU, uneven and rather indefinite strike, frosty pale gold tone."

Herdegen Specimen. EF-45. • Hans M. F. Schulman, R.T. Herdegen Collection, 1973. "Highly lustrous, choice EF condition. Reverse close to Unc. Nicely toned."

Green Specimen. EF-45. • Bowers and Merena, Green Collection, 1985: 1378. "Choice EF-45. Pleasing surfaces and light toning. Well struck overall."

• **CONDITION CENSUS:** 63-63-60-60-60-55 (multiples)

1799. BB-151.

**(B-13. H-13.)**

• **OBVERSE 2:** *Irregular date*, per traditional nomenclature, although the “irregular” feature is more notable in the telling than in the seeing. Both 9s are improperly placed, the first is tipped too far to left at top, the last 9 too far to right at top. It has been suggested by Walter H. Breen that a Draped Bust obverse die was made in 1798, but with date incomplete and as 179 only; later to be finished by adding another 9 in 1799. *A ray of star 13 touches bust.* On the left, stars 3 and 4 are wider apart than are any others. On the right, stars 10-11 are closer together than are any others. Perfect die without cracks.

Obverse die used to strike 1799 BB-151 (first use), BB-152 (intermediate use), and BB-153 (final use).

• **REVERSE D:** *Die “dot”* (rust) above E in STATES, and *die flaws* inside upper part of same letter. *Die flaws appear between and under two lower stars farthest to right.* Star is close to eagle’s beak, and barely escapes touching its upper part; ray points to right side of B in PLURIBUS. Leaf points to center of I in AMERICA. A touches fourth feather of right wing. Far right edge of A is over junction of clouds 3 and 4. The upper two berries are closest and the bottom two berries are very large. All seen are weakly struck at their centers.

Reverse die used to strike 1799 BB-151 only.

• **DIE STATES:**

Die State I: Perfect dies, including reverse die without rust. May not exist.

Die State II: As described above for BB-151. On reverse, rust spot above E in STATES. Die flaws near rightmost stars. The state usually seen.

• **AUCTION POPULATION SURVEY:** Very Good: 5, Fine: 3, Very Fine: 5, Extremely Fine: 6,

About Uncirculated: 3, Mint State-60 or better: 2. Total: 24. Average grade: VF-28.

• **COLLECTING NOTES:** 1799 BB-151 is the rarest variety of this date and is seldom encountered in the marketplace. I estimate that only 40 to 75 are extant. The grades are spread over a wide range, rather than being clustered at, say, VF.

In 1881, Haseltine rated this with his pet phrase, “excessively rare.”

• **NOTABLE SPECIMENS:**

Boyd Specimen. AU-55. • F.C.C. Boyd Collection (tentative attribution), “World’s Greatest Collection,” 1945: 76. • Lester Merkin, A.J. Ositheimer, 3rd Collection, 1968: 284. “Practically Unc. Indefinitely struck up in centers, elsewhere very sharp. Mint frost with iridescent cool tone; light adjustment marks on reverse, trivial handling marks.” This may be the same as: 1975 ANA Convention Sale (Superior): 945 EF-40, “probably ex W.G.C., Austin, Ositheimer.” 1975 ANA had two others, VF-25 (ex Rev. Edward W.W. Lewis, K.P. Austin, Ositheimer), and F-15 ex A.J. Ositheimer, 3rd.

Auction ‘87 Specimen. AU-50. • Stack’s, 1987: 779 “AU and choice. Perfectly centered and struck. Mint lustre beneath pink and iridescent toning.”

Heritage Specimen. AU-50. • Heritage, ANA Convention Sale, 1988: 955. “Steel violet surfaces displaying scattered patches of brown and gray.”

Smith Specimen. EF-45. • Harlan P. Smith. • Schuyler Collection. • M.H. Bolender Collection, 1952: 114. “Nearly Unc., just slight friction on highest portions of hair and eagle. Finely toned, considerable mint lustre.” • Dr. Charles Ruby Collection. • Superior Galleries, Gilhousen Collection, 1973: 1258. “Die flaws at E of STATES. AU or better, much mint lustre and only minor handling marks (three on rims, not very noticeable). Touches of cabinet friction consistent with a grade above EF.” • Superior Galleries, Neggen Sale, 1976: 659. • Superior Galleries, February, 1981: 654. “EF-45 or better. Surfaces of AU or better, much mint lustre and only minor handling marks (three on rims, not very noticeable).”

Touches of cabinet friction consistent with a grade above EF.”

• **CONDITION CENSUS:** 55-50-50-50-45 (multiples)

1799. BB-152.

“Blundered Stars Reverse.”

Line star pattern on reverse (only 1799 of this style).

Reverse of 1798

(B-15. H-15.)

• **OBVERSE 2:** See description under 1799 BB-151. So-called *Irregular Date*.

Obverse die used to strike 1799 BB-151 (first use), BB-152 (intermediate use), and BB-153 (final use).

• **REVERSE E:** *Reverse of 1798.* Struck from the same die as BB-123 and BB-124 of the 1798 dollars. The 5 berries are the smallest of any variety of the 1799 date. A die crack joins stem end to border below. This is significant as *the only 1799 dollar with a “line pattern” of stars on the reverse* (as explained in the general introduction to 1798 dollars in this book). Most seen are very weakly struck on the reverse stars (but not as weak as on 1798 BB-124, on which the weakness was caused by an extensively damaged lower right obverse die being opposite on the coin). Far right edge of A is over cloud 3.

Reverse die used to strike 1798 BB-123 (earliest state), BB-124 (intermediate state, now relapped); and 1799 BB-152 (latest state).

• **DIE STATES:**

Die State I: Perfect dies. No obverse cracks. Reverse always with crack from stem, as inherited from 1798 BB-123 and BB-124. May not exist without obverse cracks.

Die State II: Obverse die with hairline crack from left side of 1 in date through stars 1-4 to border opposite star 5. Bolender’s personal coin was of this die state. Not seen by author.

Die State III: Obverse die with additional hairline crack from star 9 to field near star 11. Scarcer die state than the following.

Die State IV: Bolender-15a. Obverse die with further cracks: Hairline crack from center of star 4 through star 7. Separate hairline crack from center of star 7 through LIBE. Crack from right side of R, through bottom of T, below Y, to field. Crack from Y through stars 8, 9, and 10 to bust (expansion of earlier crack from star 9 to field near star 11). 1975 ANA Convention Sale (Superior): 951 coin, EF-40, is from the Bolender and Ostheimer collections. This is the most plentiful die state of 1799 BB-152.

• **AUCTION POPULATION SURVEY:** Good: 3,

Very Good: 5, Fine: 13, Very Fine: 14, Extremely Fine: 11, About Uncirculated: 4, Mint State-60 or better: 2. Total: 52. Average grade: VF-24.

• **COLLECTING NOTES:** 1799 BB-152 is among the scarcer varieties of the year, however, a nice example can be found without undue difficulty. I believe that 300 to 500 exist.

Haseltine in his day considered this variety to be very rare. As is the case with other early dollars of which several dozen or more exist, the number of coins available exceeds the number of dedicated collectors by die varieties, thus providing the opportunity to acquire a rarity for little more than a "type" price.

Most examples of 1799 BB-152 are in lower grades. Any coin grading AU or better is especially notable. Only a few Mint State coins exist.

• **NOTABLE SPECIMENS:**

Auction '85 Specimen. MS-60. • Stack's, Auction '85, 1985: 1751. "Choice BU, shimmering mint lustre with delicate golden olive toning."

Pine Tree Specimen. AU-55. • Pine Tree, Suburban Washington Convention Sale, 1975: 246. "Brilliant AU+, nearly free of bagmarks, none worth special description except shallow rim nick above ST; sharp stars and curls."

Brooks Specimen. AU-50. • Bowers and Merena Galleries, Brooks Collection, 1989: 239. "The surfaces have pearl gray and light champagne coloration, and much of the original mint lustre still survives in the fields. A shallow planchet lamination flaw can be seen towards the center of the eagle's shield."

DeCoppet Specimen. AU-50. • André DeCoppet Collection, James F. Kelly, 1955. • Lester Merkin, A.J. Ostheimer,

3rd Collection, 1968: 286. "More or less Unc., irregular blue toning, uneven and somewhat weak strike. Planchet defect at edge near first two stars, showing also at left wing tip. Reverse, crack extended through wing tip and field towards right, unmentioned by Bolender and RR."

Turoff Specimen. AU-50. • Bowers and Ruddy Galleries, Julius Turoff Collection, 1976: 1380. "Very lovely AU with a generous quotient of original mint lustre present."

Baldenhofer Specimen. EF-45. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • K.P. Austin Collection. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 950. "Early die state. Not quite AU-50, dull frosty tone with a speck here and there of iridescent tone. Needle-sharp where fully struck up, but there are many file marks on Liberty's bust and correspondingly very weakly struck up on the reverse which is also off center."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population for all grades combined: 300 to 500 (URS-10)

• **CONDITION CENSUS:** 60-60-55-55-50 (multiples)

1799. BB-153.

15 stars on reverse
(B-4. H-4.)

• **OBVERSE 2:** *Irregular date.* See description under BB-151.

Obverse die used to strike 1799 BB-151 (first use), BB-152 (intermediate use), and BB-153 (final use).

• **REVERSE A:** See description under 1799 BB-141. 15 stars; the two extra stars are identifiable only by points emanating from the bottom of clouds. Clouds 1 and 8 are oversized to hide the blunder. The stars are arranged in arcs as 5-6-2, rather than 6-5-2. Far right edge of A is over cloud 3.

Reverse die used to strike 1799 BB-141 (later use) and BB-153 (earlier use).

• **DIE STATES:**

Die State I: Obverse die with these cracks, mostly inherited from its earlier use to coin BB-152: Hairline crack from left side of 1 in date through stars 1-4 to border opposite star 5. Hairline crack from center of star 4 through star 7. Separate hairline crack from center of star 7 through LIBE. Crack from right side of R, through bottom of T, below Y, to field. Crack from Y through stars 8, 9, and 10 to bust. Now also with hairline crack from star 1 to second curl from bottom. Reverse die without cracks (but with some raised die flaws, as made, near D of UNITED). Scarcer die state than the following.

Die State II: Obverse now with incusation marks from reverse denticles, at obverse denticles at border from star 1 through 6, slightly toward star 7. Earlier crack from Y now extends to left to border. Crack in field opposite stars 10 and 11 begins at earlier crack, is closer to neck, and goes to bust. Crack from star 10 to border opposite star 11 (on slightly later die progression, crack extends toward field from star 10 and joins earlier crack). Crack extends from earlier crack through top of star 12 to border. The obverse die failure is responsible for usual light striking at the center of the reverse. The die could not have lasted much beyond this point. This is the die state usually seen.

• **AUCTION POPULATION SURVEY:** Very Good: 9, Fine: 13, Very Fine: 23, Extremely Fine: 9, About Uncirculated: 3, Mint State-60 or better: 2. Total: 59. Average grade: VF-22.

• **COLLECTING NOTES:** I estimate that 350 to 600 examples of 1799 BB-153 are extant today, placing it in the medium range of availability within varieties of this year. Most survivors are in grades up through VF, although EF examples come on the market at intervals. In AU or Mint State, BB-153 is a great rarity. The blundered reverse die feature lends interest and value.

• **NOTABLE SPECIMENS:**

Kagin Specimen. AU-50+. • Kagin's, CSNS Convention Sale, 1979: 365. "Borderline Unc-50+. Lovely golden gray lustre, only barest friction. Full stars, collar lines and top hair strands but center hair strands back of ear not fully struck up."

Dallas Specimen. AU-50+. • Heritage, Dallas Auction, 1989: 458. "AU (50/50+). Gorgeous, with lots of original lustre still remaining on both sides. Some very shallow adjustment marks crisscross the shield on the reverse. Attractive, golden-gray color."

Ruby Specimen. AU-50. • Superior Galleries, Ruby Collection Sale, Part I, 1974: Lot 1467. "Shattered obverse die, possibly later even than Gilhousen 1249. AU, a really brilliant coin with a little too many areas of cabinet friction on face and curls. Delicate gold tone starting. One minute nick in top reverse field, otherwise just about flawless."

Austin Specimen. AU-50. • K.P. Austin Collection • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 275. "Shattered obverse. Choice Unc., weak in centers but with splendid lustre and prooflike surface; irregular toning and tarnish, natural streakiness and almost no bagmarks." • Superior Galleries, Gilhousen Collection, 1973: 1249. "Irregularly toned, prooflike Unc., weakly struck in centers but much better struck elsewhere. Advanced obverse cracks." • Superior Galleries, ANA Convention Sale, 1975: 914. "Obverse die cracks, as usual. EF-45 or better, but very weakly struck up in the center portions. Irregularly toned and has prooflike surfaces." [Author's note: We have arbitrarily assigned the grade of AU-50 to this specimen. In 1968 it was described as Choice Unc., in 1973 as prooflike Unc. and in 1975 as EF-45 or better. We have not examined this coin to determine our 1993 grade opinion.]

Austin Specimen (another). EF-45. • K.P. Austin • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 915. "Much more advanced state of the obverse dies, EF-45, cleaned, but lustrous and beginning to tone. Light handling marks visible to the naked eye."

(numerous other EF coins could be cited)

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

• **CONDITION CENSUS:** 63-60-60-50-50-45 (multiples)

1799. BB-154.

(B-18. H-18.)

• **OBVERSE 3:** Star 8 farther from Y than the first star from curl, or the star 7 from L, or the last star from bust. *Highest curl on top of head is centered under right edge of E and space between E and R, the farthest right of any 1799 obverse.* Same die used for BB-155. The first three obverse stars show light repunching (visible on high-grade specimens). On the left, stars 2 and 3 are much closer than are any other stars to each other; stars 4-5 and 6-7 have the widest spacing. On the right, stars 8-9 and 9-10 are more closely spaced than are the other star pairs.

Obverse die used to strike 1799 BB-154 (early use) and BB-155 (later use).

• **REVERSE F:** *Heavy die crack* between E and D through left wing, to top of shield, the best aid to identifying the variety (if Die State II; see Die States below). Lighter cracks usually through TATES O, from lower part of F to top of A, from border above R, top of I, through CA, stem end, tail, up through NIT. Small point at stem end. A does not touch feathers. Leaf points below left side of upright of I in AMERICA. Point of star touches lower point of eagle's beak. The U and the T in UNITED are repunched. Far right edge of A is over cloud 3. Usually weakly struck at reverse center. A few pieces are known with reverse die misalignment.

Reverse die used to strike 1799 BB-154 only.

• **DIE STATES:**

Die State I: Perfect dies. Unknown to Bolender; Haseltine called it H-20, but this was eliminated by Bolender as non-existent. From 1 to 3 are known today (reported by Douglas Winter). EF-45 reported by Warren Miller.

Die State II: Die cracks less advanced than on State III. Cf. Gilhousen (Superior, 1973), VF, called "one of the half dozen

finest, exceeded by three EFs and tied or minutely exceeded by a couple of others not quite reaching EF."

Die State III: Dies as described by Bolender, above. EF-45 reported by Warren Miller.

Die State IV: Later die state, now with a heavy crack below the left wing tip through STATES and the O in OF to the rim below; a second crack begins at the rim over the E in STATES and it then meets the crack through ED as described by Bolender.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 4, Fine: 2, Very Fine: 12, Extremely Fine: 4, About Uncirculated: 4, Mint State-60 or better: 5. Total: 33. Average grade: VF-29.

• **COLLECTING NOTES:** 1799 BB-154 is the second rarest die variety of 1799, and is exceeded only by BB-151. I estimate that only 60 to 100 are known. Nearly all of these are in well-worn grades. A few coins described as Uncirculated came on the market years ago, but it is probable that most would grade less today. The BB-154 is an ideal example of a coin that the cherrypicker can hope to buy for a "type" price. There may come a day when most early dollars on the market are attributed to BB numbers, but until then there is always the possibility of finding something quite rare for a nominal sum.

• **NOTABLE SPECIMENS:**

Hirt and Bolt Collections Specimen. MS-60. • Pine Tree, 1975: 764. "Rainbow toned Unc., weakly struck in centers that it was graded 'AU' at its earlier auction appearances. First three stars obviously repunched; U and T of UNITED recut. Heavy break from rim between ED to shield; all cracks listed by Bolender, second extended through S to wing tip."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 629. "Unc. bluish golden, struck from dished dies resulting in curl below ear and eagle's head (opposite side) not being fully struck up."

Terrell Specimen. AU-58. • Bowers and Ruddy Galleries,

Terrell Collection, 1973 • Bowers and Ruddy Galleries, Austin Collection, 1974: 27. "Unc. Lovely light iridescent toning, some very minor rubbing."

Fairfield Specimen. AU-58. • Bowers and Ruddy Galleries, Fairfield Collection, 1977: 1035. "Borderline Unc., lightly struck at centers. Deep lilac and iridescent toning."

Brooks Specimen. AU-55. • Bowers and Merena, Brooks Collection, 1989: 246. "A rare early die state lacking the 'heavy die break' described by M.H. Bolender between E and D in UNITED. Lilac and golden toning with vestiges of satiny lustre around the design elements."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Well centered, sharply struck. Practically Unc."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 or 2 (URS-1)

Approximate population AU-50 to 58: 4 to 8 (URS-3)

Approximate population VF-20 to EF-45: 40 to 65 (URS-0)

Approximate population G-4 to F-15: 15 to 25 (URS-5)

Approximate population for all grades combined: 60 to 100 (URS-7)

• **CONDITION CENSUS:** 60-58-55-50-50-45 (multiples)

1799. BB-155.

(B-19. H-19.)

• **OBVERSE 3:** See description under 1799 BB-154. From same die as BB-154, but with die crack from border under bust, through bottom of last 9, center of 179, and first three stars on left to border. Another crack from second star to hair. The obverse is invariably quite weak.

Obverse die used to strike 1799 BB-154 (early use) and BB-155 (later use).

• **REVERSE C:** See description under 1799 (1799/8) BB-143. Perfect reverse die, and also with the same crack through D in UNITED as seen on B-2. Far right edge of A is over junction of clouds 3 and 4. Reverse stars always weakly impressed.

Reverse die used to strike 1799 BB-143 (late state) and BB-155 (early state).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse without crack.

May not exist, but it could theoretically exist, unless a later example of 1799 BB-154 is discovered with obverse cracks similar to those described under Die State II.

Die State II: Obverse with crack from left side of 1 in date, extending left through stars 1, 2, and 3. Reverse without crack. Scarce die state.

Die State III: Dies described by Bolender for B-19 [BB-155]. Obverse crack expands to the right, through date, to border below drapery, and left through stars 1-3 (as before), now to border. Another crack from border through star 3 into field. Reverse without crack. The usually seen die state.

Die State IV: Obverse now with crack from star 2 to hair. Reverse now has crack from rim to right side of D in UNITED. Rare die state. This may be similar to Gilhousen (Superior, 1973): 1263, a coin earlier in the Bolender and Dr. Charles Ruby collections, "With additional obverse cracks not mentioned by Bolender."

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 2, Fine: 5, Very Fine: 11, Extremely Fine: 6, About Uncirculated: 4, MS-60 or

better: 3. Total: 32. Average grade: VF-29.

• **COLLECTING NOTES:** 1799 BB-155 is one of the key rarities of the year. I believe that only 70 to 110 exist today. However, as of the early 1990s, there are more coins available than there are specialized collectors desiring to pay a significant premium for them; thus, specimens sell for little more than "type" prices. I see this as an advantage for anyone wishing to get involved in early dollars. Further, in recent decades, especially since the mid-1970s, many newcomers to the coin market have been conditioned to buy only Mint State coins, these being said to be of "investment quality." This leaves a vast range of VF, EF, etc., coins available to astute collectors of rare varieties, who do not have to be concerned with prices being pushed up by amateur competition from investors.

Most examples of the 1799 BB-155 dollar are in lower grades through EF. Only a few AU and Mint State coins exist.

In his 1881 *Type-Table*, J.W. Haseltine designated this variety as very rare.

• **NOTABLE SPECIMENS:**

Casterline Specimen. MS-63. • Superior Galleries, Fred Casterline Collection, 1989: 3194. "An exceptional strike of the obverse, with full stars and hair detail. The reverse is a bit weak in the centers, most notably on the top of the shield and a few stars over the eagle's head but all detail is discernible. This specimen is graced by salmon rose toning in the protected areas near the devices. The fields and devices have a few minor handling marks, but these are only visible with the aid of a glass. The appearance of the coin is outstanding. Late die state with cracks extending horizontally from stars 2 and 3 and from star 3 down through date. A tiny crack from rim to Y of Liberty. The reverse has only the light crack from the rim to the D of UNITED."

New Netherlands 53rd Sale Specimen. MS-60. • New Netherlands 53rd Sale Specimen, June 1959: 1210. "Lightly toned Unc. Numerous adjustment marks and a few trivial scratches on both sides. Beautifully frosty; reverse irregularly toned to reddish-gold and steel-gray."

Davis Specimen. AU-58. • Stack's, Davis-Graves (James

Davis) Collection, 1954: 1308. "A beautiful, rare specimen in top condition; slight rubbing on high points. Lustrous, and a shade from Unc. Choice."

Dupont Specimen. AU-50. • Stack's, Anderson-Dupont Sale, 1954: 2258. • Bowers and Merena Galleries, Norweb Collection, 1988: 3760. "AU-50. A splendid specimen with bright silver surfaces accented with delicate splashes of gold."

Halpern Specimen. AU-50. • Stack's, Herman Halpern Collection Sale, 1987: 1144. "AU. Cleaned, and has many hairline scratches on both sides. Obverse die breaks more advanced than Bolender describes: Another crack from 3rd star to hair, a crack from rim through Y, and one from base of Y to 8th star."

Heritage Specimen. AU-50. • Heritage, ANA Convention Sale, 1988: 954. "Lilac toned, with hints of golden highlights on the obverse. This variety plainly shows the die breaks and sinking behind Liberty's hair which eventually led to the untimely demise of this die. Free of adjustment marks and other circulation defects. The only indications of wear are on the highest points." • Yolanda Gross Collection.

Spies Specimen. AU-50. • Stack's, W. Earl Spies Collection, 1974: 163. "Obverse of Bolender-18 with the crack through the date as described, as well as the other cracks. The reverse is Bolender-2 (the overdate reverse). AU, with considerable mint lustre and light toning."

• **POPULATION DISTRIBUTION:**

Approximate population for all grades combined: 70 to 110 (URS-8)

• **CONDITION CENSUS:** 63-60-60-55-50 (multiples)

1799. BB-156.

(B-7. H-7.)

• **OBVERSE 4:** Light “waves” (die clash marks) appear at top of date between two 9’s and to right, from the tops of the clouds in the reverse die. Letters in LIBERTY close. First star appears small and thin. “Pocket” (as Bolender calls it) or “cobweb” clash mark (from eagle’s wing in the reverse die) under throat of Liberty shows on BB-156, BB-157, and BB-162, not always well defined. The *closest star* is star 8 which is slightly closer to Y, than 7th star is to L. First star slightly farther from curl than last star is from bust.

In the marriage to this reverse die, the top of the 1 in the date is refinished and straight cut. A “pocket” or “cobweb” is at the throat, from die clashing with the eagle’s wing in the reverse die. There are also subtle traces of die clash “waves” at top of date, especially to the right of the second 9, from the tops of the clouds in the reverse die.

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE G:** Point of star touches point of upper part of eagle’s beak; ray points to right edge of B in PLURIBUS. First A in AMERICA touches third feather only. Leaf points near center of upright of I in AMERICA. Clouds 1, 7 and 8 have stars penetrating into them; other clouds have stars exceedingly close or touching. Far right edge of A is over cloud 3.

Reverse die used to strike 1799 BB-156 only.

• **DIE STATES:**

Die State I: Early state of the dies as described by Bolender, above. Obverse without cracks. Reverse without cracks. Scarce.

Die State II: Obverse as above. Reverse with hairline crack, hardly noticeable, through bottoms of RICA to stem. The die state usually seen.

Die State III: Bolender-7a. Obverse as above. Reverse now with encircling cracks, taking this path: Bottoms of RICA, through stem, eagle’s tail, bottom two arrow feathers, lower part of UNITED, wing tip, to upper part of S and T; new crack commences from middle of S, through center of T, to A, upward through A, through top of T, to border; new crack connects bottoms of ATE, goes upward through S, through upper left of S, to border; this crack connects with crack at bottom of S, touching cloud 7, splitting, and continuing, now somewhat indistinctly, through cloud 8, to wing, and downward in wing; another crack from border through top of OF, to wing tip, downward, through bottoms of AME, to join up with the RICA crack, to complete the circle. The reverse is bulged above the eagle’s head. Die state significantly scarcer than the preceding. Cf. Gilhousen (Superior, 1973): 1253, later 1975 ANA Convention Sale (Superior): 923, VF.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Fine: 4, Very Fine: 22, Extremely Fine: 14, About Uncirculated: 2, Mint State-60 or better: 1. Total: 45. Average grade: VF-27.

• **COLLECTING NOTES:** VF and even EF coins are seen with frequency, but higher grades are virtually non-existent. I estimate that 275 to 500 exist totally, a figure which may not include any Mint State coins.

• **NOTABLE SPECIMENS:**

Hollinbeck-Kagin Specimen. AU-58. • Hollinbeck-Kagin Sale, August 1970: 1086. “Virtually Unc., only barest friction, lovely golden patina.”

ANA Convention Sale Specimen. AU-50. • Kagin’s, ANA Convention Sale, 1977: 1764. “Details suggest AU, or even higher, but signs of an old cleaning, now pleasantly mellowed, full stars and all the hair detail. Toned to a rich green and gray.”

Beebe's. AU-50. • *Numismatist* advertisement, May 1953. AU.

Beebe's Specimen. EF-45. • Bowers and Merena, Aubrey and Adeline Beebe Collection, 1987: 407. "Partially prooflike surface. Sharply struck. Much original mint lustre remains in protected areas of the coin's surface. Light golden toning." • Bowers and Merena Galleries, Lloyd M. Higgins, M.D. Collection 1988: 2312. "Partially prooflike surfaces. Sharply struck. Much original mint lustre remains in the protected areas of the coin's surface. Light golden toning."

Four Landmark Collections Specimen. EF-45. • Bowers and Merena, Four Landmark Collections Sale, 1989: 1963. "Deep silver gray specimen whose toning is uniform on both sides. Mint lustre remaining in the protected areas of the reverse. Late state of the reverse die, the entire center appearing to bulge (actually, sinking in the die), and the die further broken through the bases of most of the letters in the peripheral legend."

• **POPULATION DISTRIBUTION:**

Approximate population for all grades combined: 275 to 500 (URS-10)

• **CONDITION CENSUS:** 58-55-50-50-50-45 (multiples)

1799. BB-157.

(B-5. H-5.)

• **OBVERSE 4:** See description under BB-156. In BB-157 and BB-162 the upper right corner is slightly indented in the 1 in date.

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE H:** U in UNITED *imperfect at upper left*, the vertical element being cut off at the upper left side, taking with it the upper left serif; a defective punch was employed (used on three different dies to strike BB-157; BB-158, BB-159, BB-160, and BB-161; and BB-168). Leaf points almost under left side of upright of I in AMERICA. All six upper stars touch clouds, the two on right each having two points touching, and other four have one point touching (the star that is below clouds 2-3 nearly touches 3). Far right edge of A is over junction of clouds 3 and 4. Point of

star touches point of lower part of eagle's beak; ray points directly to center of left upright of U in PLURIBUS. A touches third feather.

The reverse is similar to the die used to coin BB-158 (later, BB-159, BB-160, and BB-161), a die which must have been made about the same time, but can be easily distinguished. On BB-157, the two upper stars on the right have two points which touch clouds 7 and 8. On BB-158, etc., the upper right star has only one point which touches cloud 8.

Reverse die used to strike 1799 BB-157 only.

• **DIE STATES:**

Die State I: Obverse die without crack. Reverse die without crack. May not exist without reverse crack.

Die State II: Bolender-5a. Obverse as preceding. Reverse with hairline crack beginning below stem, progressing to the left through the tip of the eagle's tail, UNITED, wing tip, and

STA; then as the die crack continues (on slightly later states) it goes to T, then to E, the top of S, and the border. The last-named is the die state usually seen.

Die State III: Obverse as preceding. Reverse with additional cracks: Crack through bottom part of AT, below E, to top of cloud 5. Crack through AMER. Frequently seen die state.

Die State IV: Obverse as preceding. Reverse now with earlier crack through AMER now extending through IC. Crack from border, through upright of T, through cloud 2, curving left to touch star below cloud 1. The latest reverse die state seen. Scarce.

Note: Bolender said Bolender-5a has "short die cracks from lower left corner of E down to hair, and below first star." I have not seen this obverse crack on *any* die state of BB-157.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 7, Fine: 26, Very Fine: 49, Extremely Fine: 25, About Uncirculated: 13, Mint State-60 or better: 7. Total: 129. Average grade: VF-27.

• **COLLECTING NOTES:** 1799 BB-157 is one of the most plentiful issues of the year. About 650 to 1,000 are extant today. Despite this relative abundance, nearly all specimens are in circulated grades through VF, with a scattering of EF pieces as well. Higher grade pieces are few and far between. However, among those scattered high-grade gems are a few in the MS-63 to 65 echelons, suggesting the original existence of a small hoard of this variety, long since dispersed.

• NOTABLE SPECIMENS:

October Sale Specimen. MS-65 (NGC). • Superior, October Sale, 1990: 3716. "Superb! Silvery gray and iridescent blue color, flashy mint lustre underneath its toning; immaculate surfaces."

May Sale Specimen. MS-64 (PCGS). • Superior, May Sale, 1991: 951. "Razor-sharp features of Liberty and the eagle as well as its smooth satiny lustre."

Kagin Specimen. MS-60. • Kagin's, November 1987: 3245. "Lovely, steel green and gray toned specimen with tremendous strike and fantastic appearance. With a 10x glass we do detect some very light scratches and roughness on Liberty's face and neck. All of the stars are very sharp as are the feathers of the reverse eagle. Much mint lustre of a satiny imparting a gentle glow to this specimen."

Robison Specimen. MS-60. • Stack's, Spring Sale, April 1978: 717. • Stack's, Ellis H. Robison Collection, 1982: 1870. "Brilliant Unc. Full frosty lustre with lovely golden and pale iridescent toning. The barest touch of friction on the high

points but really superb."

Davis Specimen. AU-58. • Davis-Graves (James Davis) Collection (Stack's, 1954): Mint State (with friction; called AU-58 in the Condition Census below).

Anderson-Dupont Specimen. AU-58. • Stack's, Anderson-Dupont Collection, 1954: 2503. "Unc., trace of friction on eagle's breast, and two tiny nicks on drapery. Adjustment marks through LIBERTY. Exceptional condition."

Shore Specimen. AU-58. • Superior, A. Bernard Shore Collection, 1988: 2210. "Extremely well struck with detail of a fully Mint State coin. Retoned in an attempt to hide concentrated scratches on the obverse and reverse."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, March 1970: 672. "Bluish golden Unc. but close inspection reveals slight rubbing (old-time cabinet friction)." • Hollinbeck-Kagin Sale, June 1970: 621. "Unc. with lovely bluish golden prooflike patina, careful examination with a strong glass reveals a faint mint-equalization line."

Spring Quartette Sale Specimen. AU-55. • Bowers and Merena, Spring Quartette Sale, 1992: 2580. "An intermediate die state between Bolender-5 and Bolender-5a, with reverse die crack through UNITED STATES already seen, but lacking the obverse die cracks that extend from the E in LIBERTY to Liberty's hair, and below the first obverse star. A fully brilliant specimen with bold design details and lustrous, frosty surfaces."

• **Gilhausen Specimen. AU-55.** • Gilhausen Sale (Superior, 1973): 1250, AU-55. • 1975 ANA Convention Sale (Superior).

Gross Specimen. AU-50. • Kingswood Galleries Sale, August 1990: 6632, AU-50. • Yolanda Gross Collection.

• **CONDITION CENSUS:** 65-64-64-63-63-63

1799. BB-158.

(B-16. H-16.)

"Close 17 Obverse."

• **OBVERSE 5:** *Left stars distant* from curl and L; star 7 is farther from L on this than on any other obverse of the year. *Right stars close* to Y and bust. This die is quickly recognized by keeping the above in mind. Numerals 1 and 7 closer together on this than on any other 1799 obverse. Star 1 is about 2 mm. distant from curl, and star 7 is just as far from the L. Star 8 is quite close to Y, and star 13 almost as near to bust. Star 6 has raised die defect or trace of extra ray to left of topmost ray (ray pointing upward).

Obverse die used to strike 1799 BB-158 only.

• **REVERSE I:** U in UNITED defective at upper left part, which is cut off, due to employment of a defective U punch. Point of star touches point of lower part of eagle's beak; ray points to left serif at left side of U in PLURIBUS. Star under cloud 1 is noticeably smaller than any other. A in AMERICA rests on 4th feather. Leaf point is under left side of upright of I. Upper right star has *only one point* touching cloud 8 (whereas two points of this star touch the cloud on the BB-157 reverse). Far right edge of A is over junction of clouds 3 and 4. Berries boldly defined in branch for Die State I, with the one at top left being the smallest. Berries weaker in Die State II.

Reverse first used to strike 1799 BB-158, during which time it had its first relapping (berries weak), next coining BB-159, then BB-158 again, then, second relapping (removing berries), BB-160 and, finally, BB-161.

• **DIE STATES:**

Die State I: Obverse and reverse with perfect dies. Early state of reverse die with all berries strong, including one at

top left of branch (which later weakens). Examples are fairly plentiful.

Die State II: Berries slightly weaker, especially the one at the top left; probably from very light relapping. This is the die state used to coin 1799 BB-159. 1799 BB-158 dollars of this state are rare; I have seen just one.

Die State III: Bolender-16a. OBVERSE: Later state, after the dies came together (clashed) without an intervening planchet. Now with incuse "waves" above date caused by impression of reverse clouds on obverse die. Additional clash marks in left obverse field to right of stars 1 and 2, above bust, and between bust and star 13. Impact of clashing caused several cracks, including small crack through upper left of star 1; crack from bottom border, through drapery, upward and then curving left toward hair, then abruptly turning upward to area just to left of the front of neck. REVERSE: Incuse marks from obverse die include lower drapery line (which appears as a die crack, which it is not, through OF), and entire date 1799 between ES and OF (to see this, invert the coin; this is visible only on higher grade specimens). Berries somewhat weak as on Die State II. Scarce die state.

Die State IV: Bolender-16b. OBVERSE: Now with numerous die cracks shattering the dies. Cracks as above, plus additional cracks: From border opposite upper left of star 1, to star 2; from same spot through upper left of star 1 (as in Die State II); crack from border opposite star 2, through stars 3 to 6, past inner right ray of star 7 to field; additional crack from star 6, right and down through hair ribbon, hair, and bottom curl to border, with a couple other small cracks at the same border area; additional crack from star 5, down to end of hair ribbon, to hair; additional crack on right, from border up through drapery and bust, to field opposite star 9; border crack above stars 10 and 11 and above 12. (Some transitional pieces do not have all of the cracks fully developed.) REVERSE: As preceding. Examples are fairly plentiful.

• **AUCTION POPULATION SURVEY:** Very Good: 6, Fine: 18, Very Fine: 47, Extremely Fine: 47, About Uncirculated: 18, Mint State-60 or better: 7. Total: 143. Average grade: VF-31.

• **COLLECTING NOTES:** 1799 BB-158 is one of the most plentiful varieties of the year, and is readily available in most grades through AU. Mint State coins are very rare. Most auction appearances are from years ago. It is probable that some of these would only grade AU today. I estimate that 850 to 1,500 specimens of BB-158 survive in all grade combined.

Caveat emptor: J.P. Martin, of the American Numismatic Association Authentication Bureau (ANAAB), provided two counterfeit 1799 BB-158 dollars for examination. Both are Die State III of this variety. The surfaces of each displayed microscopic porosity. The rims were crisp and sharp, while the edge lettering was unusually well detailed. The edges were polished and showed microscopic scratches parallel to the rims. Both examples showed four or five raised ridges on the edge, perpendicular to the rims. On each, these were positioned at the edge device star immediately preceding H in HUNDRED. One weighed 414.8 grains, the other 419.8 grains (an authentic specimen on hand for comparison weighed 417.3 grains); the weight is apt to vary, and is not a definitive test. I recommend that any suspected example be submitted to ANAAB for checking.

• **NOTABLE SPECIMENS:**

Carter Specimen. MS-63. • Stack's, Amon Carter, Jr. Collection, 1984): 225. "Intermediate die state. Lacks second reverse crack at OF and to 5th and 6th stars. Choice brilliant Unc., blazing lustre."

Fritz Specimen. MS-60. • Lester Merkin, Fritz Collection Sale, 1966: 307. "Gray toned Unc., obverse with touches of cabinet friction, reverse needle-sharp and choice. Evidently long displayed with its beautiful reverse uppermost."

Greater New York Specimen. MS-60. • Stack's, Greater New York Convention Sale, 1978: 182. • Stack's, Greater New York Convention Sale, 1983: 1222. "Brilliant Unc. and fully frosty. Sharply struck with excellent surfaces and edges. Light russet toning mixed with pale iridescence."

Ostheimer Specimen. MS-60. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 287. "Advanced die cracks. State IV of seven known die states. RRR. Unc., peacock blue

and antique gold toning with sunset overtones; planchet defect at U; small rim dent on either side."

Stack's Specimen. MS-60. • Stack's January 1969 Sale: 256. "Brilliant Unc. Full frosty mint lustre with excellent surfaces. Struck from the terminal state of the die, showing a myriad of fine cracks all over the obverse and the double crack through 'O' of OF."

Wyatt Specimen. MS-60. • Superior Galleries, Russell and Eudora Bell Wyatt Collection, 1985: 2039. "Late die state of Bolender-16 with numerous die cracks shattering the dies. MS-60. A trifle weak around the borders, but overall well struck with full hair and feather detail. The surfaces are remarkably clean and frosty throughout. All is overlaid with an attractive blending of russet and steel violet tones."

Green Specimen. AU-58 • Col. E.H.R. Green Collection • M.H. Bolender Collection. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 288. "State VI, still further advanced cracks; RRR, more so than last. Golden and violet toned Unc., traces of cabinet friction, sharper strike than usual."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population G-4 to F-15: 175 to 300 (URS-9)

Approximate population for all grades combined: 850 to 1,500 (URS-11)

• **CONDITION CENSUS:** 63-60-60-60-60-60

1799. Stars 8x5. BB-159.

**(B-23. H-23.)**

• **OBVERSE 6:** *Only 5 stars* to right of bust. The obverse stars are arranged eight to the left and five to the right; the only 1799 with this peculiar arrangement. The reason for this configuration is unknown. It may have been a blundered die, or the engraver may have accidentally punched the eight stars on the left after just having cut a die for a 1799 \$10 gold coin (all of which have stars arranged 8x5 this year). He would then have been forced to complete the die using only five stars on the right. Given the care taken to prepare dies at the Mint for dollar coinage this year, the 8x5 stars blunder is all the more remarkable.

Obverse die used to strike 1799 BB-159 only.

• **REVERSE I:** See description under 1799 BB-158. U in UNITED defective at upper left, due to broken U punch. Now on BB-159 the upper berries are very small. Far right edge of A is over junction of clouds 3 and 4.

Reverse first used to strike 1799 BB-158, during which time it had its first relapping (berries weak), next coining BB-159, then BB-158 again, then, second relapping (removing berries), BB-160 and, finally, BB-161.

• DIE STATES:

Die State I: Perfect obverse die; no crack at B and E of LIBERTY, no clash marks. Reverse as inherited from 1799 BB-158, Die State II: Die without cracks or defects. Top two of five berries in branch are weak, especially the one on the left. Scarce die state (with perfect obverse die) for BB-159.

Die State II: Obverse develops crack extending from upper left of E in LIBERTY through lower right of B into field. Reverse as preceding. This is the most plentiful die state for BB-159.

Die State III: Obverse die has clashed with the reverse, and now heavy clash marks from the clouds on the reverse can be

seen as incuse "waves" above the date, additional waves are below the lowest two curls, incuse denticles are seen between drapery and border, extending to star 13; crack from star 9 to border; delicate, curved cracks in left obverse field begin at star 4 and at star 7. Reverse as preceding. Scarcer than Die State II.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 8, Fine: 19, Very Fine: 41, Extremely Fine: 24, About Uncirculated: 11, Mint State-60 or better: 8. Total: 113. Average grade: VF-28.

• **COLLECTING NOTES:** 1799 BB-159, with stars arranged 8x5, is exceptionally popular due to the distinctive obverse. About 500 to 900 are known, so in absolute terms the coin is not rare. However, its popularity as a type has caused specimens to sell for prices far in excess of other 1799 dollars of comparable rarity.

In a year with relatively little to offer in the way of truly notable die varieties and engraving blunders, the 1799 BB-159 is a special favorite due to its distinctive character.

Most specimens are in lower grades through VF, although EF coins are available at intervals. The literature describes certain pieces as AU or Uncirculated. It is not certain how many coins called Uncirculated years ago would qualify for this grade under today's tightened interpretations by such services as NGC and PCGS.

• NOTABLE SPECIMENS:

Boyd Specimen. MS-63. • Numismatic Galleries, World's Greatest Collection, F.C.C. Boyd, 1945: 87. • Abe Kosoff, ANA Convention Sale, 1949: 190 • Stack's, Harold Bareford Collection, 1981: 415. "Brilliant Unc. and a cameo-like gem. Wholly prooflike and an exceptional impression obverse and reverse. Superb steel and golden toning with russet highlights."

Brand Specimen. MS-63. • Virgil M. Brand (tentative pedigree). • Burdette G. Johnson. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 638. "Choice Unc. Somewhat off-center upon the obverse, although uniformly struck; Liberty's head almost cameo like. Weak and dulled upon the usual high spots, but a magnificent, mirror surfaced blue, rose and steel."

Auction '82 Specimen. MS-60. • Paramount, Auction '82, 1982: 1742. "Unc.-60. Sharply struck and perfectly centered. The medium toning is completely original and very pretty. The center is violet and gold while the periphery has shades of blue and green. The surfaces have very few marks."

DeCoppet Specimen. MS-60. • James Kelly, André DeCoppet Collection, 1955. "Unc., with beautiful lustrously toned surface. Very slight scar below bottom curl of hair."

French Specimen. MS-60. • Stack's, 1989: 226. "Brilliant Unc. Frosty and satiny, with iridescent and russet toning. The terminal state of the die, with an arc-like crack from star 1 across neck to below star 13, resulting in massive bulging of the die."

Kensington Specimen. MS-60. • Bowers and Ruddy, Kensington Collection, 1975: 795. "Choice lightly toned Unc."

Los Colinas Specimen. MS-60. • Steve Ivy, 1981: 972. "Attractive original toning of even depth covers each side. The strike is full, with good detail in Liberty's hair, the eagle's breast feathers and wings and the clouds on the reverse. The surfaces are free of detracting marks and extremely choice in appearance."

Ostheimer Specimen. MS-60. • A.J. Ostheimer, 3rd Collection (Lester Merkin, 1968), "Pale golden toned Unc."

Austin Specimen. MS-60. • Austin Collection (Bowers and Ruddy, 1974), Unc. with minor marks.

Carter Specimen. MS-60. • Amon Carter, Jr. Collection. (Stack's, 1984). Brilliant Uncirculated.

1799. BB-160.

(B-12. H-12.)

OBVERSE 7: Described by Haseltine as from same die as H-9 (BB-166), but it is from a different die. (This new die closely resembles both BB-165 and BB-166, but the first star of BB-160 is much *farther from curl*, slightly over 2.5 mm.—only about 2 mm. in BB-166.) On the right, stars 11-12-13 are closer together than are the others.

Obverse die used to strike 1799 BB-160 only.

• **REVERSE I:** *No berries.* U in UNITED defective at upper left part, which is cut off due to defective punch. Point of star touches point of lower part of eagle's beak; ray points to left serif at left side of U in PLURIBUS. Star under cloud 1 is noticeably smaller than any other. Far right edge of A is over junction of clouds 3 and 4. A in AMERICA rests on

4th feather. Leaf point is under left side of upright of I. Upper right star has *only one point* touching cloud 8 (whereas two points of the same star touch the cloud on the BB-157 reverse). No berries on branch (one tiny remnant of a stem can be seen), as the die was reground earlier (see description under 1799 BB-158).

Reverse first used to strike 1799 BB-158, during which time it had its first relapping (berries weak), next coining BB-159, then BB-158 again, then, second relapping (removing berries), BB-160 and, finally, BB-161.

• DIE STATES:

Die State I: Obverse die without cracks. Reverse relapped as inherited from BB-158. Rare die state (with perfect obverse). Only one seen.

Die State II: Obverse with tiny hairline crack extending from the lower left of the 1 in date to the field below the bottom curl. A hint of a curved hairline crack extends from the border below drapery. Reverse as preceding. Rare die state.

Die State III: Bolender-12a. Obverse cracks intensify. Crack from foot of 1 in date extends right, below 7, to border. A crack extends from the border up into the first 9, while a crosswise crack at the bottom of the first 9 goes left through the upright of 7, and right to the second 9. Curved crack from border to right now touches drapery. Crack from border between drapery and star 13 goes upward and curves to the right into field. Crack from star 12 extends to border at star 13. Reverse as preceding. A plentiful die state.

Die State IV: Bolender-12b. Obverse die cracks intensify further. Crack in right field now extends through star 9 to border. Crack from star 13 downward to border. Crack connects stars 3 to 7 with L in LIBERTY. Crack extending left from 1 in date to below lowest curl now extends farther upward, and opposite the innermost point of star 2 crosses a crack going from star 2 to the hair; original crack continues upward to end of lowest hair ribbon. Crack from border to star 1, then, somewhat split, continuing to star 2, through star 2, touching innermost ray end of star 3, to field opposite star 4. Reverse as preceding. Scarce die state. The 1975 ANA Convention Sale coin, ex Ostheimer and Bolender collections, may have been this die state, and was described as Gem Uncirculated.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 2, Very Good: 8, Fine: 17, Very Fine: 56, Extremely Fine: 19, About Uncirculated: 8, Mint State-60 or better: 18. Total: 129. Average grade: VF-28.

• **COLLECTING NOTES:** 1799 BB-160 is one of the more plentiful issues of the year, although it does not compare with the ready availability of the almost omnipresent BB-166 and BB-163. I suggest that about 650 to 1,150 of the 1799 BB-160 variety exist. Most are of Die States III and IV.

The reverse has no berries and is one of two 1799 varieties (the other is BB-161) lacking them. Accordingly, BB-160 has attracted the attention of a num-

ber of collectors who do not otherwise seek to acquire die varieties, thus accounting for added popularity of the issue. In his 1881 *Type-Table*, J.W. Haseltine called this variety very scarce. Obviously, it is very scarce no longer.

• NOTABLE SPECIMENS:

Newcomer Specimen. MS-65+. • Waldo C. Newcomer Collection • Col. E.H.R. Green Collection. • T. James Clarke, via James G. Macallister. • New Netherlands 48th Sale, 1956: 634. "Bolender-12b. Shattered obverse die as described. Brilliant Unc., almost in the gem class. Comparatively well struck and centered; full mint bloom. Microscopic evidence of contact with other coins upon the obverse only." • Superior Galleries, Jascha Heifetz Collection, 1989: 3817. "MS-67. Rich frostiness, cameo look. Resplendent gold, lavender, and blue toning."

Bolender Specimen. MS-63. • M.H. Bolender Collection • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 942. "Shattered obverse. MS-60 to 65, fully lustrous, partly brilliant, but mostly with an even grayish tone. Struck partially off center on the obverse and irregularly about the rims. A bold impression with fantastic surfaces." • Pine Tree, Brown Library Collection, 1976: 314. "Shattered obverse die. Splendid, frosty, brilliant, glittering gem Unc., unusually sharp strike. Delicate iridescent tone in the cooler range of spectrum, broad planchet. Well centered, obverse less so."

Four Landmark Collections Specimen. MS-63. • Bowers and Merena Galleries, Four Landmark Collections Sale, 1989: 1969. "Bright and lustrous on the obverse, attractively toned reverse (olive, blue, and silver gray shades). Obverse die shows numerous spidery breaks through the date numerals, rising up into the left field and on the right to touch the tip of Liberty's breast."

Orlando Specimen. MS-63 (NGC). • Superior Galleries, Orlando Sale, August 1992: 174. "Frosty lustre. Wonderfully sharp strike."

Club Cal Neva Specimen. MS-60+. • Superior Galleries, Club Cal Neva Sale, 1987. • Superior Galleries, A. Bernard Shore Collection, 1988: 2209. "Shattered obverse die with the breaks mentioned by Bolender; unlisted obverse edge crack above stars two and three. MS-60+. Obverse is untuned and satiny; the reverse displays exquisite greenish gold and reddish pastel splashes with full blazing lustre below. Raised patches of die rust and heavy network of cracks."

Newcomer Specimen (another). MS-60. • Newcomer Collection • Col. E.H.R. Green Collection. • T. James Clarke, via James G. Macallister. • New Netherlands 48th Sale, 1956: 633. "Bolender-12a. Unc. glossy prooflike look, rainbow toning. Ever so slight obverse friction on Liberty's shoulder, reverse rubbing at tops of eagle's wings only. Highly attractive, in spite of a few adjustment marks and nicks from mint."

DeCoppet Specimen. MS-60. • James Kelly, André DeCoppet Collection, 1955. "Unc. with some mint lustre."

DiBello Specimen. MS-60. • Stack's, Gaston DiBello Collection, 1970: 189. "Brilliant Unc. Full mint bloom. A boldly struck example, sharp denticles, hair, feathers, etc. Bolender-12b, showing die breaks below 1 and 7 of date and additional

die breaks across hair and bust. Another die break from the 9th star across field to tip of bust. The die must have shattered shortly after this coin was struck." • Stack's, Scanlon Collection, 1973: 1720. "Brilliant Unc. Full mint bloom. A boldly struck example, sharp denticles, hair, feathers, etc. Bolender-12b, showing die breaks below 1 and 7 of date and additional die breaks across hair and bust. Another die break from the 9th star across field to tip of bust." • Bowers and Ruddy Galleries, Krugjohann Collection, 1976: 618, Bolender-12b. "Choice Unc. with jewel-like medium gray toning and hues of blue and gold. Full mint lustre. The strike is also strong and planchet superb! Advanced die breaks on the obverse."

Hollinbeck-Kagin, August 1970: 1087, Bolender-12b. "Unc. golden, late date state with interesting die breaks. R-4."

Heritage Specimen. MS-60. • Heritage, ANA Convention Sale, 1988: 957. "Lustrous, sharply detailed surfaces subdued by hazy golden-steel patina. Free from adjustment marks and only a few of the reverse stars show noticeable softness. Minor rim bruise on the reverse at 6:00 barely disturbs the denticles."

October Sale Specimen. MS-60. • Superior Galleries, October Sale, 1991: 2624. "MS-60. Nice strike. Satiny mint lustre underneath steel gray and gold toning, with only the

slightest trace of dullness on the high points. Surfaces are clean and impressive. Extensive die cracking is visible on the obverse (Bolender-12b being a late die state)."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 1 or 2 (URS-1)

Approximate population MS-64: 1 or 2 (URS-1)

Approximate population MS-63: 4 to 8 (URS-3)

Approximate population MS-60 to 62: 20 to 40 (URS-6)

Approximate population AU-50 to 58: 35 to 70 (URS-7)

Approximate population VF-20 to EF-45: 400 to 700 (URS-10)

Approximate population G-4 to F-15: 200 to 350 (URS-9)

Approximate population for all grades combined: 650 to 1,150 (URS-11)

• CONDITION CENSUS: 65-64-63-63-63-63

1799. BB-161.

(B-11. H-11.)

• **OBVERSE 4:** See description under 1799 BB-156; die corrected as described under BB-163. Perfect, without cracks.

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE I:** *No berries.* U in UNITED defective at upper left part, which is cut off, due to the employment of a defective punch. Point of star touches point of lower part of eagle's beak; ray points to left serif at left side of U in PLURIBUS. Star under cloud 1 is noticeably smaller than any other. A in

AMERICA rests on 4th feather. Leaf point is under left side of upright of I. Upper right star has *only one point* touching cloud 8 (whereas two points of the same star touch the cloud on the reverse of BB-157). Far right edge of A is over junction of clouds 3 and 4. No berries on branch (one tiny remnant of a stem can be seen), as the die was reground earlier (see description under 1799 BB-158). This is the terminal state of this die, after having mated with four obverses including this one.

Reverse first used to strike 1799 BB-158, during which time it had its first relapping (berries weak), next coining BB-

159, then BB-158 again, then, second relapping (removing berries), BB-160 and, finally, BB-161.

• DIE STATES:

Die State I: Obverse die without cracks. Reverse die without cracks. May not exist with unbroken reverse die.

Die State II: Bolender-11a. Large crack from left border goes past right side of D of UNITED to eagle's wing; a spur of the crack goes to the edge of the D and then downward to ribbon. Scarcer die state than the following.

Die State III: Cracks enlarge, and now crack from border goes through wing, star, eagle's head, and continues upward behind head. Crack from D to ribbon now continues downward along edge of eagle's wing to shield (and is remarkably similar to a crack on 1799/8 BB-143). New crack goes from arrow feathers upward through UNITE to border. This die state, or a slightly less advanced version of it, is the state most often seen for BB-161.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 4, Very Good: 10, Fine: 21, Very Fine: 45, Extremely Fine: 24, About Uncirculated: 5, Mint State-60 or better: 7. Total: 117. Average grade: VF-25.

• **COLLECTING NOTES:** The present population of 1799 BB-161 is believed to be about 600 to 1,100. Most of these are of Die State II, according to auction offerings, but probably most were what I call Die State III. While BB-161 is obtainable easily enough in lower grades, in AU the issue is scarce, and in true Mint State it is a notable rarity. Nearly all of the auction appearances for Mint State coins mentioned above occurred well before the revision in grading interpretations that occurred in numismatics beginning in 1986.

BB-161 has no berries in the branch on the reverse, a fact not generally known, as Milferd H. Bolender noted that it has "one tiny berry." Granted, it may have a *trace* of an erstwhile berry, but anything approaching a full berry, no. The No-Berry variety has been listed in the *Guide Book* for many years, and, as such, it has drawn a circle of collectors desiring it (especially true of the better-known BB-160, which Bolender specifically noted as being berryless, but "from same die as Bolender-11," with no further explanation given).

Inasmuch as the without-berries feature on BB-161 and BB-160 was caused by relapping the die, to my mind the variety is not especially significant for

that feature. Had the berries been omitted in error by the die sinker, *that* would constitute a variety worth striving for.

• NOTABLE SPECIMENS:

Boyd Specimen. MS-63. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 73. "Similar to H-11 but reverse has die break from edge to wing and touching D in UNITED. Unc. gem." • Numismatic Gallery, ANA Convention Sale, 1949: 186. • Stack's, Harold Bareford Collection, 1981: 416. "Die break touching D of UNITED. Brilliant Unc., frosty mint bloom, with just the barest touch of friction on the high points. Lovely delicate golden toning with a blush of russet."

Davis Specimen. MS-60. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1302. "Sharp, well-centered lustrous specimen, showing 'waves' above date where clouds from reverse die are incused. A shade from Unc." • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 282. "Heavy breaks much more advanced than described for Bolender-11a. Faintly iridescent pale gray toned Choice Unc., excellent sharp strike; one or two bagmarks short of gem level."

Forrest Specimen. MS-60. • Stack's, S.S. Forrest, Jr. Collection, 1972: 983. "Sharply struck and perfectly centered. Brilliant Unc., prooflike. Slight weakness at center stars in reverse field hardly worth mentioning. Superb light gray toning."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 627. "Prooflike obverse, Unc. reverse, glittering golden patina."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc., some mint lustre."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 4 to 6 (URS-3)

Approximate population AU-50 to 58: 10 to 20 (URS-5)

Approximate population VF-20 to EF-45: 400 to 750 (URS-10)

Approximate population G-4 to F-15: 200 to 350 (URS-9)

Approximate population for all grades combined: 600 to 1,100 (URS-11)

• **CONDITION CENSUS:** 63-60-60-60-60-55 (multiples)

1799. BB-162.

**(B-6. H-6.)**

• **OBVERSE 4:** See description under 1799 BB-156. The Bolender Collection specimen shows a slight crack along border opposite point of bust. Usually found weak at the centers. In BB-157 and BB-162 the upper right corner is slightly indented in the 1 in date.

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE J:** A in STATES touches clouds. Far right edge of A is over cloud 3. Leaf points to center of upright of I in AMERICA. Letter A touches both 3rd and 4th feathers. Point of star touches lower part of eagle's beak; ray points to left upright of U, slightly to the left of its center. Upper stars about same as BB-157, except that the second star from the left has two points touching clouds. A very close to M, ME joined at lower part. The letters in E PLURIBUS UNUM seem larger and in some instances differently proportioned on this reverse (and also that of BB-164, from a different die).

Reverse die used to strike 1799 BB-162 only.

• **DIE STATES:**

Die State I: Obverse die with slight crack along border opposite bust. Perfect reverse die.

Die State II: Later obverse state with an obverse crack at the bust point through the last four stars to the rim.

Die State III: Obverse as preceding. Reverse with crack from rim to cloud 7. Crack through OF to wing. Crack from bottom left of R through field to leaf. The die state usually seen.

Die State IV: Obverse as preceding. Reverse with additional crack, from ED, through wing, through STATES, to border. Scarce die state.

Die states of this and the next indicate an interrupted striking of these two, or, BB-163 was struck before BB-162!

• **AUCTION POPULATION SURVEY:** Good: 2,

Very Good: 3, Fine: 5, Very Fine: 19, Extremely Fine: 7, About Uncirculated: 5, Mint State-60 or better: 11. Total: 52. Average grade: VF-32.

• **COLLECTING NOTES:** 1799 BB-162 is of medium scarcity. I believe that 300 to 500 survive. In his 1881 *Type-Table*, J.W. Haseltine called this variety very scarce. Most specimens are in circulated grades through VF, with an occasional EF and even more occasional AU appearing on the market. Nearly a dozen Uncirculated coins have appeared on the market in recent decades, but most were not recent enough (since 1986) to be graded by today's more stringent interpretations. Thus, the net number of Mint State coins is less than the auction data indicate.

• **NOTABLE SPECIMENS:**

Chalkley Specimen. MS-63. • Superior, Chalkley Collection Sale, 1990: 2863. "Light golden toning on the obverse with deeper multicolored toning on the reverse. A few contact marks, a tiny test mark on the rim above T of LIBERTY and a pair of pin pricks at the left ribbon and on the reverse. Struck from a rusted reverse die."

Clarke Specimen. MS-60. • Col. E.H.R. Green Collection • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 630. "Lightly toned Unc. Almost perfectly centered; better struck up than most. The only pronounced die weakness is upon the reverse ribbon at UNUM and the inside of the eagle's left wing. Obverse cracked through last four stars to bust as on Bolender-10a, Bolender-17. Reverse rusted in left field; cracked from edge between S and OF to cloud, through OF and wing, and edge to MER to branch."

Cornell University Specimen. MS-60. • Stack's, Cornell University Collection Sale, 1975: 910. "Brilliant Unc. Full lustre and 'cartwheel' effect, and attractive toning. Bold reverse with sharp denticles. A touch of friction on the high points from the choice category. Beautiful and attractive."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 622. "Brilliant slightly golden Unc., reverse prooflike."

Low-Bolender Specimen. MS-60. • Lyman H. Low sale 1918. • M.H. Bolender Collection, 1952: 93. "Unc., but a few file marks on reverse done at mint to adjust weight of planchet before striking, and usual weakness at UNUM on ribbon. Attractive color and mint lustre." • K.P. Austin Collection • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 277. "Iridescently toned choice Unc. Faint reverse adjustment marks; almost free of bagmarks. Unusually bold strike." • Superior Galleries, Gilhousen Collection, 1973: 1251. "Warmly toned Unc., sharp except in centers (where adjustment marks show on reverse); minute rim nicks." • Superior Galleries, ANA Convention Sale, 1975: 919. "Cracked reverse. Warmly toned Unc., sharp except in centers (where adjustment marks show on reverse); minute rim nicks."

Eastern Collection coin. MS-60. • Coin in a private eastern collection, Uncirculated. May duplicate another listing. (Reported by Douglas Winter.)

CSNA-Bolender Specimen. AU-55. • From the convention sale of the California State Numismatic Association in Santa Cruz (1951). • M.H. Bolender Collection, 1952: 94. "Unc., magnificent sharp even impressions. Highest portions of eagle on reverse are very slightly rubbed. Nearly full mint lustre."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc., well struck."

DeCoppet Specimen (another). AU-55. • James Kelly, André DeCoppet Collection, 1955. "Another very rare variety with heavy die break on reverse. Practically Unc."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 5 to 10 (URS-4)

Approximate population for all grades combined: 300 to 500 (URS-10)

• **CONDITION CENSUS:** 63-60-60-55-55-50 (multiples)

1799. BB-163.

(B-10. H-10.)

• **OBVERSE 4:** See description under 1799 BB-156. In this combination the "pocket" or "cobweb" under throat (die clash mark) has been removed by relapping the die. Upper side of 1 in date is a straight line. The Bolender Collection specimen shows a light die crack through last three stars. (Early die states do not show the obverse crack through stars 11-13.)

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE K:** Leaf point between left corner and left side of upright of I in AMERICA. Farthest

arrow point is under right upright of N. Point of star enters eagle's mouth, and touches lower part of eagle's beak. Another point of same star points to left upright of U in PLURIBUS. Far right edge of A is over cloud 3. Most show a die crack from border through OF, bottom of AMERICA, eagle's tail, arrows, left wing, up through ST, top of AT.

Reverse die used to strike 1799 BB-163 only.

• **DIE STATES:**

Die State I: Early state; perfect dies. No obverse or reverse cracks. May not exist.

Die State II: Bolender-10b. Obverse crack connects stars 11-12-13 but not bust (this is visible only on high grade speci-

mens). With reverse cracks from border through OF, to wing tip, through AMERICA, through branch, through eagle's tail, through arrows, below UNITED, through wing, to S. May not exist.

Die State III: Obverse crack connects stars. On reverse, peripheral crack continues through first T of STATES, through top of A, to border. This is the die state usually seen.

Die State IV: Obverse crack extends to outside ray of star 10. On reverse, additional cracks develop: Vertically from border through O, between clouds 7 and 8, toward eagle's head, splits, and branch goes left through a star. Crack from wing, through right ribbon end, into field to left of branch end. Crack from branch to eagle's leg to tail. Crack from interior of branch upward to below ER. Crack from top of A, down through TES, to cloud 5, splits, two cracks go down and to the left, and one goes to right. The die could not have survived long beyond this point. Rare die state.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 12, Fine: 29, Very Fine: 68, Extremely Fine: 23, About Uncirculated: 10, Mint State-60 or better: 9. Total: 154. Average grade: VF-25.

• **COLLECTING NOTES:** 1799 BB-163 shares the spotlight with BB-166 as one of the two most plentiful varieties of the year. I estimate that 1,000 to 1,800 of this variety exist. Curiously, nearly all are in lower grade levels through VF, plus a few scattered EF and AU coins. The offering of a Mint State coin should be a major event (at least, once the rarity of such is widely known). This variety must have been well distributed in the channels of commerce, or there may be some other explanation why so few high-grade coins were saved. In comparison, more examples of 1799 BB-166 survive in higher grades.

If die states I and II exist as described, BB-162 and BB-163 would have been struck in an interrupted sequence. First, BB-163 would have been struck, then the reverse for BB-162 was placed in the press to strike additional dollars, and finally the reverse for BB-163 was put back in the press to continue production. Additional study of these two varieties is necessary to verify this scenario.

• **NOTABLE SPECIMENS:**

CSNS Convention Sale Specimen. MS-60. • McIntire, CSNS Convention Sale, 1988: 571. "MS-60. Early die state.

Well centered, denticles are bold and quite even, strike is good, surfaces are nearly pristine and lustrous beneath light gray toning, high points are golden colored."

Heritage Specimen. MS-60. • Heritage, March 1989 Sale: 484 "Mint State (60/60). Full prooflike surfaces beneath hazy golden steel toning. Very sharply struck."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 626. "Unc. bluish golden, edge nick."

October Sale Specimen. MS-60. • Stack's, October Sale, 1990: 1660. "Brilliant Unc., golden and iridescent. The obverse shows some hairlines from an old cleaning. Well struck."

French Specimen. MS-60. • Stack's, Auction '84, 1984: 1186. "Choice Brilliant Unc. Hairline scratch across neck. Superb russet and iridescent, slightly sea green on reverse." • Stack's, French Family Collection, 1989: 11. "Choice Brilliant Unc. A hairline scratch across neck. Russet and iridescent toning, slightly sea green on reverse." • Superior Galleries, H. Roland Willasch Collection, 1990: 534. "Medium gray with ample lustre in the fields. Defect-free save for a faint hairline scratch on Liberty's neck and a reeding mark above the eagle's head. Reverse color is most pleasant, a soft sea green with loads of frost. Light die cracks mentioned by Bolender."

Harte Specimen. AU-55. • Bowers and Ruddy, Roy Harte Collection 1977: 2788. "Lustrous and bright borderline Unc. A hint of rubbing on the highest points."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 5 to 10 (URS-4)

Approximate population AU-50 to 58: 10 to 20 (URS-5)

Approximate population VF-20 to EF-45: 650 to 1,250 (URS-11)

Approximate population for all grades combined: 1,000 to 1,800 (URS-12)

• **CONDITION CENSUS:** 63-60-60-60-60-60

1799. BB-164.

(B-17. H-17.)

• **OBVERSE 4:** See description under 1799 BB-156. Although this obverse die was used to coin BB-156, BB-157, BB-161, BB-162, BB-163, and BB-164, in its use with BB-164, the state is most similar to BB-163, with the “pocket” or “cobweb” (die clash mark) at junction of chin and neck removed by relapping the die. A die crack shows through last 4 stars. A faint crack is near border opposite point of bust. All seen are weak at the centers, especially on the obverse.

Obverse die used to strike 1799 BB-156 (with clash marks), BB-157, BB-161 (now relapped), BB-162, BB-163, and BB-164.

• **REVERSE L:** Five *extremely large berries* in olive branch, the largest on any 1799 dollar. The two upper berries are partly buried in the leaves. Point of star enters eagle’s mouth, upper part of beak closing down on star. The point of the star almost touches lower part of beak; ray points to left edge of left serif of U in PLURIBUS. Leaf points near left corner of I in AMERICA. A does not touch feathers. Very short stem in claw; shortest stem on any 1799 reverse. Peculiar raised die flaws resembling an equal sign (=) are at an angle under the star that straddles clouds 2 and 3. An incuse die mark at the upper left corner of the leftmost cloud is present on the early die state; the second S in STATES is repunched at the inside of its lower loop. Far right edge of A is over junction of clouds 3 and 4. The letters in E PLURIBUS UNUM seem larger and in some instances differently proportioned on this reverse (and also on BB-162, a different die), in comparison to the other reverses of the year.

Reverse die used to strike 1799 BB-164 only.

• **DIE STATES:**

Die State I: Obverse die with crack from stars 10-13 to

drapery, plus tiny, lower crack from drapery end extending right about 2/3 the way to star 13. Reverse with no cracks. No more than 5% of surviving BB-164 dollars are of this die state.

Die State II: Obverse as preceding. Reverse with hairline crack beginning from right side of U, through bottom of N, extending (in two or three intermediate states) to bottom of D. Scarce die state.

Die State III: Bolender-17a. Obverse as preceding. Reverse with crack from border, then through UNITED as in Die State II, continuing though eagle’s wing, then (in at least two intermediate states) to S, then to left arm of T. Many seen.

Die State IV: Obverse as preceding. Reverse with crack now continuing past ST to top of A to border. Crack from bottom of S, above clouds, to OF. Crack develops at border and goes part way through space between I and C of AMERICA, then in an intermediate state, continues across branch and into right side of shield. Small cracks develop to the left of first A in AMERICA and to the right of right ribbon loop near end. Scarce die state.

Die State V: Obverse as preceding. Reverse with crack from rim at bottom through the eagle’s tail to the arrow feathers. Not seen. The description of Gilhausen (Superior, 1973): 1261 mentions the Philip Straus coin was the first of this die state reported; now possibly 8 to 12 are known. Gilhausen’s (Ostheimer’s) was VF-35.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 9, Fine: 13, Very Fine: 38, Extremely Fine: 18, About Uncirculated: 5, Mint State-60 or better: 5. Total: 89. Average grade: VF-25.

• **COLLECTING NOTES:** As an estimated 550 to 950 specimens of the 1799 BB-164 dollar are known, examples are readily available on the market. Most are in grades through EF. AU coins are somewhat more elusive than the overall rarity might suggest. Mint State coins are great rarities.

• **NOTABLE SPECIMENS:**

Davis Specimen. MS-60. • Stack’s, Davis-Graves (James Davis) Collection, 1954: 1307. “Well struck and lustrous. Unc.”

Stack's March Sale Specimen. MS-60. • Stack's, 1983: 935. "Brilliant Unc., some faint friction and a few hairlines. Full frosty mint bloom with a satiny surface. Magnificent pink and iridescent toning."

Schuyler Specimen. MS-60. • Schuyler Collection • M.H. Bolender Collection. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 289. "Unc., magnificent prooflike surfaces; faint obverse cabinet friction. Reverse superior and with full breast feathers, though weak at parts of r. wing as usual. Beautiful iridescent toning. Light reverse adjustment marks."

Essex Institute Specimen. MS-60. • Stack's, Essex Institute Collection, 1975: 992. "Brilliant Unc., frosty mint bloom displaying the unusual 'cartwheel' effect. The reverse stronger than the obverse. Pale golden and iridescent toning."

Johnson Specimen. AU-58. • B. G. Johnson, who probably obtained it from the Brand estate. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 637. "Reverse die cracked clearly from border through UNITED, left wing, up through ST. An additional crack, among others, at the base of ATES. Not quite full Unc. Fairly well struck and centered, the reverse border denticles extra bold. A very few infinitesimal obverse marks; a touch of reverse cabinet friction upon eagle's head. Two tiny planchet defects in the reverse border. Spots of lustre; iridescent golden, pale violet, and steel gray color."

New Netherlands 53rd Sale Specimen. AU-58. • New Netherlands 53rd Sale, June 1959: 1208. "Very close to full Mint State; full lustre, now overlaid with interesting obverse toning. Full sharpness save for trifling rubbing on ribbon and

beak (cabinet friction); presumably never in circulation."

Capitol City Sale Specimen. AU-55. • Mid American, Capitol City Sale, 1985: 687. "A very rare late die state, with an unlisted die break between the I and C of AMERICA. The strike is unbelievably sharp, with full hair and feather details visible. The deep, steel-blue and lavender toning is completely natural and very attractive."

Gross Specimen. AU-53. • Heritage sale, 1988, Lot 956. Sold to the following. • Yolanda Gross Collection.

Approximate population for all grades combined: 550 to 950 (URS-11)

• CONDITION CENSUS: 60-60-58-55 (multiples)

1799. BB-165.

(B-8. H-8.)

• **OBVERSE 8:** Liberty with open mouth. First star is slightly farther from curl than last star is from bust, or about 2 mm. from curl. The 7th star is slightly closer to L than 8th star is to Y. There is a die chip between star 9 and the border. Star 10 is slightly repunched on its innermost ray. On the left, the stars are fairly evenly spaced. On the right, stars 10 and 11 are significantly closer than any of the others. High-

est curl on top of head is centered more under *right half* of E in LIBERTY. The 1 in date is much farther from the curl, slightly over 1 mm. The letters in LIBERTY are usually seen with varying degrees of bifurcation, sometimes extensive, suggesting to Bolender that the letters were "fancy." This obverse closely resembles BB-160, to which compare.

Obverse die used to strike 1799 BB-165 only.

• **REVERSE M:** Die flaws inside and to right top

of final S in STATES. Far right edge of A is over junction of clouds 3 and 4. Point of star touches point of lower part of eagle's beak; ray points to left of left upright of U in PLURIBUS. Leaf points slightly right of center of I in AMERICA. AME join at lowest part. *The N in UNITED was initially cut upside down and later corrected; an extraneous serif from the error can be seen to the lower right of the N, and appears as a line between the bottoms of N and I.*

Reverse die used to strike 1799 BB-165 only.

• DIE STATES:

Die State I: Obverse die without crack. Reverse with die flaws at second S of STATES, but no line cracks. About 20% or so of BB-165 dollars are of this die state.

Die State II: Bolender-8a. Obverse with die crack from border through two points of seventh star and LIB. Reverse with these cracks: Wing up through ST to above A. Crack from cloud 3 up through TES to OF. Crack from border down to second S joins other crack. Crack from CA, to stem, through tail feathers, through arrow feathers, to U. Reverse stars are weak in this and later state. (Intermediate states of these cracks occur.) Plentiful die state.

Die State III: Bolender-8b. Obverse as II, but now with crack heavier through LIBE and extending farther. With additional crack from border above T down through TY. Reverse with additional cracks: From F through wing tip to ribbon end. From bottom of M to branch. Scarcer die state.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 4, Very Good: 7, Fine: 18, Very Fine: 53, Extremely Fine: 14, About Uncirculated: 10, Mint State-60 or better: 9. Total: 116. Average grade: VF-26.

• **COLLECTING NOTES:** 1799 BB-165 is one of the more plentiful varieties among dollars of this date. About 600 to 1,000 are known today. Most are in worn grades, with the norm being Very Fine. A few Mint State coins exist.

• NOTABLE SPECIMENS:

Auction '79 Specimen. MS-63. • Rarcoa, Auction '79, 1979: 1032. • Heritage, ANA Convention Sale, 1988: 959. "MS (63/63). Choice Unc., very close to gem quality, with deep iridescent toning. The obverse is very sharply struck with nice hair detail and every star showing full radials, while the (center) reverse stars are a trifle weak. The edge denticles are also full and complete."

Guttag Specimen. MS-62. • Guttag Collection • Bolender Collection • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 279. "Frosty, iridescently toned gem Unc., weak in central obverse and above eagle's head, elsewhere needle-sharp." • Paramount, Auction '80, 1980: 799. "Gem Unc.-65. Frosty, iridescently toned gem Unc., weak in central obverse and above eagle's head, elsewhere needle-sharp." • Heritage, ANA Convention Sale, 1988: 958. "Mint State (62/62). Frosty, iridescently toned gem Unc., weak in the central obverse and

above eagle's head, elsewhere needle-sharp. Obverse has a light vertical staple scratch." (The scratch may have occurred in the 1980s, as Paramount didn't mention it.)

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 68. "A splendid Unc. example."

Fairfield Specimen. MS-60. • Bowers and Ruddy, Fairfield Collection, 1977: 1033. "Unc. with some claims to the Choice category. Toned a deep blue gray color, lighter at the centers. The coin appears to have a deep, full mint frost. Pristine, uncleaned."

New Netherlands Specimen. MS-60. • New Netherlands 38th Sale, ANA Convention Sale, 1952: 3163. "A very late stage of the die. Crack through LIB is heavier and extends further. Additional break from border above T down through TY. Top of E and R defective. The reverse die is now badly shattered with numerous breaks. Unc. A splendid, sharp impression with full mint lustre." • W.G. Baldenhofer. • A.J. Ostheimer, 3rd.

Schenkel Specimen. AU-58 (NGC). • Bowers and Merena Galleries, Chris Schenkel Collection, 1990:363. "An exceptionally high-grade specimen."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 624. "Unc. golden, faint rubbing."

Four Landmark Collections Specimen. AU-50. • Four Landmark Collections Sale, Bowers and Merena, 1989: 1964. "AU-50. Lightly dipped at one time." • Yolanda Gross Collection.

Specimen counterstamped "EB." • A pride and joy to M.H. Bolender was a specimen of 1799 BB-165 in his collection, VG grade, said to have been counterstamped with the hallmark EB of New York silversmith and goldsmith Ephraim Brasher. Earlier, the coin was in the William Forrester Dunham sale (B. Max Mehl, 1941), from which event it went to F.C.C. Boyd. Notwithstanding the preceding, it is not certain that the EB mark is that of Brasher; Ezekiel Burr, a Providence, Rhode Island silversmith active in the 1790s, is another possibility.¹

• **CONDITION CENSUS: 63-62-60 (multiples)**

¹ Per letter from Dr. Robert Stark to the author, January 1, 1993.

1799. BB-166.

(B-9. H-9.)

• **OBVERSE 9:** Similar to BB-157, but from a different die. The stars are larger (punched more deeply into the die), making them closer together. The upper left and right stars are about equidistant from L and Y. 13th star about 1.5 mm. from bust. First star about 2 mm. from curl. On the left, stars 1 to 4 are spaced closer than are stars 4 to 7. On the right, stars 8 and 9, and 12 and 13, are spaced closer than are the other stars. Die crack below base of 1 in date on all seen.

Obverse die used to strike 1799 BB-166 only.¹

• **REVERSE N:** "Apostrophe" after final S in STATES on most (but not all) specimens. Star touches point of lower part of eagle's beak. Far right edge of A is over cloud 3. Leaf points under right side of upright of I in AMERICA. A touches 3rd feather only. Die crack through MERIC.

Reverse die used to strike 1799 BB-166 only.

• **DIE STATES:**

Die State I: Perfect obverse die without crack under 1. Perfect reverse die without "apostrophe" flaw after final S in STATES. Extremely rare. Not seen by author.

Die State II: Obverse die crack begins between two denticles and extends upward about halfway to base of 1 in date. Reverse with very tiny vertical "apostrophe" crack to upper right of final S in STATES. Scarce die state.

Die State III: Obverse die crack connects with bottom of 1 and enlarges. Another crack begins on bust and extends upward and to the right, touching chin, and ending in the field. On reverse, "apostrophe" crack enlarges slightly. Common die state.

Die State IV: Obverse crack through bust extends to star

10 and also downward to first 9 in date. Reverse as preceding. Scarce die state.

Die State V: Obverse die shatters. Additional crack in obverse field to left of stars 8, 9, and 10, connects with earlier crack. Crack connects stars 9 and 10. New crack from border, up through drapery, bust, field, to left side of star 12. By this time, the obverse field has a bumpy, "sandpaper" surface (observed on a Mint State coin), from extensive die rust. On the reverse, the "apostrophe" crack extends to border, as does a new crack to the left of the final S in STATES. Probably, about 10% to 20% of the specimens of BB-166 are of this die state.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 2, Very Good: 16, Fine: 29, Very Fine: 40, Extremely Fine: 29, About Uncirculated: 17, Mint State-60 or better: 17. Total: 151. Average grade: VF-29.

• **COLLECTING NOTES:** 1799 BB-166 and BB-163 are the most plentiful varieties of the year. It seems likely that about 1,000 to 1,800 of each are known. The population of BB-166 is distributed in a bell curve—few extremely worn ones, some VG, more in Fine grade, a cluster at VF, fewer EF, still fewer AU, and only a small number of Mint State examples. Incidentally, the same curve applies to most other early dollars, except it is sometimes truncated at the upper end. Of course, one can only guess as to how most coins offered years ago will fall into the MS-60-61-62-63, etc., distribution we know today.

• **NOTABLE SPECIMENS:**

Ivy Specimen. MS-64. • Steve Ivy, May, 1983: 1762. "Natural lilac surfaces display sea green and blue at their peripheries. The strike is very bold; the radial lines in many of the reverse stars are plain to the eye. Perfectly centered with all of

¹ See note under 1799/8 and 1799 silver dollars, general information, concerning an apocryphal new variety in the Boyd Collection.

the milling bold. Advanced obverse die cracks in the right field and into the stars."

Saunders Specimen. MS-64. • Bowers and Merena, Ebenezer Milton Saunders Collection 1987: 3517. "MS-64 to 65. Intense lilac and magenta toning at center, changing to some iridescence at borders. Very well struck in all areas."

Stack's Auction '90 Specimen. MS-63. • Stack's, 1980: 258. "Brilliant Unc., nearly choice. Strong strike, lovely rose and blue violet toning, excellent surfaces."

Ebsen Specimen. MS-63. • Superior Galleries, Buddy Ebsen Collection, 1987: 1903. "Perfect obverse die. MS-63. Boldly struck with full prooflike surfaces on both sides. Toned in warm sunset shades of russet and grayish violet, a hint of iridescence."

Baldenhofer Specimen. MS-60 to 65. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955 • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 930. "Additional fine obverse die cracks, including one connecting ninth and 10th stars. MS-60 to 65, frosty and iridescently toned with full original mint lustre. Well centered obverse with lovely clean surfaces, although two minute pin scratches can be seen with a glass. The most noticeable being just left of the 10th star. Few adjustment marks on Liberty's bust."

ANA Centennial Auction Specimen. MS-60. • Bowers and Merena, ANA Centennial Sale, 1991: 441. "Lustrous, deep silver gray toning, with darker Harvard gray on raised devices. Reverse has traces of rich deep champagne around the eagle's head. Later state of the reverse, a cud forming beside the second S and the die breaking from rim above second A, extending to center of neighboring I."

Austin Specimen. MS-60. • Bowers and Ruddy, Austin Collection 1974: 28. "Brilliant Unc. with just minimal evidence of having been in a bag with other coins. Full brilliant mint frost just beginning to tone a subtle light iridescent brown."

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 69. "Unc."

Davis Specimen. MS-60. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1301. "Later die state of the variety. Beautiful Unc. with much mint lustre."

Elder Specimen. MS-60. • Thomas L. Elder sale, 1924 • M.H. Bolender Collection, 1952: 100. "Unc., beautiful impressions, except for slight friction on reverse center. Finely toned, mint lustre."

Gable Specimen. MS-60. • William Gable Collection, S. Hudson Chapman, 1914. • J.T. Reeder Collection. • M.H. Bolender Collection, 1952: 101. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 280. "Die flaws below I; reverse apostrophe break right of final S. Advanced die cracks.

Iridescent golden toned Unc., a couple of faint pin scratches short of gem grade."

Holmes Specimen. MS-60. • Stack's, Milton Holmes Collection, 1960: 2246. "Unc., with faintest sign of cabinet friction on cheek. Full mint bloom. Sharply struck."

Schuyler Specimen. MS-60. • Schuyler Collection. • M.H. Bolender Collection, 1952: 103. "Die breaks not as advanced as on last two. Some file marks on reverse done at mint to reduce planchet weight. Sharply struck, Unc., with mint lustre."

Stack Specimen. MS-60. • Stack's, James A. Stack Collection, 1989: 528. "Brilliant Unc., nearly choice. Strong strike, all reverse stars sharp. Rose and blue violet toning, excellent surfaces."

Taylor Specimen. MS-60. • Bowers and Merena, Frederick Taylor Collection 1987: 414. "Magnificently toned around the peripheries in shades of sky blue and violet, with lavender and sunset at the centers. Distinctive die flaw on the reverse following the final S in STATES, resembling an apostrophe. Advanced die state with several breaks. A crack on the obverse begins beneath T in LIBERTY, and intersects with another break in the field extending from 10th star to Liberty's chin and neck. Another extends from rim to right of date to her drapery. The reverse has a few faint cracks in AMERICA."

Stirling Specimen. AU-55. • Frank M. Stirling Collection, Heritage, February 1986: 1340. Bolender-5a variety. Obverse with "splashes of iridescent golds and blues."

(Many more AU coins could be cited.)

• POPULATION DISTRIBUTION:

• CONDITION CENSUS: 64-64-63-63-60 (multiples)

1799. BB-167.

**(B-14. H-14.)**

• **OBVERSE 10:** *Two raised die flaws in field, or “tears,” before eye, one very clear. The smaller is in the field close to and opposite to the bottom of the forehead, just above the bridge of the nose. The larger and by far the most notable is in the field about 40% of the way from the nose bridge to star 9. On some lower grade coins these “tears” are not visible. Last star near bust (about 0.5 mm.) and a little closer than 8th star is to Y. 7th star farther from L, and first star nearly 2 mm. from curl. Stars 11, 12, and 13 point to spaces between denticles. Small die flaw in field to left of ray of star 8 closest to bottom of Y. The last 9 is about as near bust as star 8 is to Y. Die flaw from outer point of 10th star. Same obverse die used for BB-168. All examples are weakly struck on the hair.*

Obverse die used to strike 1799 BB-167 (earlier use) and BB-168 (later use).

• **REVERSE O:** *Die flaws under AM, between two lower stars just back of eagle’s head, between the F in OF and the wing tip, and one below the D in UNITED. Point of star touches point of lower part of eagle’s beak. Another point of same star points to space between B and U of PLURIBUS. Far right edge of A is over junction of clouds 3 and 4. Leaf points to center of I in AMERICA. A does not touch feathers of right wing, but is near 3rd feather. Die crack through upper part of AME.*

Reverse die used to strike 1799 BB-167 (earlier use) and BB-169 (later use).

• **DIE STATES:**

Die State I: Perfect dies. No obverse flaws. No reverse cracks. May not exist.

Die State II: Obverse with “tears” in field before face. Re-

verse with flaws below first A of AMERICA, slanting downward to halfway below M. Common die state.

Die State III: Obverse as above. Reverse now with crack connecting tops of AM and extending upward toward wing. The most common die state.

Die State IV: Obverse as above. Reverse now with crack connecting tops of AME. As described by Bolender for BB-167. Scarcer than preceding.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 2, Very Good: 7, Fine: 14, Very Fine: 29, Extremely Fine: 10, About Uncirculated: 2, Mint State: 2. Total: 67. Average grade: VF-21.

• **COLLECTING NOTES:** 1799 BB-167 is in the middle range of varieties of this year so far as availability is concerned. About 400 to 700 are known. Most examples are in grades of Fine and VF, with an occasional EF. Any coin finer than that is truly exceptional. This is another of many early dollar varieties that is readily available in VF grade but becomes a rarity if finer.

• **NOTABLE SPECIMENS:**

Chapman Specimen. MS-60. • Henry Chapman. • M.H. Bolender Collection, 1952: 115. “Die flaws in field before eye will identify this variety. Reverse: die crack through top of AME. Unc., strong impressions, reverse struck somewhat off center to right as usual with this variety. Mint lustre.”

Krugjohann Specimen. AU-58. • Bowers and Ruddy Galleries, Krugjohann Collection, 1976: 619. “Brilliant Unc. with some very light rubbing (cabinet friction), mainly on the obverse. Exceptional fields and a nice strike.”

Baldenhofer Specimen. AU-50. • W.G. Baldenhofer Collection • Farish-Baldenhofer Sale (Stack’s). • A.J. Ostheimer, 3rd Collection. • 1975 ANA Convention Sale (Superior): 94.

Getty Specimen. AU-50. • Bowers and Ruddy Galleries, 1977: 536. “A choice well-struck early silver dollar. Just the lightest wear on the higher areas. Nearly full original mint

frost in the fields."

Getty Specimen (another). AU-50. • Bowers and Ruddy Galleries, Getty Collection, 1977: 1695. "Sharply struck and well defined AU. Beautiful light lilac-gray patination."

Gross Specimen. AU-50. • New England Rare Coin Galleries, May 1979. "Toned, attractive, original color. Traces of prooflike surface." Sold to the following. • Yolanda Gross Collection.

Mount Vernon Specimen. EF-45. • Superior Galleries, Mount Vernon Collection, 1976: 817. "Die flaws before the eye. EF-45+. Partly lustrous with pale lilac and golden toning. Excellent surfaces with minimal handling marks."

Kagin Specimen. EF-45. • Kagin's, NASC Convention Sale, 1979: 529. "EF-45 with original bluish gray toning, usual slightly dished reverse die, lint marks, faint lines in field."

Carmichael Specimen. EF-45. • Superior Galleries, Hoagy Carmichael Sale, 1986: 1188. • Superior Galleries, A. Bernard Shore Collection, 1988: 2211. "EF-45+. Obverse and reverse die flaws as described by Bolender. Sharply struck and original with light golden centers changing to golden iridescence at borders. The centering is excellent with all the den-ticles sharp; some lustre is visible in the protected areas. A few

small marks on the obverse."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 or 2 (URS-1)

Approximate population AU-50 to 58: 4 to 8 (URS-3)

Approximate population VF-20 to EF-45: 250 to 450 (URS-10)

Approximate population G-4 to F-15: 150 to 250 (URS-9)

Approximate population for all grades combined: 400 to 700 (URS-10)

• **CONDITION CENSUS:** 60-55-55-50-50-45 (multiples)

1799. BB-168.

(BB-22. H-22.)

• **OBVERSE 10:** See description under 1799 BB-167. Die flaws in field before eye as on BB-167.

Obverse die used to strike 1799 BB-167 (earlier use) and BB-168 (later use).

• **REVERSE P:** *Horizontal die crack* entirely across center of reverse, from right side of E to left side of M. One arrow extends slightly past right side of upright of N. Star touches lower point of eagle's beak; ray points to left upright of U in PLURIBUS. Leaf point is slightly right of being under center of I in AMERICA. Letter A touches only 3rd feather. U in UNITED is cut off at upper left; made from defec-

tive punch (used on three different dies to strike BB-157; BB-158, 159, 161 and 162; and BB-168). Far right edge of A is over cloud 3.

Reverse die used to strike 1799 BB-168 only.

• **DIE STATES:**

Die State I: With perfect obverse die; reverse die not shattered. May not exist.

Die State II: Obverse with delicate crack connecting stars 11, 12, and 13. Reverse die with bisecting horizontal crack beginning at left border, right side of E, ribbon, wing, eagle's neck, wing, ribbon, left side of M, to right border. The usually seen die state.

Die State III: Obverse as preceding. Reverse is a slightly later state with blob at crack as it touches upper right of E.

Scarcer than preceding.

Dies as described by Bolender for BB-168. Reverse die broken across.

Die State III: Later state with the obverse developing multiple cracks to the point of shattering. Cf. Pine Tree Auctions Sale, September 1974, Lot 1028. Extremely rare. Not seen.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 7, Fine: 21, Very Fine: 23, Extremely Fine: 4. Total: 57. Average grade: F-16.

• **COLLECTING NOTES:** With a known population estimated to be in the range of 300 to 500 coins, 1799 BB-168 is at once elusive but sufficiently available that every serious specialist can own one. Most specimens are in lower grades through VF. EF coins are very rare. AU coins? Where are they? Mint State? Forget it.

• **NOTABLE COINS:**

Aspen Specimen. EF-40. • Bowers and Merena Galleries, Dr. Nelson Page Aspen Collection, 1989: 387. "The fields are remarkably smooth, warmly toned in pleasing hues of lilac and gold. A tiny obverse rim bump is noted at 4:00."

Hollinbeck-Kagin Specimen. EF-40. • Hollinbeck-Kagin Sale, August 1970: 1093. "Heavy die break horizontally bisecting reverse, EF (obverse not quite that; but reverse better)."

Springfield Specimen. EF-40. • Bowers and Ruddy, Springfield Library and Museums Sale, 1981: 242. "Die flaws in field before eye; reverse die broken in half horizontally just above shield. Strictly EF-40, reverse with plenty of lustre and more like EF-45; obverse weaker."

Chalkley Specimen. VF-35. • Superior Galleries, Chalkley Collection, 1990: 2871. "Darkly toned, faint scratches above and on Liberty. Reverse die suffered a catastrophic horizontal crack spanning the entire die."

October Sale Specimen. VF-35. • Superior Galleries, October Sale, 1990: 1206. "Darkly toned, perhaps to help hide some faint tooling on Liberty and the surrounding fields. Reverse has a huge, horizontal die break, is sharp."

Aspen Specimen (another). VF-30/EF-40. • Bowers and Merena Galleries, Dr. Nelson Page Aspen Collection, 1989: 388. "Blushes of faint champagne iridescence enhance both surfaces."

Aspen Specimen (another). VF-30/EF-40. • Bowers and Merena Galleries, Dr. Nelson Page Aspen Collection, 1989: 3506. "Horizontal die break which bisects the reverse. Blushes of warm steel gray and coppery golden toning enhance the fields and motifs. Wisps of satiny lustre can be seen at the peripheries."

Von Stetten-Buchenbach Specimen. VF-30/EF-40. • Bowers and Merena Galleries, von Stetten-Buchenbach Collection, 1986: 1954. "VF-30 obverse, EF-40 or better reverse. Reverse die is cracked horizontally at center."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population for all grades combined: 300 to 500 (URS-10)

• **CONDITION CENSUS: 45-45-40 (multiples)**

1799. BB-169.

(B-21. H-21.)

• **OBVERSE 11:** Star 8 much closer to Y than star 1 to curl, or star 7 to L, or star 13 to bust. Star 1 is

farthest from hair. In date, numeral 1 is close to curl. Slight die roughness below first star, between mill and curl. The second star on the obverse is

repunched and the obverse shows die rust which becomes extensive on the late die state. The obverse is similar in appearance to BB-154 and BB-155; identification is simplified by the reverse which reuses the 1799 BB-167 die.

Obverse die used to strike 1799 BB-169 only.

• **REVERSE O:** See description under 1799 BB-167. Far right edge of A is over junction of clouds 3 and 4.

Reverse die used to strike 1799 BB-167 (earlier use) and BB-169 (later use).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse with light crack over AME, extending slightly to the left. Raised die breaks under A and left side of M. Specimen with perfect obverse die not known to exist.

Die State II: Obverse die now with hairline crack from border, up to right through 99 to drapery. Rare early die state.

Die State III: Obverse as preceding, but now with crack from bust through field to near star 12. Reverse with crack from border above F, through wing, to AME, thus expanding earlier crack.

Die State IV: Obverse now with these additional cracks: From border up through 7 to drapery. Earlier crack from bust now extends to touch star 11. Additional crack connects bust (where flesh meets drapery) to star 13, continuing irregularly upward through all stars on the right, through TY, faintly to R. The die state usually seen.

Die State V: Later die state, as exemplified by Gilhousen (Superior, 1973): 1264, catalogued as "the die cracks and rust marks are more advanced than Bolender mentions," otherwise undescribed.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 6, Fine: 18, Very Fine: 29, Extremely Fine: 12, About Uncirculated: 8, Mint State-60 or better: 5. Total: 80. Average grade: VF-25.

• **COLLECTING NOTES:** 1799 BB-169 is in the middle range of availability among the varieties of this year. 450 to 850 are believed to exist. Most are in lower grades up through EF. AU and finer coins are rare.

• **NOTABLE SPECIMENS:**

Harte Specimen. MS-63. • Bowers and Ruddy Galleries, Roy Harte Collection, 1977: 2787. "Choice Unc., lightly toned. Exceptionally well struck, particularly on the 13 stars

on the obverse."

Holmes Specimen. MS-60. • Stack's, Milton Holmes Collection, 1960: 2253. "Brilliant Unc. example. Well struck, however a minor reverse scratch, from A of STATES to back of eagle's beak."

New Netherlands 54th Sale Specimen. MS-60. • New Netherlands 54th Sale, April 1960: 656. "Long straight obverse crack slanting up through both 9's to drapery. Lightly toned, frosty, but somewhat softly struck Unc. Without obvious evidence of cleaning, rubbing, nicks, dents, or any other impairments."

DeCoppet Specimen. AU-58. • James Kelly, André DeCoppet Collection, 1955. "Another rare variety, well struck and just a shade from Unc. Some mint lustre."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, August 1970: 1092. "Die flaws under AM, near Unc. with light golden patina."

F.U.N. Specimen. AU-53 PCGS. • Mid American, Florida United Numismatists Sale, 1991: 915. "Late die state with extensive rust on the obverse and heavy cracks on the reverse. Lightly worn and lustrous with mottled medium to deep pastels on the obverse and reverse. Boldly detailed with the centers showing nearly full detail."

Willasch Specimen. AU-53 PCGS. • Superior Galleries, H. Roland Willasch Collection, 1990: 548. "Dark irregular toning, especially on the reverse. Hints of lustre remain in the fields. Well struck on the periphery, although the central reverse is a touch weak on the right wing of eagle. Struck from cracked dies, the obverse crack through the date is visible to the naked eye."

Coinage Context

Large mintage: The government mintage figure of 220,920 marks the last time the production of early silver dollars crossed the 100,000 mark. By this time, dollars were being exported in quantity, and it was considered futile to coin large quantities.

Die making: Working dies for 1800 dollars were prepared in the same manner as were 1799-dated dollars, to which refer. Varieties are best distinguished by noting the spatial relationships of certain features to each other.

Obverse: The bust of Miss Liberty was punched into the die, after which the letters of LIBERTY, the

stars, and the digits in 1800 were all added with individual punches.

Reverse: Punched into the master die were the letters in E PLURIBUS UNUM, which can vary slightly in their placement or size (1800 BB-184 has smaller letters). The master die with the eagle punch contained the eagle, clouds, arrows, upper part of the olive branch, and inscribed ribbon. Added separately to the working die were the letters of UNITED STATES OF AMERICA, the stars above the eagle, end of the olive branch, and berries. In 1800, workmanship continued to improve at the Mint, and individual die differences become increasingly difficult to differentiate.

Die use: During the year 1800, die relapping was practiced very little. The dies were used while they were in excellent condition, after which most were discarded, even though according to standards in place a year or two before, they could have struck many more coins. Obverse and reverse dies tended to mate for the duration of their mutual lives, without ever being paired with another. Of 12 different obverse dies known for 1800, only three had more than one mate. Likewise, of 11 different reverse dies, only four had more than one partner. Because of this, the die linkages that can be constructed effectively for earlier dates do not have such an extensive counterpart here.

Quality considerations: In general, dollars of 1800 have fewer adjustment marks, planchet defects, or evidence of weak striking than do their ancestors. Quality controls must have been in place at the Mint, at least more so than previously.

Numismatic Information

Commentary: 16 die combinations are known of 1800-dated dollars, most of which do not constitute major differences, although varieties with just 12 arrows or just 10 arrows are listed in the *Guide Book* in addition to the standard with 13 arrows. The

AMERICA I variety is simply a standard design with a stray mark from a punch (called a die break or crack by many cataloguers) following the last letter in AMERICA, giving it a fanciful resemblance to an I. It has been suggested that this may be a remnant of an A letter in the wrong place, but I believe it is either a stray mark or was caused by a piece of foreign matter when the die was made. The AMERICA I issue, not particularly rare, has been popular over the years.

The large number of dies made vs. the number of coins produced may indicate problems with die steel or with some other aspect of the minting process.

Striking periods: There do not seem to be early and late styles of 1800 silver dollars. Thus, while striking periods can be theorized, it is not possible to place them in chronological order. Further study of edge lettering may help to determine a specific chronology.

1800: Summary of Characteristics

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart),
model by John Eckstein

Designer of reverse: Robert Scot (from the Great

Seal)

Weight and composition: 416 grains; .8924 silver,
balance copper

Melting value (silver bullion value) in year minted:
Considered by Mint officials to be on a par with
the Spanish dollar, and worth about \$1.00 intrin-

sically (see discussion under Summary of Characteristics, 1794).

Dies prepared: At least 12 obverse and 11 reverse.

Business strike mintage, calendar year: 220,920 (not including pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: January 21: 24,000 (+3); February 6: 34,000 (+3); February 14: 29,200 (+3); March 25: 3,500 (+1); May 6: 2,500 (+3); May 9: 8,220 (+3); June 14: 11,000 (+3); June 25: 10,850 (+3); August 22: 23,000 (+3); September 30: 34,000 (+3); October 22: 6,000 (+3); October 29: 8,300 (+3); November 10: 5,500 (+3); December 9: 4,000 (+3); December 22: 7,850 (+3); December 31: 9,000 (+3).

Estimated business strike mintage of 1800-dated dollars (author's estimate): 100,000 (rounded).

Estimated quantity melted: Unknown

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 2 to 4 (URS-2)

Approximate population MS-63: 5 to 10 (URS-4)

Approximate population MS-60 to 62: 35 to 65 (URS-7)

Approximate population AU-50 to 58: 150 to 290

(URS-9)

Approximate population VF-20 to EF-45: 3,400 to 6,000 (URS-13)

Approximate population G-4 to F-15: 1,500 to 2,400 (URS-12)

Approximate population for all grades combined: 5,000 to 9,000 (URS-14)

• **CONDITION CENSUS:** 64-64-63 (multiples)

• **AVERAGE AUCTION APPEARANCE** (for all varieties combined): VF-25

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

None

Commentary

Silver dollars dated 1800 are for the most part quite well struck. This is the last year dollars were made in large quantities.

Additional Information

The Year 1800 in History

For much of January and February, tributes to George Washington were held in cities and towns in the various states. Mason Locke Weems, an Episcopal clergyman, published *The Life and Memorable Actions of George Washington*, which went into multiple editions, the fifth of which (published in 1806) included the fanciful tale of young Washington and the cherry tree. Much of Weems' fiction passed into popular "history." *Hymns and Odes Composed on the Death of General George Washington*, was published and included contributions from many sources, including Thomas Paine.

In the presidential election, Democratic-Republican Thomas Jefferson won 73 Electoral College votes as did Aaron Burr, followed by 65 for President John Adams and 64 for Charles Pinckney. After many more ballots, the opposition of Alexander Hamilton to Burr swung the majority to Jefferson's side in February 1801.

During the summer of 1800, the capital of the United States was moved from New York City to Washington, D.C., with 123 federal clerks participating in the move. Congress met in Washington for the first time on November 17, 1800,

the same day President John Adams moved into the White House. The Executive Mansion had no plumbing, and water had to be carried from five blocks away. The Library of Congress was founded with a \$5,000 appropriation for the purchase of 900 books, among which was Adam Smith's 1776 *Wealth of Nations*. The nucleus of the new library was ordered from London booksellers Cadell & Davies; 740 volumes were forwarded with an invoice of £489, 5 s., dated December 11, 1800. The 1800 census showed that Washington, D.C. had 2,464 free residents and 623 slaves. These figures were part of the decennial head count which showed a total national population of 5,308,483, including 896,849 slaves.

The Division Act of May 7, 1800 created the Indiana Territory from the western part of the Northwest Territory. The Louisiana Territory, ceded to Spain by the Treaty of Paris of 1763, was returned to France on October 1, 1800, under a secret agreement in the 1796 Treaty of San Ildefonso. France guaranteed not to transfer the territory to any country but Spain. German physician F.J. Gall founded the practice of phrenology, which would flourish in the United States at the middle of the nineteenth century.

1800 Heraldic Eagle

Varieties

1800. BB-181.

(B-1. H-1.)

• **OBVERSE 1:** 180 close in date. TY too far apart. The 1 in date *barely misses* touching the hair. Slight *elevation* in field between lowest left star and hair due to depression in die. *Die flaws* near inside point of star 11 and also at lower outside of same star. Star 8 near Y, and star 13 near bust, the two about equidistant. On the left, stars 3 and 4 are closer together than are any others. Point of star 11 closest to border has its end bent upward, a most unusual characteristic.

Obverse die used to strike 1800 BB-181 only.

• **REVERSE A:** *Leaf touches* lower right corner of serif of I in AMERICA (compare to reverse of BB-183, which touches bottom of I at a different point). Point of star touches point of lower part of eagle's beak. A in AMERICA touches only 3rd feather. First T in STATES is *double-punched*. AME joined at lower part. A over clouds 2 and 3. Tip of arrowhead under center of U in UNITED.

Reverse die used to strike 1800 BB-181 (earlier use) and BB-182 (later use).

• DIE STATES:

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 2, Fine: 7, Very Fine: 8, Extremely Fine: 2. Total: 21. Average grade: F-17.

• **COLLECTING NOTES:** This is one of the scarcer varieties of the year. I estimate that 90 to 160 exist in all grades combined.

The literature shows a confusing difference of opinion concerning rarity. In his 1881 *Type-Table* J.W. Haseltine simply noted it as being "scarce." In 1950, M.H. Bolender felt differently, and stated this: "My records over a period of 40 years show it to be extremely rare." Today in the early 1990s, it is felt that the population is somewhere in the range of 90 to 160 coins, an estimate which is large enough to provide a specimen for most advanced specialists seeking one.

Most examples are in lower grades, with VG and Fine being quite acceptable for the variety. VF coins are very rare, and any piece over VF, such as the Spies EF, would be a sure-fire Condition Census item. All seen are lightly struck at the centers.

• NOTABLE SPECIMENS:

European Specimen. MS-60. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 639. "Full Mint State.

Highly lustrous and without visible signs of wear. A very few light and insignificant nicks. Originally discovered in Europe, currently the property of a New York dealer."

Merkin Specimen. EF-40. • Lester Merkin, June 1972: 294. "EF, considerable mint lustre and iridescence; some areas suggest Unc., others weaker. Planchet defect (start of a split), at final O. Unimportant bagmarks."

Spies Specimen. EF-40. • Stack's, W. Earl Spies Collection, 1974: 172. "Die flaws are bold and now extend from the chin through the 11th star to edge. The 'bar' at the first star is bold. EF with considerable frosty lustre."

Brooks Specimen. VF-35. • Bowers and Merena Galleries, Brooks Collection, 1989: 252. "VF-35. An attractive example having a faint nuance of pleasing heather coloration. The surfaces are as smooth as one might expect to see on examples in the EF range. The obverse die of this variety can be immediately recognized by the presence of a bulge by the first star."

Davis Specimen. VF-30. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1311. "Minor edge bruise under bust point; some lustre and wear. VF to EF."

Baldenhofer Specimen. VF-30. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 970. "Die flaw at first star. VF-30, bright, obviously cleaned at one time, and now acquiring a delicate tone. Not perfectly centered, but clean and fairly attractive."

March Sale Specimen. VF-30. • Stack's, March Sale, 1985: 1232. "Dash-like die crack at the first star. A strong VF, nearly EF."

Boyd Specimen. VF-20. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 88. "VF."

Taylor Specimen. VF-20. • Bowers and Merena Galleries, Frederick Taylor Collection, 1987: 785. "VF-20 or better. Some original mint lustre still survives. From the standpoint of actual wear the piece is probably EF or finer, but the striking is such that certain of the central details are lost, giving the piece the value of VF."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 or 2 (URS-1)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 45 to 80 (URS-7)

Approximate population G-4 to F-15: 45 to 80 (URS-7)

Approximate population for all grades combined: 90 to 160 (URS-8)

• CONDITION CENSUS: 60-45-45-40-35-35-30 (multiples)

1800. BB-182.

(B-2. H-2.)

• **OBVERSE 2:** Medium wide date, figures evenly spaced. Upper point of 8th star is very close to top right tip of Y. The R in LIBERTY is *double-punched*. On the left, stars 6 and 7 are more *widely* spaced than are any of the others. On the right, stars 11 and 12 are more *closely* spaced than are any of the others.

Obverse die used to strike 1800 BB-182, BB-183, and BB-184.

• **REVERSE A:** See description under 1800 BB-181.

Note: J.W. Haseltine was in error in describing this reverse as differing from No. 1. It is a crack in the die that "joins the A" to the fourth feather, and this crack continues to border. There is also a slight crack through OF to wing.

Reverse die used to strike 1800 BB-181 (earlier use) and BB-182 (later use).

• **DIE STATES:**

Die State I: Without reverse cracks. May not exist.

Die State II: Die crack joins the first A in AMERICA to the 4th feather of the eagle, the crack continuing to the border. Hairline crack through OF to wing. The die state usually seen.

• **AUCTION POPULATION SURVEY:** Good: 2, Fine: 3, Very Fine: 4, Extremely Fine: 2. Total: 11. Average grade: F-19.

• **COLLECTING NOTES:** 1800 BB-182 is one of the great rarities of the year. Only an estimated 30 to 50 are known to exist. Years ago, the issue was regarded as unique. J.W. Haseltine knew of only one, and M.H. Bolender stated the same, noting that it may have been the Haseltine specimen that came under his view. Thus, when Bolender's book went to press in 1950, it was believed that there was just a single coin extant.

Since then, additional pieces have been recognized. BB-182 is not only remarkable for its rarity, but also for the fact that all known specimens show evidence of circulation. Among examples which have been reported, not a single piece makes the AU level. It appears that the finest grade is about EF-40.

• **NOTABLE SPECIMENS:**

French Specimen. EF-45+. • Stack's, French Family Collection, 1989: 1019. "EF, nicely balanced and centered. Pale gray russet toning."

DeCoppet Specimen. VF-30. • André DeCoppet Collection, James F. Kelly, 1955. • Stack's, Art Lovi Collection, 1968: 296. "Nearly EF; lustrous, lightly bag marked, sunset toned."

Chalkley Specimen. VF-30. • Superior Galleries, Chalkley Collection, 1990: 2888. "VF-30. Even steel gray toning, uncleaned or damaged, just millimeters of pleasing surfaces scroll by when examined with a glass. Weakly struck on the right wing of eagle, probably due to the die state more than

actual wear. The cracks on the reverse as mentioned by Bolender as present."

Willasch Specimen. VF-30. • Superior Galleries, H. Roland Willasch Collection, 1990: 555. "VF-30. Somber gray toning with hints of original frost peering out from the fields. Some minor rim marks, one on the obverse and a few tiny ones on the reverse are the only evidence of circulation aside from wear. Early die state on the obverse with only a few tiny die cracks on the reverse."

Ostheimer Specimen. VF-20. • New Netherlands Coin Co. (September 1954) • K.P. Austin • A.J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 971. "VF-20, well toned and tarnished. A flat strike, but clean with only two tiny obverse rim dents left and right of 11th star."

Spies Specimen. VF-20. • Stack's, W. Earl Spies Collection, 1974: 173. "The reverse of Bolender-1 with a break from the fourth feather to the first 'A' in AMERICA to the rim and another break branching out through OF. A nice VF, with a few minor reverse scratches."

• **POPULATION DISTRIBUTION:**

• **CONDITION CENSUS:** 40-40-35-30-30-25 (multiples)

1800. BB-183.

(B-3. H-3.)

• **OBVERSE 2:** See description under 1800 BB-182.

Obverse die used to strike 1800 BB-182, BB-183, and BB-184.

• **REVERSE B:** Leaf touches center of lower stand

of I in AMERICA (compare to reverse of 1800 BB-181, which touches lower right of the same letter). The two upper stars on the right do not touch the clouds; the other stars each have one point touching. Point of star enters eagle's mouth, *not touching* lower part of beak. End of branch curves toward eagle's tail. AME close but do not join. A touches both 3rd and 4th feathers. Center of A over cloud 3. Tip of arrowhead under center of U in UNITED.

Reverse die used to strike 1800 BB-183 only.

• DIE STATES:

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 1, Fine: 1, Very Fine: 7, Extremely Fine: 4, About Uncirculated: 3, Mint State-60 or better: 1. Total: 18. Average grade: VF-27.

• **COLLECTING NOTES:** The 1800 BB-183 dollar is rare in all grades. Only 40 to 70 are believed to exist.

The record for 1800 BB-183 is quite interesting inasmuch as until recent decades it was considered to be a prime rarity. In 1881, J.W. Haseltine knew of but a single specimen, in Very Fair condition, perhaps equal to what we would call Good or VG today. By 1950, M.H. Bolender had seen just one, a coin which he noted (in the 1952 catalogue of his personal collection) as being "excessively rare, the finest known, and not found by me until 1949. Formerly in 'World's Greatest Collection.' VF, obverse edge nick at top."

Since then, others have been found, but today in the early 1990s 1800 BB-183 remains quite rare. Several dozen or so are known. Why weren't these known earlier? The answer is that by 1950, when Bolender wrote his book, only a few dealers bothered to attribute early dollars in their inventories or auction listings. Nearly all 1800 H-3 (later, BB-183) dollars were bought and sold as having no special consequence. Even today, the leading grading services—NGC and PCGS—do not attribute the early dollars that pass through their hands. Who knows, among the numerous they have certified of this date may be a few of the BB-183 variety. In his 1881 *Type-Table*, J.W. Haseltine called this variety "excessively rare."

As time goes on, the evaluation of rarity ratings

will become more scientific and less empirical. My feeling is that the next decade or two will see a great interest in early dollars, and that this will bring with it a new series of studies, just as has happened in the later dollars series such as the Liberty Seated and Morgan issues.

• NOTABLE SPECIMENS:

European Specimen. MS-60. • New Netherlands 48th Sale, 1956: 640. "Full Mint State. Highly lustrous, a very few light and insignificant nicks. Originally discovered in Europe, currently the property of a New York dealer."

Baldenhofer Specimen. AU-50. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 972. "AU-50, well toned, struck, and has highly polished surfaces. Not perfectly centered, but bold detail with sharp denticles. A few minor edge nicks, mostly above CA of AMERICA." • Superior Galleries, February, 1981: 658, AU-50. "Well toned, struck, and has highly polished surfaces. Not perfectly centered, but bold detail with sharp denticles. A few minor edge nicks." • Auction '86, Rarcoa, 1986: 732. "AU, with nice lustre. Well struck and beautiful."

Holmes Specimen. EF-45. • Stack's, Milton A. Holmes Collection, 1960: 2255. "Lustrous, sharply struck and superbly toned. Full denticles. EF, choice." • Stack's, Don Corrado Romano Collection, 1987: 756. "EF and choice. Lustrous, sharply struck and superbly toned. Full denticles. Glorious gold and pastel iridescent toning."

Boyd Specimen. EF-40. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 90. "EF with some wear on high spots."

Spies Specimen. EF-40. • Stack's, W. Earl Spies Collection, 1974: 175. "EF, with mint lustre, some mottled iridescent toning."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 (URS-1)

Approximate population AU-50 to 58: 5 to 8 (URS-4)

Approximate population VF-20 to EF-45: 30 to 55 (URS-6)

Approximate population G-4 to F-15: 5 to 8 (URS-4)

Approximate population for all grades combined: 40 to 70 (URS-7)

• **CONDITION CENSUS:** 60-55-50 (multiples)

1800. BB-184.

**(B-12. H-12.)**

• **OBVERSE 2:** See description under 1800 BB-182.

Obverse die used to strike 1800 BB-182, BB-183, and BB-184.

• **REVERSE C:** A die dot inside lower part of E in UNITED, and a more prominent die flaw at lower left side of E in AMERICA. Flaw or crack like a single quotation mark or line to the upper left of U in UNITED. These things quickly distinguish this reverse from all others. *Left side of N in UNUM about in a line with edge of eagle's neck*, the only 1800 reverse for which this is true. Smallest letters in E PLURIBUS UNUM of any reverse die used this year. The berries are small. Leaf point under left side of upright of I in AMERICA. Point of upper part of eagle's beak shuts down near point of star. A does not touch feathers, and AME do not join. A over clouds 2 (partly) and 3 (mostly). Tip of arrowhead under right upright of U in UNITED. The U in UNITED is defective at its upper left corner, from a broken punch (as with 1799 reverses H, I and P), but was hand-corrected by its engraver; thus, this is possibly one of the earliest 1800 dies. The fact that all but two 1799 reverses had small letters in E PLURIBUS UNUM also reinforces this suggestion.

Reverse die used to strike 1800 BB-184 only.

• **DIE STATES:**

Die State I: Obverse die without cracks. Reverse die without cracks. The usual die state seen.

Die State II: Bolender-12 a. Obverse with hairline crack from star 7 to L. Reverse with a crack across top of OF and right wing tip, nearly to A. A tiny crack extends from the milling down through center of F. Some show a line through the star under cloud 8. About 20% or so of BB-184 dollars are of this die state.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 4, Fine: 6, Very Fine: 18, Extremely Fine: 8, About Uncirculated: 8, Mint State-60 or better: 2. Total: 48. Average grade: VF-27.

• **COLLECTING NOTES:** The 1800 BB-184 dollar is fairly scarce. About 250 to 450 are known in all grades combined. As is the case with the majority of 1800 Bolender numbers, it is typically seen in worn grades up to and including VF. EF specimens are very rare, AU pieces are rarer yet. The two Mint State coins listed below date well before the grading renaissance; I list them as MS-60 in the population distribution, but it is not known if they would grade full Mint State today.

• **NOTABLE SPECIMENS:**

Green Specimen. MS-60. • Col. E.H.R. Green Collection • M.H. Bolender Collection, 1952: 146. "Unc., Proof surface on reverse."

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 631. "Unc. golden."

Four Landmark Collections Specimen. AU-58. • Bowers and Merena, 1989: 1974, Medium Date. AU-58 to MS-60. "Prooflike reverse. Beautifully toned—iridescent purple, pale golden brown, and silver-gray shades on both sides. The reverse surface is highly reflective and prooflike. Obverse strike is sharp, save on some stars on the right, as often seen on the variety; while the reverse shows pleasing detail in the eagle's wing and tail feathers."

Baldenhofer Specimen. AU-55. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 991. "AU-55 or so, lustrous olive, but not fully struck up in the centers of both sides. Lovely cartwheel effect and very minimal signs of contact with other coins or handling marks."

Brown University Specimen. AU-55. • Pine Tree, Brown University Sale, 1976: 316. "R in LIBERTY repunched; small berries, die chip at E(R), another before U. Surfaces suggest full MS-60, but there is just enough cabinet friction on iso-

lated details to require that we downgrade it to AU-55. Attractive light golden tone. Free of visible handling marks."

Bergen Specimen. AU-55. • Herbert M. Bergen Sale (Quality Sales): 1356. • Paramount, Auction '84, 1984: 733. "Choice AU-55. Boldly struck and well centered. A lovely warm gray color with gold, blue and russet highlights."

• **POPULATION DISTRIBUTION:**

Approximate population VF-20 to EF-45: 140 to 250 (URS-9)

Approximate population G-4 to F-15: 100 to 175 (URS-8)

Approximate population for all grades combined: 250 to 450 (URS-10)

• **CONDITION CENSUS:** 60-58-55-55-55 (multiples)

1800. BB-185.

(B-20.)

• **OBVERSE 3:** The upper right star is in position similar to the obverse of the 1804 dollars, with two points almost touching Y. Therefore, as Bolender related, this variety has been used at least twice in idle fabrication of an 1804, by altering the last figure of date. The upper point of star 8 nearly touches Y at a point *below* its top, as in the 1804 dollars. Star 7 is about as near L as star 13 is from bust. Star 1 is distant, over 3 mm., from hair. On the left, star 1 is below the arc line of stars 2-7.

This obverse was not known to Haseltine when he compiled his *Type-Table* in 1881.

Obverse die used to strike BB-185 only.

• **REVERSE D:** *Die flaws* show at top and to right of ES, easily identifying this die which was also used for BB-186 and BB-187. *Lower right serif of F is extremely close to or touches cloud 8;* the only reverse of 1800 with this characteristic. The eagle's beak closes down on extreme point of a star. Leaf points slightly right of center of I in AMERICA. First A in

AMERICA rests on wing. Letter T in UNITED is *double-punched*. A over clouds 2 and 3. Tip of arrow-head under right side of right upright of U in UNITED.

Reverse die used to strike 1800 BB-185, BB-186, and BB-187, possibly in that order.

• **DIE STATES:**

Die State I: Early state of obverse without bulging. Very rare, if, indeed, it exists at all.

Die State II: Bulge begins at center of obverse, especially in the left field. Die crack links stars 9 to 13. The usual state seen.

Die State III: Bulge becomes very prominent. The Spies Collection coin is VG-8.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 1, Fine: 3, Very Fine: 4, Extremely Fine: 2. Total: 11. Average grade: F-19.

• **COLLECTING NOTES:** Only about 20 to 40 are known of the 1800 BB-185, believed to be the rarest variety of the year. Bolender knew of only a single undamaged specimen of this variety, stating it

was "as rare as an 1804." Since that time, other examples have come to light. None is known in a grade of AU or higher.

• **NOTABLE SPECIMENS:**

Bolender Specimen. EF-40. • M.H. Bolender Collection, 1952: 162. "EF, sharp even impressions, well-toned." • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 1003. "EF-45, lovely blue-gray iridescence, and a choice impression. Trifle central weakness and a faint scratch is under LI of LIBERTY toward the sixth star; otherwise, virtually perfect. Discovery specimen."

Willasch Specimen. VF-20. • Superior Galleries, H. Roland Willasch Collection, 1990: 577. "VF-25. Even gray but cleaned long ago with the faint hairlines in the field. A small planchet defect is visible between third and fourth stars on the obverse and corresponding area on the reverse, only affecting the dentils. Weakly struck on Liberty's neck and surrounding curls, probably from buckling of the die. Early die state before the reverse broke at the E of AMERICA. Pedigree: Unknown, likely purchased by Mr. H. Roland Willasch as it does not appear to have come from any of the recent large Bust dollar sales."

Boyd Specimen. VF-20. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 108, (Haseltine-20), Not in Haseltine. Struck off center, 00 in date high, with last 0 closer to bust. Die break through E in AMERICA. VF.

Helfenstein Specimen. VF-20. • Lester Merkin, 1968: 281. "VF, lustrous, golden russet, blue and brown toning. Borderline R-8. Obverse die has caved in, producing a bulge left of curls and below ribbon, accounting for immediate discard of this obverse."

Polis Specimen. VF-20. • Bowers and Merena Galleries, George N. Polis, M.D. Collection, 1991: 2227. "VF-20. Attractive,

pleasing combination of pale and darker gray. The central devices nicely offset against darker fields.

Hollinbeck Specimen. F-12. • Hollinbeck Coin Co. (January 1955). "Fine, with an X-shaped rubber-band 'burn' on the obverse." • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 311. "Fine; obverse planchet flaws forming a cross." • Stack's, W. Earl Spies Collection, 1974: 208. "Obverse new and unknown to Haseltine, starting to bulge at center but the central hair is still fairly strong. Reverse from Bolender-4 die with the die flaws not too prominent. Fine, with a rubber-band (?) 'burn' in the shape of an X across obverse. R-7."

Spies Specimen. VG-8. • Stack's, W. Earl Spies Collection, 1974: 209. "Advanced die state with the obverse bulge very prominent, making the central portion very weak. VG."

Note: At least two more have been damaged by altering the last date digit to 4, to read "1804" (per M.H. Bolender).

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population G-4 to F-15: 8 to 15 (URS-4)

Approximate population for all grades combined: 20 to 40 (URS-6)

• **CONDITION CENSUS:** 45-35-30-20 (multiples)

1800. BB-186.

(B-4. H-4.)

• **OBVERSE 4:** 1 in date close to curl, and 8

tipped too much to right at top. Liberty's mouth open. 7th, 8th, and 13th stars are all equidistant

from L, Y and bust, and are near. Star 1 about 2.5 mm. distant from hair.

Obverse die used to strike 1800 BB-186 only.

• **REVERSE D:** See description under BB-185.

Reverse die used to strike 1800 BB-185, BB-186, and BB-187, possibly in that order.

• **DIE STATES:**

Die State I: Perfect dies of BB-186 without obverse crack. Apparently, unknown to Bolender in 1950. Very rare. One of these is 1975 ANA Convention Sale (Superior): 973, described as "Bolender-4b," perfect dies, just one of four known; a second piece was in the same sale; both were cataloged as VF-20.

Die State II: Obverse shows slight die crack from border below 1 of date, through base of 1, upward through 8 to first 0. Another fine crack from border under first O through base of second O to bust. The usually seen die state of BB-186.

Die State III: Bolender-4a. Now with extensive die cracks on obverse. Die crack from border up through entire 1 of date and bust to 12th star. Another crack through first star to curl under ribbon. Another crack between IB touching left lower part of B down through hair. Crack along inner points of 10th to 12th stars. Always found weakly struck. Considerably scarcer than the preceding.

• **AUCTION POPULATION SURVEY:** Very Good: 2, Fine: 5, Very Fine: 23, Extremely Fine: 6, About Uncirculated: 8. Total: 44. Average grade: VF-27.

• **COLLECTING NOTES:** 1800 BB-186 is one of the scarcer varieties of a year which has quite a few elusive die combinations. I estimate that only 150 to 275 are known. Quite a few of these are in grades such as EF and AU, in contrast to, for example, BB-182, which is mostly known in lower grades.

In his pioneering study in 1881, Capt. J.W. Haseltine considered it to be very rare. By Bolender's publication date, 1950, many dozens of coins had been located.

• **NOTABLE SPECIMENS:**

MacFarland Specimen. AU-55. • Bowers and Ruddy Galleries, 1981: 1577. "AU-55. Original mint brilliance intact, traces of dirt on breast, and a small weak area on reverse at far right cloud. Intermediate die state with all of the obverse cracks listed for Bolender-4, plus the arc crack from rim to rim passing through 1, shoulder, neck and 12th star (as listed for Bolender-4a). But with no signs of the other Bolender-4a cracks (between IB or along 10th to 12th stars, or through the 1st star to ribbon)."

Rarcoa Auction '86 Specimen. AU-55. • Rarcoa, Auction '86, 1986: 733. "Lovely choice AU, well struck with most of

the original mint lustre intact."

Ebsen Specimen. AU-55. • Superior Galleries, Buddy Ebsen Collection, 1987: 1912. "Prooflike surfaces and all is magnificently toned. Boldly struck with full hair detail, complete diagonal lines within all the stars and is well centered on a perfect problem-free planchet. Some light handling marks which are scattered about. Lustrous surfaces are overlaid with a beautiful blending of antique tones, shades of gray and violet mixed with golden iridescence."

Akers Auction '88 Specimen. AU-55. • David Akers, 1988: 629. "Sharply struck, off a little to the right. Excellent lustre under attractive medium iridescent gold, russet and blue toning. Very clean surfaces; just a trace of friction on the highest points."

F.U.N. Specimen. AU-55. • Mid American, Florida United Numismatists Sale, 1989: 608. "AU-55. Light lilac toning appears on the high points on this attractive, high-grade example. Traces of original mint lustre still remain! Intermediate state of the dies, showing a number of fine die cracks on the obverse."

Dillard Specimen. AU-53. • Heritage, Dillard Sale, 1990: 540. "AU (53/53). Considerable amounts of lustre and lovely pale pearl-gray color which becomes slightly deeper at the edges. Excellent detail and minimal actual wear on the high spots."

New England Museum Specimen. AU-50. • Stack's, New England Museum Collection, 1988: 582. "AU, marvelous golden pink toning with a hint of iridescence."

New England Museum Specimen (another). AU-50. • Stack's, New England Museum Collection, 1988: 1970. "The obverse with massive cracks and quite naturally, the reverse showing weakness in the corresponding areas. AU, frosty lustre."

• **POPULATION DISTRIBUTION:**

Approximate population for all grades combined: 150 to 275 (URS-9)

• **CONDITION CENSUS:** 58-55-55-55-50 (multiples)

1800. BB-187.

(B-16. H-16.)

• **OBVERSE 5:** Close date, 1 almost touches curl. The 8 is too low, and top tipped too much to right. Last O near bust. *Die dot just to left of highest curl* on top of head. On the left, stars 1, 2 and 3 are more widely spaced from each other than are stars 5, 6, and 7. On the right, stars 9 and 10 are more widely spaced than are any others. The ray of star 10 that is nearest to an adjacent ray of star 11 is misaligned with that ray of star 11. Die flaws *between top of R and T in LIBERTY*.

Obverse die used to strike 1800 BB-187 only.

• **REVERSE D:** See description under 1800 BB-185.

Reverse die used to strike 1800 BB-185, BB-186, and BB-187, possibly in that order.

• DIE STATES:

Die State I: Perfect obverse die without die crack. Reverse with some roughness between E and S of STATES. Does a perfect obverse die impression exist?

Die State II: Obverse with curved hairline crack up through right side of second 0 in date, through bust, point of chin, to star 10. Some light clash marks between stars 3 to 6 and the border. Roughness between E and S of STATES. This is the die state usually seen.

Die State III: As preceding, but roughness has developed into a prominent period-like crack between the tops of E and S.

Die State IV: As BB-187, but with die clash marks as "waves" along the top of the date. Stack's Auction '89: 1779 AU.

Die State V: Very late state. New die flaws form at the top of ES in STATES, the back of Miss Liberty's head, between the L and I in LIBERTY and stars 7 and 8. A new obverse crack is present along the denticles from below the 8 to just past the second 0.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 10, Fine: 28, Very Fine: 34, Extremely

Fine: 28, About Uncirculated: 12, Mint State-60 or better: 4. Total: 117. Average grade: VF-27.

• **COLLECTING NOTES:** The 1800 BB-187 is about tied with BB-193 as the most plentiful variety of the year. About 700 to 1,200 are known to exist. This plethora of specimens in no way indicates that BB-187 is readily available in Mint State, for it is not. Why, no one knows.

• NOTABLE SPECIMENS:

1988 ANA Specimen. MS-62. • Auction '79, Rarcoa, 1979. • Heritage, ANA Convention Sale, 1988: 965. "Mint State (62/62). A vibrant Mint State specimen. Medium iridescent toning, in shades of gold, blue and sea green, over fully lustrous surfaces. Well struck and attractive."

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 102, Haseltine-16. Unc. • Abe Kosoff, ANA Convention Sale, 1949: 201. • Stack's, Harold Bareford Collection, 1981: 419. "An arc-like die crack from 10th star to the last 0 of the date. Brilliant Unc., sharply struck, with full mint lustre. Struck from dies which are beginning to buckle, showing some light mounding here and there."

DeCoppet Specimen. AU-58. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc., well struck with lustrous prooflike surface."

December Sale Specimen. AU-55. • Stack's, 1987: 1523. "Choice AU, soft strike at bust tip, clouds below OF, and some central details. Virtually free of marks, with lustre suggestive of a Mint State specimen."

Carter Specimen. AU-50. • Amon Carter, Jr. Collection, Stack's, 1984: 231, AU, with bifurcated letters. • Stack's Auction '86: 293.

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population VF-20 to EF-45: 400 to 750 (URS-10)

Approximate population G-4 to F-15: 275 to 400 (URS-10)

Approximate population for all grades combined: 700 to 1,200 (URS-11)

• **CONDITION CENSUS:** 60-60-60-60-55 (multiples)

1800. BB-188.

(B-8. H-8.)

• **OBVERSE 6:** Bolender said this: "Look for the die 'dot' inside lower part of R, near the left upright, in LIBERTY." This easily distinguishes this die, which was also used for BB-189. Left base of E slightly high in relation to bottom of B (this same characteristic is true of the different obverse used to strike BB-193). Mouth of Liberty closed. Star 7 is closer to L, by a tiny amount, than star 8 is to Y, and star 13 is separated from the bust even farther, and the hair from star 1 farther yet. On the left, stars 1-2 and 2-3 are closer together than are any other stars. On the right, stars 10-11 and 12-13 are wider apart than are any other stars. Stars 2-3 and 11-12 are slightly misaligned in relation to each other.

Obverse die used to strike 1800 BB-188 (earlier use) and BB-189 (later use).

• **REVERSE E:** Three upper stars on right on reverse *do not touch* clouds. Three upper stars on left on reverse each have *one point* touching clouds. Leaf points slightly left of center of I in AMERICA. Star enters eagle's mouth, upper part of beak closing down on side of star point. Letter A just touches 3rd and 4th feathers. AME do not join each other. Very large berries. A over clouds 2 and 3. Tip of arrowhead under center of U in UNITED.

Reverse die used to strike 1800 BB-188 only.

• DIE STATES:

Die State I: Obverse and reverse dies without crack. The die state usually seen.

Die State II: Obverse die without cracks. Reverse with crack through AMER.

Die State III: As preceding, but reverse crack forms a tiny blob at upper right of R, and continues to border at that point.

Die State IV: As above, but with additional crack from right side of R to top of I to border above C. Crack through AMER now extends to the left through wing and F.

• **AUCTION POPULATION SURVEY:** Good: 4, Very Good: 2, Fine: 6, Very Fine: 15, Extremely Fine: 6, About Uncirculated: 3, Mint State-60 or better: 4. Total: 40. Average grade: VF-26.

• **COLLECTING NOTES:** The 1800 BB-188 dollar is on the scarce side. Perhaps 150 to 275 survive in all grades combined. This population is far higher than the number of specialists seeking them. Thus, there will be no problem acquiring one for a "type" price.

• NOTABLE SPECIMENS:

Boyd Specimen. MS-60. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 95. "A very handsome Unc. coin, though with slightest edge nick."

Superior Auction '88 Specimen. MS-60. • Superior Galleries, 1988: 212. MS-60. "Extremely well struck with most of obverse hair strands individually defined; just a touch of weakness is noted at the innermost part of the eagle's wings. Not quite perfectly centered with the denticles at the left obverse narrow while wide at the right obverse. The surfaces are completely lustrous and display superb natural medium gold toning with splashes of iridescence at the obverse and reverse borders plus some bright golden orange in the protected areas of the reverse. One small mint-made reverse flaw which runs from the IB of PLURIBUS through the ST in STATES to the rim; otherwise, the surfaces are virtually pristine."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc. A beautiful, well-struck coin."

Ebsen Specimen. AU-50. • Superior Galleries, Buddy Ebsen Collection, 1987: 1913. "Die dot inside lower part of R in LIBERTY; very large berries. AU-50+. Boldly struck with nice wide denticles, and is well centered on a perfect planchet. A blending of grayish violet, pale blue and greenish golden iridescence."

Higgins Specimen. AU-50. • Bowers and Merena, Lloyd Higgins, M.D. Collection, 1988: 2222. "AU-50 (ANACS), outstanding. Sharply struck, virtually full central obverse detail. The majority of Liberty's hair strands are sharp and separate. The stars are sharply struck as are the letters in LIBERTY and the numerals of the date. Similarly well struck reverse, slightly soft in the center given the sinking of the die at this point. The coin is highly lustrous, particularly on the reverse. The

reverse is lightly toned in a delicate golden brown shade. One small darker area is noticeable on the reverse."

Four Landmark Collections Specimen. AU-50. • Bowers and Merena, Four Landmark Collections, 1989: 1972. "AU-50, prooflike. Bright and reflective surfaces. The obverse and reverse peripheries are lightly toned in pale blue and iridescent golden-brown shades." • Yolanda Gross Collection.

• **POPULATION DISTRIBUTION:**

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 3 to 5 (URS-3)

Approximate population VF-20 to EF-45: 100 to 190 (URS-8)

Approximate population G-4 to F-15: 40 to 75 (URS-7)

Approximate population for all grades combined: 150 to 275 (URS-9)

• **CONDITION CENSUS:** 60-60-60-55 (multiples)

1800. BB-189.

(B-5. H-5.)

• **OBVERSE 6:** See description under 1800 BB-188.

Obverse die used to strike 1800 BB-188 (earlier use) and BB-189 (later use).

• **REVERSE F:** A *die flaw* just to left of lower part

of second T in STATES quickly identifies this reverse, the die also used for BB-190. Star enters eagle's mouth, the upper part of beak touching star. All the stars above firmly touch clouds, except the star under cloud 7 which is very close. Leaf points under left side of upright of I. The A touches both

3rd and 4th feathers, AM joined at lower part. Center of A over cloud 3. Tip of arrowhead under left side of right upright of U in UNITED.

Reverse die used to strike 1800 BB-189 (earlier use) and BB-190 (later use).

• DIE STATES:

Die State I: Obverse and reverse without cracks.

Die State II: Obverse with hairline crack through top of LIB. Reverse without cracks.

Die State III: Bolender-5b.¹ Obverse hairline crack now extends from stars 5 through 7, through LIB, and upward past B to rim. On reverse, hairline crack connects tops of ED in UNITED.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 2, Fine: 8, Very Fine: 24, Extremely Fine: 10. Total: 45. Average grade: VF-22.

• **COLLECTING NOTES:** About 200 to 350 examples of 1800 BB-189 are estimated to survive, making it one of the rarer varieties of the year. Still, enough specimens exist that the patient specialist will experience no difficulty in acquiring one. While numerous VF and EF coins exist, there is a dividing wall at that point. Why AU and Uncirculated pieces are not known is another of the intriguing mysteries that pervade the early dollar series.

• NOTABLE SPECIMENS:

Washington Specimen. EF-45. • Pine Tree, Suburban Washington Convention Sale, 1975: 250. "Better than EF, sharpness nearer AU, full breast feathers, gray tone, many trivial bagmarks."

Montgomery Specimen. EF-45. • Bowers and Ruddy Galleries, Montgomery Collection, 1976: 2002. "Attractive EF-AU, with lilac and light magenta toning."

Johnson Specimen. EF-45. • Bowers and Merena Galleries, Byron F. Johnson Collection, 1989: 573. "EF-45. An attractive, sharp, and pleasingly toned specimen. The obverse and reverse are pale gray, with faint golden-brown highlights around the peripheries. There is considerable detail visible in the eagle's tail feathers, and even in its breast feathers, which can be seen without the aid of magnification. An attractive and nicely toned specimen."

Aspen Specimen. EF-45. • Bowers and Merena, Dr. Nelson Page Aspen Collection, 1989: 394. "EF-45 to AU-50,

deep bluish gray and aureate iridescence. The fields are very reflective for the grade, giving the coin a semiprooflike appearance. Breast feathers well defined, and some faint adjustment marks can be seen crossing Miss Liberty's cheek, hair, and forehead. A nick is present in front of Miss Liberty's mouth as illustrated."

Johnson Specimen. EF-40. • B.G. Johnson, possibly ex Virgil M. Brand. • M.H. Bolender Collection, 1952: 138, "EF, some lustre."

Pine Tree Specimen. EF-40. • Pine Tree Auction, February 1975, Lot 250. "EF or finer."

Austin Specimen. EF-40. • Bowers and Ruddy Galleries, Austin Collection, 1974: 40. "Attractive EF grade."

Seller Specimen. EF-40. • Bowers and Ruddy Galleries, Seller Collection, 1980: 3275. "EF-40, toned with reasonably pleasing surfaces."

1982 ANA Specimen. EF-40. • Steve Ivy, 1982 ANA Convention Sale, 1982: 724. "EF-40, Bolender-5b. Obverse crack from star five to E in LIBERTY (R-6). Untoned. A bit weak on the upper portions of the hair. An area of roughness on the reverse through CA in AMERICA. • Heritage, ANA Convention Sale, 1988: 962. Bolender-5b. EF (40/40). Bright steel-gray surfaces which were carefully cleaned years ago. A bit weak on the upper portions of the hair. An area of roughness on the reverse through CA in AMERICA."

Green Specimen. VF-35. • Col. E.H.R. Green Collection • Bolender Collection. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968): 300. "Nearly EF, sharp, lustrous, tiny rim dent; reverse dark streak, in flan before striking"

Approximate population VF-20 to EF-45: 140 to 240 (URS-9)

Approximate population G-4 to F-15: 60 to 110 (URS-7)

Approximate population for all grades combined: 200 to 350 (URS-9)

• **CONDITION CENSUS:** 45 (multiples)

¹ B-5a was described by Bolender as having perfect dies, but bifurcated letters; I do not recognize this as a separate die state.

1800. BB-190.

**(B-10. H-10.)**

• **OBVERSE 7:** *Wide date, 00 very wide apart, and the 8 too low.* The 8th star is close to Y, last star not quite so near bust. Star 7 is distant from L, Star 1 still farther from hair. Die clash marks in field near stars 12 and 13, probably the cause of the relapping (a rather unusual occurrence among 1800-dated dollars) that made the highest curl on the head incomplete.

Obverse die used to strike 1800 BB-190 (earlier use) and BB-191 (later use).

• **REVERSE F:** From same die as BB-189, but now with *light* die crack from leaf through C to border.

Reverse die used to strike 1800 BB-189 (earlier use) and BB-190 (later use).

• **DIE STATES:**

Die State I: Perfect obverse die, without relapping. Reverse with hairline crack connecting tops of ED in UNITED, as inherited from earlier use coining 1800 BB-189. May not exist without relapping.

Die State II: Obverse die lapped. No die cracks. Reverse as preceding. Scarce.

Die State III: Obverse as preceding. Reverse with crack expanded at tops of NITED to border. Additional crack from border to left side of C in AMERICA to leaf. (Transitional die states exist between II and III.) Common.

Die State IV: Bolender-10a. As preceding, but now the die crack on reverse is more pronounced through C, and an additional crack extends from right ribbon end through ER. Commonest of all. 1975 ANA Convention Sale (Superior): 985, VF-30, was called Condition Census. Davis-Graves: 1315 (Stack's, 1954) is AU. Amon Carter, Jr.: 227 (Stack's, 1984) is Unc.

Die State V: As preceding, but with additional crack from border to U of UNITED. Apparently, common, although not known to Bolender. Cf. 1975 ANA Convention Sale which had four coins, VF-30, VF-20 (ex Ruby Collection), another VF-20, and F-15.

Die State VI: As preceding, but with crack through U extending upward through arrows. Two new cracks, approximately parallel, through C of AMERICA to branch, the leftmost crack extending to border. Crack from wing to star above and to the right of M in UNUM.

Die State VI: As preceding, but with two approximately parallel cracks through ME of AMERICA. Crack from border to U to arrows now extends up to wing. Scarce.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 5, Fine: 18, Very Fine: 47, Extremely Fine: 13, About Uncirculated: 7, Mint State-60 or better: 5. Total: 96. Average grade: VF-25.

• **COLLECTING NOTES:** Among dollars of this date, 1800 BB-190 is one of the most plentiful issues. As many as 600 to 1,100 are believed to exist. Once again, although the issue is readily available, most known specimens are in circulated grades. BB-190 is elusive AU, and in Mint State is rare.

• **NOTABLE SPECIMENS:**

Bebee's. MS-60. • *Numismatist* advertisement, 1953. "Brilliant Unc."

Baldenhofer Specimen. MS-60. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 982. "Reverse, light die break from leaf through C of AMERICA to border. MS-60, fully lustrous, but well tarnished. Microscopic obverse handling marks, reverse reflective."

Carter Specimen. MS-60. • Stack's, Amon Carter, Jr. Collection, 1984: 227, Bolender-10a. "Brilliant Unc. Frosty and satiny, with considerable prooflike surface, mostly on the reverse. A simply splendid coin from any point of view. Pale golden russet and iridescent."

Davis Specimen. AU-55. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1315. "Bolender-10a. R-3. Later state of die. Wide serrated borders, showing a minor bruise below first star; slight rubbing on high spots. Beautiful prooflike

surface, nicely toned and struck. Just about Unc."

Clarke Specimen. AU-55. • Col. E.H.R. Green Collection • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 641. "Die flaw in field left of second T in STATES. Very close to, but not quite Unc. Comparatively well struck, although soft at the centers. Obverse rim defect at the eighth star, one minute reverse rim nick, a light scratch or so from eagle's wing to a point between I and T of UNITED. With considerable mint frost; iridescent blue and pink toning. Undescribed reverse die crack from border through top of ITED."

Four Landmark Collections Specimen. AU-55. • Bowers and Merena, Four Landmark Collections, 1989: 1973. "AU-55. Just a trace of faint iridescent golden brown toning around the rims. The surfaces are clear and lustrous, with a pleasing cartwheel effect visible on both sides. The centers are softly struck, as if often seen on this variety. There is a small, hidden nick on the eagle's head."

DeCoppet Specimen. AU-50. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc."

Approximate population for all grades combined: 600 to 1,100 (URS-11)

• **CONDITION CENSUS:** 60-60-60-60-60-55 (multiples)

1800. BB-191.

AMERICA1 Reverse

(B-11. H-11.)

• **OBVERSE 7:** See description under 1800 BB-190. All coins seen have been from relapped die.

Obverse die used to strike 1800 BB-190 and BB-191.

• **REVERSE G:** AMERICA1 variety (one of two AMERICA1 varieties, the other, which shares this reverse, is BB-192). After the word AMERICA, an almost vertical line, a stray mark (apparently, not a die crack), perhaps from a punch or from a stray piece of metal during the die making process, appears more or less like an "I" added. There are no serifs to the stray mark, and it takes some imagination to call it an I, but the nomenclature has been with us for a long time, and "AMERICA1" it is. No-

where else in the silver dollar series has a stray die mark done so much for a coin's value and desirability in the eyes of collectors.

Other characteristics: Star enters eagle's mouth; point of lower part of beak touches star lightly below point. Upper part of beak does not quite touch. Point of leaf slightly right of being under left upright of I in AMERICA. Middle berry is small and joined to a leaf point by what seems to be a die scratch. A touches 3rd feather only, and ME almost join at bottom. Center of A over cloud 3. Tip of arrowhead under left side of left serif of N in UNITED. Usually (always?) weakly struck at the reverse center and on the stars above the eagle's head.

Reverse die used to strike BB-191 (earlier use) and BB-192 (later use).

• **DIE STATES:**

Die State I: Perfect obverse die, without relapping. Reverse die without cracks. May not exist with obverse not showing relapping.

Die State II: Obverse die relapped. No die cracks. Reverse without cracks. The usual die state seen.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 4, Fine: 13, Very Fine: 13, Extremely Fine: 8, About Uncirculated: 2, Mint State-60 or better: 1. Total: 43. Average grade: VF-22.

• **COLLECTING NOTES:** 1800 BB-191 dollars survive to the extent of an estimated 200 to 350 coins, ranking it among the scarcer issues of a year with many elusive varieties. The desirability of BB-191 is greatly increased by the AMERICA! feature on the reverse, a stray mark from a punch that is in the right position to make it appear (with some imagination) as the letter I, hence AMERICA!

Bolender called it "excessively rare" and noted that it took him 35 years to find a specimen! He went on to say that several times he found "H-11" coins (equivalent to BB-191 today), but upon inspection they invariably proved to be the plentiful H-19 (BB-192) variety struck from the same reverse die.

• **NOTABLE SPECIMENS:**

Carter Specimen. MS-60. • Stack's, Amon Carter, Jr. Collection, 1984: 228. "Brilliant Unc., with just a tiny rub or two on the high points. Full mint lustre with delicate peripheral toning."

University of Rochester Specimen. AU-50. • Bowers and Ruddy Galleries, University of Rochester Collection, 1980: 3285. "AU-50, gorgeous antique gold toning over fully lustrous surfaces. Included in the University of Rochester holdings unattributed, therefore a new discovery."

Ostheimer Specimen. EF-45. • R. J. Lathrop Collection • ANA Convention Sale, 1952: 1270. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968): 303. "Where struck up, this is nearer AU than EF, with considerable mint brilliance. Central weakness on both sides as almost always, but mint frost even in some weak areas. Small but deep obverse planchet defect (split) above. Faint traces of old cleaning."

Gilhausen Specimen. EF-45. • M.H. Bolender. • Dr. Charles Ruby Collection. • Superior Galleries, Gilhausen

Collection, 1973: 1269. "EF, lustrous, richly toned, many areas suggesting AU."

Stack's Auction '84 Specimen. EF-45. • Stack's, 1984: 1187. "EF with lustre in the devices. Pale steel and iridescent."

Brooks Specimen. EF-45. • Bowers and Merena Galleries, Brooks Collection, 1989: 255. "EF-45. Quite sharply struck with most of Miss Liberty's hair details boldly rendered. Both surfaces are warmly toned in blue and coppery golden hues. The obverse is very well centered."

1976 ANA Specimen. EF-40. • Stack's, ANA Convention Sale, 1976: 1340, "EF, russet toning."

Boyd Specimen. EF-40. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 97. EF.

Davis Specimen. EF-40. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1316. "Lustrous, well struck and centered specimen, showing little or no handling defects or wear of any sort. EF. Mr. James Davis purchased this piece prior to 1890, and it has remained untouched for the last 64 years."

Shore Specimen. EF-40. • Superior, A. Bernard Shore Collection, 1988: 2223. "EF-40. Deep silvery gray with bright orange-gold undertones in the fields. Mostly well struck and original with some lustre in the protected areas."

Stack Specimen. EF-40. • Stack's, James A. Stack Collection, 1990: 419. "EF, pale gray with russet and iridescent toning."

• **POPULATION DISTRIBUTION:**

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 1 or 2 (URS-2)

Approximate population AU-50 to 58: 4 to 8 (URS-3)

Approximate population VF-20 to EF-45: 125 to 215 (URS-9)

Approximate population G-4 to F-15: 70 to 125 (URS-8)

Approximate population for all grades combined: 200 to 350 (URS-9)

• **CONDITION CENSUS:** 60-55-50-50-50-45 (multiples)

1800. BB-192.

**AMERICA Reverse****(B-19. (H-19.))**

• **OBVERSE 8:** *Point of star 1 is closer to hair than point of star 7 is to L. Right stars close to Y and bust. The last O in date is just as close to bust as is star 13. The 1 almost touches curl. Vertical die flaw below right side of first star near border. On the left, stars 1-2 and 5-6 are closer together than are other stars. On the right, stars 11-12 are farther apart than are other stars.*

Obverse die used to strike BB-192 only.

• **REVERSE G:** See description under BB-191. The AMERICA Reverse variety.

Reverse die used to strike BB-191 (earlier use) and BB-192 (later use).

• **DIE STATES:**

Die State I: Perfect dies without clash marks. May not exist.

Die State II: Clash marks on obverse at date (from clouds on reverse), at E in LIBERTY (from eagle's tail), and Y through star 11 (MERIC incuse from reverse). Small die flaw or crack below star 1. This is the die state usually seen.

Die State III: Bolender-19a. Dies as BB-192, Die State II, but now with die crack along top of three upper left stars on obverse continuing along top of LIBE. Obverse clash marks seen on Die State II are now mostly gone (from light relapping?), but a new group of clash marks, slightly different in configuration, is seen in and around the date, and extending along the border to star 3.

Die State IV: Obverse as preceding. Reverse with additional die crack along border above U, left top of N, down through I (eventually to left ribbon end in a slightly later state). Die clash marks around date and at sides. Rare.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 9, Fine: 25, Very Fine: 39, Extremely Fine: 16, About Uncirculated: 6, Mint State-60 or better: 10. Total: 108. Average grade: VF-25.

• **COLLECTING NOTES:** 1800 BB-192 is one of the most populous varieties of the year. An estimated 600 to 1,100 exist. The BB-192 is by far the commoner of the two varieties with AMERICA Reverse (the other being BB-191). Examples are available in all basic grade ranges, with most being in the VF category.

• **NOTABLE SPECIMENS:**

Paramount Auction '85 Specimen. MS-64. • Paramount, 1985: 1264. "Gem Unc. (65/65). A truly magnificent early bust dollar with a fully prooflike obverse, broad even dentilation, an incredibly sharp impression and superb natural medium gray and golden brown toning."

Stack's Auction '85 Specimen. MS-63. • Stack's, 1985: 1753. "Brilliant Unc., and a choice specimen with russet and iridescent toning. A curious light spot in the field behind the head where it didn't tone." • Auction '86, Stack's: 294. (Previous description repeated.)

Rarcoa Auction '86 Specimen. MS-63. • Rarcoa, 1986: 734, Bolender-19a. "Choice Unc., well struck, with nice lustre and attractive orange and lavender toning."

Four Landmark Collections Specimen. MS-62. • Bowers and Merena, 1989: 1978. "MS-60 to 63. Attractive pale silver gray and golden-brown toning on both sides. The mint lustre is nearly complete on both sides, and creates a pleasing cart-wheel effect on the obverse and reverse. The reverse mint lustre is outstanding around the peripheries."

Ivy Specimen. MS-60. • Steve Ivy Sale, December 1976: 759. • Kagin's, ANA Convention Sale, 1977: 1772. "Die flaw near border between first star and date. Brilliant frosty Unc., mediocre strike (stars sharp, centers less so); dipped long ago, beginning to acquire faint golden (obverse) and honey color (reverse) peripheral tone."

Shore Specimen. AU-58+. • Superior, A. Bernard Shore Collection, 1988: 2220. "About MS-60. Very early die state with conspicuous raised die lines below 180 in the date which extend to below the curls. An exceptional strike with centers showing every fine detail and full radial line sin stars. The

surfaces are nearly completely prooflike and covered by irregular toning. Some marks are noted on the obverse with most obvious being a pinprick below TY in LIBERTY."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "A choice practically Unc. specimen."

Wolfson Specimen. AU-55. • Stack's, Samuel A. Wolfson Collection, 1963: 1386. "Just a shade from Unc., delicately toned, full mint lustre."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, August 1970: 1096. "Virtually Unc., only barest friction, lovely bluish golden."

• **CONDITION CENSUS:** 64-63-63-60 (multiples)

1800. BB-193.

(B-13, formerly B-18. H-13.)

• **OBVERSE 9:** Star 13 slightly closer to bust than Star 8 is from Y. Star 7 is much farther from L, and the star 1 is the farthest from hair, 2.75 mm. Left base of E slightly high in relation to bottom of B (this same characteristic is true of the different obverse used to strike BB-188 and BB-189). On the left, stars 4-5 and 5-6 are more closely spaced than are the others. On the right, stars 9-10 are the most closely spaced and stars 10-11 are the most widely spaced.

Obverse die used to strike 1800 BB-193 only.

• **REVERSE H:** Similar to BB-188, but A and M touch, and A in STATES is in different position; A over cloud 3 (mostly) and area between clouds 3 and 4. Tip of arrowhead under and just slightly right of center of U in UNITED.

Reverse die used to strike 1800 BB-193 only.

• **DIE STATES:**

Die State I: Perfect dies. Obverse without cracks. Reverse without clash marks or cracks. This is the regular BB-193 variety. Three or more times scarcer than Die State III.

Die State II: First clashing. Obverse with clash marks at left side of date and stars 1 and 2, incuse impressions of clouds on reverse. No die cracks. Reverse with light clash marks at F, clouds 7 and 8, and below cloud 7, incuse impression of drapery folds. As additional striking occurs, the obverse clash marks fade away slightly. Scarce.

Die State III: (Bolender-18) Second clashing. Obverse with faded clash marks from first clashing. No die cracks. Reverse with massive injury from second clashing. Now with raised lines through F and clouds 7 and 8 to stars below those clouds; clash marks in same position as Die State II, but now much bolder and more extensive. Die crack along top of AMERICA, extending about halfway beyond final A along the border toward eagle's tail. This "variety," actually a die state, used to be called Bolender-18, and is very common. In nearly all striking, the 8 of the date appears "pinched" and the last two numerals appear somewhat heavier toward the bottom,

undoubtedly the result of metal flow during striking.

Die State IV: Bolender-18a. Obverse die fails at stars 2 and 3, which bulge outward. An arc-like crack connects star 1 with star 4, and curves through the field just beyond stars 2 and 3. On the reverse, the metal displacement caused by the obverse bulge causes weakness at RI of AMERICA. Scarce die state.

• AUCTION POPULATION SURVEY:

These were catalogued as BB-193: Very Good: 1, Fine: 3, Very Fine: 14, Extremely Fine: 1, About Uncirculated: 3, Mint State-60 or better: 1. Total: 23.

These were catalogued as Bolender-18: Less than Good: 1, Good: 2, Very Good: 7, Fine: 9, Very Fine: 39, Extremely Fine: 13, About Uncirculated: 8, Mint State-60 or better: 7. Total: 86. Average grade for all listings: VF-26.

• **COLLECTING NOTES:** 1800 BB-193, as we know the variety today, is one of the most plentiful dollars of the year, and is about tied with BB-187 as the most common. An estimated 700 to 1,200 are known. In the present text, the population of BB-193 includes what used to be called Bolender-18, from the same dies, but a later state with clashing. Today, specialists recognize Bolender-18 as simply a later die state of BB-193.

For many years, Bolender-13 was considered to be one of the rarer varieties of 1800, while Bolender-18 was one of the more common issues. Auction data suggest that "old" B-13 coins were about three and one-half times rarer than "old" B-18 coins. As might be expected "old" B-13 coins were considered to be great rarities in high grades. The Mint State 1975 ANA Convention Sale (Superior) coin, earlier in the W.G. Baldenhofer Collection, was considered the finest known. Now come more than a half dozen records of Mint State "old" B-18 coins to dilute the desirability of the "old" B-13.

My feeling is that as time goes on, the "old" B-18 will be forgotten, and will be considered for what it really is: a die state of BB-193 [B-13]. Values will settle at the lowest common denominator, which means that Die State I of BB-193 (equal to the "old" B-13 in its entirety) may be worth slightly more than Die State III (equal to the "old" B-18), but not much more. Time will tell.

• NOTABLE SPECIMENS:

Fairfield Specimen. MS-64. • Bowers and Ruddy Galleries, Fairfield Collection, 1977: 1037, Bolender-18a. "Gem Unc. Full lustre under lovely lilac, sea green, and iridescent toning. Virtually flawless. Except for the gorgeous natural toning this coin is in the same condition as it was when it left the dies nearly two centuries ago."

Four Landmark Collections Specimen. MS-63. • Bowers

and Merena, 1989: 1976. "MS-63 to 64. A lovely, lustrous example. Both the obverse and reverse are toned in delicate silver gray with faint rosy highlights. The mint lustre on both sides full and unbroken cartwheels! The obverse strike is very sharp, with all stars showing full central detail and Liberty's hair strands completely struck up. On the reverse, the eagle's breast feathers may be seen without the aid of magnification. Fairly late state of the reverse die, with a 'spray' of breaks arising from the tip of the eagle's right wing (as seen), arching down to the fourth and fifth stars above the eagle's head. Other, subsidiary, breaks may be seen elsewhere on the die."

Baldenhofer Specimen. MS-60. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 993. "Clashed die reverse. MS-60, fully lustrous and iridescently toned. Very choice despite a small edge nick above the left upright of U of UNITED on the reverse. A trifle flat at Liberty's brow; otherwise, superb."

Johnson Specimen. MS-60. • B.G. Johnson. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 105. "H-18A. Not in Haseltine, Similar to H-18, but obverse die cracks. Unc." • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 309. Bolender-18b. "Brilliant Unc., peripheral tone, part of cheek and adjacent hair not up, some other localized weaknesses from advanced die failures. With obverse cracks in stars, this die state rarer still."

New Netherlands Specimen. AU-55. • New Netherlands 52nd Sale, 1958: 620. "Die cracked through tops of AMERICA to tail (intermediate between Bolender-18 and Bolender-18a). Marked 'Br Unc.,' this frosty and highly lustrous example is just a rub away from full Mint State, though evidently cleaned years ago—not badly."

Davenport Specimen. AU-55. • Superior Galleries, Davenport Collection, 1977: 482. "AU-55, fully lustrous and iridescently toned. Several minor rim nicks and some light handling marks."

Garrett Specimen. AU-55. • Bowers and Ruddy, Garrett Collection, 1980: 693. "Choice AU-55, with many claims to full Unc. status. Nearly perfect strike, no adjustment marks, obverse displaying nearly complete mint frost, missing only the highest areas of Miss Liberty. The slight friction there may well be attributable to coin-to-coin contact in a mint bag shortly after it was struck. Reverse is fully frosty."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 634. "Comet variety, spray of die breaks through clouds. Near Unc."

Bebee's. AU-50. • *Numismatist* advertisement, 1953. AU.

DeCoppet Specimen. AU-50. • James Kelly, André DeCoppet Collection, 1955. "Well struck and practically Unc."

Pradeau Specimen. AU-50. • Superior Galleries, A. Pradeau Collection, 1970: 461. "A beautiful type coin. Choice toned AU."

Four Landmark Collections Specimen (another). AU-50. • Bowers and Merena, 1989: 1977, AU-50. "About the same die state as [the other specimen]. Both obverse and reverse have a beautiful, pale purple, golden brown, and silver gray toning scheme. The surfaces and rims are problem-free for the grade."

F.U.N. Convention Specimen. AU-50 (PCGS). • Mid

American, Florida United Numismatists Convention Sale, 1991: 916, AU-50 (PCGS). "Deep, even olive-gray color can be seen on the obverse and on the reverse. both sides show very sharp detail and the surfaces appear to be quite lightly marked below the aforementioned coloration."

Dillard Specimen. EF-40. • Heritage, Dillard Sale, 1990: 539. "EF (40/40). Bolender-13a. (Formerly Bolender-18). R-3. Late Die State; struck from clashed and worn dies. Untoned with much lustre on both sides. A small, thin scratch can be seen to the left of the first star on the obverse. ANACS certificate for grade and authenticity."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

• **CONDITION CENSUS:** 64-63-63-58-58-55 (multiples)

1800. BB-194.

Dotted Date

(B-14. H-14.)

• **OBVERSE 10:** *Dotted date*, that is, curious die breaks or cracks are visible inside and above first O in date. Tiny dot-like die breaks appear in many other places, particularly between L and I, under nose, before chin, below first star, and under the 6th and 7th stars. The steel used to make this die must have been defective. Star 8 is closer to the Y than star 13 is from the bust. Star 7 is a little farther from L, and star 1 is very distant from hair, over 3 mm. On the left, stars 2 and 3 are closer together than are any others; 1-2 and 3-4 are farther apart than are any others and are also misaligned in relation to each other. On the right, stars 8-9 are farther apart than are any others.

Obverse die used to strike 1800 BB-194 only.

• **REVERSE I:** *Only 12 arrows* show plainly; the 13th arrow is much smaller and almost hidden, and

appears faintly as the 3rd shaft from the left. Leaf points to center of I in AMERICA. Point of star touches point of *lower part* of eagle's beak, and point of upper part of beak shuts down on top side of same star point. All upper stars touch clouds decidedly, except that under cloud 7 which barely misses. Die dot between second and third upper stars from right. ME touch at base. A over cloud 3 and area between clouds 3 and 4. Tip of arrowhead under right side of right upright of U in UNITED.

Reverse die used to strike 1800 BB-194 only.

• **DIE STATES:**

Die State I: Perfect obverse die without breaks (dots). May not exist.

Die State II: Dies for BB-194 as described by Bolender. (Does an even *earlier* state, without flaws, exist?) The die state usually seen. LIBERTY usually weakly struck, especially at the tops of ERTY.

Die State III: As preceding, but with hairline crack on obverse from border up through star 1 to a short distance in

field. Die breaks (dots) at date enlarge. Crack on reverse from D through wing to S. Raised clash marks at OF from drapery creases on obverse. Scarce.

Die State IV: Bolender-14a. As preceding, but now with the following die cracks. Heavy die crack under first 0 in date, up through left top of second 0 to bust. Crack through right side of last 0 from milling to bust. Crack from lower part of last 0, bust, and ending in right field. Light cracks in first 3 stars. Reverse die cracks also appear from border, through right top of N into field. A crack from milling to right top of E, base of D, left wing, lower part of clouds, continues in several cracks up through OF. Another crack from top of D through left wing to S. Scarcer than either of the preceding.

Die State V: Later state than III, now with die rust on the obverse, and with failure at the rim above LIBERTY.

• **AUCTION POPULATION SURVEY:** Good: 2, Very Good: 4, Fine: 17, Very Fine: 41, Extremely Fine: 31, About Uncirculated: 3, Mint State-60 or better: 1. Total: 99. Average grade: VF-25.

• **COLLECTING NOTES:** 1800 BB-194 is another plentiful variety. About 500 to 900 are believed to survive in all grades combined. As the case with the AMERICA variety, the value of the Dotted Date is enhanced by die flaws, a curious situation from the viewpoint of logic. Ever since Richard S. Yeoman listed it in the *Guide Book* as a "major variety," it has been inordinately popular. Actually, there are numerous varieties of early dollars more significant than this that are not listed in the *Guide Book*.

Most known specimens of 1800 BB-194 are in lower grades. In Mint State, the issue is a major rarity. Who knows what the Boyd coin would grade today? I have arbitrarily assigned the grade of MS-63 to it.

• NOTABLE SPECIMENS:

Boyd Specimen. MS-63. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 100, Haseltine-14. "An Unc. gem, with brilliance of original mint lustre. Nick on chin."

NASC Convention Sale Specimen. AU-50. • Kagin's, 1979: 536, Bolender-14a, Dotted Date. "AU-50, with natural gray toning, some original lustre present, sharp strike, some old light hairline scratches obscured by the toning."

Buss Specimen. AU-50. • Superior Galleries, Dr. Jerry Buss Collection, 1985: 1334. "AU-50. Well struck with plenty of mint lustre still adhering to the surfaces; all overlaid with light grayish toning and with some electric blue iridescence about the borders. A wonderful defect-free specimen, with just a few minute marks about the rims."

Boyd, Brand and Ryder Collections Specimen. AU-50. • Bowers and Merena Galleries, 1990: 2462, AU-50. "Largely brilliant with some exceedingly faint blushes of aureate coloration. Much satiny mint lustre survives in the fields of both surfaces. Virtually all of Miss Liberty's hair strands are nicely delineated except for those directly behind her temple. All of the breast feathers on the eagle are visible. Some faint hairlines on the obverse indicate that this piece may have been carefully cleaned long ago."

Helfenstein Sale Specimen. EF-45. • Lester Merkin, 1968: 280. "EF-AU, deeply toned. a couple of minute rim nicks."

River Oaks Specimen. EF-45. • Bowers and Ruddy Galleries, 1976: 704. "Nice EF-AU grade with some vestigial mint lustre."

Seller Specimen. EF-45. • Bowers and Ruddy Galleries, 1980: 3276. "Choice EF-45, considerable mint lustre overlaid by bright silvery gray toning. The familiar Dotted Date variety, from a badly rusted and pitted obverse die. First and second clouds defective at bottom."

Matlock Specimen. EF-45. • Bowers and Merena Galleries, 1991: 477, EF-45. "Light silver gray in the fields with areas of golden brown around the central devices and elsewhere. Original mint lustre can be seen around the stars on the obverse, and across much of the reverse surface. Well struck, with nicely separated hair strands and bodice lines on the obverse, most breast and tail feathers on the reverse visible without the aid of magnification."

Brilliant and Sieck Collections Specimen. EF-45. • Bowers and Merena, 1992: 1275, EF-45 to AU-50. "Obverse highly attractive, light silver gray with areas of darker gray on the high points, lighter gray on the fields, with pale champagne hues visible on most portions of the field. A very light rim bump above F on reverse is noted."

• **CONDITION CENSUS:** 63-55-50-50-50-45 (multiples)

1800. BB-195.

(B-15. H-15.)

• **OBVERSE 11:** Star 13 very close to bust; a point barely escapes touching the junction of drapery with bosom. The 1 in date is very close to curl, but does not touch. Numerals 180 in date are close, and the last 0 more distant. Star is near L. Die dot between R and T. The first star is very distant from hair, 4 mm. On the left, stars 3 and 4 are more widely spaced than are any others. On the right, stars 8-9 and 11-12 are closer together than are any other pairs. Often weakly struck on the hair.

Obverse die used to strike 1800 BB-195 only.

• **REVERSE J:** Only 10 perfect arrows and 3 arrow heads *without sticks*. Numerous die flaws in TES and especially between last S of STATES and 0 enable quick identification. A does not touch feathers. AME join at base, the left base of M high and overlapping A. Star very close but does not quite touch eagle's beak. A over clouds 2 (part of left foot of A) and 3 (mainly). Tip of arrowhead under right side of right upright of U in UNITED.

Reverse die used to strike 1800 BB-195 only.

• **DIE STATES:**

Die State I: Perfect dies. The obverse and (particularly) the reverse denticles are usually very long and well pronounced.

• **AUCTION POPULATION SURVEY:** Very Good: 6, Fine: 11, Very Fine: 16, Extremely Fine: 7, About Uncirculated: 4, Mint State-60 or better: 2. Total: 46. Average grade: VF-24.

• **COLLECTING NOTES:** 1800 BB-195 is of medium scarcity. I believe that about 250 to 450 survive. Once again, most specimens are in lower grades through VF. At the EF level BB-195 becomes rare, and AU or finer coins are very rare.

• **NOTABLE SPECIMENS:**

Austin Specimen. AU-58. • Bowers and Ruddy Galleries,

1974: 37. "Unc., some evidence of rubbing. Very light iridescent toning."

Newport Specimen. AU-58. • Bowers and Ruddy Galleries, 1975: 1047. "Unc., with some very light friction on the highest parts. Exceedingly well struck, and almost cameo-like in appearance."

Carter Specimen. AU-58. • Stack's, Amon Carter, Jr. Collection, 1984: 229. "AU, just a whisper from full Mint State. Fully lustrous and nicely struck. A tiny concealed dig just below the lower ribbon."

Krugjohann Specimen. AU-55. • Bowers and Ruddy, 1976: 625. "AU with much mint lustre. Toned a lovely gun-metal gray. Sharply struck on a perfect planchet."

Chalkley Specimen. AU-50. • Superior Galleries, Chalkley Collection, 1990: 2883. "AU-50. Sharply struck with bold dentils on the obverse and reverse; these serve to frame the bold design with admirable success. Ample lustre remains, gently dusted with golden hues. A clean planchet; no unsightly dark streaks." • Yolanda Gross Collection.

Willasch Specimen. AU-50 (PCGS). • Superior Galleries, H. Roland Willasch Collection, 1990: 567. "AU-50 (PCGS). Deep gray toning throughout with some minor planchet streaks and spotting on the reverse. Faint lustre remains atop the lightly worn devices."

• **POPULATION DISTRIBUTION:**

Approximate population for all grades combined: 250 to 450 (URS-10)

• **CONDITION CENSUS: 60-60-55-55-50-50**

1800. BB-196.

**(B-17. H-17.)**

• **OBVERSE 12:** A "collar" (clash mark) shows along neck about half the length of bust, due to clashing from the reverse die. A line extends to left from just above foot of 1 in date. Upper left star very distant from L, almost as far as first star is from hair, between 2 and 3 mm. 180 in date close, 1 originally cut too far to the left.

Obverse die used to strike 1800 BB-196 only.

• **REVERSE K:** Only 12 arrows. Point of star touches point of upper part of eagle's beak. Leaf point is under left side of stand of I in AMERICA. Center of A over cloud 3. Tip of arrowhead under right upright of U in UNITED.

Reverse die used to strike 1800 BB-196 only.

• **DIE STATES:**

Die State I: Without obverse clash mark or reverse die crack. May not exist.

Die State II: Obverse with clash marks visible as a "collar" at Miss Liberty's neck and bosom. This is the die state usually seen.

Die State III: Bolender-17a. As preceding, but now with additional die cracks as follows: Hairline crack at right of star 1 extends slightly into field. Crack from border to hair between star 1 and date. Tiny crack between stars 11 and 12. Reverse with prominent raised clash marks (from drapery folds) from S through OF and extending downward (called die breaks by Bolender). Die crack from border through top of A, lower part of M, to end of branch. Scarce.

Die State IV: As preceding, but now with obverse crack from star 6 to ribbon. Scarce.

• **AUCTION POPULATION SURVEY:** Very Good: 6, Fine: 12, Very Fine: 37, Extremely Fine: 21, About Uncirculated: 5, Mint State-60 or better: 5. Total: 86. Average grade: VF-27.

• **COLLECTING NOTES:** The 1800 BB-196 dol-

lar is quite plentiful. About 500 to 950 survive in all grades combined. Unlike many of its contemporaries, it is not unusual to encounter in EF. AU specimens are in the rare category, and Mint State coins are exceedingly rare.

• **NOTABLE SPECIMENS:**

DeCoppet Specimen. MS-60. • James Kelly, André DeCoppet Collection, 1955. "Unc. with original mint lustre."

Brilliant and Sieck Collections Specimen. MS-60. • Bowers and Merena, 1992: 1277. "MS-60/62. Once dipped and lightly retoned, in attractive light golden brown shades. Frosty, sharp detail. Typical states of the dies, clear clash marks visible above the date, along Liberty's bosom, and in many places across the reverse surface. One small hairline scratch is noted in left obverse field. Some original mint lustre can be seen in protected areas of the reverse."

Hollinbeck-Kagin Specimen AU-58. • Hollinbeck-Kagin Sale, August 1970: 1094. "Bolender-17a. Unc. with lovely light golden and bluish patina, faint rubbing." • September 1970: 889. "B0-17A, Near Unc."

Boyd Specimen. AU-55. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 103, Haseltine-17. "Barely circulated."

Cohen Specimen. AU-55. • Bowers and Merena, Milton Cohen Collection, 1985: 528. "Choice AU-55 with a sizable percentage of the original mint lustre still remaining. Exceedingly sharply struck, with a wealth of needle-sharp design detail, including on the high parts of the center. Light gray fields at center are highlighted by traces of gold. Mottled light gunmetal blue and iridescent toning characterizes the borders."

Green Specimen. AU-50. • Col. E.H.R. Green Collection. • Bolender Collection • James Kelly, André DeCoppet Collection, 1955. "Practically Unc." • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 308. "Bolender-17b. R-1. AU or so, dull gold toning, some mint lustre; reverse superior to obverse, almost full breast feathers."

Forrest Specimen. AU-50. • Stack's, S.S. Forrest, Jr. Collection, 1972: 633. "AU, with the slightest wear on the high points. Considerable mint lustre. Dipped many years ago, now beginning to acquire a light golden hue."

BB-214	B-4	H-4	URS-10	VF-24

Coinage Context

The price of silver: Whereas during the period 1794-1799 the intrinsic value of the silver dollar had not exceeded its face value, in 1800 the dollar became worth slightly more as bullion than face value. In 1801 a silver dollar was worth about \$1.03. For this reason, mintages declined. As silver dollars continued to be worth more than face value, most (including earlier-minted coins on hand) were melted or exported. The situation was intolerable, and in 1804 production was halted.

Mintage commentary: Conventional wisdom has it that part of this mintage was dated 1800. In his *Encyclopedia*, p. 428, Walter H. Breen states this: "Mintage reported for 1801 consisted largely of coins dated 1800; similar backdating was the rule through 1804."

Die making: Die making procedures followed those employed in 1800.

On the obverse, variables include the positional relationships of the 13 stars, the word LIBERTY and its component letters, the date, and the portrait of Miss Liberty.

On the reverse, variables include the positional relationships of the letters in UNITED STATES OF AMERICA, the branch, arrows, eagle, clouds, and stars above the eagle. The reverse of 1801 BB-214 has the lower right serif of the T partially broken (from an injured or worn punch), while on the re-

verse of BB-213 lower right serif or foot of the T is completely missing.

Die combinations: Two obverse dies were mated with four reverses to produce dollars dated this year. The division wasn't equal: one obverse was coupled with three different reverses to create BB-211, BB-212, and BB-213, and the other obverse was monogamous with another reverse to create BB-214 (but after its obverse "died," it went on in later years to additional unions with obverses dated 1802 and 1803 to create 1802/1 BB-233, 234, 235, and 242; 1803 BB-251 and BB-252).

Similarly, the reverse die used to coin 1801 BB-212 is one of several dies in the early dollar series that was employed to strike coins with more than one obverse date. Not only did it combine with an 1801 die to create BB-212, it also was used to strike 1802/1 BB-231, BB-232, and 1802 BB-241; and 1803 BB-254 and BB-255.

Of dies and year dating: Concerning the long-lived reverse dies used to create 1801 BB-212 and BB-214, BB-212 *may have been* made first, as the lower right serif of the foot of T is intact, whereas on BB-214 it is partially missing. (Made still later was the reverse to coin BB-213, with the lower right serif completely missing). However, the set of punches which contained the broken T also had duplicate(s), as evidenced by a perfect T used to make the two new reverse dies found on the 1801-1804 novodels.

Reverse die progression evidence indicates that the reverse die used to coin 1801 BB-212 (called by Bolender, Reverse A), indicates that this die was used no earlier than 1802. Similar evidence reveals that the reverse die used to coin 1801 BB-214 (Bolender's Reverse B) was not used before 1802. Thus, neither 1801 BB-212 nor 214 were coined in 1801. As obverse die progression indicates that 1801 BB-213 was struck after 1801 BB-212, this means that 1801 BB-213 also was struck after 1801. Further, 1801 BB-213 has broken T letters on the reverse,

from the employment of a broken T punch. 1802 BB-241 has the same broken T on the obverse. As the 1802 obverse die could not have been made in 1801, nor would it have made sense to have made it in 1803, this isolates the year 1802 for the production of the reverse used to coin 1801 BB-213, another verification that 1801 BB-213 was struck in 1802 at the earliest.

Thus, 1801 BB-211 is the only variety dated 1801 that *might have been* actually struck in 1801! However, it too could have been struck later.

Because of this, the 54,454 silver dollars the Mint reported as having been coined in calendar year 1801 probably consisted largely of pieces of earlier dates.

Order of striking: It seems likely that the order of striking of 1801-dated dollar varieties was as follows:

1801 BB-211. Struck in 1801 or later. The only 1801-dated dollar for which there is a possibility it was actually struck in 1801.

1801 BB-212. Struck in 1802 or later.

1801 BB-213. Struck in 1802 or later.

1801 BB-214. Struck in 1802 or later.

Numismatic Information

Commentary: Four business strike die varieties exist, none of which is a formidable rarity. In his 1881 *Type-Table*, Capt. J.W. Haseltine said nothing of the rarity of any of the four varieties he listed (H-1 through H-4, equal to BB-211 through BB-214 today); apparently, he considered them all common. Today, as in yesteryear, the completion of a full set of 1801 dollars is a realistic goal. The 1801 is scarce as a date, as are also 1802 and 1803. The 1801 Proof novodel "restrike," made decades later, is discussed in chapters 5 and 6.

Identification of the four varieties is literally and figuratively as easy as 1-2-3 (and 4) using the Easy-Finding Guide presented earlier. Most specimens in existence today are in worn grades. It is significant to mention that as of October 1992, NGC and PCGS combined had graded just one 1801 dollar as Mint State.

1801: Summary of Characteristics

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Weight and composition: 416 grains; .8924 silver, balance copper

Melting value (silver bullion value) in year minted: Traditionally considered by Mint officials to be on a par with the Spanish dollar, and worth about \$1.00 intrinsically, but by 1801 the value had risen to about \$1.03.

Dies prepared: unknown

Business strike mintage, calendar year: 54,454 (may include some struck from dies dated earlier; figures do not include pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: January 10: 6,850 (+3); February 4: 8,483 (+3); February 16: 9,800 (+3); February 28: 3,500 (+3); March 16: 5,773 (+3); April 15: 7,350 (+3); May 15: 1,150 (+2); August 19: 7,040 (+3); September 30: 3,746 (0); December 26: 762 (+1).

Estimated business strike mintage of 1801-dated dollars (author's estimate): 35,000 (rounded).

Estimated quantity melted: Unknown

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 to 2 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 65 to 125 (URS-8)

Approximate population VF-20 to EF-45: 1,200 to 2,100 (URS-12)

Approximate population G-4 to F-15: 625 to 1,100 (URS-11)

Approximate population for all grades combined: 1,800 to 3,300 (URS-12)

• **CONDITION CENSUS:** 63-60-60-58 (multiples)

• **AVERAGE AUCTION APPEARANCE** (for all varieties combined: VF-24)

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

Proof novodels were made decades later (see chapters 5 and 6)

Commentary

Coinage of dollars dated 1801 was small, and specimens are scarce today. Apparently, only one variety of 1801-dated dollar, BB-211, has the possibility of being actually coined in calendar year 1801.

Additional Information

Dickeson on 1801 Dollars

The following appeared in Dr. Montroville W. Dickeson's 1859 book, *An American Numismatical Manual* and told of an apparently short-lived influx of silver dollars dated 1801 appearing for sale:

"The high premiums paid for specimens of this emission, lately brought to light, and into the market, a very considerable number, and also of the emissions from 1795 to 1803, which furnished a temporary supply to collectors. Apart from this, they are getting to be scarce, and soon must again be so, as a small number coined, with the inducement to bring them out, has had the effect, we think, to develop the full supply."

The Year 1801 in History

In 1801 the United States entered a state of war—in this case undeclared—when Yusuf Karamanli, pasha of Tripoli, ordered his soldiers to cut down the American flag after the United States refused to pay tribute to Barbary Coast pirates. Several years later, on February 16, 1804, U.S. troops led by Lt. Stephen Decatur sneaked aboard the captured American ship *Philadelphia* in Tripoli harbor, attacked the guards, and set the ship afire, before rowing away to safety. In 1805, the U.S. consul in Tunis assembled a rag-tag army in Egypt, which crossed 600 miles of desert to attack Tripoli from the rear. The phrase in the *Marine Hymn*, "to the shores of Tripoli," refers to this conflict.

Thomas Jefferson was inaugurated on March 4, 1801, following his controversial election finalized on the 36th ballot

by the House of Representatives on February 17. He abolished lavish social events at the White House and dressed casually to receive visitors. To American citizens, he promised "peace, commerce and honest friendship with all nations—and tangling alliances with none." John Marshall, then secretary of state, was named chief justice of the Supreme Court. During the next 34 years his court would make several landmark decisions affecting interpretation of the Constitution.

The New York *Evening Post* was founded by Alexander Hamilton; in later decades it would become one of America's most influential newspapers. In New York City, the American Company of Booksellers was formed, and went on to sponsor five book fairs from 1802 to 1806. Congregationalist and Presbyterian religious denominations adopted the Plan of Union, which permitted them to combine their resources in frontier areas, and allow ministers from each denomination to use the same church at different times. On January 1, Parliament created the United Kingdom of Great Britain and Ireland. French inventor Joseph Marie Jacquard invented an automatic loom which used punched cards to control movements and reproduce designs; the device would continue in wide use for more than a century afterward.

At the Mint, half dollars, which had not been coined since 1797, were first produced utilizing the Draped Bust obverse design with the Heraldic Eagle reverse. The famous "Three Errors" large cent was produced, with the reverse having these blunders: UNITED appeared as IUNITED, the fraction was a mathematically meaningless 1/000, and there was just one (instead of two) stem to the wreath.

1801 Heraldic Eagle

Varieties

1801. BB-211.

(B-1. H-1.)

• **OBVERSE 1:** *The distance from 1 in date to curl is about the same as the distance from star 8 to upper right serif of Y.* The so-called Wide Date, most space between 180, the 01 closest; this traditional nomenclature is only useful if you have a Close Date (BB-214) on hand with which to compare it. The first 1 not very close to curl. The last 1 about as far from bust as first 1 is from curl. Star 8 close to Y. Other three key stars—7, 1, and 13—are distant from L, hair, and bust. Small dot to left of center dot. Right serif of I is level with left serif of B (on BB-214, the serif of B is higher).

Obverse die used to strike 1801 BB-211 (earliest use), BB-212 (intermediate use), and BB-213 (latest use).

• **REVERSE A:** *Arrowhead under U of UNITED.* Point of star almost touches point of lower part of eagle's beak. 13 arrows. Ray of star points to left side of U in *PLURIBUS* (the only 1801 for which this is true). A in *AMERICA* touches 3rd and 4th feathers. Leaf point is under left side of upright of I in *AMERICA*.

Reverse die used to strike 1801 BB-211 only.

Note: As the other three varieties of 1801 dollars—1801 BB-212, 213, and 214—were all struck in 1802 or later (see descriptions under their respec-

tive categories), this leaves 1801 BB-211 as the only candidate for a variety that *might have been* actually struck in 1801.

• **DIE STATES:**

Die State I: Perfect dies. About 10% or so are of this die state.

Die State II: As preceding, except for a tiny hairline die crack on obverse to left of 1 in date, slanting down toward the border.

Die State III: With reverse clash marks at TED and eagle's wing, showing on high-grade coins the distinct incuse impressions of obverse stars, probably stars 1 and 2, plus traces of others, as well as incusation marks from obverse denticles. This injury may have precipitated a die crack which extends through STA down through the clouds on the right, extending (in several intermediate states) to the first A in *AMERICA*. On worn specimens, the clash marks and crack are not easily seen. This is the usual die state encountered.

Die State IV: With reverse cracks from the rim through STA to the right wing to the first A in *AMERICA* to M and E to the rim. Cf. Sotheby's December 8-9, 1992: 499 (one of two pieces in the lot). Rare. Not seen.

Die State V: The latest state, of which there are several progressive stages, shows a crack from the clouds to the right wing and, finally, a large bulge at *AMER*. Cf. Sotheby's December 8-9, 1992: 499 (one of two pieces in the lot) was described as: "more advanced state of the die with the die crack through OF, and struck from clashed dies." Rare. Not seen.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 3, Very Good: 7, Fine: 20, Very Fine: 26, Extremely Fine: 20, About Uncirculated: 11, Mint State-60 or better: 2. Total: 90. Average grade: VF-26.

• **COLLECTING NOTES:** I estimate that about 500 to 900 exist of 1801 BB-211, ranking it with BB-212 as one of the most plentiful varieties of the year. However, as a date, 1801 dollars are measurably more elusive than are those of the earlier years of the Heraldic Eagle type, up to this point in time. The BB-211 is about as available as BB-212 if all grades combined are totaled, but in higher ranges, the BB-211 is the scarcer of the two.

Quite a few AU specimens of BB-211 have crossed the auction block over the years, but at the Uncirculated level, appearances fall off sharply. In fact, I am not aware of any Mint State coins sold in the past two decades, nor do I know if those sold earlier would qualify for this grade now.

• **NOTABLE SPECIMENS:**

Hollinbeck-Kagin Specimen. AU-58. • Hollinbeck-Kagin Sale, June 1970: 635. Bolender-1a. "Die breaks on reverse with die starting to buckle at right, Unc. golden, top hair strands not struck up as sharply as balance. Sharp stars."

New Netherlands Specimen. AU-55. • New Netherlands 57th Sale, 1963: 1092, Bolender-1a. "Unlisted die state. Star point about touches lower prong of beak. Weakly and unevenly struck, but very near, indeed to Unc. Highly lustrous and some iridescent toning."

Howe Specimen. AU-50. • Howe Collection. • M.H. Bolender Collection, 1952: 163. "Perfect Dies. Sharp stars, well-filled. Only slight signs of circulation, strong impressions, mint lustre."

Holmes Specimen. AU-50. • Stack's, Milton A. Holmes Collection, 1960: 2259. "Nicely centered, sharply struck except in center no doubt due to the buckling of the dies. Brilliant, AU. Full mint lustre."

Green Specimen. AU-50. • Col. E.H.R. Green. • M.H. Bolender. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968): 312, Bolender-1b. AU.

Spies Specimen. AU-50. • Stack's, W. Earl Spies Collection, 1974: 213. "Bolender-1c. AU, lustrous with pale steel toning." • Stack's, March 1983: Lot 937. (Description repeated from preceding.)

Superior Auction '88 Specimen. AU-50. • Superior Galleries, Auction '88, 1988: 213. "AU-50. Superb original toning. The strike is about as sharp as one could hope for. Excellent centering, full denticles plainly visible on both the obverse and reverse. Lovely deep rose gray color with underlying bursts of electric blue on the obverse and rich russet gold on the reverse."

November Specimen. AU-50. • Heritage, November Sale, 1989: 460. "AU (53/53). Deeply and uniformly toned in rich, steel, lavender and golden color. The piece is absolutely original and shows little trace of actual wear."

Chalkley Specimen. AU-50. • Superior Galleries, Chalkley Collection, 1990: 2891. "AU-50. Cleaned with whispers of hairlines in the fields, but plenty of lustre still remaining. Sharp strike."

Willasch Specimen. AU-50. • Superior Galleries, H. Roland Willasch Collection, 1990: 578. Bolender-1a. "AU-50. Bright and lustrous, glowing lustre. Hint of golden toning further offsets devices. Exceptional strike." • Yolanda Gross Collection.

October Sale Specimen. AU-50. • Superior Galleries, October Sale, 1990: 1214. "AU-50. Vibrant lustre dances about the fields, high rim boldly impressed into the planchet, saving devices from wear. Middle die state with a crack through STA of STATES on reverse."

Brilliant and Sieck Specimen. AU-50. • Bowers and Merena, Brilliant and Sieck Collections, 1992: 1634. "AU-50. Sharply struck. Mottled light silver, lilac and gray toning."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 25 to 50 (URS-6)

Approximate population VF-20 to EF-45: 350 to 650 (URS-10)

Approximate population G-4 to F-15: 125 to 200 (URS-9)

Approximate population for all grades combined: 500 to 900 (URS-11)

• **CONDITION CENSUS:** 58-58-55 (multiples)

1801. BB-212.

**(B-2. H-2.)**

• **OBVERSE 1:** See description under 1801 BB-211. Now with die clash marks around date. Often struck lightly at the upper obverse.

Obverse die used to strike 1801 BB-211 (earliest use), BB-212 (intermediate use), and BB-213 (latest use).

• **REVERSE B:** The point of the leftmost arrowhead is under the left edge of the left serif of N in UNITED. The point of upper part of eagle's beak touches down on a point of a star slightly back from extreme star point. Only 12 arrows show plainly (13th faintly shows, but is difficult to find). First A in AMERICA touches third feather, and is connected by die crack to 4th feather. Leaf points more towards left corner of base of I in AMERICA.

The same hub used to produce this reverse was also employed to make Reverse X and Reverse Y for the 1801-2-3-4 novodel series (see Chapter 6). It had 12 arrows, instead of the correct 13. Whenever this hub was used, the 13th arrow was added by hand, always with a light impression from a separate punch.

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

Note: Die progression study reveals that 1801 BB-212 was struck after 1802/1 BB-231 and BB-232, but before 1803 BB-254 and 1803 BB-255; thus it was not struck before 1802.

• **DIE STATES:**

Die State I: Perfect dies without clash marks on obverse or reverse. Scarce.

Die State II: The obverse has clash marks as follows: At top of bust are double clash marks, from two clashes, slightly misaligned between strikes; the impressions (from top of eagle's wing by UNUM on reverse) appear as a double "collar." Incusations from clouds can be seen at the date, and other incusations extend left to star 3. On the reverse, a tiny crack can be seen from the eagle's second feather to the left rim. A very light clash mark (not a die crack) from the drapery can be seen through OF. LIBERTY is often lightly struck, as is the eagle's tail, on this and Die State III (perhaps the clashing caused some misalignment of the die faces).

Die State III: Obverse die lightly relapped, removing one of the "collar" marks (now it is a single "collar"), most of the incusation marks at date and to the left, and reducing the size of a raised die line to the left of the 1 (that has appeared since its first use on 1801 BB-211). Reverse as preceding. This is the die state most often seen.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Very Good: 7, Fine: 16, Very Fine: 37, Extremely Fine: 18, About Uncirculated: 8, Mint State-60 or better: 4. Total: 91. Average grade: VF-26.

• **COLLECTING NOTES:** The population of 1801 BB-212 is about 500 to 900, or about the same as 1801 BB-211. These two varieties are the two most populous of the year. However, of the four business strike varieties of the date, none is a rarity.

Examples are quite rare AU or finer. I know of no Uncirculated specimen coming on the market in recent decades. Perhaps some coins listed in that grade many years ago will resurface to be graded by today's interpretations, and some future edition of this book will list them. The Winsor-Mills coin probably does qualify, and in the Condition Census I arbitrarily assign the grade of MS-63 to it.

• **NOTABLE SPECIMENS:**

Winsor Specimen. MS-63. • Richard Winsor Collection

(1895). • Mills Collection (Chapman brothers, 1904).

Boyd Specimen. AU-58. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945: 110. "A splendid coin, Unc., though with cabinet friction on high spots. Brilliant."

Brooks Specimen. AU-58. • Bowers and Merena Galleries, 1989: 269. "AU-58/MS-60. The obverse field has a pleasing satiny texture. The reverse is prooflike; even the stripes within the eagle's shield exhibit a mirrorlike finish. Both surfaces are attractively toned in appealing pastel hues of gold, blue, and rose."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc., beautifully toned."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 636. "Bolender-2a. Light die break through O in OF, very close indeed to Unc. with only the barest of rubbing in center, sharp stars, lovely bluish golden patina."

Gross Specimen. AU-55. • Paramount International Coin Corporation, 1973. "AU, choice." • Yolanda Gross Collection.

New Netherlands Specimen. AU-50. • New Netherlands Coin Company's 57th Sale, 1963, AU.

Hollinbeck-Kagin Specimen. AU-50. • Hollinbeck-Kagin Sale, August 1970: 1097. "Near Unc., attractive patina."

Newport Specimen. AU-50. • Bowers and Ruddy, Newport Collection, 1975: 388. "Very beautiful AU, with much original mint lustre still in evidence. A tiny ding on the reverse rim above D of UNITED must be mentioned for accuracy."

CSNS Specimen. AU-50. • Kagin's, CSNS Convention Sale, 1980: 946. "Choice AU-50+, lovely gray bluish toning, traces of original lustre. Strong strike, sharp stars, nice overall clear surfaces."

Ebsen Specimen. AU-50. • Superior Galleries, Buddy Ebsen Collection, 1987: 1919. "Die chip right of foot of I in AMERICA. AU-50+. Nice even strike, a bit shallow through the central areas of Liberty, but all the details are easily discernible. Well centered on a perfect planchet. The stars are

fully struck up nice and bold and the reverse is particularly sharp. The surfaces are lustrous and frosty, with an attractive natural mixture of warm sunset tones."

DSCE Sale Specimen. AU-50. • Heritage, DSCE Sale, June 1988: 712. "AU (50/50). Choice steel gray surfaces with ample lustre remaining. Free from mentionable flaws and a fine candidate for a high-grade type set."

Casterline Specimen. AU-50. • Superior Galleries, Fred Casterline Collection, 1989: 3215. "AU-50. Untoned and exceptionally frosty. Some very light wear on the high spots of the obverse and, to a lesser degree. The strike is extremely sharp, just a few small marks strewn about the fields."

Aspen Specimen. AU-50. • Bowers and Merena, Dr. Nelson Page Aspen Collection, 1989: 400. "AU-50. Clean and attractive with ample mint lustre still surviving in the protected areas. Blushes of light golden toning enhance the surfaces."

Spring Quartette Sale Specimen. AU-50. • Bowers and Merena Galleries, Spring Quartette Sale, 1992: 2319. "AU-50. Generous amounts of mint lustre are retained in the recessed areas."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

• CONDITION CENSUS: 63-58-58-55 (multiples)

1801. BB-213.

(B-3. H-3.)

• **OBVERSE 1:** See description under 1801 BB-211.

Obverse die used to strike 1801 BB-211 (earliest use), BB-212 (intermediate use), and BB-213 (latest use).

• **REVERSE C:** Point of star *touches outside* of upper part of eagle's beak. *Right foot of all T's missing*, the result of a broken punch (apparently, this die was made immediately after the die for 1801 BB-214, which has a partially broken lower right serif). A touches 3rd feather only. 13 arrows. AM joined at base, E extremely close (Bolender said it is joined). Leaf touches I in AMERICA slightly right of center of base. Star under cloud 7 double punched (an interesting error, but a rare one; it is a wonder that more stars were not double punched c. 1798-1803).

Note: As 1801 BB-213 was struck after 1801 BB-212 (per obverse die state evidence), and as 1801 BB-212 was struck no earlier than 1802, it follows that 1801 BB-213 was also struck no earlier than 1802.

Reverse die used to strike 1801 BB-213 only.

• **DIE STATES:**

Die State I: Perfect dies without clash marks. May not exist.

Die State II: Obverse die perfect. Reverse with curved clash mark (from outline of bosom on obverse) above and to the right of M in UNUM; light clash mark from obverse drapery is extending from O to cloud 6 (called a die crack by Bolender).

Die State II: Reverse with massive clash marks (called die breaks by Bolender); the entire date 1801, incuse and reversed, is visible under ES O! Clash marks from obverse denticles are at border above STATES OF.

Die State II: With clash marks on reverse as described above.

Die State III: Now with a crack from the rim below the curl to the 1 in the date and another from under the curl near the rim. Die flaws between LIBERTY and the rim and scattered throughout the reverse legend.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 8, Fine: 17, Very Fine: 22, Extremely Fine: 11, About Uncirculated: 7, Mint State-60 or better: 6. Total: 74. Average grade: VF-25.

• **COLLECTING NOTES:** I estimate that about 425 to 800 examples are known of the 1801 BB-213 dollar today. This is just slightly more available than BB-214, and each of these two varieties is less abundant than 1801 BB-211 and BB-212. Again, the issue is scarce in higher grades. Although a number of Mint State coins have crossed the block, these date from before 1986 when the change in grading interpretations took place.

• **NOTABLE SPECIMENS:**

Golding Specimen. MS-60. • Ex Golding Collection, Stack's, 225, June 20, 1952. • Stack's, Harold Bareford Collection, 1981: 420, "Brilliant Unc. with frosty mint bloom. Full breast feathers on the eagle. The slightest touch of rubbing on the high points."

Doolittle Specimen. AU-58. • Bowers and Ruddy, 1977: 2839. "Borderline Unc. with beautiful iridescence in the fields covering what appears to be virtually complete mint lustre. Some friction on the higher points."

Austin Specimen. AU-58. • Bowers and Ruddy Galleries, 1974: 41. "Brilliant Unc., with some rubbing."

Green Specimen. AU-55. • Col. E.H.R. Green. • James G. Macallister. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 646. "Rusted obverse die. Remarkably sharp, very close to Unc. Even impressions; faint rubbing primarily upon the reverse high spots. Two or three rim nicks. Almost entirely lustrous with vivid pink, blue and golden tarnish."

Kreisberg Specimen. AU-55. • Abner Kreisberg mail bid

sale, September 18, 1961: 1063. • A.J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 1009. "AU-55, partly frosty with some blue and green iridescence around the stars and the reverse legend. Rubbed on the high spots and with too much obverse handling and abrasion marks to qualify for MS-60."

Herdman Specimen. AU-55. • Bowers and Ruddy, 1977: 5819. "Borderline Unc. with beautiful iridescence in the fields covering what appears to be virtually complete mint lustre. Only friction on the higher points and a few surface marks. Exceptionally well struck."

Davis Specimen. AU-50. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1323. "Well struck and centered specimen of high quality. Minor edge bruise at sixth star and slight bag defects, but lustrous."

Garrett Specimen. AU-50. • Garrett Collection (Bowers and Ruddy, 1980): 694, AU-50. • Stack's Auction '83: 1793. • Yolanda Gross Collection.

• **CONDITION CENSUS:** 60-58-58-58-55 (multiples)

1801. BB-214.

(B-4. H-4.)

• **OBVERSE 2:** *The distance from 1 in date to curl is a tiny fraction of the distance from star 8 to upper right serif of Y. So-called Close Date, figures evenly spaced. The first 1 is very close to curl, the last 1 in date distant from bust. The 8th star is about as near to Y as last star is from bust, slightly under 1 mm. Star 7 is about 1.5 mm. distant from L, and star 1 is about the same distance from curl. Right serif of I is lower than left serif of B (on BB-211 through BB-214, the serifs are level).*

Obverse die used to strike 1801 BB-214 only.

• **REVERSE D:** The point of the leftmost arrowhead is under the center of the left upright of the N in UNITED. There is a "spur" on the curved part of D. Leaf points under center of I in AMERICA. Point of a star touches the outside of upper part of eagle's

beak slightly above beak's point. This long-lived die was mated with obverses dated 1801, 1802, and 1803. Letters T in UNITED and STATES have lower right serif partially broken. Apparently, this die was made immediately before the die used to coin the reverse of 1801 BB-213, which has the lower right serif completely missing. Die progression evidence indicates that 1801 BB-214 was struck no earlier than 1802.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• **DIE STATES**

Die State I: Perfect obverse and reverse dies without cracks.

Die State II: As above, except a tiny vertical crack begins to develop between arrows and eagle's leg feathers, closer to eagle's leg (this crack advances slightly with use of the die with other obverses). The die state usually seen.

Die State III: Tiny die crack extends diagonally to the left from border to near cloud 6. At least five to 10 times scarcer than the preceding.

• **AUCTION POPULATION SURVEY:** Very Good: 8, Fine: 19, Very Fine: 26, Extremely Fine: 9, About Uncirculated: 6, Mint State-60 or better: 4. Total: 72. Average grade: VF-24.

• **COLLECTING NOTES:** About 400 to 750 specimens are known of 1801 BB-214, slightly edging BB-213 for the title of scarcest issue of the year. However, in an absolute sense, enough exist that every numismatist who wants one can have one.

Most specimens exist in lower grade levels. However, the Carter is notable, quite possibly the finest known, at MS-60.

• **NOTABLE SPECIMENS:**

Carter Specimen. MS-60. • Stack's, Amon Carter, Jr. Collection, 1984: 232. "Gem Brilliant Unc., wholly prooflike. Prooflike surface. There is a circular area in the center of the obverse which is frosty. Russet and iridescent toning." • Superior Galleries, Buddy Ebsen Collection, 1987: 1921. "MS-60. Well struck, full center detail. Some stars below clouds are a bit softly struck. Semiprooflike surfaces on both sides. Some light drift marks appear faintly across the obverse. Beautiful natural toning consisting of medium violet and electric blue with some areas of untuned chrome-like lustre peeking through."

Hollinbeck-Kagin Specimen. AU-58. • Hollinbeck-Kagin Sale, June 1970: 637. "Close date, brilliant slightly golden Unc., sharp strike!"

Shore Specimen. AU-58. • Superior, A. Bernard Shore Collection, 1988: 2226, Close Date. Bolender-4a. "Spur on D of UNITED. Faint reverse crack from the denticle to the right of the second S in STATES. AU-58. Somewhat weakly struck, lustrous, toned in original rich gray and lavender hues."

Davis Specimen. AU-50. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1324. AU, showing only slight rub-

bing on bust and light scratches in hair.

Dupont Specimen. AU-50. • Stack's, Anderson Dupont Collection, 1954: 2506. "AU, almost full mint surface, but minor friction on head, and nick above shield."

NASC Convention Sale Specimen. AU-50. • Kagin's, 1979: 539. "AU-50, with some portions AU-55, sharply struck with lovely blue, golden gray lustre. R-5."

First National Bank of Denver Specimen. AU-50. • Bowers and Merena Galleries, 1987: 427. "AU-50. Highly reflective surfaces toned in shades of medium gray, iridescent green, and pale orange. A few trivial rim bumps on obverse are noted."

Bebbee Specimen. AU-50. • Bowers and Merena Galleries, Aubrey and Adeline Bebee Collection, 1987: 414, AU-50. "Mostly brilliant surfaces, with some light toning. A generous amount of original mint lustre still survives in the fields and other areas., particularly among the devices and other protected spots. Nicely centered."

Four Landmark Collections Specimen. AU-50. • Bowers and Merena, 1989: 1980, AU-50. "Brilliant and untuned. There is pleasing mint lustre that can be seen on both sides, creating partial cartwheel effects."

Coinage Context

Mintage figures: Only 41,650 silver dollars were reported as having been coined in calendar year 1802. However, the proportionately large number of extant specimens indicates that many more than that must have been coined bearing the 1802 date, in 1803 and/or 1804.

Numismatic Information

Commentary: Overdates exist in narrow date and wide date form. The close date varieties are BB-231, 232, and 235, while the wide dates are BB-233 and 234. While wide-date and close-date terminology has been popular, these adjectives are quite arbitrary and, on their own, do little to help with identification. However, on BB-231, 232, and 235, the 0 and 2 in the date are closer together than on BB-233 and 234. None of the five 1801 undertype dies used for the overdates was ever employed for 1801-dated coinage; this can be easily ascertained by observing

the position of star 13 on both 1801 dies (farther from bust) and the five 1802/1 dies (closer to bust).

While there are no legendary rarities among 1802 dollars, BB-235 is considered to be quite elusive. Only a small fraction of 1802 dollars in existence have been attributed. Thus, the possibility exists not only for finding scarce issues such as BB-235 for “type” prices, but to discover a new die variety.

1802/1 dollar die varieties are fairly difficult to attribute. As most buyers seek only the overdate, not a specific Bolender variety, relatively few coins have been attributed, as noted. Because of this, I believe that the number of known specimens of the various die varieties will increase, should collecting by varieties become more popular than it is now.

In terms of availability, 1802 BB-241 overwhelms every other die variety and is many times more plentiful. As of October 1992, NGC and PCGS have designated one 1802/1 dollar as Mint State and 10 specimens of the 1802 regular date. Presumably, most of the 10 are of the BB-241 variety.

Overdates: The year 1802 is distinguished by the presence of five different varieties of 1802/1 overdates from as many obverse dies. Just why five 1801 dies were overdated with a final 2 digit is not clear, inasmuch as at least three regular 1801 varieties (1801 BB-212, 213, and 214) were struck later than 1801, quite possibly in 1802. Perhaps, the answer is that the five known dies that were overdated had not been hardened yet in the die-making process. Thus, another digit could be stamped over the final 1 without any problem. Possibly, the other 1801 dies that were not overdated (1801 BB-212, 213, and 214) were already hardened, and were not suitable for alteration.

Striking order. Attention was not paid to striking coins in the years the dies bore. I consider it highly probable that many 1802-dated dollars were struck in 1803. The production of 1801, 1802, and 1803 dollars seems to have been done with the obverse

dies mixed, as evident by the primary use of just two reverse dies with a much larger number of obverses.

Bearing the 1802 date and sharing one common reverse are 1802/1 BB-231, 1802/1 BB-232, and 1802 BB-241. Apparently, BB-231 and 232 were struck before 241.

Bearing the 1802 date and sharing another common reverse are 1802/1 BB-233, 1802/1 BB-234, 1802/1 BB-235, and 1802 BB-242. Die progression studies show that 1802/1 BB-233 represents the first use of this die, which was also used to coin 1801 BB-214 and 1803 BB-251 and 252, in addition to the other 1802 dollars mentioned.

If one assumes that strikings from the same reverse die occurred at the same time, this would give two "striking periods." Which one occurred first is not known. I have not had the opportunity to make detailed die studies of actual specimens of BB-235

and BB-242. If this is done at a future date, additional conclusions may be drawn. It is known that the reverse die was relapped after 1802/1 BB-233 was struck. This would have necessitated removing the reverse die from the press. Because of this, another "striking period" could have occurred after BB-233 was produced.

FIRST STRIKING PERIOD:

1802/1 BB-231
1802/1 BB-232
1802 BB-241

SECOND STRIKING PERIOD:

1802/1 BB-233
1802/1 BB-234
1802/1 BB-235
1802 BB-242

1802/1 and 1802: Summary of Characteristics

(Years Combined)

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Weight and composition: 416 grains; .8924 silver, balance copper

Melting value (silver bullion value) in year minted: \$1.03+

Dies prepared: Unknown

Business strike mintage, calendar year: 41,650 (all varieties of 1802 combined; may include some struck from dies dated earlier; figures do not include pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: January 26: 731 (+1); March 8: 9,110 (+3); June 22: 8,710 (+2); August 27: 957 (+2); November 8: 10,220 (+1); December 8: 3,240 (+1); December 29: 8,682 (+1).

Estimated business strike mintage of 1802-dated dollars (author's estimate): 80,000 (rounded).

Estimated quantity melted: Unknown

1802/1 OVERDATE

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 2 to 4 (URS-2)

Approximate population MS-60 to 62: 4 to 8 (URS-3)

Approximate population AU-50 to 58: 13 to 26 (URS-5)

Approximate population VF-20 to EF-45: 700 to 1,200 (URS-11)

Approximate population G-4 to F-15: 350 to 650 (URS-10)

Approximate population for all grades combined: 1,100 to 1,900 (URS-12)

• **CONDITION CENSUS:** 63-63-60 (multiples)

• **AVERAGE AUCTION APPEARANCE** (for all varieties combined): VF-24

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

1802

Approximate population MS-65 or better: 0 or 1 (URS-1)

Approximate population MS-64: 0 or 1 (URS-1)

Approximate population MS-63: 8 to 15 (URS-5)

Approximate population MS-60 to 62: 10 to 20 (URS-5)

Approximate population AU-50 to 58: 100 to 200 (URS-8)

Approximate population VF-20 to EF-45: 1,150 to 2,100 (URS-12)

Approximate population G-4 to F-15: 325 to 525 (URS-10)

Approximate population for all grades combined: 1,600 to 2,800 (URS-12)

• **CONDITION CENSUS:** 63 (multiples)

• **AVERAGE AUCTION APPEARANCE** (for both varieties): VF-31

Characteristics of striking: Depends upon the variety. If weakly struck, this is often observed at the center of the obverse and among the stars above the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

Proof novodels were made decades later (see Chapters 5 and 6)

Commentary

The year 1802 is remarkable for having five different overdated obverse dies.

Additional Information

The Year 1802 in History

In April 1802, the United States learned that Napoleon Bonaparte of France had secured the return of the Louisiana Territory via a secret treaty with Spain. President Jefferson sought to buy land on the lower Mississippi River to use as a port, but the U.S. minister to France, Robert R. Livingston, was unsuccessful. In October 1802, the remaining Spanish officials in New Orleans refused to let American ships use the port. The prospect of continuing difficulties prompted Jefferson in 1803 to negotiate the purchase of the Territory from France. The Enabling Act, signed by Jefferson on April 30, 1802, provided that a territory established under the Ordinance of 1787 could become a state, once certain procedures were followed.

The U.S. Military Academy was established at West Point and opened on July 4. The Library of Congress issued what is believed to be the first catalogue of books printed in America. The first version of *The New Practical American Navigator* to be published by Nathaniel Bowditch, a revision of an earlier work by J. Hamilton Moore, was distributed and would go on to many editions. One hundred merino sheep were brought

to the United States and set the foundation for a textile industry using high-quality wool. E.I. Du Pont du Nemours and Company, manufacturer of gunpowder, was founded on the Brandywine River near Wilmington, Delaware. In Saratoga Springs, New York, the first lavish “grand hotel,” the Union Hotel, was built by Gideon Putnam, and set the pace for the town becoming an important social center and spa during the nineteenth century. The Abel Porter & Co. brass mill began operations in Waterbury, Connecticut, a city that would become famous for its metalworking industries, including the later Scovill Works (important manufacturer of Hard Times and other tokens in the 1830s and 1840s).

British Parliament revoked the income tax initiated in 1799. Mme. Tussaud’s first wax museum was opened in London; the concept would become popular, and the Tussaud name would be associated with wax museums for the ensuing two centuries. Thomas Wedgwood of England, son of famed ceramics manufacturer Josiah Wedgwood, took the world’s first photographs, using paper sensitized with silver nitrate, but was unable to permanently fix the image.

1802/1 and 1802 Heraldic Eagle

Varieties

1802/1 Overdate. BB-231

(B-1. H-1.)

• **OBVERSE 1:** Close date, 02 closer than other figures. The 8 centered between 1 and 0 but too low. "Pocket" at throat and "collar" at neck-line, at base on most (but not all), a product of die clashing. The 1 is very close to lowest curl, but does not quite touch. A "dot" is before upper lip, under nose (visible only on high-grade coins). On the left, star pairs 1-2 and 2-3 are closer together than are star pairs 5-6 and 6-7.

Obverse die used to strike 1802/1 BB-231 only.

• **REVERSE A:** Same die used to coin 1801 BB-212, described earlier, but herewith repeated: The point of the leftmost arrowhead is under the left edge of the left serif of N in UNITED. The point of upper part of eagle's beak touches down on a point of a star slightly back from extreme star point. Only 12 arrows show plainly (13th faintly shows, but is difficult to find). First A in AMERICA touches third feather, and is connected by die crack to 4th feather. Leaf points more towards left corner of base of I in AMERICA.

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state);

1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• **DIE STATES:**

Die State I: Perfect dies. May not exist.

Die State II: Obverse with clash marks as described above under BB-231. The state usually seen.

• **AUCTION POPULATION SURVEY:** Good: 3, Very Good: 6, Fine: 11, Very Fine: 7, Extremely Fine: 7, About Uncirculated: 5. Total: 39. Average grade: VF-22.

• **COLLECTING NOTES:** The 1802/1 BB-231 is very rare in all grades. Only about 100 to 175 are estimated to survive. It and BB-233 are of about equal availability. Specimens exist mainly in the lower grades, although a few AU pieces have appeared in the literature. For this variety, EF would be a notable condition. Apparently, Mint State examples are unknown.

Curiously, in 1881 Haseltine did not mention this variety or any other 1802/1 as being an overdate; this was by implication in that he called non-overdated varieties "perfect" dates.¹ H-1 (equivalent to BB-231) was called very scarce.

• **NOTABLE SPECIMENS:**

¹ The term *perfect date* is currently used by the *Guide Book of U.S. Coins* and certain other references to denote a date on a coin which is not overdated, notably repunched, or with some other distinctive feature.

Beebe's. AU-50. • Numismatist advertisement, 1953. AU.

Superior Specimen. AU-50. • Superior Galleries Sale, September 1970: 1463. "Toned AU."

CSNS Specimen. AU-50. • Kagin's, CSNS Convention Sale, 1979: 370. "Choice AU-50+, nice strike with full stars, lovely golden bluish lustre. R-4."

Stirling Specimen. EF-45. • B. Max Mehl, January 1954, "Proof surface Uncirculated." • Frank M. Stirling Collection, Heritage, February 1986: 1341. "EF-45. Colorful splashes of iridescence accentuate lustrous steel gray surfaces."

Blevins Specimen. EF-45. • Superior, H. W. Blevins Collection, 1988: 4771. "Very early die state with the lower loop of the 8 sharply recut. Almost AU-50. Softly struck on upper part of obverse device but extremely well impressed on reverse. Planchet is quite large with full milling visible. A considerable amount of original mint lustre is visible below delightful golden gray and iridescent color."

Hollinbeck Specimen. EF-40 net (AU-55, badly cleaned). • Hollinbeck Coin Co., August 1954 mail bid sale. • K.P. Austin. • A.J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 1015. "AU-55 sharpness with a prooflike surface obverse, but cleaned neither too wisely nor too well. Some original lustre still evident, mostly about the devices on the reverse, along with a little iridescent toning. While the obverse has handling marks, and one medium-sized rim bruise at 3:00, the reverse is virtually free from defects."

Davenport Specimen. EF-40. • Superior Galleries, Davenport Collection, 1977: 483. "EF-45 with the surfaces somewhat prooflike. Cleaned a few years ago and now retoning."

Bolender Specimen. EF-40. • M.H. Bolender Collection, 1952. EF.

Herdegen Specimen. EF-40. • Herdegen Collection (Hans M.F. Schulman, 1973), EF.

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 2 to 4 (URS-2)

Approximate population VF-20 to EF-45: 40 to 70 (URS-7)

Approximate population G-4 to F-15: 55 to 100 (URS-7)

Approximate population for all grades combined: 100 to 175 (URS-8)

• **CONDITION CENSUS:** 50-50-45 (multiples)

1802/1 Overdate. BB-232.

(B-4. H-4.)

• **OBVERSE 2:** Close date, the 1 firmly touching curl. The 8 is tipped slightly to right. Star 13 almost touches bust near junction of drapery with bosom. Star 1 near hair, star 8 near Y, and star 7 distant from L. Base of B in LIBERTY is below base of E. On the left, star pairs 3-4 and 6-7 are farther apart than are any others. On the right, stars 8-9 are closer

together (but only by a small margin) than are any others.

Obverse die used to strike 1802/1 BB-232 only.

• **REVERSE A:** Described under 1801 BB-212 (repeated under 1802/1 BB-231).

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803

BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• **DIE STATES:**

Die State I: With perfect obverse die. Reverse die in early state. Scarcer than the following.

Die State II: Obverse now with a crack through the right side of the bust to near star 13. Reverse die in early state. The die state usually seen.

Die State III: Obverse with crack extending to the left to drapery. Second crack, short in length, approximately parallel and slightly below the first, develops at bosom. Reverse now with a tiny crack connecting the base of the first A in AMERICA to the third feather. Rare.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 5, Fine: 13, Very Fine: 31, Extremely Fine: 14, About Uncirculated: 5, Mint State-60 or better: 5. Total: 74. Average grade: VF-26.

• **COLLECTING NOTES:** It is believed that about 400 to 750 specimens of 1802/1 BB-232 dollars exist, about the same number as estimated for BB-234. Most examples are in lower grades, although a few AU and Mint State coins have been reported.

• **NOTABLE SPECIMENS:**

Generales Specimen. MS-63. • Stack's, Generales Collection, 1984: 1254. "Choice Brilliant Unc., Wholly prooflike, has the appearance of a restrike! Some faint planchet adjustment marks."

1949 ANA Sale Specimen. MS-60. • 1949 ANA, 207, (incorrectly attributed as H-1), Numismatic Gallery, August 1949. • Stack's, Harold Bareford Collection, 1981: 421. "Brilliant Unc., even steel, russet, and iridescent toning. Sharply struck even though the obverse is starting to 'mound.'"

Davis Specimen. MS-60. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1326. "Lustrous and nicely toned, but struck weakly on left side. Unlisted die breaks on obverse make this coin so much the rarer. Left side of 8 recut. Reverse

has prooflike surface. Not quite in the 'gem' class. Unc."

Smith Specimen. MS-60. • Elliot Smith Collection, sold by J.G. Morgenthau & Co. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 647. "Strictly Unc. Evenly centered, narrow thin border on obverse. Sharp, uniform impressions, boldly struck throughout. Faint indications of mint adjustment marks towards the upper left obverse border. Splendid blue and pinkish gold iridescence."

Carter Specimen. AU-58 (PCGS). • Stack's, Amon Carter, Jr. Collection, 1984: 233. "Brilliant Unc., full blazing lustre with splendid satiny surfaces. Exquisite golden russet toning." • Heritage, Dillard Sale, 1990: 970. "AU-58. Overdate not distinguished on PCGS holder. Satiny lustre, handsomely framed in golden-russet toning, with traces of iridescent blue along rims." Recently re-graded MS-61 (PCGS).

Lee and Shaffer Specimen. AU-58. • Superior Galleries, Lee and Shaffer Collections, 1988: 972. "AU (58/58). R-5. Lustrous, attractive light golden toning on both sides. Extremely well struck and defect-free."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 5 to 10 (URS-4)

Approximate population VF-20 to EF-45: 275 to 500 (URS-10)

Approximate population G-4 to F-15: 125 to 225 (URS-9)

Approximate population for all grades combined: 400 to 750 (URS-10)

• **CONDITION CENSUS:** 63-60-60-60-58 (multiples)

1802/1 Overdate. BB-233.

(B-2. H-2.)

• **OBVERSE 3:** Wide date, the *most space* between 1 and 8. The 1 farther from curl than last. Last star close to bust. Uppermost wave centered under E. On the left, star pairs 2-3 and 5-6 are closer together than are any other stars. On the right, stars 10-11 are farther apart than any others, and stars 11-12 are the closest together.

Obverse die used to strike 1802/1 BB-233 only.

• **REVERSE B:** Description under 1801 BB-214, herewith repeated: The point of the leftmost arrowhead is under the center of the left upright of the N in UNITED. There is a "spur" on the curved part of D. Leaf points under center of I in AMERICA. Point of a star touches the outside of upper part of eagle's beak slightly above beak's point. Called Reverse B by Bolender, this die was mated with obverses dated 1801, 1802, and 1803.

Die crack sequences reveal that 1802/1 BB-233 represents the first use of this reverse die; 1801-dated coins were struck later.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• DIE STATES:

Die State I: Perfect dies.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 1, Fine: 10, Very Fine: 14, Extremely Fine: 10, About Uncirculated: 1. Total: 37. Average grade: VF-23.

• **COLLECTING NOTES:** Only about 100 to 175

are known of 1802/1 BB-233. Specimens appear on the market with about the same frequency as BB-231, which isn't very often. As is the case with the preceding, specimens of BB-233 are nearly always found in lower grades. AU specimens are great rarities, and it may be the case that no Mint State coins survive.

• NOTABLE SPECIMENS:

1988 ANA Specimen. AU-50. • Heritage, ANA Convention Sale, 1988: 968. "AU (50/50). Well struck, silvery gray example. Very clean, save for a few minor marks on Liberty's cheek and hair."

Long Beach Specimen. EF-45. • Heritage, Long Beach Exposition Sale, 1988: 971. "EF (45/45). Untoned and very clean, save for a few minor marks on Liberty's profile."

Earle Specimen. EF-45. • George H. Earle Collection (Henry Chapman, 1912). • Schuyler Collection. • M.H. Bolender Collection, 1952: 170. "EF, nearly Unc., considerable lustre, sharp impressions."

New York Specimen. EF-40. • Stack's, Metropolitan New York Convention Sale, 1967: 1179. "EF, Well centered, mint lustre."

Herdegen Specimen. EF-40. • Hans M. F. Schulman, R.T. Herdegen Collection, 1973. "EF with some lustre and nice gray toning."

Leavitt Specimen. EF-40. • Leavitt & Co., auctioneers, 1879. • Bowers and Ruddy, Garrett Collection, 1980: 695. "EF-40. Light gray toning overall with some darker areas among the stars and letters. A few marks on the reverse are hidden among the clouds."

Ostheimer Specimen. EF-40 net (EF-45, cleaned). • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968): 313. "EF-AU, brilliant, doubtless cleaned long ago, lightly bag marked."

Hollinbeck-Kagin Specimen. VF-35. • Hollinbeck-Kagin Sale, June 1970: 638. "Bust is VF; LIBERTY, date and stars EF, reverse EF."

Boyd Specimen. VF-35. • Numismatic Gallery, World's

Greatest Collection, F.C.C. Boyd, 1945: 114. "A splendid, lustrous specimen, almost EF."

Holmes Specimen. VF-35. • Stack's, Milton A. Holmes Collection, 1960: 2261. "Just a shade from EF. Somewhat toned, nicely centered."

New Netherlands Specimen. VF-30. • New Netherlands 44th Sale, 1954: 595. "Almost EF, though not bold at the forelock. Lustrous, the surface rather prooflike. With numerous faint, hardly visible obverse scratches on Liberty's throat, together with a few minor edge defects."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 1 or 2 (URS-1)

Approximate population VF-20 to EF-45: 65 to 130 (URS-8)

Approximate population G-4 to F-15: 35 to 55 (URS-7)

Approximate population for all grades combined: 100 to 175 (URS-8)

• **CONDITION CENSUS:** 50-45 (multiples)

1802/1 Overdate. BB-234.

(B-3. H-3.)

• **OBVERSE 4:** Wide overdate, with *most space* between 8 and 0. Small die crack is usually seen in the field between stars 8 and 9 and Liberty's forehead. On the left, star pairs 1-2 and 6-7 are more widely spaced than any others. On the right, stars 8 and 9 are more widely spaced than are any others.

Obverse die used to strike 1802/1 BB-234 only.

• **REVERSE B:** See description under 1801 BB-214; repeated under 1802/1 BB-233.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• **DIE STATES:**

Die State I: Perfect obverse and reverse dies. May not exist.

Die State II: Obverse die with small raised crack in field opposite space between stars 8 and 9 about 40% of the dis-

tance to the forehead. Reverse die relapped. Most of cloud 6 is now missing. Some arrowheads disconnected. Scarcer than the following.

Die State III: Obverse with very light clash marks (from reverse clouds) visible above and slightly to the left of the date. Obverse crack opposite stars 8 and 9 now slightly enlarged and in the shape of an oblong pellet. Reverse die relapped. Most of cloud 6 is now missing. Some arrowheads disconnected. The usual die state seen.

• **AUCTION POPULATION SURVEY:** Good: 5, Very Good: 6, Fine: 12, Very Fine: 25, Extremely Fine: 14, About Uncirculated: 5, Mint State-60 or better: 4. Total: 71. Average grade: VF-25.

• **COLLECTING NOTES:** An estimated 400 to 750 specimens exist of the BB-234 overdate, about as many as survive of BB-232. Although several Mint State pieces are known, most are in significantly lower grades, with VF being average.

• **NOTABLE SPECIMENS:**

Freeman Specimen. MS-60. • Harley L. Freeman Collection, C.S.N.S. Sale, 1977. • Goshen Collection, Stack's, 1978:

310. • **Stack's, Ellis H. Robison Collection, 1982: 1881.** "Brilliant Unc. Full mint bloom, traces of prooflike surface. Attractively toned about but periphery, somewhat deeper in color on left side. Sharply struck, with stars on left showing full radial lines. The reverse is unusually bold."

Ebsen Specimen. MS-60. • Superior Galleries, Buddy Ebsen Collection, 1987: 1922. "MS-60+. Full blazing prooflike surfaces on the obverse, subdued frosty mint lustre on reverse. Quite bold with all engraved features of Liberty's hair clearly defined. Well centered, with full denticle detail and struck on a perfect problem-free planchet. A minute rim bruise next to last star. Toned with superb array of antique hues that include shades of blue, russet gray and green."

Gross Specimen. AU-55. • Steve Ivy, November 1982. Coin has die lump in field at 2 o'clock. • Yolanda Gross Collection.

Davis Specimen. AU-50. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1325. "Die lump below eighth star; 8 and 0 in date widely spaced. Sharp, lustrous strike, well centered, cabinet friction on high spots. A shade from Unc." • Ambassador and Mrs. R. Henry Norweb. Norweb Sale, Bowers and Merena, 1988. A 1992 note from Douglas Winter stated this: "Some specialists consider the Norweb Collection coin, earlier from the Davis-Graves Collection sale, to be the finest known, and now higher than MS-65 in grade." (Aren't some grading interpretations at once wondrous and perplexing?)

NASC Convention Sale Specimen. AU-55. • Kagin's, 1979: 540. "Bifurcated letters (particularly obverse), die break

from cloud below last S in STATES to top of O in OF, borderline Unc.-55. Slight friction on hair. Needle-sharp stars at left, lovely prooflike blue-golden gray-pink lustre, deep sharp edge dentilations."

Long Beach Specimen. AU-50. • Heritage, Long Beach Exposition Sale, 1989: 805, almost Unc. (53/53). "Lustrous, sharply struck, pale steel gray in color with delicate golden and lilac overtones."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 1 or 2 (URS-1)

Approximate population MS-60 to 62: 2 to 4 (URS-2)

Approximate population AU-50 to 58: 5 to 10 (URS-4)

Approximate population VF-20 to EF-45: 250 to 475 (URS-10)

Approximate population G-4 to F-15: 150 to 275 (URS-9)

Approximate population for all grades combined: 400 to 750 (URS-10)

• **CONDITION CENSUS: 63-60-60-58-55 (multiples)**

1802/1 Overdate. BB-235.

(B-9.)

• **OBVERSE 5:** The figures of date are small and well spaced, the 8 centered between 1 and O and not too low as in No. 1, nor tipped to right, as in No. 4. Look at the overdate 2 over 1, and observe that the left top of 1 under 2 is in line with left top and base of 2. A flaw in the die shows midway between base of B in LIBERTY and end of curl on head just be-

neath. Liberty has closed lips, while the mouth is open on all other overdates.

Obverse die used to strike 1802/1 BB-235 only.

• **REVERSE B:** See description under 1801 BB-214; repeated under 1802/1 BB-233.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly

missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• **DIE STATES:**

Die State I: Obverse die without cracks. Reverse die relapped. Tiny crack between arrows and eagle's leg (as seen on all uses of this die). Usual state seen.

Die State II: Obverse with die cracks 5:00 rim to the drapery, and the border opposite star 13 through the center of the star 12 into the field past the inner point of star 11. The first published was the New Netherlands 51st Sale coin, VF/Fine. Rare. Reverse as preceding.

Die State III: As above, but with additional obverse crack from border through 02 of date into field above 8. Rarer than preceding.

• **AUCTION POPULATION SURVEY:** Fine: 1, Very Fine: 16, Extremely Fine: 1. Total: 18. Average grade: VF-20.

• **COLLECTING NOTES:** The 1802/1 BB-235 is the rarest overdate of the year as well as the rarest of all 1802 varieties. Only about 50 to 90 are estimated to be known. I have found no Mint State specimen, nor has an AU been reliably reported.

Unknown to Haseltine in 1881, and to other early scholars, this obverse and die combination was discovered by M.H. Bolender in the Marmaduke Fox Collection in 1950 after the plates to his book went to press, but before the text was printed. Once the variety was announced, specimens started "coming out of the woodwork," as the listing below indicates.

• **NOTABLE SPECIMENS:**

Baldenhofer Specimen. EF-45. • W.G. Baldenhofer. • A.J. Ostheimer, 3rd. • Superior, Gilhousen Collection, 1973: 1279, 2 over 1. "Bolender-9b, with diagnostic die chip between curl point and B, and the crack from rim to drapery, and the second crack through 11th and 12th stars to rim; said to be one of only two known in this final die state. Better than EF, richly toned."

Gross Specimen. EF-40, edge bruise. • Rarcoa, 1976. Surfaces not "richly toned" (thus eliminating duplication with the Baldenhofer coin). Sold to the following. • Yolanda Gross Collection.

Autumn Sale Specimen. VF-35. • Stack's, 1978: 300. "Evenly spaced date. A strong VF, nearly EF."

Newport Specimen. VF-30. • Bowers and Ruddy, Newport Collection, 1975: 389. "VF or better, the only flaw being a minor planchet striation near 6th star and a small edge ding on reverse."

Willasch Specimen. VF-25. • Superior Galleries, H. Roland Willasch Collection, 1990: 596. "VF-25. Mottled gold and sea green toning throughout and boldly struck. Very early die state before the obverse cracked below bust. A few minor edge marks, which show that this coin is not from any of the major collections sold in the past couple of decades. No trace of heavy crack below bust."

Fox Specimen. VF-20. • Marmaduke Fox Collection, 1950. • M.H. Bolender Collection, 1952: 176. "A new variety which I discovered in 1950 when I purchased the Marmaduke Fox Collection of United States coins. Unknown to Haseltine, and to me also until 1950. Strictly Fine." • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 320. "VF, light toning. Third finest. The discovery coin, identified by Bolender in the Marmaduke Fox Collection (1950)."

Bauer Specimen. VF-20. • M.H. Bolender. • Lester Merkin, Bauer Collection, 1968: 422. "Bolender-9b. Straight cracks from rim into bust and from rim through 12th to 11th star. VF, deep toning, excellent surfaces, a couple of trivial rim nicks. Pedigree: Ex Bolender."

Spies Specimen. VF-20. • Stack's, W. Earl Spies Collection, 1974: 226. "A new obverse with an evenly spaced die. With the die lump between the B and curl. Strictly VF." • Stack's, March Sale, 1985: 1234. VF.

Spies Specimen (another). VF-20. • Stack's, W. Earl Spies Collection, 1974: 227. "Bolender-9a. Die cracks: From milling through the 02 into the field above the 8. Another into the bust and a third through 12th star into field. VF, small obverse edge ding."

Stack's December Sale Specimen. VF-20, net. (VF-35, polished). • Stack's, December Sale, 1985: 1155, Bolender-9b. "VF, close to EF. Multi-colored iridescent toning with light devices. Die breaks on obverse from rim to middle of bust tip; branching from that through star 13 through star 12 and touching left point of star 11 as it curves into field, and another from rim left of date, through base of 2, upper part of 0, and into lowest curl near shoulder. Lightly polished, later die state than the Spies coin."

Blevins Specimen. VF-20. • Superior, H. W. Blevins Collection, 1988: 3800. "VF-20. Mottled violet and gray coloring with some lighter areas on relief details."

New Netherlands 54th Sale. Specimen. VF-20. • New Netherlands 54th Sale, 1960: 1014, Bolender-9a. Chip in field between B and point of curl; die crack from bust to border. VF, obverse a hair's breadth off, reverse better. Tiny obverse nick on the neck." • Quality Sales auction, September 10-12, 1973: 480. • Pine Tree, GENA Convention Sale, 1974: 1052. "Unlisted die breaks, from border opposite 13th star, through center of 12th, and into field past inner point of 11th star; not so known to Bolender. VF, rather boldly struck up, with pleasing warm gray surfaces; unusually clean and choice for the grade, save for a pin-point nick on nape of neck." • Pine Tree, Breen III Sale, 1978: 603. (Previous description repeated.)

New Netherlands 51st Sale Specimen. F-15. • New Netherlands 51st Sale, 1958: 700. "Close overdate; chip between curl point and B. Unpublished die break from border to bust above drapery. Obverse close to VF; reverse just Fine. A couple of minor reverse rim bruises."

ANA Centennial Sale Specimen. VF-20. • Bowers and Merena Galleries, ANA Centennial Convention Sale, 1991: 1423, Overdate. "VF-20. Central areas are brilliant changing to intermingled golden brown and sea green shades at the borders. Traces of frosty mint lustre seen around stars, numerals, and letters. Obverse edge cut is noted at 1:00.

Lee and Shaffer Collections Specimen. F-15 net (VF-20, cleaned). • Superior Galleries, Lee and Shaffer Collections, 1988: 3168. "Sharpness of VF-20 but lightly cleaned at one

time. Surfaces are now mostly recovered and show a lilac-gray color with some lighter areas noted on the relief details. Strike is exceptionally sharp with centers showing unusually good detail."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 (URS-0)

Approximate population VF-20 to EF-45: 45 to 80 (URS-7)

Approximate population G-4 to F-15: 5 to 10 (URS-4)

Approximate population for all grades combined: 50 to 90 (URS-7)

• **CONDITION CENSUS:** 45-35-35-30 (multiples)

1802. BB-241.

(B-6. H-6.)

• **OBVERSE 6:** Close perfect date. *Wide space between 8 and 0.* The figure 2 is distant from bust. Right foot of T in LIBERTY missing. This die must have been made about the same time as the reverse for 1801 BB-213, which also displays broken T letters from the same punch.

Obverse die used to strike 1802 BB-241 only.

• **REVERSE A:** See description under 1801 BB-212 (repeated under 1802/1 BB-231). Third cloud from left has a protruding spur; die flaws below E and around D in UNITED.

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse as described above. Scarce.

Die State II: Obverse die with slight crack just beginning to develop from innermost point of star 7, headed toward junction of hair and highest ribbon. Scarce.

Die State III: Obverse die lightly relapped to remove the

slight crack noted under II, making bottom arm of E somewhat light, removing the outline of the neck truncation and field at the left of the truncation, and introducing flat spaces in the lower left hair curls (one of which becomes a tiny "island"). By far the commonest die state.

• **AUCTION POPULATION SURVEY:** Less than Good: 1, Good: 4, Very Good: 11, Fine: 41, Very Fine: 100, Extremely Fine: 56, About Uncirculated: 31, Mint State-60 or better: 41. Total: 285. Average grade: VF-31.

• **COLLECTING NOTES:** With an estimated population of 1,500 to 2,750 specimens, 1802 BB-241 is more plentiful than all other varieties of 1802 combined! Indeed, it is the most common variety of the 1798-1803 Draped Bust style. In terms of all dates of early dollars, only 1795 Flowing Hair BB-21 and BB-27 are of about equal availability. Mint State specimens exist in multiples, a highly unusual situation for an early dollar. The spectacular list of "notable specimens," below, must surely contain duplications.

• **NOTABLE SPECIMENS:**

Clarke Specimen. MS-63. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 649. "Brilliant Unc. 'gem.' Few

infinitesimal signs of 'bag handling.' Pedigree: From Europe."

Merkin Specimen. MS-63. • Lester Merkin, September, 1970: 540. "Lightly toned, frosty, choice Unc. Needle-sharp strike."

Terrell Specimen. MS-63. • Bowers and Ruddy Galleries, 1973: 72. "Sharply struck choice Unc., with a lovely light patination as acquired over a period of years. Exquisitely detailed surfaces and attractive overall appearance."

Washington Specimen. MS-63. • Pine Tree, Suburban Washington Convention Sale, 1975: 252. "Brilliant Unc., frosty, sharply struck, light bagmarks mostly on obverse; overall, splendid and beautiful. Sharper strike than Herstal: 559 or other offered in recent years."

C.S.N.A. Specimen. MS-63. • California State Numismatic Association Sale, May 1974. • Pine Tree, Suburban Washington Convention Sale, 1975: 253. "Rich, warmly toned Unc., well struck, there are fewer bagmarks [than on the previous lot, another specimen]." (This may be the same as the Terrell Collection coin.)

Fairfield Specimen. MS-63. • Bowers and Ruddy Galleries, Fairfield Collection, 1977: 1038. "Choice Unc., with gray toning, light gray overtones. Well struck, well centered, and sharp in all details."

More Specimen. MS-63. • Bowers and Ruddy Galleries, 1978: 726. "MS-63, Brilliant Unc. Pale silvery gray toning (the lightest kind), evenly distributed over the superbly clear surfaces. Fully struck on a superior planchet. Centered dies on the planchet. Lustre is not as bright as it might be in a few places, and there are some minute marks on Liberty's neck and cheek, but this is offset by a total lack of adjustment marks."

Adams Specimen. MS-63. • Edgar H. Adams. • Col. E.H.R. Green. • F.C.C. Boyd. • Auction '80: 1327. "Gem Brilliant Unc., uniformly well struck, obverse and reverse. Full blazing lustre under slightly mottled purple, gold and steel toning. The reverse with some sea green iridescence as well."

Auction '87 Specimen. MS-63. • Superior, 1987: 1599. "MS-63. Sharp strike, hair and feathers bold, denticles on either side are raised and full. The obverse is lustrous and somewhat prooflike with superb lilac and bluish toning; reverse is untuned and silvery in its upper part, while its lower area is covered with splashes of deep violet and rose gold."

Rarcoa Auction '79 Specimen. MS-63. • Heritage, ANA Convention Sale, 1988: 967. "Mint State (62/62). R-1. Sharply detailed, steel gray specimen, boasting splendid mint lustre beneath splashes of rose-gold toning. Trivial edge bump on the reverse at 10:00 and a planchet depression between eagle's beak and stars 7 and 8."

1988 ANA Specimen. MS-63. • Heritage, ANA Convention Sale, 1988: 974. "Mint State (63/63), prooflike. Lightly cleaned. R-1. An early striking, as evidence by the needle-sharp detail. Reflective surfaces overlaid in a hazy blend of gold and blue pastels. A few faint hairlines are visible, more so on the obverse."

Heifetz Specimen. MS-63. • Superior, Jascha Heifetz Collection, 1989: 2405. "MS-63. Full mint lustre and superb sea-green and light silver toning. Fully struck. Fields are very clean with marks hidden on the devices. A minute planchet mark between stripes of shield."

Boyd, Brand and Ryder Collections Specimen. MS-63. • Bowers and Merena Galleries, 1990: 2463. "MS-63. Nicely centered and sharply struck. The fields are smooth and satiny, toned in vivid hues of gold, sea green and violet."

Willasch Specimen. MS-63. • Superior Galleries, H. Roland Willasch Collection, 1990: 591. "MS-63. Extra bold detail on Liberty's hair curls and drapery folds, equally sharp eagle. small defect above eagle's beak, and two tiny rim marks. Smooth mint lustre."

May Sale Specimen. MS-63 (PCGS). • Superior Galleries, 1991: 952. "MS-63 (PCGS). Deep original toning in shades of golden red and blue, along with 'old silver' gray. Cascading lustre present when the coin is swirled in a counterclockwise motion under a light."

Starr Specimen. MS-63. • New Netherlands Coin Co., November 1956, private sale to Floyd Starr. • Stack's, Floyd Starr Estate Sale, 1992: 578. "Close, normal date. Choice Brilliant Unc. Bright silver gray, with outstanding purple, blue, green, and rose iridescence. Some obverse stars soft in their centers. Softly struck in upper right of horizontal shield stripes where some foreign matter had adhered to the die. Full borders of denticles. Perfect edge inscription."

Shore Specimen. MS-62 (PCGS). • Superior, A. Bernard Shore Collection, 1988: 2227. "MS-62 (PCGS). Quite well struck and fully lustrous with some light toning in the obverse field. There are a few trivial marks on the obverse; the reverse is extremely choice."

Brown University Specimen. MS-60+. • Pine Tree, Brown University Collection, 1976: 317. "Brilliant Unc., frosty, sharply struck, light bag marks mostly on obverse. Sharper strike than Herstal:559 or other offered in recent years."

1952 ANA Specimen. MS-60. • New Netherlands 38th Sale, ANA Convention Sale, 1952: 1282. "Unc. Bright, frosty surface shows only traces of toning and tarnish. Bust displays evidence of contact with other coins, being lightly nicked in one or two spots."

Davis Specimen. MS-60. • Stack's, Davis-Graves (James Davis) Collection, 1954: 1328. "Sharp, bluish gold, Unc. Shows no wear but a slight nick on forehead."

Holmes Specimen. MS-60. • Stack's, Milton A. Holmes Collection, 1960: 2263. "Brilliant Unc., full mint bloom, superb iridescent toning."

Newcomer Specimen. MS-60. • Waldo C. Newcomer Collection. • B. Max Mehl. • Col. E.H.R. Green Collection. • James G. Macallister. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 650. "Unc. Both sides well struck, the obverse extra nice. Cabinet friction on eagle's head, breast and wing tops. Black carbon streaks in planchet before striking."

Herstal Specimen. MS-60. • Bowers and Ruddy Galleries, Stanislaw Herstal Collection, 1974: 559. "Unc., beautiful pale gray toning, sharply struck, well centered, free of adjustment marks or planchet defects."

Cornell University Specimen. MS-60. • Stack's, Cornell University Collection, 1975: 912. "Unc., deeply toned with blue iridescence. Darker at the periphery. A lovely coin with a faintly porous surface."

Robison Specimen. MS-60. • Stack's, Ellis H. Robison Collection, 1982: 1883. "Unc., gently mottled golden and iri-

descent toning. A nicely struck specimen, with just microscopic signs of friction."

Carter Specimen. MS-60. • Stack's, Amon Carter, Jr. Collection, 1984: 234. "Brilliant Unc. and a pristine example. A small 'keg mark' on the chin but really 'as struck.' Full blazing mint lustre with satiny iridescence. Perfectly struck where all of the stars on the obverse and virtually all on the reverse have their radial lines."

Generales Specimen. MS-60. • Stack's, Generales Collection, 1984: 1255. "Brilliant Unc. Full frosty lustre with the slightest touch of friction on the cheek. Surfaces are immaculate. Pink, russet and light iridescent toning."

Long Beach Specimen. MS-60. • Kagin's, February 1985: 1263. "MS-60/60. Sharp strike, intricate hair detail and breast feathers. Lustre has assumed an amber glow beneath predominantly blue toning acquired delicately over nearly two centuries of undisturbed aging. The centering is perfect; the planchet is uncracked."

Bartle Specimen. MS-60. • Stack's, Primary Bartle Collection, 1985: 221. "Choice Brilliant Unc. Dipped some time ago. A few tiny keg marks."

Auction '87 Specimen. MS-60. • Stack's, 1987: 780. "Brilliant Unc., satiny surface. Light bagmarking on the bust and a reverse streak (mint made)."

Rarcoa Auction '83 Specimen. MS-60. • Rarcoa, Auction '83. • Bowers and Merena Galleries, Aubrey and Adeline Bebee Collection, 1987: 2562, MS-60 or better. "Choice Unc., fully lustrous fields overlaid by just a whisper of light toning."

Stack Specimen. MS-60. • Stack's, James A. Stack Collec-

tion, 1990: 403. "Brilliant Unc., frosty lustre. Dipped but really not to its detriment as it emphasizes lustre, strike and centering." • Auction '90: 259. (Preceding description repeated.)

Kuntz Specimen. MS-60. • Superior Galleries, G. Lee Kuntz Collection Sale, 1991: 2631. "MS-60. Glowing lustre surrounds devices and is toned down only by light gold color with some blue highlights."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 or 1 (URS-1)

Approximate population MS-64: 0 or 1 (URS-0)

Approximate population MS-63: 8 to 15 (URS-4)

Approximate population MS-60 to 62: 10 to 20 (URS-5)

Approximate population AU-50 to 58: 100 to 200 (URS-8)

Approximate population VF-20 to EF-45: 1,100 to 2,000 (URS-12)

Approximate population G-4 to F-15: 300 to 500 (URS-10)

Approximate population for all grades combined: 1,500 to 2,750 (URS-12)

• **CONDITION CENSUS:** 63 (multiples)

1802. BB-242.

(B-5. H-5.)

• **OBVERSE 7:** Normal date. Base of T in LIBERTY perfect. These two characteristics, used together, are diagnostic for the variety. Star 1 over 2.5 mm. from hair curl. Star 7 close to base of L, star 8 closer to base of Y, and star 13 even closer to bust. On the left, stars 3 and 4 as well as stars 5 and 6 are closer than the other star pairs. Stars 8 and 9 on the

right are closer than the others; stars 12 and 13 are wider than the others. Distance of tip of 1 to curl is 0.2 mm. 1 and 8 in date more widely spaced than the other digits. The left base of 2 is very minutely repunched.

Obverse die used to strike 1802 BB-242 only.

• **REVERSE B:** See description under 1801 BB-214, repeated under 1802/1 BB-233.

Kagin's 313th Sale: 707 described a reverse with a perfect T in UNITED; this has not been verified by the author; all others seen of this reverse have a defective T.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse in state as described above.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 2, Fine: 6, Very Fine: 9, Extremely Fine: 8, About Uncirculated: 2, Mint State-60 or better: 2. Total: 30. Average grade: VF-27.

• **COLLECTING NOTES:** With an estimated population of only 75 to 140 specimens, 1802 BB-242 is at once the rarest (by far) non-overdated 1802, and the second rarest (after 1802/1 BB-235) variety of the year. In 1881, this was the only variety of 1802 that Haseltine designated as rare.

• **NOTABLE SPECIMENS:**

Hollinbeck-Kagin Specimen. MS-60. • Hollinbeck-Kagin Sale, June 1970: 539. "Unc. golden."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc."

Lee and Shaffer Collections Specimen. AU-50. • Superior Galleries, Lee and Shaffer Collections, 1988: 3164. "Sharpness of AU-55, but unfortunately, retoned. Very sharply struck with what appears to be virtual full mint lustre below toning."

Seller Specimen. EF-45. • Bowers and Ruddy Galleries, 1980: 3278, "Choice EF-45, golden gray, with adjustment

marks on reverse at bottom; no other defects. R-6." • James Matthews Collection. (Coin illustrated in the present book.)

Bolender Specimen. EF-45. • M.H. Bolender Collection, 1952. • Dr. Charles Ruby Collection, Gilhousen Sale, Part III, Superior. • Superior's California Collection Sale: 1335. • Superior Galleries, February 1981: 665. "EF-45/AU-50. some original prooflike surfaces, warm light iridescent tone. Reverse with full breast feathers." • Paramount, Auction '86: 1802.

Bebbee's. EF-40. • *Numismatist* advertisement, 1953. EF.

Howe Specimen. EF-40. • The Bolender Collection coin from the Howe Collection, called "EF sharp" by Bolender, later appeared in Superior's Ruby, Gilhousen III (1973): 1280 (EF+), 1975 ANA: 1022 (EF-40), and February 1981 (EF/AU), then as Rarcoa's Auction '86: 736; the obverse is plated in the Bolender book; once called the second finest known.

Herdegen Specimen. EF-40. • Herdegen Collection (Hans M.F. Schulman 1973), EF.

Coinage Context

Final mintage: 1803-dated dollars were the last produced during the early nineteenth century. By this time it had become profitable to export or melt newly-minted dollars, and the continued production of them would have been an exercise in futility. Had it not been for this factor, coinage undoubtedly would have continued for many years. The existence of so many worn early dollars of the 1794-1803 years is mute testimony to their success in domestic channels of commercial circulation (other dollar-sized coins, notably the Spanish-American issues, circulated very effectively as well). After the end of the Draped Bust obverse, Heraldic Eagle reverse coinage, the mantle fell to the half dollar to be the largest silver coin of the realm, a mandate the denomination filled admirably. As discussed under 1795 sil-

ver dollars, the half dollar denomination played second fiddle to the silver dollars. When large quantities of dollars were being made, small numbers of halves were produced. When dollars were not being minted, such as from mid-October 1794 through late spring 1795, and after early 1804, production of half dollars increased tremendously.

The Mint reported that 66,063 silver dollars were minted in calendar year 1803, and 19,570 were struck in 1804. As no original 1804-dated dollar has ever been found or reliably reported, the assumption is that these 19,570 coins bore earlier dates, probably mostly 1801, 1802, and 1803 (not necessarily all dated 1803, as some have suggested).

Numismatic Information

General information: Dollars dated 1803 include those of the Large 3 and Small 3 type. Walter H. Breen believes that the Large 3 type was struck in 1804. As an aid to collecting, the *Guide Book of U.S. Coins* helpfully divides the coinage of 1803 into the Small 3 varieties (of which there are five) and the Large 3 (just one variety, BB-255). Milferd H. Bolender referred to these as the Thin Top and Thick Top varieties.

All six varieties considered, 1803 dollars go from the very rare (BB-253, the very existence of which is doubted by some) to the very common (BB-255, the Large 3 variety, of which well over 1,000 are believed extant).

1803 Dollar: Market Values

Year	VG	Fine	VF	EF	AU	Unc.
1803	—	—	—	—	—	\$1.00
1860	\$1.10	\$1.25	\$1.50	\$1.75	\$2.50	5.00

1803: Summary of Characteristics

Business Strikes:

Enabling legislation: Act of April 2, 1792

Designer of obverse: Robert Scot (after Stuart),
model by John Eckstein

Designer of reverse: Robert Scot (from the Great
Seal)

Weight and composition: 416 grains; .8924 silver,
balance copper

Melting value (silver bullion value) in year minted:
\$1.03-\$1.04.

Dies prepared: Unknown

**Business strike mintage for calendar year 1803,
calendar year:**¹ 66,044 (may include some struck
from dies dated earlier; figures do not include
pieces reserved for the Assay Commission; these
are given in parentheses); Delivery figures by day:
February 3: 7,394 (+1); February 28: 6,153 (+1);
March 15: 8,130 (+2); March 31: 16,000 (+2);
April 5: 2,779 (+2); May 26: 12,100 (+2); June 30:
1,288 (+2); December 12: 6,380 (+2); December
31: 5,840 (+1).

**Estimated business strike mintage of 1803-dated
dollars (author's estimate):** 60,000 (rounded).

Estimated quantity melted: Unknown

Approximate population MS-65 or better: 0 (URS-
0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 2 to 3 (URS-2)

Approximate population MS-60 to 62: 10 to 20
(URS-5)

Approximate population AU-50 to 58: 45 to 85
(URS-7)

Approximate population VF-20 to EF-45: 1,300 to
2,300 (URS-12)

Approximate population G-4 to F-15: 1,000 to 1,600
(URS-12)

Approximate population for all grades combined:
2,350 to 4,000 (URS-13)

• **CONDITION CENSUS:** 63-63-60 (multiples)

• **AVERAGE AUCTION APPEARANCE** (all varieties
combined): VF-24

Characteristics of striking: Depends upon the variety.
If weakly struck, this is often observed at the
center of the obverse and among the stars above
the eagle on the reverse.

Known hoards of Mint State coins: None

Proofs:

Proof novodels were made decades later (see Chapters 5 and 6)

Commentary

Some 1803 silver dollars are believed to have
been struck in 1804.

¹ Also see business strike mintage for calendar year 1804, which consisted of 19,570 coins dated prior to 1804. If the figures 66,044 and 19,570 are added, a mintage of 85,634 is obtained for 1803, a figure given in the *Guide Book* and some other texts.

Additional Information

The Year 1803 in History

Ohio became the 17th state in the Union on February 19, 1803, and the first new state which abolished slavery from the beginning of statehood; earlier, Vermont, which joined the Union in 1791, had abolished slavery under its constitution of July 1777. The Louisiana Purchase was completed at a cost of about \$15 million, and added about 828,000 square miles of land to the United States. New York and Massachusetts threatened to secede from the United States in protest of Jefferson's purchase, which was made secretly.

Fort Dearborn, later known as Chicago, was established on the western shore of the lower part of Lake Michigan. Buffalo, New York was founded where the Niagara River meets Lake Erie. In May 1803, official U.S. architect Benjamin Latrobe addressed the American Philosophical Society on the subject of steam power, but was not enthusiastic about its prospects. In the meantime, great advances in steam power had been made elsewhere, particularly in England by Boulton & Watt. South Carolina resumed importing slaves to solve a labor shortage brought about by increased need for cotton

pickers; Eli Whitney's cotton gin, invented in 1792, made it possible to vastly expand the crop.

In April 1803, John James Audubon arrived from France and began banding the feet of phoebes to study their habits; later, Audubon's studies would become famous, and an elephant-folio-size collection of his bird paintings would be published. William Dunlap adapted a French play to create *The Voice of Nature*, the first popular melodrama to be produced on the American stage.

The British Passenger Act of 1803 mandated that each passenger on a transatlantic vessel have a minimum of 43 square feet of space, a law which dramatically slowed emigration from the British Isles to the United States. George Rapp emigrated to America from Germany in 1803; in 1805 he and his followers established the cooperative community of Harmony, Pennsylvania; in 1814-1815 they moved to Indiana and established another Harmony; in 1825 that community was sold to British industrialist and social reformer Robert Owen, after which the Rappites founded Economy, Pennsylvania.

1803 Heraldic Eagle

Varieties

1803. BB-251.

**Small 3 in date
(B-1. H-1.)**

• **OBVERSE 1:** Thin top to 3 in date, right top of 3 slanting toward bust, short left tip slanting toward 0. 1 does not touch curl. Stars 8 and 13 equidistant from Y and bust respectively, and each is close. Star 8 close to Y and in the same relative position to Y as on the 1804 dollar. Liberty's mouth open.

Obverse die used to strike 1803 BB-251 only.

• **REVERSE A:** Described under 1801 BB-214, repeated herewith: The point of the leftmost arrowhead is under the center of the left upright of the N in UNITED. Leaf points under center of I in AMERICA. Point of a star touches the outside of upper part of eagle's beak slightly above beak's point.

Called Reverse B by Bolender, this die was mated with obverses dated 1801, 1802, and 1803.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect; first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse as described above. May not exist with perfect obverse.

Die State II: Obverse with light crack from denticles through left side of R in LIBERTY to hair. Reverse as preceding. The state usually seen.

Die State III: Obverse crack at top widens and splits into two sections at bottom of R, continuing down to hair. A new crack extends from the left side of 8 in the date up into the bust. Reverse as preceding. Slightly scarcer than Die State II.

• **AUCTION POPULATION SURVEY:** Good: 4, Very Good: 4, Fine: 7, Very Fine: 16, Extremely Fine: 7, About Uncirculated: 3. Total: 41. Average grade: VF-21.

• **COLLECTING NOTES:** The 1803 BB-251 dollar is scarce. Probably, about 240 to 450 exist totally, just enough to make it a challenge for the advanced collector to find. EF coins are scarce, AU pieces are very rare (if, indeed, they exist), and Mint State specimens have not been seen.

• **NOTABLE SPECIMENS:**

Forrest Specimen. EF-45 net. (AU-50, cleaned). • Stack's, S.S. Forrest, Jr. Collection, 1972: 987. "Brilliant AU, just the faintest evidence of wear. Cleaned at one time."

Brooks Specimen. EF-45 net. (AU-50, cleaned). • Bowers and Merena Galleries, 1989: 695. "AU-50. Lightly cleaned in the past, but still very attractive. The fields are reflective and

the design features are mostly quite sharp save for a few softly defined strands behind Miss Liberty's temple."

Holmes Specimen. EF-45. • Stack's, Milton A. Holmes Collection, 1960: 2264. "EF, choice. Just the slightest wear on the high points. Mostly blue toning. Sharp, well struck."

Frontenac Specimen. EF-45. • Bowers and Merena Galleries, Frontenac Collection, 1991: 2223. "EF-45 to AU-50. Somewhat prooflike surface. A very pleasing coin with lilac, gun-metal blue, and iridescent surfaces."

Frontenac Specimen (another). EF-40 (PCGS). • Bowers and Merena Galleries, Frontenac Collection, 1991: 2224. "EF-40 (PCGS). Medium gray toning. A sharp example."

DeCoppet Specimen. EF-40. • James Kelly, André DeCoppet Collection, 1955. "EF, well struck."

Hollinbeck-Kagin Specimen. EF-40. • Hollinbeck-Kagin Sale, August 1970: 1100. "EF and sharp, attractive patina."

Stirling Specimen. EF-40. • Frank M. Stirling Collection, Heritage, February 1986: 1344. "Toned a steel gray with peripheral iridescence. There is a small surface dent on Liberty's neck, and the obverse displays some fine hairlines."

Ebsen Specimen. EF-40. • Superior Galleries, Buddy Ebsen Collection, 1987: 1927. "EF-40, a typical shallow strike, yet with a minimal amount of light wear. Plenty of frosty mint lustre is still intact, particularly about the protected areas of

the devices. Well centered. Toned with light grayish violet turning to sea green iridescence."

Stack's Autumn Sale Specimen. VF-35. • Stack's Autumn Sale, 1978: 302. • Stack's, May 1990: 1204. "EF, short scratch behind eye. Russet and violet toning. Full motto, nice detail."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 0 to 1 (URS-0)

Approximate population VF-20 to EF-45: 155 to 300 (URS-9)

Approximate population G-4 to F-15: 80 to 140 (URS-8)

Approximate population for all grades combined: 240 to 450 (URS-9)

• **CONDITION CENSUS:** 45 (multiples)

1803. BB-252.

Small 3 in date.

(B-5. H-5.)

• **OBVERSE 2:** Thin top to 3, the 3 too high. Figures of date all close. Stars 8 and 13 are about equidistant from Y and bust, and much closer than stars 1 and 7 are from hair and L. On the left, star pairs 2-3 and 5-6 are closest, while stars 6-7 are noticeably wider than any of the others. On the right, stars 10-11 and 12-13 are wider apart than any others, but not by much. The 3 almost touches bust, and 1 is near curl.

Obverse die used to strike 1803 BB-252 only.

• **REVERSE A:** Described under 1801 BB-214, repeated under 1803 BB-251, above.

In 1803 BB-252, the reverse is found with a spur on the outside lower right of the curve of the D in UNITED. Often found weakly struck at the centers. Some strikings show heavily bifurcated letters and were considered to be a separate die state (B-5a) by Bolender.

Reverse die used to strike 1801 BB-214 (typically with crack from border toward cloud 6); 1802/1 BB-233 (perfect);

first use of the die), BB-234 (die relapped, cloud 6 mostly missing, some arrowheads disconnected; some with clash mark from cloud 5 to border above O), and BB-235; 1802 BB-242 (spur on D from now on); 1803 BB-251 (relapped, struck before BB-252) and BB-252 (relapped, struck after BB-251).

• DIE STATES:

Die State I: With perfect obverse die. Reverse as described above. Some strikings have bifurcated letters on the reverse and are called Bolender-5a by Bolender, but I do not consider these to be a separate die state.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Good: 13, Fine: 18, Very Fine: 29, Extremely Fine: 14, About Uncirculated: 6, Mint State-60 or better: 9. Total: 90. Average grade: VF-25.

• **COLLECTING NOTES:** With an estimated population of 500 to 950 coins, 1803 BB-252 is the second most plentiful variety of this year. Examples are known in all major grade categories. Most are in lower grades up through VF and EF. AU examples are rare, but are seen more often than most other varieties of the date. Several high-quality Mint State coins exist. In fact, in Mint State, the BB-252 is the most populous variety of the year.

• NOTABLE SPECIMENS:

Schenkel Specimen. MS-63 (NGC). • Bowers and Merena, 1990: 369. "MS-63 (NGC). Attractive light gray and lilac toning over silver surfaces on obverse. Well struck and well detailed. Reverse toned a medium gray over lilac surfaces and likewise well detailed." • Bowers and Merena Galleries, ANA Centennial Convention Sale, 1991: 445. MS-63 (NGC). (Description repeated.)

Adams Specimen. MS-63 (NGC). • Superior Galleries, Adams Collection, 1992: 2123. MS-63 (NGC). "Razor-sharp. Pristine fields and immaculate; surfaces have acquired light to medium gray toning with golden undertones on obverse, while the reverse is uniformly darker, approaching iridescent steel in its tone." (Same coin as preceding?)

Alto Specimen. MS-60. • Stack's, Alto Collection, 1970: 1068. "Brilliant Unc., boldly struck, full mint bloom. Iridescent toning further enhances the beauty of this coin."

San Diego Specimen. MS-60. • Mid-American, 1989: 719. "MS-60. Obverse nearly fully prooflike with mirrorlike reflectiveness below rich antique gray-gold and rose color; reverse tends more toward frostiness and has similar color. Excellent strike, as is centering."

May Sale Specimen. MS-60. • Stack's, 1991: 593. "Brilliant Unc., full frosted surfaces. The central portion slightly soft in strike."

DeCoppet Specimen. AU-55. • James Kelly, André DeCoppet Collection, 1955. "Practically Unc."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 643. "Near Unc."

Bolender Specimen. EF-40. • M.H. Bolender. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968): 326. "EF, rainbow tone, obverse stronger than reverse. Tiny obverse rim nick above R, smaller border nicks near 2nd star. Finer than Fairbanks:575 or the piece in New Netherlands 54th sale."

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 2 or 3 (URS-2)

Approximate population MS-60 to 62: 5 to 8 (URS-4)

Approximate population AU-50 to 58: 10 to 20 (URS-6)

Approximate population VF-20 to EF-45: 275 to 550 (URS-10)

Approximate population G-4 to F-15: 200 to 350 (URS-9)

Approximate population for all grades combined: 500 to 950 (URS-11)

• **CONDITION CENSUS:** 63-63-60 (multiples)

1803. BB-253.

No specimen is available to photograph

(Status uncertain; may not exist)

Small 3 in date.

5th Edition Bolender says: "Now believed that no such variety exists."

(B-2. H-2.)

• **OBVERSE 3:** Thin top to 3, top parallel to bust, left tip parallel to 0. The 3 is lower than other figures, and the 1 defective at top. Upper stars equidistant from L and Y. First star distant from hair. (Description from Bolender book.)

Obverse die used to strike 1803 BB-253 only.

• **REVERSE B:** Same die used to coin 1801 BB-212, described earlier, but herewith repeated: The point of the leftmost arrowhead is under the left edge of the left serif of N in UNITED. The point of upper part of eagle's beak touches down on a point of a star slightly back from extreme star point. Only 12 arrows show plainly (13th faintly shows, but is difficult to find). First A in AMERICA touches third feather, and is connected by die crack to 4th feather. Leaf points more towards left corner of base of I in AMERICA.

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• DIE STATES:

Die State I: Description not available.

• **AUCTION POPULATION SURVEY:** Good: 1, Very Fine: 1, Extremely Fine: 2, Mint State-60 or better: 1. Total: 5. Average grade: VF-33.

• **COLLECTING NOTES:** 1803 BB-253 is a major rarity *if it exists*. There is no illustration of it in the Bolender book, and no one with whom I have been in contact in connection with the present book has

reported owning one. The 5th edition (1988) of the Bolender book has the added phrase, "Now believed that no such variety exists." Based upon auction appearances, with some extrapolation, perhaps five to 10 exist, *if they can be found*. If it exists, 1803 BB-253 is one of the key issues among all dates of Heraldic Eagle reverse dollars. Only at infrequent intervals have specimens been listed in past auctions.

• NOTABLE SPECIMENS:

Hollinbeck-Kagin Specimen. AU-50. • Hollinbeck-Kagin Sale, June 1970: 641. "Near Unc. with lustre, die break after D in UNITED and left wing tip to edge, 12 arrows show plainly but 13th is faint. Extremely rare." (Not plated)

Pradeau Specimen. EF-45. • Superior, 1970: 466. "Toned choice EF-AU." The plate of Lot 466 in this sale appears to be a mis-attributed example of 1803 BB-255, the Large 3 variety.

Pradeau Specimen (another). EF-40. • Superior, Pradeau Collection, 1970: 465. "Toned EF." (Not plated)

Boyd Specimen. VF-20. • Numismatic Gallery, World's Greatest Collection, F.C.C. Boyd, 1945:121. "VF. An extremely rare variety." (Not plated)

Haines Specimen. G-4. • S. H. and H. Chapman, Ferguson Haines Collection, 1888: 29. Good. (Not plated)

• POPULATION DISTRIBUTION:

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 1 or 2 (URS-1)

Approximate population VF-20 to EF-45: 3 to 6 (URS-2)

Approximate population G-4 to F-15: 1 or 2 (URS-1)

Approximate population for all grades combined: 5 to 10 (URS-4)

• **CONDITION CENSUS:** 50-45-40-20-4

1803. BB-254.

**Small 3 in date.****(B-4. H-4.)**

• **OBVERSE 4:** Thin top to 3, top side long, and ends near bust, very close. 1 firmly touches curl. Last star almost touches bust. Stars 7 and 8 distant from L and Y. On the left stars 4-5 and 5-6 are closer together than are any of the others. On the right, stars 10-11 and 12-13 are wider apart than are any others.

Obverse die used to strike 1803 BB-254 only.

• **REVERSE B:** Same die used to coin 1801 BB-212, described earlier, repeated under 1803 BB-253 above.

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• DIE STATES:

Die State I: Perfect obverse die. Reverse as described above.

• **AUCTION POPULATION SURVEY:** Good: 4, Very Good: 7, Fine: 9, Very Fine: 18, Extremely Fine: 8, About Uncirculated: 5, Mint State-60 or better: 1. Total: 52. Average grade: VF-24.

• **COLLECTING NOTES:** I estimate that about 300 to 550 examples are known of 1803 BB-254, placing it squarely in the scarce or rare class. Most specimens are in lower grades, with VF being about par. Examples exist through and including the AU categories. Whether any Mint State coins exist as per stringent present-day grading interpretations is a

matter for debate.

The pressman was doing his job well when BB-254 dollars were struck, as these are usually sharp. Higher grade pieces are sometimes seen with prooflike surfaces. However, "higher grade" in this instance is apt to mean AU, as noted, for no Mint State coins have come to our attention.

• NOTABLE SPECIMENS:

Baldenhofer Specimen. AU-55. • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 1031. "AU-55 or better, mostly iridescent blue toning about the boldly struck borders. Centers partly brilliant and the surfaces prooflike. Minor handling and a few microscopic handling marks."

Hollinbeck-Kagin Specimen. AU-55. • Hollinbeck-Kagin Sale, June 1970: 642. "Unc. with lovely bluish golden patina, sharp stars. Some slight rubbing (probably from sliding on the velvet in the old coin cabinets)."

NASC Convention Sale Specimen. AU-55. • Kagin's, NASC Convention Sale, 1979: 543. "Choice AU-55, sharp struck, golden bluish lustre."

May Sale Specimen. AU-55. • Stack's, 1992: 2196. "AU, near choice. Planchet notch as made at 5:00, marvelous reflective surfaces create exceptional brilliance."

Bebee's. AU-50. • *Numismatist* advertisement, 1953. AU.

Holmes Specimen. AU-50. • Stack's, Milton A. Holmes Collection, 1960: 2265, Thin top to 3. "Just AU, full mint bloom, however struck on a partially porous planchet."

Fairfield Specimen. EF-45. • Bowers and Ruddy Galleries, Fairfield Collection, 1977: 218. "EF-AU, weakness in clouds on reverse (as struck)."

Hetrich Specimen. EF-45. • Bowers and Ruddy Galleries, Dr. Hetrich Collection, 1982: 568. "Choice EF-45, prooflike. Sharply struck."

• **POPULATION DISTRIBUTION:**

Approximate population MS-65 or better: 0 (URS-0)

Approximate population MS-64: 0 (URS-0)

Approximate population MS-63: 0 (URS-0)

Approximate population MS-60 to 62: 0 (URS-0)

Approximate population AU-50 to 58: 10 to 20

(URS-4)

Approximate population VF-20 to EF-45: 170 to 300 (URS-9)

Approximate population G-4 to F-15: 125 to 225 (URS-9)

Approximate population for all grades combined: 300 to 550 (URS-10)

• **CONDITION CENSUS:** 58-55 (multiples)

1803. BB-255.

Large 3 in date.

(B-6.)

• **OBVERSE 5:** Thick top to 3 in date. Star 13 close to bust. Star 1 distant from hair, about 2.3 mm. On the left, stars 1-2 and 5-6 are closer than any others, while stars 4-5 are the most widely separated. On the right, the stars are remarkably evenly spaced. The 180 wide, and 3 a trifle low at base. The 3 is lightly double punched at its base and has a spur at its bottom.

Obverse die used to strike 1803 BB-255 only.

• **REVERSE B:** See description under 1801 BB-212 (description repeated under 1803 BB-253).

Reverse die used to strike 1801 (intermediate state) BB-212; 1802/1 BB-231 (early state) and BB-232 (early state); 1802 BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists) and BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

• **DIE STATES:**

Die State I: Perfect obverse die. Reverse as described above. The die state usually seen.

Die State II: Obverse with hairline crack, hardly discern-

ible, connecting stars 10 and 11. This progresses (in intermediate states) to connect with star 9, then 12. About 20% to 30% of BB-255 dollars are of this die state.

Die State III: Obverse hairline crack connects all stars on the right. Scarcer than the preceding.

• **AUCTION POPULATION SURVEY:** Good: 4, Very Good: 25, Fine: 49, Very Fine: 85, Extremely Fine: 42, About Uncirculated: 13, Mint State-60 or better: 11. Total: 229. Average grade: VF-24.

• **COLLECTING NOTES:** I estimate that about 1,250 to 2,000 specimens are known of 1803 BB-255. The 1803 BB-255 is about as plentiful as 1802 BB-241, and, like it, the 1803 BB-255 dominates its year—accounting for more coins than all other die varieties of 1803 combined. Notwithstanding all of this, in Mint State it is not the most often seen 1803 variety. That distinction goes to BB-252, for reasons not understood today.

• **NOTABLE SPECIMENS:**

New England Rare Coin Galleries Specimen. MS-60, prooflike. • New England Rare Coin Auction's sale of April 10, 1980. 705. • New England Rare Coin Auction's sale of

June 4, 1981. 1311, accompanied by the text of a letter from Walter Breen in which he expressed his belief that the coin was a special presentation striking. • Stack's, Auction '89: 1780, Bolender-6a. "Brilliant Unc. and fully prooflike, struck from polished dies on a polished planchet. A few light hairlines under russet gold toning, deepening to a tan gray at the peripheries. Unusually sharp strike for this variety. The dies were refinished and polished in the Mint at a time when they were in a late state and had rusted slightly."

Brand Specimen. MS-60 • Virgil M. Brand Collection. • M.H. Bolender Collection, 1952: 181. "Sharp Unc., beautiful mint lustre, and some Proof surface. Strong sharp impressions. Pedigree: from the Brand Collection."

Gable Specimen. MS-60 • Gable Collection, 1914. • M.H. Bolender Collection, 1952: 183. "Bolender-6b. Shows obverse die crack faintly through stars on right. Unc., with Proof surface."

Hollinbeck-Kagin Specimen. MS-60 • Hollinbeck-Kagin Sale, June 1970: 644. "Brilliant Unc. gem with some prooflike surface."

MANA Specimen. MS-60 • Kagin's, 21st MANA Convention Sale, 1973: 1304. "Glittering golden Unc., with raised edge and shimmering lustre."

Smith Specimen. MS-60 • Elliot Smith Collection. • Stack's, Harold Bareford Collection, 1981: 423. "Brilliant Unc., sharply struck, with lustrous, satiny surface. Splendid glistening iridescent toning."

Baldenhofer Specimen. AU-58 • W. G. Baldenhofer to Stack's, Farish-Baldenhofer Sale, 1955. • A.J. Ostheimer, 3rd Collection • Superior Galleries, ANA Convention Sale, 1975: 1035, Bolender-6a. "Later state: fine die crack connects all of the stars on the right. Virtually MS-60, dark iridescent toning, and fully lustrous with a sparkling cartwheel effect. Minor signs of handling, a few microscopic obverse rim nicks, and not fully struck up on high points."

Clarke Specimen. AU-58 • New Netherlands 48th Sale,

T. James Clarke Collection, 1956: 652, Bolender-6a. "Unc., but not pristine. Evenly struck, the borders a bit imperfect upon the obverse at I. Liberty mostly bold, a light scratch on her cheek. A tiny reverse edge nick at bottom, and the usual quota of minor handling marks. Attractive toned, a touch or so of tarnish or carbon streaking."

DeCoppet Specimen. AU-55 • James Kelly, André DeCoppet Collection, 1955. "Well struck and practically Unc. Prooflike surface."

Hollinbeck-Kagin Specimen. AU-50 • Hollinbeck-Kagin Sale, August 1970: 1101. "Near Unc., toned."

DeCoppet Specimen. AU-50 • DeCoppet Collection (James F. Kelly, 1955). "AU, prooflike."

Carter Specimen. AU-50 • Amon Carter, Jr. Collection (Stack's, 1974), AU.

• **CONDITION CENSUS: 60** (multiples)

1803. BB-256.

Small 3 in date.
(B-3. H-3.)

• **OBVERSE 6:** Thin top to 3, position of 3 simi-

lar to 1803 BB-251, but star 8 is more distant from Y. Close date. On the left, stars 1 and 2 are more widely separated than are any others.

Obverse die used to strike 1803 BB-256 only.

• **REVERSE C:** AM touch at base. Point of star touches point of *lower part* of eagle's beak. Very short stem in claw. Right edge of right foot of A over edge of cloud 4 (the only such instance for a dollar of 1803).

Reverse die used to strike 1803 BB-256 only.

Note: As 1803 BB-256 stands alone without die linkage to any other 1803 dollars, it is not possible to determine the striking sequence within the year.

• **DIE STATES:**

Die State I: Perfect dies. Bolender noted that this variety is always weak at the center of the reverse.

• **AUCTION POPULATION SURVEY:** Good: 1, Fine: 3, Very Fine: 5, Extremely Fine: 2, About Uncirculated: 1, Mint State: 1. Total: 13. Average grade: VF-25.

• **COLLECTING NOTES:** The 1803 BB-256 is the second rarest die variety of the year (after BB-253, if BB-253 exists). I estimate that 30 to 60 are known. Examples seldom surface on the market. This issue is one that the specialist would be well advised to acquire in any condition, using leisure time to upgrade if the opportunity is presented.

In his 1881 *Type-Table*, J.W. Haseltine called this variety extremely rare, but did not inform the reader whether an *extremely* rare coin was more or less populous than an *excessively* rare one.

• **NOTABLE SPECIMENS:**

Newcomer Specimen. MS-60. • Waldo C. Newcomer. • Col. E.H.R. Green. • James G. Macallister. • New Netherlands 48th Sale, T. James Clarke Collection, 1956: 651. "Unc., a gorgeous first-strike. Slightly off-center; deeply struck at borders, enhancing the mirrorlike 'Proof' lustre. Two small rim bruises at bottom of obverse, and possibly a few other, less important edge imperfections. Lustrous, attractive purple toning, much iridescence."

Herdegen Specimen. AU-50. • Hans M. F. Schulman, R.T. Herdegen Collection, 1973. "AU showing faint wear on rather weakly struck center. A beautiful coin with prooflike surface, but very likely a first strike."

Cohen Specimen. EF-45. • Bowers and Merena, Milton Cohen Collection, 1985: 530. "Choice EF-45, semiprooflike. Light gold toning."

Newport Specimen. EF-40. • Bowers and Ruddy Galleries, Newport Collection, 1975: 503. EF.

Blevins Specimen. VF-35. • Superior, H. W. Blevins Collection, 1988: 3802. "VF-35. Light gray with splashes of attractive rich orange-gold coloring on both sides. Extremely well struck with the centers and borders both showing good definition. A considerable amount of mint lustre."

Frontenac Specimen. VF-30. • Bowers and Merena Galleries, 1991: 1276. "VF-30, light gray surfaces."

Stirling Specimen. VF-20 net. (VF-30, cleaned). • Frank M. Stirling Collection, Heritage, February 1986: VF-30, "lightly cleaned surfaces, prooflike."

Spies Specimen. F-15. • Stack's, W. Earl Spies Collection, 1974: 232. "A strong Fine."

Werner Specimen. F-15. • Thomas Werner, April 1954. • K.P. Austin. • A.J. Ostheimer, 3rd Collection. • Superior Galleries, ANA Convention Sale, 1975: 1030. "Not quite VF-20 and a flat impression on the high points as usual. Uneven tarnish mixed with faint original lustre around the devices. Some reverse edge bruises and nicks, the most serious at 7:00."

Ostheimer Specimen. F-15. • Lester Merkin, A.J. Ostheimer, 3rd Collection, 1968: 3234. "Just about VF, flat impressions in the usual places, some areas of EF sharpness."

Willasch Specimen. F-15. • Superior Galleries, H. Roland Willasch Collection, 1990: 598. "F-15+. Broad, flat rims protected the delicate engravings. Well balanced coin with ample detail remaining and most importantly, rarest variety of the year. Minor cleaning lines in the fields, sprinklings of toning. Early die state as are all seen of this variety."

CHAPTER 5

1804 Novodel Dollars

AND 1801-2-3 NOVODELS

by R.W. Julian

Dollar Production Halted

In March 1804 the government finally managed to halt the coinage of silver dollars, which would not resume for more than 30 years. Too many of them were leaving the country. The loss of silver to the United States was not good for the economy or long-term prospects of the Philadelphia Mint. The whole point was to force exporters to use Spanish dollars for export and, on the whole, this was done.

It is not quite clear how the halt in dollar coinage was accomplished, but it is very likely that Elias Boudinot was the man behind the action. There were probably confidential discussions with key government officials in Washington (the capital had moved there in 1800) over the course of action proposed by the director. In 1806 Secretary of State James Madison belatedly issued an order confirming the suspension of eagle and dollar coinage, but the true decision had been made two years earlier. Part of the drive to suspend dollar coinage came from the Bank of the United States; it was this institution which made the formal request to the State Department for the action.

Beginning in 1804 it was government policy to coin the half dollar as the largest silver coin. These were used as bank reserves but also circulated heavily, especially in the interior of the country. Treaty payments to Indians were often made in half dollars and spent by the recipients in frontier stores.

Background of the 1804 Dollar

It is perhaps an axiom of modern life that we are fascinated by those people and things that have a stigma of some kind. So it is with the 1804 silver dollar. It was not struck until 30 years after the date it bears but was originally struck for royalty. Now it

is known by collectors as the “King of American Coins,” a title suggested decades ago by numismatic promoter B. Max Mehl.

Suspension of the dollar coinage in 1804 was primarily due to the increase in silver dollar coins of various dates going to the Chinese port of Canton and not returning. The sending of silver to China in exchange for luxury goods became a serious problem for American authorities as it was felt that Spanish coins should be used if at all possible. The ending of American dollar coinage in 1804 forced exporters in that direction.

It must be remembered that the silver dollars actually struck in 1804, all 19,570 of them, were dated 1803 or earlier. There were two primary reasons for the old dies being used, with a third thrown in for good measure. The most important reason was that the decision had been made, probably no later than December 1803, to end the dollar coinage as soon as possible. Under these circumstances there was little point in cutting new dies when the old ones of 1803 (or any earlier dates on hand) were still perfectly good.

The second reason for using the 1803 dies was a shortage of die steel. From 1803 through 1805 there was difficulty in this area, and the order of striking for several denominations is confused. The die steel shortage is also clearly seen in the half dollar coinage of 1804, which used dies of 1803 exclusively; there are no 1804-dated half dollars for an otherwise large coinage of more than 150,000 pieces. The cents of 1804 are another well-known example, with only one obverse die known for a calendar-year coinage of nearly 100,000 pieces.

The last reason, and perhaps the least important, is the penchant for economy which existed in the

early Mint. Die steel cost money, and if a dated die was still serviceable it might still be in use two or three years later; 1797 half cent dies, for example, were still minting coins in the spring of 1800.

One of the odder controversies of the past century was not settled until a few decades ago. Mint reports long carried the cryptic entry that 321 dollars had been coined in 1805, and thereby hangs a tale.

A deposit from a major bank in that year was found to contain 321 American dollars. Once the deposit had been accepted and entered into the records, the only way of handling the U.S. coinage was to route them through the Mint in a bookkeeping operation that left the coins untouched. They were then returned to the depositor—the Bank of the United States—at the proper time.

The official Mint report for 1805 does not mention the 321 silver dollars. However, there was an 1805 document which did mention these coins, the annual report from the Treasury Department to Congress on the operations of the Mint. The Treasury report did not flag the 321 dollars as something special, however. The matter would have lain undisturbed except that someone, reading the 1805 Treasury report, assumed that the regular Mint report for 1805 was in error and simply added the figure.

At some unknown date, probably in the 1930s, an enterprising engraver re-engraved the dates on some original dollars of the early 1800s to give them new dates: 1804 and 1805. There was considerable fanfare in the 1960s when the owner of these pieces, having bought them from old-time dealer Louis S. Werner and believing them to be genuine, published the two coins in the numismatic press.¹ They were then both exposed as altered dates by Eric P. Newman, who has specialized in the history of the 1804 dollar.

From 1804 to the 1830s the place of the dollar was taken by the half dollar, coined in great quantities. There is a persistent rumor that these halves did not circulate, being locked up in bank vaults to back the issuance of paper currency by private banks.

There is an element of truth in this rumor, but the reality is more complex.

While it is true that half dollars were used as backing for paper currency and were even found in bank vaults as late as the 1930s, large numbers of them went directly to circulation. The government favored the half dollar, for example, as a coin of choice to make treaty payments to Indians; once paid over at the usual annual or semi-annual ceremony, the recipients would rush off to a frontier store to spend the money. In this way the half dollar was relatively plentiful, compared to other U.S. silver coins, on the frontier before 1830.² (Spanish silver was used on the frontier as well.)

The government also used the half dollar in payment for other contractual obligations, such as bond redemptions. Many of these coins, however, eventually wound up in bank vaults.

The same mercantile process of sending silver to Canton continued unchanged through the late 1820s, but in early 1831 there was a sudden reverse flow, which confounded the experts on trade. On April 13, 1831, Mint Director Samuel Moore, in office since the death of his predecessor Robert Patterson in 1824, wrote Treasury Secretary S.D. Ingham that the Mint had actually received for deposit a large parcel of Spanish dollars that had originated in Canton. Moore had made inquiries and found that this was not the first occasion of silver being shipped to America from the Orient.

Resumption of Dollar Coinage Proposed

In view of this change in commercial practice, in 1831 Director Moore asked the Treasury to transmit to President Andrew Jackson a request that the 1806 prohibition against dollar coinage be lifted and the Mint given permission to resume production. On April 18 the Treasury replied, saying that the president had approved the request.

Based on the die progression of the 1804 dollar hubs as compared to the 1801–1803 Proof “re-strikes” (novodels), it seems likely that Director

¹ It was generally overlooked or forgotten at the time, that these same two 1804 and 1805 silver dollars had been the subject of a letter to the editor of *The Numismatist*, January 1940, by David Spink, who stated that the 1804 had been altered from an 1801 and that the 1805 had been altered from 1803. (Actually, the “1804” had been altered from an 1802/1 B-4, and the “1805” had been altered from an 1803 B-6).

² Harry E. Salyards, M.D. note, per letter to Q.D.B., January 15, 1993: “The circulation of the half dollar is in *inverse* proportion to its *estimated survival*, which Walter H. Breen (*Silver Coinages of the Philadelphia Mint*, p. 5) put at “about 5%” for halves 1794–1803, “rising to possibly 30% or more in the 1820s and 1830s.”

Moore ordered Chief Coiner Adam Eckfeldt, whose department prepared working dies in those days, to make up several dollar dies. It appears that four obverses were made as compared to two reverses. The intent seems to have been to have two pairs with an additional two obverses for emergency purposes. One of the obverses, later to be used for the 1801 Proof novodel, did not have stars, date, or even carry the word "LIBERTY."

These dies used the old Liberty head and eagle hubs last used for the dies of 1803, but also incorporated certain changes, such as a beaded border, introduced by Engraver William Kneass in 1828. This, of course, shows only that the dies could not have been made before 1828 and does not prove that they were made in 1831.

There was no dollar coinage in 1831 because the odd shift in commercial patterns went back to the old way by the summer of that same year. One assumes that Moore made further inquiries and found the situation was rather unstable and that exporters had now gone back to the familiar process of sending Spanish (or Mexican) dollars to China for goods.

All was now quiet, waiting for the other shoe to fall. And fall it did, in the summer of 1834. As part of an ongoing effort to open up certain countries to trade with the United States, Edmund Roberts was made a special commercial representative to the Middle East. He was told to go to the Kingdom of Muscat (on the Arabian peninsula) as well as Siam.

Coins Made for Presentation

Roberts suggested a considerable number of presents (such as telescopes), and he also believed that sets of American coins should be included on such a list. The coins were to be suitably encased in "caskets" with colors representing the national arms of the given country. The State Department asked the Treasury to handle the matter. Soon Director Moore found himself being ordered to prepare sets of American coins. The instructions were a little vague, with considerable room for interpretation.

Because Chief Coiner Adam Eckfeldt had been at the Mint in varying capacities since 1792 and had collected a nearly complete set of coins issued since that time, it was natural for Moore to consult this officer in the decision on which coins to strike. The major problem was the silver dollar and gold eagle, neither of which had been minted since 1804.

Eckfeldt presumably consulted his collection and

found that he had not saved the 1804 dollar. No one remembered in the 1830s that the 1803 date (and/or other earlier dates) had been used exclusively in 1804. Although of course no one now knows precisely why the decision was made to include the dollar and eagle, it has to be assumed that the most important reason behind the choice was one of prestige. Smaller coins might impress virtually no one while the dollar and eagle were certainly magnificent to behold when coined with a Proof finish.

(Although Adam Eckfeldt had made an effort to save every different date for each denomination, he was not always successful or perhaps short of money on occasion. In particular he is known to have missed the 1815 and 1822 half eagles. The latter date was obtained by Eckfeldt in 1834 or 1835 when great quantities of old tenor gold came in for reminting into coins to the August 1, 1834 standard. The 1822 was found in one of the deposits; perhaps other dates were saved at that time.)

It is odd that the last coining date (1804) was chosen for both the eagle and dollar, but perhaps Moore thought that this was the best way to go. The small, but growing, number of collectors might not be so happy if they were unable to get 1834 dollars, but those of 1804 (which Eckfeldt assumed were out there) were another matter. Condition was not as important to collectors in 1834, and Proofs were not as widely coveted then as now.

In November 1834 the two sets of coins were duly struck and placed in the "caskets" manufactured by a Philadelphia artisan. The cases were of such high quality that they actually cost more than the coins enclosed! Perhaps the ornately embossed leather required for the covering added materially to the expense.

At the end of 1834 the State Department extended the Roberts trip to include Indo-China (then called Annam) and Japan. Two additional sets of coins were ordered from Director Moore, but this time the cases were produced within the Mint, perhaps a reaction to the high cost of the first two.

In all, there had been four 1804 dollars struck by official order along with an unknown number of others. Adam Eckfeldt certainly received one (the ultimate destination was the Mint Collection when the chief coiner sold his collection to the government in 1838). As there are eight originals known at present, it is a safe assumption that the three not accounted for above were struck in 1834 or 1835.

Details of the 1804 Dollars

The 1804 Class I dollars, struck with the first reverse die, all have an obverse in which the hair curl is missing at the top of the head; in other words the curl had chipped off the hub after the first two obverse dies had been executed. There was absolutely no point in creating that many obverse dies in 1834 for just a tiny run of dollar coins, and the only logical time for the dies to have been made was 1831 when dollar coinage was contemplated but not carried out.

It is not difficult to decide why the curl broke off when the new dies were made. The hub device (punch) was nearly 40 years old and had been used heavily from 1795 through 1803. In addition steel changes texture over a period of time and becomes brittle with age. Small wonder, then, that the breaking of the hair curl has left us with a key marker for the sequence in which the dies were prepared.

In April 1835 Roberts at last left on his oft-delayed trip. He visited Muscat and Siam where he presented, among other items, the special cased sets of American coins. (The 1804 dollars handed over at that time would later be known as specimens owned by the Imam of Muscat and the King of Siam.) However, he fell sick at Bangkok and was taken to the Portuguese enclave of Macao on the Chinese coast, where he died in June 1835. The remaining presents were returned to the State Department in due course.

Knowledge of the 1804 Dollars

The first public knowledge of the 1804 silver dollar came in 1842 when Jacob R. Eckfeldt, son of Adam Eckfeldt, and William E. DuBois published *A Manual of Gold and Silver Coins of All Nations, Struck Within the Past Century*. Their illustration for the dollar of 1795–1803 was none other than the 1804 dollar. The image was produced by Joseph Saxton's (1799–1873; joined the Mint staff in 1837) medal-ruling machine, which created via a pantograph stylus tracing over the surfaces of an electro-type of a coin or medal, a depiction of a numismatic specimen true to life in its details and proportions. Thus, all illustrations, including the hitherto unknown 1804 silver dollar, were from actual coins in the Mint Cabinet. The books were sold through several outlets, including the branch mints, where officers solicited orders for the \$5 volume.

Famed early collector Matthew A. Stickney learned of the 1804, probably from the Eckfeldt-DuBois book, and sought to obtain one of these rare coins. In May 1843 he was to succeed, by trading to the Mint an extremely rare 1785-dated Immune Columbia coin struck in gold for the 1804 dollar. The nature of the transaction implies that he was dealing with the curator of the Mint Cabinet of coins and that the extra 1804-dated silver dollars made in 1834–1835 had later been earmarked for the Cabinet.

The two returned sets of coins went to the State Department archives where they were probably “liberated” by some non-collector and simply spent. It is the opinion of this writer that these two coins were to become what are now known as the Mickley and Cohen specimens. The remaining cabinet coins (probably three were left after Stickney received his) were no doubt traded off or sold in the 1840s.

By 1856 the number of numismatists in this country showed a dramatic rise from earlier decades. Whereas in the 1840s the number of serious collectors was probably no more than 50, the figure was to grow several fold by the end of the 1850s.

Restrikes and Novodels

Because of the rising demand by the public for old and rare coins, in the late 1850s Mint Director James Ross Snowden decided to restrike a limited number of coins and medals for sale or trade. Snowden was especially interested in building up the national collection (housed in the Mint) and was fairly successful at this until 1860 when scandals forced an end to the program. It should be emphasized that Snowden probably did not profit personally, and his sole motive seems to have been to improve the Mint Cabinet.

Although it is not quite clear just which coins were struck by Snowden, it is likely that his main interests were the Gobrecht dollars of 1836–1839, the half cents of 1840–1848, and the 1856 Flying Eagle cent. There was very strong collector interest in all of these series. It is now known that certain 1836 and 1839 Gobrecht dollars were issued for circulation, but in Snowden's time this fact had been lost sight of, and all considered them patterns. The Proof-only half cents were thought of in the same way. The 1856 Flying Eagle cent was a popular rarity which had been trading for \$1 to \$2 on the market, just a few years after its issue.

Other employees of the Mint were not so high-minded as Snowden and decided that they could sell coins and patterns and pocket the money. One of these individuals was Theodore Eckfeldt (a grandson of Adam Eckfeldt), but names of the others have been lost to history.

About 1858 this group struck at least five of the 1804 dollars, using a second reverse die, and proceeded to sell them to collectors. Snowden learned what had happened and bought back four of the pieces. One was saved for the Mint Cabinet. It is a bizarre piece struck over a cut-down Swiss shooting taler of 1857!

The subterranean group of individuals surfaced

again by striking several more 1804 dollars, among other coins. This time, however, the 1804 dollars were held back until after Snowden retired from the Mint in 1861, and then sold quietly over a period of years. The Class III dollars, as they are now known, had their edge lettering applied *after* striking, a further indication of their clandestine nature.

For those who wish to read more of the diplomatic background of the 1804 dollars or the subsequent numismatic history of the several specimens, the book *The Fantastic 1804 Dollar* by Kenneth E. Bressett and Eric P. Newman, published in 1962, is highly recommended.

CHAPTER 6

The Mint Novodels

1801-2-3-4 DOLLARS

by Q. David Bowers

1801-2-3-4 Novodel Silver Dollars

BB to Bolender Equivalents

Coin	BB#	Bolender#
1801 Proof	BB-301	B-5
1802 Proof	BB-302	B-8
1803 Proof	BB-303	B-7
1804 Class I	BB-304	—
1804 Class II	BB-305	—
1804 Cl. III	BB-306	—

The 1801-2-3-4 Novodels

The so-called Proof “restrike” silver dollars of 1801, 1802, and 1803, and the famous 1804 dollar were never part of the silver dollar mintages of the 1794-1804 era. Rather, they were created at the Mint decades later for numismatic purposes and for presentation, as R.W. Julian has stated.

As each is struck from dies made much later than the dates on the coins, and as no comparable originals were ever produced, they fall into the category of *novodels*. I prefer this term to, for example, “antedated fantasy” (Newman and Bressett referring to the 1804 dollar), *pièce de caprice* (Don Taxay and others), etc., although these terms are also applicable in certain instances.

Over the years, the term *restrike* has been applied to the Proof dollars dated 1801, 1802, and 1803. However, *restrike* implies that originals were made, usually from the same dies, and in the instance of the 1801-2-3 Proofs, there never were original counterparts. These Proofs are believed to have been

made in the 1870s, using a close collar and beaded border process not used at the Mint during the 1801-1804 era, and were struck from dies made not earlier than the 1830s.

Characteristics of the Dies

At this point it is useful to consider the characteristics of the dies from which each of the preceding six issues were made.

Two Reverse Dies

There were two different reverse dies (designated as Reverse X and Reverse Y, per the Newman-Bressett, *The Fantastic 1804 Dollar*, p. 35) used to make the novodels dated 1801-2-3-4, each of the Heraldic Eagle style as first employed in the silver dollar series in 1798 and originally continued in use for silver dollars at the Mint through the end of coinage dated 1803. The dies used to make the novodels were made later, no earlier than the late 1820s (when new technology was first used at the Mint), and certainly no later than 1834, as it is a fact that Reverse X, slightly cracked, was employed in autumn 1834.

I am virtually certain that Reverse X and Reverse Y were made at the Mint at the same time by the same person.

First a description of each:

Reverse X: The reverse is a Mint copy of the Heraldic Eagle reverse type used to coin silver dollars of the dates 1798-1803, but is not precisely identical to any die of that era. It was made by using a Heraldic Eagle punch, and with additional punches adding details including the letters of UNITED STATES OF AMERICA, stars above the eagle, one arrow

(added to 12 already in the punch), and the stems and berries.

Specific descriptions of the punches used to create the die follow:

- 1. The central hub punch, with the Heraldic Eagle motif, included these features: eagle, shield, ribbon in beak, lettering E PLURIBUS UNUM on ribbon (with defect connecting E and P), eight clouds above eagle, leg with claw holding olive branch (without berries), and leg with claw holding 12 arrows. This identical punch, but with the defect connecting E and P in a slightly earlier state, was used to make certain dies originally employed shortly after the turn of the nineteenth century, including the one used to strike the following silver dollar varieties: 1801 BB-212 (intermediate state); 1802 BB-231 (early state), BB-232 (early state), and BB-241 (slightly advanced intermediate state); and 1803 BB-253 (if it exists), BB-254 (slightly advanced intermediate state), and BB-255 (terminal state).

- 2. Individual letter punches (A, C, D, E, F, I, M, N, O, R, S, T, and U) for UNITED STATES OF AMERICA, an early font of the style used c. 1798-1803 at the Mint, distinguished by having a lopsided T (right arm heavier than left), small top space in A, etc.

- 3. Star punch, small and with six points. Used for punching the 13 stars above the eagle, in an arc pattern arranged 6-5-2 (this pattern is seen on both Reverse X and Reverse Y).

- 4. Berry punch, for adding five berries to the olive branch.

- 5. Berry stem punch, for adding a tiny stem to each berry.

- 6. Tiny arrowhead(?) punch, made up separately, longer, narrower, and more tapered than the stock arrowheads on the Heraldic Eagle punch. Used for adding the missing 13th arrowhead to the arrow cluster.

As each of the aforementioned punches was applied separately to the working die, the positional relationships among the elements vary. Thus, Reverse X has positional differences in comparison to Reverse Y.

Idiosyncrasies of Reverse X include:

The A in STATES straddles clouds 3 and 4; the O in OF is entirely over cloud 7. Arc star pattern as standard after 1798 is used; the 13 stars were punched individually. The letters in UNITED

STATES OF AMERICA in the same general font as used 1798-1803, were punched individually into the die. The 13th arrow shaft was added to the die by hand and is found to the right of the two leftmost arrow shafts. On Reverse X the 13th arrow is shorter than on Reverse Y, thus placing the arrowhead in a slightly different position. The top right berry is slightly lower on the branch than is the top left berry. The border denticles are more bead-like (later style) than tooth-like (original style).

The Reverse X die was used to strike 1801, 1802, 1803, and 1804 Class I novodel silver dollars.

Reverse Y: The reverse is another Mint copy of the Heraldic Eagle reverse type used to coin silver dollars of the dates 1798-1803 and, like Reverse X, is not precisely identical to any die of that era. In every instance, the punches used on Reverse Y were the same as Reverse X, and were in the same condition when used to make the die. This is an important consideration, for had Reverse X been made years earlier than Reverse Y, some punches may have deteriorated by the time Reverse Y was made.

Idiosyncrasies of Reverse Y include:

The A in STATES is centered over cloud 3. O in OF over junction between clouds 7 and 8. Arc star pattern as standard after 1798 is used; the 13 stars were punched individually. The letters in UNITED STATES OF AMERICA in the same general font as used 1798-1803, were punched individually into the die. The 13th arrow shaft was added to the die by hand and is found to the right of the two leftmost arrow shafts. On Reverse Y the 13th arrow is longer than on Reverse X, thus placing the arrowhead in a slightly different position. Top right berry slightly higher on branch than top left berry. The border denticles are more bead-like (later style) than tooth-like (original style).

Reverse die used to strike Class II and III 1804 novodel silver dollars.

Reverse X and Reverse Y compared:

In summary, positional differences on Reverse X and Reverse Y are compared as follows:

- Lettering around the border:

Reverse X: The A in STATES straddles clouds 3 and 4; the O in OF is entirely over cloud 7. Left side of left foot of first A in AMERICA embedded in feather. Tops of N and I in UNITED widely separated from each other (in comparison to Reverse Y).

Reverse Y: The A in STATES is centered over cloud 3. O in OF over junction between clouds 7 and 8. Left side of left

foot of first A in AMERICA just touches feather. Tops of N and I in UNITED close to each other (in comparison to Reverse X). As the letters were punched individually, there are numerous other points of difference in letter spacing, alignment, etc., between Reverse X and Reverse Y.

• Stars above eagle:

Reverse X: Cloud 1, one point of star touches, with point to its right having a distinct separation from the cloud. Cloud 3, no point of star touches. Cloud 8, one point of star touches. As each of the 13 stars was punched individually, there are numerous other points of difference between Reverse X and Reverse Y.

Reverse Y: Cloud 1, one point of star touches, with point to its right touching or extremely close, no distinct separation. Cloud 3, one point of star touches. Cloud 8, two points of star touch. As each of the 13 stars was punched individually, there are numerous other points of difference between Reverse X and Reverse Y.

• 13th arrow:

Reverse X: 13th arrow, actually just a tiny arrowhead, is superimposed on the third shaft from the left, and is under the left side of the fourth large arrowhead (counting from the left), about 2/3 of an arrowhead's distance below it.

Reverse Y: 13th arrow, likewise just a tiny arrowhead, is also on the third shaft from the left, but is slightly larger and just below the left side of the fourth large arrowhead, nearly touching it.

• Berries and their stems:

Reverse X: The top right berry is slightly lower on the branch than is the top left berry. Each of the three middle berry stems (excluding the lowest and highest stem) has a microscopic trace of the stem punch protruding from the other side of the olive branch. The topmost berry stem goes *on top* right of the berry (instead of connecting to its outside border) and appears quite curious under high magnification. The berry stems are longer than on Reverse Y.

Reverse Y: The top right berry is slightly higher on branch than is top left berry. The berry stems are shorter and more carefully punched into the die than on Reverse X.

• Denticles around the border:¹

Reverse X: 188 rounded denticles of a modern (c. 1830s) style, unlike those used on original Heraldic Eagle dollars.

Reverse Y: 184 rounded denticles of a modern (c. 1830s) style, unlike those used on original Heraldic Eagle dollars.

Commentary: Both Reverse X and Reverse Y were given polished mirror fields and, as such, were intended to produce specimen (Proof) coins for numismatic or presentation purposes.

As noted, Reverse X is known to have been employed at least by autumn 1834, when it was mated with the 1804 dollar obverse die and used to create an 1804 dollar for presentation to the King of Siam.

By that time, the reverse die had cracked through NITED, indicating that it may have been used prior to autumn 1834 for other coinage. Alternately, it could have cracked in hardening. That this break is partially circumferential and not linear through the die face supports this idea.

So far as is known, Reverse Y was not used until circa 1858, when it was used to make 1804 Class II and unfinished Class III dollars.

Four Obverse Dies (Order of Use)

To strike the Proof novodels dated 1801, 1802, 1803, and 1804, four different obverse dies, one for each date, were utilized. As it developed, each of these four obverses was mated with Reverse X, but only the 1804 obverse was mated with reverse Y.

All known novodels struck from Reverse X have the die break through NITED. This die break was "active" and increased in its length as the die was used. A study of this die break reveals that obverse dies were mated with it in the following order:

• First mating: 1804 die. In this mating (as exemplified by examination of the King of Siam 1804 dollar) the break extends just slightly more than a denticle's width past the D in UNITED. This is the earliest die break seen. Thus, the 1804 must have been struck before the following. As the King of Siam 1804 dollar is known to have been struck in late 1834, this die was in use in 1834.

• Second mating: 1802 die. In this mating, the break is known extending farther past D, ending, and then resuming to continue to the bottom of the leftmost wing feather (the break is probably continuous to the feather, but so subtle that for a small distance it cannot be seen); and on another 1802 specimen, extending uninterruptedly from the D to the lowest wing feather. Thus, 1802 must have been struck after the 1804 dollars. The year in which this die was used is not known from evidence presented thus far, but the coins had to have been struck no earlier than late 1834.

• Third mating: 1803 die. In this mating, the break from D to the leftmost wing feather is continuous and very distinctive. In addition, all known 1803 novodels have a linear depression on the reverse in the field below UM of UNUM, from a piece of for-

¹ Denticle count from Newman-Bressett, p. 51.

1804 Class I Silver Dollar

Obverse of 1804 Class I silver dollar, the “King of Siam” specimen, glittering Proof. Note the denticles, which are beaded and are much more symmetrical than those of early issues. The left tip at the top of Miss Liberty’s hair curl is missing. A delicate die crack is seen through the tops of the letters LIBERT. This die was cut at the Mint sometime between 1831 and 1834.

1804 Class I Silver Dollar

Reverse of the "King of Siam" Class I 1804 silver dollar. There are many differences between this and the Class II and III. Note the position of the A in STATES in relation to the clouds below it, the distance between the right foot of the final A of AMERICA and the eagle's claws, and the position of the star points below cloud 8. By comparing this to the illustration of the Class II and III reverse other differences can be seen as well. This die was cut at the Mint circa 1831-1834.

1804 Class III Silver Dollar

1804 Class III silver dollar, from The Harry Einstein Collection, Lot 1736. The obverse is from the same die as the Class I. Six specimens of the Class III dollar are known today, compared to eight of the Class I. It is believed that Class III dollars were made at the Mint in the early 1870s. To aid in their sale they were given various phony pedigrees.

1804 Class III Silver Dollar

Reverse of the Class III 1804 silver dollar from The Harry Einstein Collection, Lot 1736. Compare this to the illustration of the Class I dollar, noting the position of the A in STATES in relation to the clouds below it, the distance between the final A in AMERICA and the eagle's claws, and other differences. The dollar shown above is slightly double struck, which can be noted at the top of the eagle's sinister wing and at the stars to the left and right of the eagle's head.

eign matter adhering to the die. This also is found on all known 1801 novodels, but not on 1802s. The year in which this die was used is not known from evidence presented thus far. However, the presence of this piece of foreign matter in the die suggests that the 1803 and 1801 novodels were struck at the same time.

- Fourth mating: 1801 die. This attribution is tentative. Photographic evidence indicates the obverse die crack may be in a slightly later state.

Provisional conclusions: The conclusions summarized to this point are as follows:

- The 1804 was struck first, and was struck no later than autumn 1834.

- The 1802 was struck next, at an unknown date, but not before the King of Siam 1804 was struck in late 1834.

- The 1803 was struck next, at an unknown date, after the 1802 novodels were struck, in the same press operation as the 1801 striking (as evidenced by foreign matter on the reverse die), but before the 1801s were made.

- The 1801 was struck next, at an unknown date.

Four Obverse Dies (Characteristics)

One of the most interesting aspects of the 1801-2-3-4 novodels is that just as the dies were not used in the sequence of 1801, 1802, 1803, and 1804, neither were the dies manufactured in that order. In fact, the dollar with the earliest date, 1801, was the last made. As the first step, it is useful to consider the elements of which each die was composed. The obverse dies have the following characteristics:

1802-3-4 obverses: Each obverse die (except 1801) utilized these separate punch elements:

- 1. The central hub punch, with the Draped Bust motif, as used to prepare dies for original dollars bearing dates from 1795 to 1803.

- 2. Individual letter punches (B, E, I, L, R, T, and Y) for LIBERTY, an early font of the style used c. 1798-1803 at the Mint, distinguished by having a lop-sided T (right arm heavier than left), small top space in A, etc., and curves to the inside of the serifs. These punches are from the same letter font used to produce Reverse X and Reverse Y.

- 3. Star punch, large (in comparison to the star punch used on the reverse) and with six points.

- 4. Four numeral punches for the date. These are

from original punches (including large 3 punch for 1803), except for the 2 in 1802, which is from a new punch with a fancy top, similar to that used on 1820 half dollars, but unlike any punch found on an original 1802 silver dollar; and the 4 in 1804, as no numeral 4 was ever originally used on Draped Bust dollar coinage. The 4 is of the plain (not crosslet) type and may be of a later manufacture, as the taper to the bottom serif does not match, for example, that on the digit 1, and because *most* original coinage of 1804, including the large-diameter \$10 gold issue, used the crosslet 4 design.

1801 obverse: The 1801 obverse die alone used these separate punch elements:

- 1. The central hub punch, with the Draped Bust motif, as used to prepare dies for original dollars bearing dates from 1795 to 1803. This is the same punch used on the novodels dated 1802-3-4.

- 2. Individual letter punches (B, E, I, L, R, T, and Y) for LIBERTY, from a later font and of a different style from that used either at the Mint c. 1798-1803 or on reverses X and Y or the 1802-3-4 novodels. On the 1801 die, the letters in LIBERTY are more angular, without curves to the inside of the serifs.

- 3. Star punch of a different type. The stars on the 1801 are entirely unlike any used on original early silver dollars or the novodels of 1802-3-4. On the 1801, the stars do not have narrow, somewhat delicate points. Instead, the stars are, as Newman and Bressett relate, heavy with 60° angles to the points, somewhat like a traditional Star of David. This type of star was used on mid-nineteenth century coinage, but not on earlier dies.

- 4. Three numeral punches for the date (the 1 was repeated), of a more modern type unlike that used at the turn of the nineteenth century. The 1 tapers down at its top, the 8 is squatter and differently proportioned, and the 0 has straight left and right sides to its interior space.

Four Obverse Dies (Order of Manufacture)

Now, I endeavor to determine the order in which the 1801, 1802, 1803, and 1804 obverse dies were *made* (which differs from the sequence in which they were *used*). Fortunately, the Draped Bust design punch provides a valuable clue. On the 1802 and 1803 dies, the punch impression is complete. The left tip of the highest wave of hair is there, and is well

defined.¹ However, on the 1801 and 1804 dies, the left tip of the highest wave of hair is missing. These dies were thus raised from a broken punch, and made later than the 1802 and 1803. To this point the following conclusions can be made:

- Dies made earlier: 1802 and 1803.
- Dies made later: 1801 and 1804.
- As the 1804 die was in use by autumn 1834 (to strike the King of Siam dollar), and as the 1804 die was made later than the 1802 and 1803 dies, the 1802, 1803, and 1804 dies were all in existence by autumn 1834.

The 1801 is a mystery at this point. I suggest that it was made at a *substantially* later date, when the letter, star, and numeral punches used to make the 1802-3-4 dies were no longer available. If it had been made prior to autumn 1834, contemporaneously with the 1802-3-4 dies, there is no reason why it would not have employed correct letters, stars, and numerals. If this conjecture is accepted as correct, then the order of manufacture of the dies was as follows:

- 1802 and 1803, from unbroken Draped Bust punch, contemporary letters, stars, and numerals.
- 1804, from broken Draped Bust punch, contemporary letters, stars, and numerals.
- 1801, from broken Draped Bust punch, modern letters, stars, and numerals.

Now follows a brief review of each obverse die:

1801 Obverse Die

The obverse of the 1801 novodel is anomalous. The stylistic differences between this issue and the novodels of 1802-3-4 are several and are important. One can conclude that this die was made casually, without any special effort to imitate an original die of the 1801 era.

The 1801 has curved-top 1's in date, quite unlike the straight-top 1's of the early 1800s.

The stars on the 1801 are entirely unlike any used on original early silver dollars or the novodels of 1802-3-4. On the 1801, the stars do not have narrow, somewhat delicate points. Instead, the stars are, as Newman and Bressett relate, heavy with 60° angles

to the points, somewhat like a traditional Star of David. Viewed from the top, each star seems to be composed of six diamond-shaped "pieces" fitted into a star-shaped pattern, much as might be seen in a puzzle or Pennsylvania Dutch hex sign (this distinction is more obvious in the seeing than in the telling). The result is that to the eye the stars on the 1801 novodel appear heavier and more solid.

The letters in LIBERTY are more angular, without curves to the inside of the serifs. A different letter punch font was used to make the obverse of the 1801 novodel, in contrast to the traditional, early font (with curves to the inside of the serifs) employed on the novodels of 1802-3-4.

In addition, the obverse die has these characteristics: On the left, the stars are fairly evenly spaced, with excellent alignment of the star points. On the right, the star spacing is also of a high order, except that stars 11 and 12 are slightly closer together than are the other pairs. The alignment of the star points is excellent. The letters in LIBERTY are well spaced and aligned. The obvious conclusion is that the die represents the work of a skilled craftsman.

As is the case with all 1801-2-3-4 novodels, the denticles on the borders are bead-like (rather than the tooth-like style used in the early 1800s).

The left tip of the highest curl is missing, a flaw caused by a broken portrait punch. This flaw also is represented on the 1804 novodels, but not the 1802 and 1803.

DIE STATES (obverse and reverse die states):

Die State I: Obverse without cracks. Reverse with tiny crack through NITED to wing tip. May not exist with perfect obverse die.

Die State II: Crack from below bust through the bottom of the date through the stars on the left (description from Newman-Bressett, 1962). Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather Cf. Newcomer specimen.

Die State III: Additional crack from below right side of bust, through the date, and continuing through stars 1 through 8. Reverse with new (and fatal) crack from bottom border, through eagle's claw and arrows, left side of shield, to eagle's breast. Cf. Carter specimen. This state undoubtedly represents the last striking of *any* 1801-2-3-4 novodel from this reverse die.

¹ It has been suggested that the hair tip was added to the 1802 and 1803 dies by hand retouching. However, this is not the case, as examination of the coins themselves, as well as inspection of photographic overlays, reveals that the hair tip is absolutely identical on the 1802 and 1803, something that would not be possible if they had been retouched individually. Moreover, the hair tip is identical to that found on original early Draped Bust dollars.

Note: All known 1801 and 1803 Proof dollars (but not 1802 or 1804) have a small linear depression in the space between UM in UNUM and the shield from a piece of metal or other foreign material on the die face during striking.

1802 Obverse Die

The 2 in date is curled at top, differing from any original 1802 obverse, and of the same “fancy” or curlicue style seen on certain 1820 half dollars (but half dollar dies were made from a smaller punch). Star 1 is about the same distance from the second curl as star 7 is from L. The star positioning is cruder than any original dollar of this date. On stars 1 to 7, *all* points closest to adjacent stars are misaligned! Obviously, whoever made this die was not accustomed to this work. On the right, the stars are aligned better, but this is ruined by something else that never occurred on an original of this date: stars 12 and 13 are so close that they actually touch at their inner points! One is tempted to speculate that as the 1802 and 1803 obverses were the first novodels made, this 1802 was the very first, and represented the diecutter “warming up.”

Highest curl centered below the E in LIBERTY. Raised border with denticles made up of truncated bead-like denticles quite unlike the tooth-like denticles of original dollars of the Draped Bust type. Original 1, 8, and 0 punches from the early 1800s were used to make the die. Digit 2 copied from one of the “fancy 2” digits used on half dollars of the 1820s, as noted. Perfect die without cracks.

The top left curl tip is intact on the 1802 (and 1803) novodels, whereas on the 1801 and 1804 issues it is missing (due to hub damage). Thus, the 1802 and 1803 dies were made before the others. Possibly, the 1802 was made first, then the 1803.

DIE STATES (obverse and reverse die states):

Die State I: Obverse without cracks. Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather. (Cf. Cleneay and Wilharm specimens)

1803 Obverse Die

Large 3 as on the 1803 Large 3 dollar (B-6) but from a new die. Stars on left are much better aligned than on the obverse of the 1802 novodel. On the 1803, the spacing is fairly good, but stars 3 and 4 are wider apart than are any others. Star 1 is closer to the second curl than star 7 is to L. On the right, the stars are well spaced and aligned.

Highest curl on top of head about centered under upright of E, and next top curl centered under R. A small raised line is present just above the obverse center dot; *heavy* rust marks around star four and light rust marks at the 18 in the date, *possibly indicating the die was used long after it was made*. The die was made by using original number punches from the early nineteenth century. Raised border with denticles made up of truncated beads.

The top left curl tip is intact on the 1803 (and 1802) novodels, whereas on the 1801 and 1804 issues it is missing (due to hub damage). Thus, the 1802 and 1803 dies were made before the others.

DIE STATES (obverse and reverse die states):

Die State I: Obverse without cracks. Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather. Apparently, struck about the same time as the 1802 Proof novodel. All specimens seen have raised spots, from heavy die rust, on and near star 4 and similar marks between the 1 and 8 in 1803, indication that the novodels were struck measurably later than the time the obverse die was prepared. Although dies could rust quickly in the humid Philadelphia summer weather, *deep* rust pits such as these must have taken years to form.

Note: All known 1801 and 1803 Proof dollars (but not 1802 or 1804) have a small linear depression in the space between UM in UNUM and the shield from a piece of metal or other foreign material on the die face during striking.

1804 Obverse Die

A later (circa 1830s) Mint copy of the general type with Draped Bust original used 1795-1803, with bust of Miss Liberty at the center, 7 stars left and 6 right, LIBERTY above, and the date 1804 below. Later (as used in the 1830s) style of denticulated border.

On the left, stars 1 and 2 are spaced closer together than are any of the others. Stars 2-3 and 4-5 are more widely spaced than any others. On the right, stars 12-13 are the closest together, and stars 10-11 have the widest separation. In LIBERTY, the I is tilted slightly to the right, with the left bottom serif being slightly too high, and the right bottom serif slightly too low.

The left tip of the highest curl is missing, a flaw caused by a broken portrait punch. This flaw also is represented on the 1801 novodel, but not the 1802 and 1803.

DIE STATES:

Die State I: Perfect obverse die without cracks. Perfect re-

verse die without cracks. May not exist.

Die State II: Mint Collection specimen: Obverse: Break from outer point of star 6, touching same point of star 7, ending at upper left serif of L; another in field just left of upper left serif of L, through tops of LIBERT ending above center of T. Also, tiny crack connects tops of TY. (Data from Michael Hodder, who inspected the coin.)

Die State III: King of Siam specimen: Obverse: With hairline crack beginning to the left of the top of L in LIBERTY, about 60% of the way toward the nearest upper point of star 7, and in line with the top of the L, extending through LIBER, to top of the left upper serif of T, then at a slight angle toward the border, ending above the junction of the upright of T and its left arm. Reverse: With hairline crack from top right serif of N, sloping slightly downward through ITED, and ending just past the left edge of the second denticle past the D. Crack resumes, and is hardly visible, at the leftmost feather. Struck prior to the 1802 and 1803 Proof dollars. The King of Siam coin may have been struck earlier than the Mint specimen. (Data from inspection of coin.)

Why Were 1801-2-3-4 Novodels Made?

This question is now posed: Why were the 1801, 1802, 1803, and 1804 novodels made? I include the 1801-2-3 dates, in addition to 1804, as the obverse dies for each were in existence by autumn 1834, and at least the 1804 obverse in combination with Reverse X had actually been used for coinage by that time.

Silver dollar mintage anticipated in 1831: Inasmuch as the coins display Proof surface, this indicates that they were made for display or numismatic purposes. Up to that time (1834) it had not been the practice to strike Proof coins for use in circulation. In my opinion, the answer lies in what R.W. Julian has stated in Chapter 5:

On April 13, 1831, Mint Director Samuel Moore, in office since the death of his predecessor Robert Patterson in 1824, wrote Treasury Secretary S.D. Ingham that the Mint had actually received for deposit a large parcel of Spanish dollars that had originated in Canton. Moore had made inquiries and found that this was not the first occasion of silver being shipped to America from the Orient.

In view of this change in commercial practice, Director Moore asked the Treasury to transmit to President Andrew Jackson a request that the 1806 prohibition against dollar coinage be lifted and the Mint given permission to resume production. On April 18 the Treasury replied, saying that the president had approved the request.

Based on the die progression of the 1804 dollar hubs as compared to the 1801-1803 Proof "restrikes" (novodels), it seems likely that Director Moore ordered Chief Coiner Adam Eckfeldt, whose department prepared working dies in those days, to make up several dollar dies. It appears that four obverses were made as compared to two reverses. The intent seems to have been to have two pairs with an additional two obverses for emergency purposes. One of the obverses, later

to be used for the 1801 Proof novodel, did not have stars, date, or even carry the word "LIBERTY."

These dies used the old Liberty head and eagle hubs last used for the dies of 1803, but also incorporated certain changes, such as a beaded border, introduced by Engraver William Kneass in 1828. This, of course, shows only that the dies could not have been made before 1828 and does not prove that they were made in 1831.

There was no dollar coinage in 1831 because the odd shift in commercial patterns went back to the old way by the summer of that same year. One assumes that Moore made further inquiries and found the situation was rather unstable and that exporters had now gone back to the familiar process of sending Spanish (or Mexican) dollars to China for goods.

The hubs and implements already existed for Draped Bust obverse, Heraldic Eagle reverse dollars. The design, however, was obsolete and had not been used on any American coinage after the passing of the 1808 half cent (on silver coinage, the final use was the 1807 dime, quarter, and half dollar). Consulting Mint production records, Chief Coiner Adam Eckfeldt learned that the final years in which silver dollars of that design had been made, starting with the latest, were 1804, 1803, and 1802. He had no way of knowing, nor did anyone at the Mint remember, that the dollars struck in 1804 were not dated 1804.

Dies on hand at the Mint in 1831: Two reverse dies (designated by Eric P. Newman and Kenneth E. Bressett as X and Y, as earlier noted) were prepared, and three obverses. The latter were made in this order: 1802-1803 from a perfect Draped Bust punch, and 1804 from a broken punch. It is possible that another obverse was made, but with just the bust of Miss Liberty, without surrounding stars, letters, or date. Per this scenario, on hand in the Coining Department at the Mint in 1831 were the following dies:

Incomplete Draped Bust obverse.

1802 Draped Bust obverse.

1803 Draped Bust obverse.

1804 Draped Bust obverse.

Heraldic Eagle reverse "X"

Heraldic Eagle reverse "Y"

As we know that as of autumn 1834, no 1802 or 1803 Proof dollars had been struck, the only logical assumption is that any dollars minted from 1831 to 1834 had to have borne the date 1804. If Chief Coiner Eckfeldt was called upon to make just a few strikings of a new silver dollar for display, or for use with congressmen, he may have considered it appropriate to select the most recent date, 1804. The 1802 and 1803 dies were left unused, and, as R.W. Julian

has stated, the die that was later to become the 1801, by this time had no date, stars, or lettering—it contained only an impression of the Draped Bust motif. It is also possible that the 1802 and 1803 dies had not yet received their dates.¹

As of 1834, there was no special numismatic value attached to an 1804 silver dollar. Coin collecting was in its infancy, and what few numismatists there were, contented themselves with acquiring as many different dates of cents, dollars, or whatever, as they could find. There were no published lists of what United States coin dates were struck, and their values. No collector had an 1804 in his cabinet, but this does not mean that the 1804 was missed.

1804-dated dollars struck: In the meantime, as has been related in Chapter 5 by R.W. Julian, and elsewhere by others, including Newman and Bressett in their 1962 book, *The Fantastic 1804 Dollar*, a call came in 1834 for two display sets of United States coinage, and in 1835 for two more. It is known that the 1834 sets contained Proof 1804 dated dollars from the novodel obverse and Reverse X, and it is believed that the 1835 sets, now untraced, did as well. By autumn 1834, the 1804 dollar obverse die and its companion reverse die had already been used for coinage, as evidenced by the Mint Collection specimen of the 1804 dollar, furnished by Chief Coiner Adam Eckfeldt, which is of a slightly later die state than the King of Siam coin (as evidenced by a shorter die break on the obverse).

Presumably, had anyone applied to Eckfeldt for a specimen silver dollar at any time between 1831 and 1834, one would have been provided for face value, possibly plus a small preparation charge. The Mint was very accommodating in such matters. It is a well-known story that in 1827, Joseph J. Mickley received at face value from the Mint four Proof quarters of that year.

Robert Gilmor, Jr., a Baltimore collector who had one of America's finest cabinets and who numbered among his possessions a 1787 Brasher gold doubloon, wrote the following to Roberts Poinsett (who was contemplating the founding of the National Institute for the Promotion of Science, such to include a coin collection) on April 14, 1841:²

The Mint has aided me considerably, and has even provided desiderata from the old dies, when I require it—Mr.

Eckfeldt of the Mint has been of great service to me, and was stimulated by my attempt to commence one for the Mint itself, which really ought not to be without a specimen of every one of its coins—by timely attention to the subject whoever has charge of the department may soon make a considerable advance towards obtaining those in circulation, but no time should be lost, as the old gold coin is gradually disappearing by being coined into the new. The Mint would no doubt aid you in this, and coin your deficiencies.

Possibly, the Mint would have coined an 1804 dollar for Gilmor, had he requested one, but, there is no record of such a request having been made. Certainly, Eckfeldt seemed to be quite agreeable on such matters.

In June 1838, Adam Eckfeldt established the Mint Cabinet, aided by a modest appropriation from Congress. The action could have been at the suggestion of Gilmor, but probably not specifically, as Eckfeldt had maintained an interest in numismatics for many years previous. He transferred to the Cabinet a collection of United States coins he had formed by saving specimens as they were struck, and from pieces extracted from bullion deposits made at the Mint, which had been continuous ever since the Mint first started striking silver coins in 1794. After the Act of June 28, 1834, lowering the weight of gold coins, countless examples of heavier "old tenor" gold issues came to the Mint for melting; Gilmor made a reference to this in the 1841 quotation above.

1804 dollar recognized as rare: In 1842, Eckfeldt and William E. DuBois, assayer at the Mint, published the *Manual of Coins of All Nations*, which illustrated on Plate II a Draped Bust silver dollar bearing the date 1804, the first book published in the United States relating to American numismatics. The volume achieved fairly wide sale (judging from the number of copies still in existence today), and helped to popularize the young hobby of coin collecting. Soon, collectors who assembled holdings of silver dollars by date realized that an 1804 dollar existed, as illustrated. They desired to own one. Of course, bullion dealers, banks, and exchange houses—the traditional sources for silver dollars for collections—could not supply an 1804, as none was ever circulated.

Eckfeldt and DuBois realized that they had a profit-making potential on their hands, if not for them personally, then certainly as a way to add

¹ Possibility suggested by Harry E. Salyards, M.D., letter to the author, January 15, 1993.

² As quoted by Dr. Joel J. Orosz in his article, "Robert Gilmor, Jr. and the Cradle Age of American Numismatics," *Rare Coin Review* No. 58, 1985, p. 19.

needed pieces to their pet project, the ever expanding Mint Cabinet. Apparently, the first opportunity to dispose of an 1804 dollar at a meaningful advantage took place on May 9, 1843, when Massachusetts numismatist Matthew A. Stickney visited the Mint and obtained an 1804 dollar in exchange for a 1785-dated IMMUNE COLUMBIA token struck in gold.¹ The token was larger than a current \$5 gold piece, and for gold value alone represented a profit of several hundred percent over the face value of the 1804.

There is no indication by die rust marks, documentation, or any other evidence that 1804 dollars struck using Reverse X were ever made later than the 1830s, perhaps with the exception of the Parmelee coin (for reasons to be given below).

A question of weight: At the Mint at any given time, a silver dollar currently being struck under official auspices would be made to the prevailing standard of weight. Until January 18, 1837, the authorized weight of the silver dollar was 416 grains. After that date, the legal weight was 412.5 grains.

Presumably, any 1804 dollar struck officially at the Mint before January 18, 1837—and it is to be remembered that during this period there still was no premium value attached to the 1804 dollar—would have been struck to the 416-grain standard. Any specimen struck after January 18, 1837 would have been made to weigh 412.5 grains.

An examination of the weights of 1804 dollars made by combining the 1804 novodel obverse with Reverse X (known as Class I 1804 dollars), as listed by Newman and Bressett, reveals the following:

Mint Cabinet coin: 415.2 grains. Within legal tolerance for pre-1837 coinage.

Siam coin: 415.5 grains.

Waters coin: 416.7 grains.

Stickney coin: 415.3 grains. Within legal tolerance for pre-1837 coinage.

Cohen coin (worn down to the VF level): 410.21 grains. Original weight not known.

Mickley coin: 416.4 grains. Within legal tolerance for pre-1837 coinage.

Parmelee coin: 412 grains. (per Newman-Bressett.) Within legal tolerance for *post*-1837 coinage.

Dexter coin: 415.8 grains. Within legal tolerance for pre-1837 coinage.

Not including the worn Cohen coin, it seems that all known 1804 dollars of the Class I type are of the

pre-1837 standard. The unworn, high-grade Proof Parmelee Collection coin is a likely candidate for having been struck after January 18, 1837. If this is the case, then the obverse die break should be at least equal to, and perhaps greater than, the largest extent of the break as found on any 416-grain standard Class I dollar. The Parmelee catalogue mentions a break through the tops of LIBERTY.

A Scenario for Class I 1804 Mintage

It seems likely that a batch of 1804-dated dollars was made in the early 1830s, probably all within a short time frame. With the possible exception of the Parmelee coin, none seems to have been struck after January 18, 1837.

I suggest that a group of 1804 dollars was made in the early and/or mid-1830s as noted, and whatever remained (after diplomatic gifts and other dispersals during the early years) as “working stock” was used by Eckfeldt and DuBois for disposal as they saw fit.

As to the Parmelee coin, in *The Fantastic 1804 Dollar*, p. 123, this comment is found: “It has been stated that a lady obtained this dollar from the Mint during the period of President Polk’s administration (1845-1849).” If, indeed, a lady had visited the Mint circa 1845-1849 and had sought an 1804, and if all had been disposed of from the “working stock” before then, another coin could have been struck for her—using available planchet stock of 412 grains weight.

I can find no evidence, nor does the literature indicate, that there was any chicanery, deception, fraud, or anything else misleading in the *original distribution* of the Class I 1804 dollars. This was to change in later years, however, when certain Mint officials issued affidavits and statements to the effect that such coins absolutely and positively were struck at the Mint in the year 1804, not at any other later date!

What happened to the obverse dies of the 1802-3-4 novodels and Heraldic Eagle reverses X and Y after the striking of the Parmelee coin (or whatever coin was the last to be made) is not known. Apparently, the 1804 obverse and the not-yet-used Reverse Y were kept together in one location at the Mint, and the 1802 and 1803 novodel obverse dies, and Reverse X, were kept together in another place.

¹ The story of the Stickney exchange with the Mint was related by Henry Chapman in connection with the sale of the Stickney 1804 dollar in Chapman’s June 1907 auction. Newman and Bressett devote a chapter to the transaction.

The Mint Scene in 1858

By 1858, numismatics was a booming hobby. A strong demand had built up for scarce and rare dates in nearly all copper and silver series (but not gold, due to the expense of the face values involved). Key issues such as large cents dated 1793, 1799, and 1804 sold for several dollars each or more, and even the relatively recent 1858 Flying Eagle cent sold for over a dollar.

James Ross Snowden: Also in demand were half cents of rare dates in the 1840s, quarter dollars of 1827, and other issues considered to be hard to find. At the Mint, Director James Ross Snowden, himself a dedicated numismatist (and who would write two excellent numismatic books, one published in 1860 and the other in 1861),¹ was very interested in and proud of the Mint Cabinet, and advertised that he would give coins in exchange for Washington tokens and medals needed for the Mint display. He looked forward to February 22, 1860, the day that the Washington collection section of the Mint Cabinet would be dedicated in a special ceremony (and for which the Mint issued a beautiful medal).

While it has not been suggested that Snowden made additional 1804 silver dollars, it is believed that he allowed the restriking of 1836-8-9 Gobrecht dollars, 1856 Flying Eagle cents, and certain other rarities. If these restrikes were not done officially, then, at least, he filed no objection to them. It is quite possible that these were made for private profit of Mint employees, with Director Snowden looking the other way. This had ample precedent. In the past, until his dismissal for the practice (among others) in 1854, Franklin Peale, one of the Mint's most valued employees, used Mint facilities to create dies and strike medals for private clients. Chief Engraver James B. Longacre accepted private commissions for die preparation, as, for example, Dubosq & Co. California gold coin dies (as evidenced by die trials in the Longacre estate effects preserved in the Ridgway Library, Philadelphia).

Snowden proposes to restrike rarities: That Snowden considered it proper to strike rarities for collectors is evidenced by a letter from him, dated January 22, 1859, to Secretary of the Treasury Howell Cobb, noting that dealers were selling "pat-

tern pieces of coin, and rare types" at "excessive prices," and proposing "to check this traffic, and at the same time to gratify a taste which has lately greatly increased in this country, and seems to be increasing every day, namely, by striking some of each kind and affixing a price to them, so that the profits may inure to the benefit of the Mint Cabinet of Coins and ores which is the property of the U. States; an exact account of which will be kept and rendered to the Department."²

No reply to this letter exists in the National Archives, and it is not known what Secretary Cobb's response, if any, was. The letter does show that Snowden believed that profits from coining rarities should be for the benefit of the Mint Cabinet, a selfless position.

A clandestine coinage: Unbeknownst to Director Snowden, one or more people with access to Mint dies gained unauthorized, temporary possession of the 1804 novodel obverse and Reverse Y and proceeded to strike coins.³ The job was an amateurish one. Apparently, the clandestine coiners did not have access to Mint planchet stock, which was kept under lock and key. Accordingly, they struck at least one coin by using an 1857 Swiss 5-franc taler, filing off the edge device, and overstriking it with the 1804 obverse and the hitherto unused Reverse Y, creating what have been called Class II dollars.

Newman and Bressett present evidence that five newly made plain-edge Class II 1804 dollars were taken outside of the Mint, several of which were sold to collectors for \$70 to \$75 each. In an interview in 1880 with then-director of the Mint, Archibald Loudon Snowden (nephew of James Ross Snowden), S.K. Harzfeld, Philadelphia coin dealer who crusaded against Mint abuses, learned the following:⁴

About this period [c. 1858] an old employee of the Mint, a relative of one of the first and most valuable officers of the Mint, who had charge of the dies in the engraver's department, was discovered by the sales made by an erring son to have taken impressions from 1804 and some other dies. On this discovery vigorous efforts were put forth to recover the coins, and it is believed that most, if not all, were returned and destroyed, and precautions were taken to prevent a recurrence of like error. Several of these dies were destroyed, and the balance—four or five in number—were boxed and sealed up and placed in the director's vault.

¹ *A Description of Ancient and Modern Coins in the Cabinet Collection at the Mint of the United States, 1860. The Medallion Memorials of Washington in the Mint of the United States, 1861.*

² Letter quoted in Newman-Bressett, p. 78.

³ Expanded details are given in Newman-Bressett, pp. 75 ff.

⁴ *Ibid.*, p. 81, also the source for the Mason quotation.

In later reminiscences, Philadelphia dealer Ebenezer Locke Mason stated that at his store he "was offered by young Eckfeldt three genuine U.S. 1804 dollars at \$70 each and nearly all the rare 1/2 cents in dozen of duplicates were purchased."

Newman and Bressett identify George J. Eckfeldt, who had been employed at the Mint since 1830 and who was Engraving Department foreman in 1858, as the man responsible for the restriking, and his "erring son" as Theodore Eckfeldt (1837-1893). Walter H. Breen has called the father-and-son team of George and Theodore Eckfeldt the "Midnight Minters."

Only one 1804 Class II dollar is known today, and is in the Mint Collection on display at the Smithsonian Institution.

It is quite probable that the 1804 Class III dollars were also struck at this time. See later description of Class III pieces.

Breen on the "Midnight Minters": Walter H. Breen has commented as follows concerning the Eckfeldts:¹

Few people at the Mint would have had ready access to blank planchets as it was Mint practice to treat second process (upset rims) planchets of *silver or gold* as money. As this did not apply to base metals, clearly the "Midnight Minters" [Theodore and George Eckfeldt] could have easily made copper coins and "trial pieces." I therefore postulate that the "Midnight Minters" had to obtain silver or gold planchets from outside the Mint, and that this fact (for fact it certainly is; witness the 1804 overstruck on an 1857 Bern shooting taler, an extant 1838 Gobrecht dollar on an 1859 dollar, one specimen of an 1851 restrike dollar on an 1855 dollar and another on an unspecified New Orleans Mint dollar, 1827 restrike quarters on 1806 and other Draped Bust quarters, etc.) accounts not merely for these overstrikes but for the variable weights of other silver restrikes. That the restrike half cents vary so greatly in weight indicates that the "Midnight Minters" most likely cut blanks from strip of atypical thickness; probably few normal 84-grain blanks were left over from 1857. . . .

I have long since stopped taking as fact anything that either James Ross Snowden, Archibald Loudon Snowden, or Henry R. Linderman ever said about how many pieces were made, or when, or about die destruction.

The Class III 1804 Dollars

As it turned out, the striking of 1804 dollars from the 1804 novodel obverse in combination with Reverse Y was not limited just to the five plain-edge coins which caused all the ruckus when the younger Eckfeldt peddled them for \$70 to \$75 each. Apparently, there were more plain-edge dollars struck. These latter pieces received lettered edges, apparently *long after* the pieces were struck, probably in the mid to late 1860s or even the early 1870s. Today, these are known as Class III 1804 dollars.²

It is not known when or by whom the Class III 1804 dollars were struck, but George and/or Theodore Eckfeldt certainly are not above suspicion. In the meantime, numerous high-minded proclamations were issued by Mint officials, who stated that restriking was no longer taking place, earlier obverse dies had been destroyed, etc. All this was so much nonsense, as the use of earlier dies continued at the Mint at least until 1876 (when "pattern" silver dollars Judd-1470 and 1471 were struck from a reverse die of the type that was obsolete after 1866—although, as Thomas K. DeLorey has pointed out, it can be argued that the use of such a die would be valid if the motto IN GOD WE TRUST already appeared on the obverse and was not needed again for the reverse³). *The Fantastic 1804 Dollar* book gives many details.

A review of the extant Class III 1804 dollars and the date that each first was known to exist is informative:⁴

Berg specimen. 402.8 grains. Said to have been located in Vienna in 1875.

Adams specimen. 416.25 grains. Said to have been sold by J.W. Haseltine c. 1876.

Davis specimen. 415.9 grains. Said to have been sold by J.W. Haseltine in 1877.

Linderman specimen. 413.2 grains. Obtained directly from the Mint when Linderman was director, in the late 1860s or the 1870s. (Linderman was director from April 1867 to April 1869, and again from April 1873 to December 1878.)

Rosenthal specimen. 415.48 grains. Said to have been held for over 40 years by the son of a freed slave, who sold it in

¹ Specific contribution to this book.

² In a letter to the author, December 10, 1992, Kenneth E. Bressett commented as follows: "I firmly believe that all of the 1804 Class II and Class III pieces were made at the same time (c. 1858). They were all made with a plain edge. Later, all but one of these had crude edge lettering applied, and were sold through J.W. Haseltine and/or other dealers. Evidence of the single striking is in the unique die orientation of all Class II and Class III pieces. All have the 0 in the date aligned opposite the second T in STATES, whereas the Class I dollars are all of the normal 180° alignment."

³ Letter to the author, January 11, 1993.

⁴ Data from Newman-Bressett, pp. 129 ff.

1893. (Probably, this is just a nice story.)

Idler specimen. 411 grains. Found in the estate of Philadelphia coin dealer William Idler (father-in-law of John W. Haseltine) in 1908.

Data such as these indicate that no example of the 1804 Class III dollar is known to have appeared on the market before 1875. Four of the six coins are directly traceable to Haseltine.

Weights of 1804 Class III dollars: Per the above, Class III dollars seem to fall into two weight categories: Pre-1837 weight of 416 grains: Adams, Davis, Rosenthal. Later weight of 412.5 grains: Berg, Linderman, Idler.

Concerning Class III 1804 dollars, as all are believed to have been made no earlier than 1858, and as the authorized weight for dollars 1858 and later was 412.5 grains, I believe that either special heavy planchets were made at the Mint to strike some of these (Adams, Davis, Rosenthal specimens), or, they were overstruck on silver dollars from the 1798-1803 era (which were available on the numismatic market for \$1.20 to \$1.50 or so each). However, no traces of under-types have been seen. The lightweight coins (Berg, Linderman, Idler) may have been struck on current silver dollar planchets, or even overstruck on current silver dollars, given the problems that George and Theodore Eckfeldt had with obtaining blank planchets. Under this scenario, the coins had edge lettering applied separately at a later date, presumably after James Ross Snowden left office in 1861. This would place the 1860s as the time frame in which the 1804 Class III dollars were completed.

It was widely believed that Dr. Henry Richard Linderman, whose Class III coin was described as “a beautiful sharp Proof. . . the finest known specimen,” when it was auctioned in 1888, was obtained by Linderman directly from the Mint during his period of service there. Don Taxay (in *Counterfeit, Mis-Struck and Unofficial Coins*, 1963, quoted at length under “What Others Have Said About the 1804 \$1,” in the 1804 dollar section, below) noted that in 1869, specimens of Class III dollars, said to have been freshly made at the Mint, were being offered for \$600 apiece to collectors. Certainly, by 1875-1876, Philadelphia dealer John W. Haseltine had a supply of them on hand.

A study of Class III dollars should reveal the break at LIBERT to be more advanced than on Class I coins. Study of the growth of the break among Class III coins would determine their sequence of issue.

As Newman and Bressett have outlined in detail, it is the Class II and, in particular, the Class III 1804 dollars that caused many dealers, collectors, and others to turn against Mint practices in the 1870s. Official pronouncements of authenticity increased in quantity as numismatic disgust kept pace. Thus was set the scene for a controversy surrounding the 1804 dollar that would last for the better part of a century, until Newman and Bressett laid the matter to rest by printing the facts in their 1962 book, *The Fantastic 1804 Dollar*.

The 1801-2-3 Novodels

Let me reiterate what I have stated to this point concerning the 1801-, 1802-, and 1803-dated novodel silver dollars:

- The dies for the 1802 and 1803 were made before autumn 1834.

- The die for the 1801 was made at a later date, possibly *much* later, using different star, letter, and numeral punches.

- The 1801 and 1803 novodels were struck about the same time, as evidenced by a piece of foreign metal adhering to the reverse die when each was made.

- The 1801-2-3 novodels all used Reverse X, and show die breaks at NITED more advanced than on Class I dollars, also made with Reverse X.

The 1801 novodel: The 1801 novodel is known with the NITED break on the reverse, believed (from the photographic evidence) to be the latest state. Thus, the 1801 novodel was struck after the 1803, and it follows that both were struck after the 1802.

Order of striking summarized: *To this point the order of striking would seem to be as follows:*

- 1804 Class I novodel dollar
- 1802 novodel dollar
- 1803 novodel dollar
- 1801 novodel dollar

1801-2-3 novodels first sold in 1876: A curious, I believe *telling*, fact is that the existence of the 1801, 1802, and 1803 novodel Proofs was not publicized until 1876, when J.W. Haseltine displayed several examples and offered them for sale.

Years later (Lyman Sale catalogue, 1913) Samuel Hudson Chapman stated that *Mint officials* were offering these coins for sale in May 1876. As Chapman

worked for Haseltine, he undoubtedly knew the truth.

In the 1950s Stephen K. Nagy told the present writer that large quantities of 1801-2-3 Proof novodels passed through his hands in a single lot shortly after the year 1900, and that he had sold *several hundred* pieces in a group to a Colorado numismatist, and that they had not come on the market since then, nor did he disclose this information to Edgar H. Adams.¹ No such cache of 1801-2-3 novodels (Nagy was careful to say that no 1804-dated dollars were included) has come to light since then, so perhaps a future generation of numismatists will be delighted and surprised with the dispersal of this hoard. There is no reason to doubt Nagy's assertion, for other information he provided seemed to be reliable. On the other hand, it may have been a made-up story to impress me.

If 1802 and 1803 novodels were made at the Mint in the mid- or late 1830s, a cache of these would have had to have remained intact until they were first marketed by *Mint officials* in 1876. From 1836 to 1876 is a long time, a span of four decades. During this interval, persons connected with the Mint had made and sold numerous delicacies, including restrike 1840-1849 half cents, 1856 Flying Eagle cents, 1851 185-2 restrike dollars, and many other items. If these 1802-1803 novodels had been on hand in storage at the Mint, how could the temptation have been resisted to have marketed them before 1876? Of course, the same thing could be said about the dies in storage.²

1801-2-3 novodels struck about the same time: As the 1801 novodels were marketed in 1876 with the 1802 and 1803 novodels, the 1801 novodels were under the care of the same person. This seems to indicate a common purpose and, probably, a common striking time for the origin of the 1801 with the 1802 and 1803 pieces.

The rarity of the 1801 novodels today is explained by the attrition of the dies. The obverse failed, apparently early in the striking process. To create additional coins would have meant making a

new obverse. This was not done. Presumably, only a very few 1801 novodels were made.

Weight of the 1801-2-3 novodels: It is curious, even *telling*, that all known 1801-2-3 novodels weigh in the range of 419.5 and 423 grains.³ These weights are far above any reported for Class I, II, or III 1804 dollars and are above the 416-grain authorized weight for silver dollars up to January 18, 1837, and the 412.5-grain standard in use after that time.

Returning to the puzzle of the weight of the 1801-2-3 novodels, at 419.5 to 423 grains, it seems indeed curious that if they had been produced in the mid-1830s, when most if not all Class I 1804 dollars were made, that they would not have been struck on planchets under the 416-grain standard. This has been demonstrated by the weights of Class I 1804 dollars. Conclusion: 1801-2-3 novodels were not struck before January 18, 1837, when the 416-grain standard was in effect.⁴

1801-2-3 novodel facts reviewed: We know these facts:

1. All 1801-2-3 novodels weigh from 419.5 grains to 423 grains.

2. *Trade dollars*, first authorized and minted in 1873, are of 420-grain standard (with a tolerance of 419.5 to 423 grains being acceptable), a weight unlike that of any other previous United States silver coin. In other words, prior to 1873, the Mint would not have had planchets weighing 420+/- grains on hand.

3. No 1801-2-3 novodels were known to numismatists until 1876. During the late 1850s and early 1860s, Mint officials and others connected with the Mint sold many fancy restrikes and special pieces, and yet during that time, no 1801-2-3 novodels came on the market.

Posing questions: Could it be that 1801-2-3 novodels did not exist in the late 1850s and early 1860s? Could it be that they were not made in the 1830s, 1840s, 1850s, or 1860s?

1801-2-3 novodels first struck in the 1870s?: So far as I know, all Class I 1804 dollars are of a reverse die state (break through NITED) earlier than the

¹ Adams was America's foremost numismatic researcher in the 15 years immediately following the year 1900, a time when Stephen K. Nagy was very active in the rare coin business.

² Possibility suggested by Harry E. Salyards, M.D., letter to the author, January 15, 1993. Presumably, dies would have been under tighter security than minted coins would have been.

³ Newman-Bressett, p. 50, as well as the author's own findings.

⁴ Michael Hodder notes that he Groves-Gibson specimen from Superior's 1/93 sale, Lot 615 is said to weigh 370.70 grains, but this may be a cataloging error.

1801-2-3 novodels. Accordingly, the 1801-2-3 novodels were made later than the Class I dollars.

Could it have been the case that the *dies* for the 1802 and 1803 novodels, plus the Reverse X die, were kept on hand at the Mint or in the hands of someone else, until the early 1870s, and *first used* to strike 1802-1803 novodels at that time? At that time, a new obverse die could have been made up for the 1801, using the damaged Draped Bust punch (or a die prepared earlier but only with the Draped Bust punch impressed), but new punches for the letters and stars (for, perhaps, the old ones no longer were on hand); this would explain why the 1801 does not match the 1802-1803. Using 420-grain planchets on hand at the Mint for the current production of trade dollars, the 1802, 1803, and 1801 novodels were struck, in that order, sometime between 1873 and when they were first marketed in 1876.

Author's conclusion: Sometime c. 1873-1876, Mint Director Henry Richard Linderman or someone under his direction, took the 1802 and 1803 novodel obverses, to this point unused, made a new 1801 novodel obverse, and combined these with the Reverse X to strike 1801-2-3 novodel dollars on trade dollar planchets. This late striking could easily explain the *significantly higher average grade* of 1801-2-3 novodels in existence today, in comparison to 1804 dollars (all of which were made before the 1870s) and, for that matter, surviving Proof coins known to have been actually struck in the 1830s (such as original 1836 and 1839 Gobrecht dollars).

Point of caution: As this book goes to press, detailed die progression studies of extant specimens of Class I 1804 dollars have not been made. Should these studies be made in the future, it will be possible to make additional conclusions, such as whether any Class I 1804 dollars have the NITED break any more advanced than seen on the 1802-1803 novodels. As we believe that the 1801 novodel represented the latest use of this die, any intermediate coinages of Class I 1804 dollars would have to show the NITED break more advanced than on the 1801-1802-1803 novodels.

1801-2-3-4 Novodels: Conclusions

I summarize my thoughts and conclusions concerning the 1801-2-3-4 novodels as follows:

- 1801 Proof novodel: First struck at the Mint in

the mid-1870s from an obverse die possibly made in the mid-1870s and from Reverse X made in the early 1830s. Intended for sale to numismatists. Struck in the same time period, but just after the 1803 novodels were struck. However, P. Scott Rubin has a different opinion, and notes this:

I believe that there is no evidence to support this as the obverse letter punches are similar to 1830s-style, and new star punches may have been made in 1830 and never used again. This would be the reason for them not being used on other coins even in the 1870s. I believe the 1801 obverse was first made but rejected because 1830s-style letters did not look right for the 1804 intended coin for presentation sets.¹

- 1802 Proof novodel: First struck at the Mint in the mid-1870s from an obverse die made before autumn 1834 and from Reverse X made in the early 1830s. Intended for sale to numismatists. Struck in the same time period, but just before the 1803 novodels were struck.

- 1803 Proof novodel: First struck at the Mint in the mid-1870s from an obverse die made before autumn 1834 and from Reverse X made in the early 1830s. Intended for sale to numismatists. Struck in the same time period, but after the 1802 novodels and before the 1801 novodels.

- 1804 Class I Proof novodel: Struck at the Mint c. 1831-1835, but in any event not after January 18, 1837, from an obverse die prepared in the early 1830s and from Reverse X made in the early 1830s. Possibly one specimen, the Parmelee coin, was made in the 1840s from lighter planchet stock. Not intended for sale to numismatists.

- 1804 Class II Proof novodel: Struck without official approval or authorization at the Mint by George and Theodore Eckfeldt circa 1858, using an obverse die prepared in the early 1830s and from Reverse Y made in the early 1830s, but not hitherto used. Intended for sale to numismatists.

- 1804 Class III Proof novodel: Struck at the Mint secretly circa 1858, but with edge lettering applied later, before the mid-1870s, by persons unknown. Intended for sale to numismatists.

- Summary of production dates:

1804 Class I novodel dollar, struck c. 1831-1835.

1804 Class II novodel dollar, struck c. 1858.

1804 Class III novodel dollar, struck c. 1858, edge lettered in the 1860s.

1802 novodel dollar, struck c. 1875-1876. First of the 1801-2-3 novodels to be struck.

¹ Special contribution to this book.

1803 novodel dollar, struck c. 1875-1876. Second of the 1801-2-3 novodels to be struck.

1801 novodel dollar, struck c. 1875-1876. Third (last) of the 1801-2-3 novodels to be struck.

1801-2-3-4 Novodels: Fame

Just as the unofficial background of the 1913 Liberty Head nickel has not harmed its fame—people are fascinated by a “naughty lady,” it seems—the Proof novodels of 1801, 1802, 1803,

and 1804 are more desired by collectors today than ever before.

The background of the 1804 dollar, reviewed in exacting detail by Eric P. Newman and Kenneth E. Bressett in the 1962 book, *The Fantastic 1804 Dollar*, only served to increase the demand for “The King of American Coins.” Since 1962, market prices never dreamed of then have been realized, with one coin selling for the best part of a million dollars (\$990,000).

(B-5.)

• **OBVERSE:** The obverse of the 1801 novodel is anomalous, and is stylistically different from either the original dollars of this date or the other novodels dated 1802-3-4. I believe that it was made at the Mint in the 1870s, possibly starting with a die that had received an impression of the Draped Bust punch, but no other details, in the early 1830s. Alternately, it may have been created in its entirety in the 1830s, but not used.

As noted in the introductory text, the differences include the following:

The 1801 has curved-top 1's in date, quite unlike the straight-top 1's of the early 1800s.

The stars on the 1801 are entirely unlike any used on original early silver dollars or the novodels of 1802-3-4. On the 1801, the stars do not have narrow, somewhat delicate points. Instead, the stars are, as Newman and Bressett relate, heavy with 60° angles to the points, somewhat like a traditional Star of David.

The letters in LIBERTY are more angular, with-

out curves to the inside of the serifs. A different letter punch font was used to make the obverse of the 1801 novodel, in contrast to the traditional, early font (with curves to the inside of the serifs) employed on the novodels of 1802-3-4.

In addition, the obverse die has these characteristics: On the left, the stars are fairly evenly spaced, with excellent alignment of the star points. On the right, the star spacing is also of a high order, except that stars 11 and 12 are slightly closer together than are the other pairs. The alignment of the star points is excellent. The letters in LIBERTY are well spaced and aligned. I conclude that the die represents the work of a skilled craftsman.

As is the case with all 1801-2-3-4 novodels, the denticles on the borders are bead-like (rather than the tooth-like style used in the early 1800s).

The left tip of the highest curl is missing, a flaw caused by a broken portrait punch. This flaw also is represented on the 1804 novodels, but not the 1802 and 1803.

Obverse die used to strike 1801 Proof novodels only.

• **REVERSE:** The reverse, called "Reverse X" by Eric P. Newman and Kenneth E. Bressett, is a Mint copy of the Heraldic Eagle reverse type used to coin silver dollars of the dates 1798-1803, but is not precisely identical to any die of that era. It was made by using a Heraldic Eagle punch, and adding details including the letters of UNITED STATES OF AMERICA, stars above the eagle, and the berries and their stems. Old letter punches, the Small Letters font of 1798 or a similar set, were used; the lopsided T, with the left serif shorter than the right, is distinctive. Twelve of the arrows were part of the eagle punch (the 13th arrow, with its tiny shaft and head to the right of the two leftmost large shafts, was added by hand and differs slightly on this as compared to Reverse Y). This identical die was used to coin all 1801-2-3 novodel and Class I 1804 varieties.

The A in STATES straddles clouds 3 and 4; O in OF is entirely over cloud 7. The arc star pattern is employed, as was standard after 1798. UNITED STATES OF AMERICA in the same general Small Letters font as used 1798-1803. The 12 arrows in the Heraldic Eagle punch are perfectly formed and delineated (as noted, a 13th was later added by hand), far better than any definition seen on any original business strike dollar c. 1798-1803.

Top right berry slightly lower on branch than top left berry. The border denticles are more bead-like (later style) than tooth-like (original style).

"Reverse X" die used to strike 1801, 1802, 1803, and Class I 1804 novodel silver dollars.

• DIE STATES:

Die State I: Obverse without cracks. Reverse with tiny crack through NITED to wing tip. May not exist with perfect obverse die.

Die State II: Obverse crack from below bust through bottom of the date through the stars on the left (description from Newman-Bressett, 1962; Kenneth E. Bressett advised the author that the illustration of the reverse of the 1801 restrike in that book was not of an 1801 but, rather, was a "stock photo" of an 1802 or 1803 reverse, mentioned here for the record). Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather (cf. Newcomer specimen).

Die State III: Obverse crack from below right side of bust, through the date, and continuing through stars 1 through 8. Rough, unpolished field areas above and behind Liberty's head and hair ribbon.

Note: All known 1801 and 1803 Proof dollars (but not 1802 or 1804) have a small linear depression in the space between UM in UNUM and the shield from a piece of metal or

other foreign material on the die face during striking.

• **COLLECTING NOTES:** Of all of the 1801-2-3-4 novodel dates, the 1801 Proof dollar is by far the rarest. Numerous collections which had an example of the 1804 lacked the 1801.

• REGISTRY OF KNOWN SPECIMENS:

1. Cleneay Specimen, Proof-65, dipped

- Capt. John W. Haseltine.
- Thomas Cleneay.
- Cleneay Collection sold by the Chapman brothers, December 9, 1890, Lot 944, \$18.50.
- Peter Mougey
- Mougey Collection sold by Thomas L. Elder, September 1910, Lot 961, \$10.00.
- John P. Lyman
- Lyman Collection sold by S.H. Chapman, November 7, 1913, Lot 13.
- H.O. Granberg, Oshkosh, Wisconsin.
- Granberg Collection sold by B. Max Mehl, July 16, 1919, Lot 29, \$42.00.
- Frederick C.C. Boyd.
- Boyd, "World's Greatest Collection," sold by Numismatic Gallery (Abe Kosoff and Abner Kreisberg), January 20, 1945, Lot 112. "Brilliant Proof restrike." \$225.00.
- Unknown intermediaries.
- Beverly Hills Stamp & Coin Shop (Max L. Justus), fixed price list, August 1, 1957.
- Abe Kosoff. Sold to the following.
- Ken Nichols, Costa Mesa, California. Sold to the following.
- Newport Balboa Savings and Loan (Newport Beach, CA).
- Abe Kosoff.
- Unknown intermediaries.
- Stack's Autumn Sale, 1978, Lot 303, \$42,000. "Brilliant Proof, delicate golden-russet toning."
- Ed Hipps. Sold to the following.
- Steve Ivy. Sold to the following.
- Martin Paul. Consigned to the following.
- Metropolitan New York Sale. New England Rare Coin Auctions, March 1982, Lot 1575, "A spectacular cameo Proof, mostly brilliant with attractive golden-russet toning. Virtually perfect in all respects, and simply stunning to behold." \$46,000.00.
- Walton Hood and Reed Spencer (owners of Palm Beach Rare Coins). Sold or traded to the following at the beginning of the June 1982 Long Beach (CA) Coin Show.
- Ed Owen. Sold to the following at the June 1982 Long Beach Coin Show.
- Larry Hanks and Jay C. Miller. "I believe the price paid was in the mid to high \$30,000 range," Jay Miller recalled.¹

¹ Letter to the author, May 19, 1992.

Sold to the following.

- Massachusetts collector.

Dipped. Plate coin in Breen Proof coins (1977) and regular (1988) *Encyclopedias*; illustrated in color cover of *COINage* magazine, May 1966.

2. Newcomer Specimen, Proof-65, cracked planchet

- Capt. John W. Haseltine
- Waldo C. Newcomer, Baltimore, Maryland. Consigned to the following.
 - B. Max Mehl, circa 1931-1932. Sold to the following c. 1932.
 - Col. Edward H.R. Green.
 - Burdette G. Johnson, St. Louis, Missouri.
 - Jack V. Roe.
 - Roe collection sold by B. Max Mehl, June 12, 1945, Lot 426, \$220.00.
 - Will W. Neil
 - Neil collection sold by B. Max Mehl, June 17, 1947, Lot 28, \$300.00.
 - Amon G. Carter.
 - Amon G. Carter, Jr.
 - Carter Collection sold by Stack's, January 1984, Lot 238, \$55,000.00. "Delicate pale gray and golden russet toning." Sold to the following.

- John Nelson Rowe III, as agent for the following.
- L.R. French, Jr.

• French Family Collection sold by Stack's, January 1989, Lot 12. "Brilliant Proof. . . . Delicate pale gray and golden russet toning." \$82,500.00.

MARKET NOTES

The following auction offerings are in chronological sequence and give an idea of the market at the times indicated, although it is not known if all specimens actually found buyers at the prices indicated:

- 1877, Haseltine's June 11th sale, Lot 338.
- 1879, Haseltine's January 15th sale, Lot 282.
- 1890, December. Cleneay specimen. \$18.50.
- 1910, September. Cleneay specimen. \$10.00.
- 1913, November. Cleneay specimen. \$40.00.
- 1919, September. Cleneay specimen. \$42.00.
- 1945, January. Cleneay specimen. \$225.00.
- 1945, June. Newcomer specimen. \$220.00.
- 1947, June. Newcomer specimen. \$300.00.
- 1978, September. Cleneay specimen. \$42,000.00.
- 1982, March. Cleneay specimen. \$46,000.00.
- 1984, January. Newcomer specimen. \$55,000.00.
- 1989, January. Newcomer specimen. \$82,500.00.

1801 Proof Novodel: Summary of Characteristics

Enabling legislation: None

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Statutory weight: 416 grains; .8924 silver, balance copper (statute irrelevant to novodels). Novodels weigh 419.5 to 423 grains.

Melt-down (silver value) in year minted: Not relevant; coins not minted in 1801.

Dies prepared: Obverse: 1; Reverse 1 (same reverse used on all 1801-2-3-4 novodels)

Business strikes: None

Proof mintage: Unknown; possibly fewer than 5; in any event, fewer than any other 1801-2-3-4 novodel.

Approximate population Proof-65 or better: 2 (URS-2)

Approximate population Proof-60 to 64: 0 (URS-0)

Commentary

This is the rarest issue of the 1801-2-3 Proof novodel dollars.

1802 Proof Novodel Dollar

Mintage

Fewer than 10 Proofs (estimated)

Varieties

1802. Proof Novodel. BB-302.

(B-8.)

• **OBVERSE:** The 2 in date is curled at top, differing from any original obverse, and of the same “fancy” or curlicue style seen on certain 1820 half dollars (but half dollar dies were made from a smaller punch). Star 1 is about the same distance from the second curl as star 7 is from L. The star positioning is cruder than any original dollar of this date. On stars 1 to 7, *all* points closest to adjacent stars are misaligned! Obviously, whoever made this die was not accustomed to this work. On the right, the stars are aligned better, but this is ruined by something else that never occurred on an original of this date: stars 12 and 13 are so close that they actually touch at their inner points!

Highest curl centered below the E in LIBERTY. Raised border with denticles made up of truncated beadlike denticles quite unlike the toothlike denticles of original dollars of the Draped Bust type. Original 1, 8, and 0 punches from the early 1800s were used to make the die. 2 copied from one of the “Fancy 2” digits used on half dollars of the 1820s.

Perfect die without cracks.

The top left curl tip is intact on the 1802 (and 1803) novodels, whereas on the 1801 and 1804 issues it is missing (due to hub damage). Thus, the 1802 and 1803 dies were made before the others.

Obverse die used to strike 1802 Proof novodels only.

• **REVERSE:** As preceding, “Reverse X.” See description under 1801 Proof novodel dollar.

“Reverse X” die used to strike 1801, 1802, 1803, and Class I 1804 novodel silver dollars.

• **DIE STATES:**

Die State I: Obverse without cracks. Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather. (Cf. Cleneay and Wilharm specimens)

• **COLLECTING NOTES:** The 1802 Proof dollar is more available than the 1801 but is considerably rarer than the 1804.

• **REGISTRY OF KNOWN SPECIMENS:**

1. **Boyd Specimen, Proof-65**

• Capt. John W. Haseltine

•Frederick C.C. Boyd

•“World’s Greatest Collection” sale (Boyd Collection) by Numismatic Gallery (Abe Kosoff and Abner Kreisberg), January 1945, Lot 119, \$210.00. “Brilliant Proof restrike. . . . Similar to the Dunham-Higgy specimen.”

•Milferd H. Bolender (and into his reference collection)

•M.H. Bolender’s 183rd Sale, February 1952, Lot 175, \$275. “Brilliant and sharp perfect Proof. . . . Just as rare as the 1804 dollar, but not as valuable because of the date. In very few of the great collections of the past, there was none in the great Stickney sale, although there was the 1804.”

•New York Collection

•Stack’s sale of the “Groves” Collection, November 1974, Lot 443, \$37,000.00. “A gem.”

•Auctions by Bowers and Merena, Inc., Four Landmark Collections Sale, March 1989, Lot 1981, \$90,750.00. “423.6 grains. A gem specimen. The obverse and reverse surfaces are delicately toned in pale silver gray, while around the rims there are faint hints of iridescent pale golden brown. . . . This example appears to be tied for finest known with Stack’s French: 13 (the Carter coin).” • Superior Galleries, January 1993 Auction. Lot 615. “Proof-65.”

Like No. 2 in this list, *this coin has no rust pit* midway between the next to lowest wing feather and the top leaf of the olive branch. The edge was lettered before striking and is similar to that of No. 2, described below.

2. Cleneay Specimen, Proof-64 (PCGS)

•Capt. John W. Haseltine

•Thomas Cleneay

•Cleneay Collection sold by S. Hudson and Henry Chapman, December 9, 1890, Lot 949, \$12.50.

•Peter Mougey

•Mougey Collection sold by Thomas L. Elder, September 1, 1910, Lot 962, \$15.00.

•John P. Lyman

•Lyman Collection sold by S. Hudson Chapman, November 7, 1913, Lot 14, \$40.00.

•H.O. Granberg

•Granberg Collection sold by B. Max Mehl, July 16, 1919, Lot 30, \$42.00.

•Unknown intermediaries

•B. Max Mehl private treaty sale to the following, January 11, 1937.

•Ambassador and Mrs. R. Henry Norweb.

•Norweb Collection sold by Auctions by Bowers and Merena, Inc., November 1988, Lot 3770, \$71,500.00. “420.0 grains [weight of a trade dollar planchet]. Proof-65. A gem specimen of this highly prized rarity. The fields are toned a beautiful mixture of iridescent electric blue and gold.”

•Don Hosier. Shown at the 1992 ANA Convention.

Gem Proof. Certified Proof-65 (PCGS). On the obverse, stars 12 and 13 are connected by a die flaw. On the reverse there is a delicate die break from the right top of N through

ITED to the eagle’s sinister wing tip. This coin has no rust pit midway between the next to lowest wing feather and the top leaf of the olive branch.¹ The edge lettering appears to be crushed, indicating that the planchet was lettered before striking, not after. Additionally, after the striking of the piece, and possibly to remove some signs of the compression on the edge, the extreme outer portions of the edge seem to have been beveled, as if by a medal lathe, with grinding marks very clearly overlying some letters in the edge lettering. Further, the finish of the edge is not prooflike.

3. Wilharm Specimen, Proof-64

•Capt. John W. Haseltine

•Dr. G.F.E. Wilharm, Pittsburgh, Pennsylvania.

•B. Max Mehl’s sale of the Wilharm Collection, February 15, 1921, Lot 592, \$21.00, to the following.

•Virgil M. Brand.

•Brand Estate, via B.G. Johnson.

•William Forrester Dunham, Chicago. Sold with collection to the following in 1939.

•B. Max Mehl (into his inventory, although few people knew this).

•B. Max Mehl’s sale of the Dunham Collection, June 3, 1941, Lot 1055, \$127.50. “A gem, and of high interest.”

•1942 American Numismatic Association Convention Sale (Abe Kosoff).

•Michael F. Higgy.

•Numismatic Gallery (Abe Kosoff) sale of the Higgy Collection, September 1943, Lot 817, \$250.00.

•Beverly Hills Stamp & Coin Co. (Max L. Justus), fixed price list, August 1, 1957.

•Abe Kosoff. Sold to the following.

•Ken Nichols, Costa Mesa, California. Sold to the following.

•Newport Balboa Savings and Loan (Newport Beach, CA).

•Abe Kosoff.

•Unknown intermediaries.

•Stack’s Autumn Sale, September 1978, Lot 304, \$40,000.00. “Brilliant Proof. Superb golden and iridescent toning.”

•Ellis H. Robison, Troy, New York pharmaceutical wholesaler (owner of John Thompson & Sons).

•Stack’s sale of the Robison Collection, February 1982, Lot 1884, \$43,000.00. “Superb golden and iridescent toning.”

•Larry Whitlow, Illinois dealer. Sold to the following.

•Larry Hanks, El Paso, Texas. Consigned to the following.

•Auction ‘84, Superior Galleries, July 1984, Lot 171, \$70,400.00. “Brilliant Proof-63. Well struck with beautiful natural bluish and golden toning on both sides. A few minor hairline scratches are visible with the aid of a 5X glass.” Consignor reserve of \$64,000 was not met. Subsequently sold by Larry Hanks to the following.

¹ The matter of the reverse rust pit needs more study; all specimens should be surveyed for this feature or lack of it.

- Pennsylvania collector. Consigned to the following.
- Harry Einstein Collection, Auctions by Bowers and Merena, Inc., June 1986, Lot 1734, \$39,600.00. "Proof-63 to 65." Coin illustrated in Breen Proof (1977) and regular (1988) *Encyclopedias*.

4. Newcomer Specimen, Proof-65

- Capt. John W. Haseltine.
- Waldo C. Newcomer, Baltimore, Maryland. Consigned to the following circa 1931.
 - B. Max Mehl.
 - Col. Edward H.R. Green (purchased circa 1932).
 - Jack V. Roe.
- B. Max Mehl's sale of the Roe Collection, June 12, 1945, Lot 427, \$220.00.
- Will W. Neil.
- B. Max Mehl's sale of the Neil Collection, June 17, 1947, Lot 29, \$300.00.
- Amon G. Carter.
- Amon G. Carter, Jr.
- Stack's sale of the Carter Collection, January 1984, Lot 239, \$60,500.00. "Brilliant Proof. A gem with superb russet-golden and iridescent toning." Sold to the following.
 - John Nelson Rowe III, as agent for the following.
 - L.R. French, Jr.
- Stack's sale of the L.R. French, Jr. Family Collection, January 1989, Lot 13, \$77,000.00. "Brilliant Proof. A gem with superb russet-golden and iridescent toning." Plate coin in Newman-Bressett.

NOTES:

- Additional auction appearances include the following:
- J.W. Haseltine's January 15, 1879 sale, Lot 283.

- J.W. Haseltine's sale of his reference collection, June 1880, Lot 982.
- Chapman brothers' sale of the Wilcox Collection, November 1901, Lot 323.

MARKET NOTES

The following auction offerings are in chronological sequence and give an idea of the market at the times indicated, although it is not known if all specimens actually found buyers at the prices listed:

- 1880, June. Haseltine specimen. Price unavailable.
- 1890, December. Cleneay specimen. \$12.50.
- 1901, November. Wilcox specimen. Price unavailable.
- 1910, September. Cleneay specimen. \$15.00.
- 1913, November. Cleneay specimen. \$40.00.
- 1919, July. Cleneay specimen. \$42.00.
- 1921, February. Wilharm specimen. \$21.00.
- 1941, June. Wilharm specimen. \$127.50.
- 1943, September. Wilharm specimen. \$250.00.
- 1945, January. Boyd specimen. \$210.00.
- 1945, June. Newcomer specimen. \$220.00.
- 1947, June. Newcomer specimen. \$300.00.
- 1952, February. Boyd specimen. \$275.00.
- 1974, November. Boyd specimen. \$37,500.00.
- 1978, September. Wilharm specimen. \$40,000.00.
- 1982, February. Wilharm specimen. 43,000.00.
- 1984, January. Newcomer specimen. 60,500.00.
- 1986, June. Newcomer specimen. \$39,600.00.
- 1988, November. Cleneay specimen. \$71,500.00.
- 1989, January. Newcomer specimen. \$77,000.00.
- 1989, March. Boyd specimen. \$90,750.00.

1802 Proof Novodel: Summary of Characteristics

Enabling legislation: None

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Statutory weight: 416 grains; .8924 silver, balance copper (statute irrelevant to novodels). Novodels weigh 419 to 423 grains.

Melt-down (silver value) in year minted: Not relevant; coins not minted in 1802.

Dies prepared: Obverse: 1; Reverse 1 (same die used to strike all 1801-2-3-4 novodels)

Business strikes: None

Proof mintage: Probably at least 10-15

Approximate population Proof-65 or better: 3 (URS-3)

Approximate population Proof-64: 1 (URS-1)

Approximate population Proof-60 to 63: 0 (URS-0)

Commentary

Most of these Proofs have a gray-blue toning quality, as do the 1801 and 1803 novodels.

1803 Proof Novodel Dollar

Mintage

Fewer than 10 Proofs (estimated)

Varieties

1803. Proof Novodel. BB-303.

(B-7.)

• **OBVERSE:** Thick 3. Stars on left are much better aligned than on the obverse of the 1802 novodel. On the 1802, the spacing is fairly good, but stars 3 and 4 are wider apart than are any others. Star 1 is closer to the second curl than star 7 is to L. On the right, the stars are well spaced and aligned.

Highest curl on top of head about centered under upright of E, and next top curl centered under R. A small raised line is present just above the obverse center dot; heavy rust marks around star 4 and light rust marks at the 18 in the date. The die was made by using original number punches from the early nineteenth century. Raised border with denticles made up of truncated beads.

The top left curl tip is intact on the 1803 (and 1802) novodels, whereas on the 1801 and 1804 issues it is missing (due to hub damage). Thus, the 1802 and 1803 dies were made before the others.

Obverse die used to strike 1803 novodel dollars only.

• **REVERSE:** As preceding. See description under 1801 Proof novodel dollar.

"Reverse X" die used to strike 1801, 1802, 1803, and Class I 1804 novodel silver dollars.

• DIE STATES:

Die State I: Obverse without cracks. Reverse with hairline crack from top right serif of N, sloping slightly downward through ITED, and ending at the bottom of the leftmost wing tip feather. Apparently, struck about the same time as the 1802 Proof novodel. All specimens seen have raised spots, from die rust, on and near star 4 and similar marks between the 1 and 8 in 1803, indication that the novodels were struck measurably later than the time they were prepared.

Note: All known 1801 and 1803 Proof dollars (but not 1802 or 1804) have a small linear depression in the space between UM in UNUM and the shield from a piece of metal or other foreign material on the die face during striking.

• **COLLECTING NOTES:** The 1803 Proof novodel is more available than the 1801, but is considerably rarer than the 1804.

• REGISTRY OF KNOWN SPECIMENS:

1. Cleneay Specimen, Proof-63

- Capt. John W. Haseltine.
- Thomas Cleneay.
- Chapman brothers' sale of the Cleneay Collection, December 1890, Lot 954. \$12.25.

- John P. Lyman.
 - S.H. Chapman's sale of the Lyman Collection. November 1913, Lot 15, \$30.00.
 - H.O. Granberg
 - B. Max Mehl's sale of the Granberg Collection, July 1919, Lot 31.
 - Frederick C.C. Boyd
 - Numismatic Gallery (Abe Kosoff and Abner Kreisberg) sale of the "World's Greatest Collection" (Boyd Collection), January 1945, Lot 125, \$210.00. "Brilliant Proof restrike."
 - Beverly Hills Stamp & Coin Shop (Max L. Justus), fixed price list, August 1, 1957, listed as having been sold.
 - Dr. J. Hewitt Judd. Omaha, Nebraska physician.
 - Abe Kosoff.
 - Armand Champa, Louisville, Kentucky.
 - American Auction Association (Q. David Bowers and James F. Ruddy) sale of the Champa Collection, May 1972, Lot 916, \$14,000.00. "Splendid brilliant Proof with light toning."
 - Stack's Autumn Sale, September 1978, Lot 305, \$40,000.00. "Splendid russet, sea green and iridescent toning." Some rust spots on and around the 4th [obverse] star."
 - Ellis H. Robison, Troy, New York.
 - Stack's sale of the Robison Collection, February 1982, Lot 1885, \$39,000.00. "Brilliant Proof. Splendid russet, sea green and iridescent toning."
 - Larry Whitlow, Illinois dealer. Sold to the following.
 - Larry Hanks, El Paso, Texas. Consigned to the following.
 - Superior Galleries' section of Auction '84, July 1984 Lot 172, Reserved by the consignor at \$68,000.00. "Brilliant Proof-63. Well struck with beautiful natural bluish and light golden toning on both sides. Some minor imperfections in the fields, most of which were as made." Consignor reserve not met. Listed price: \$74,800.00. Subsequently sold by Larry Hanks to the following.
 - Pennsylvania collector. Consigned to the following.
 - Harry Einstein Collection Sale, Bowers and Merena, June 1986, Lot 1735, \$41,800.00. "Beautiful magenta, gun-metal blue, iridescent toning."
- Illustrated in the Breen Proof coin (1977) and regular (1988) *Encyclopedias*.

2. Newcomer Specimen, Proof-65

- Capt. John W. Haseltine.
- Waldo C. Newcomer, Baltimore, Maryland.
- B. Max Mehl (on consignment from Newcomer).
- Col. Edward H.R. Green (purchased it circa 1932).
- Jack V. Roe.
- B. Max Mehl's sale of the Roe Collection, June 12, 1945, Lot 428, \$220.00.
- Will W. Neil.
- B. Max Mehl's sale of the Neil Collection, June 17, 1947, Lot 30, \$300.00.

- Amon G. Carter.
- Amon G. Carter, Jr.
- Stack's sale of the Carter Collection, January 1984, Lot 240, \$68,750.00. "A gem with exquisite cobalt blue and golden iridescent toning. Obverse [with] some spots on and around the 4th star." Sold to the following.
- John Nelson Rowe III, as agent for the following.
- L.R. French, Jr.
- L.R. French, Jr. Family Collection. Stack's, January 1989, Lot 14, \$85,250.00.
- Martin B. Paul. Certified by NGC as Proof-65. Sold to the following.
- Walton Hood and Andrew Lustig.
- Superior Galleries' section of Auction '89, July 1989, Lot 666, \$165,000.00. "NGC graded Proof-65. An absolutely superb gem with indescribably lovely electric blue and golden iridescent coloring."
- American Rare Coin Fund, L.P., Hugh Sconyers (manager), Beverly Hills, CA. Sold on October 26, 1989 to the following.¹
- Bruce Amspacher, Newport Beach, CA. Long-time rare coin dealer, writer, and a founder of the Professional Coin Grading Service. Sold to the following late in 1989.²
- William E. Spears, Seattle, Washington, a dealer who later moved to Naples, Florida. Sold to the following.
- Washington state collection (where it remained in 1992). Certified by PCGS as Proof-65.
- Plated in Newman-Bressett.

3. Mougey Specimen, Proof-66

- Capt. John W. Haseltine.
- Peter Mougey.
- Thomas L. Elder's sale of the Peter Mougey Collection, September 1910, Lot 965, \$10.25.
- Adolphe Menjou.
- Numismatic Gallery (Abe Kosoff and Abner Kreisberg) sale of the Menjou Collection, June 1950, Lot 2078, \$280.00.
- Kreisberg-Schulman Golden Sale II, January 1963, Lot 3049.
- Kreisberg-Schulman 1964 Sale, Lot 1146.
- Rarcoa's section of Auction '86, July 1986, Lot 738, \$55,000.00. "Exhibiting gorgeous multi-colored toning over perfect Proof surfaces. . . . We note a couple of small lint marks, as struck, on Liberty's cheek, and a single one in the hair."
- Walton Hood and Andrew Lustig. Certified by NGC as Proof-66.
- Superior auction of May 1991, Lot 702, \$264,000.00. "PCGS graded Proof-66. Premium quality. Superb! The finest known example. . . . You'll be awestruck by its vibrant gold and blue colors. . . ."
- Kenneth Duncan and Jack Lee.
- Jay Parino. Advertised in the *Numismatist*, January 1993, p. 13.

¹ Letter from American Rare Coin Fund, B.J. Searls, to the author, November 23, 1992.

² Bruce Amspacher, letter to the author, December 7, 1992.

4. The Milas Specimen, Proof-65.

- Capt. John W. Haseltine.
- Unknown intermediaries.
- Texas rare coin dealer who bought it over the counter from a private party, 1991. Sent to PCGS and certified Proof-65. Sold to the following.¹
- Specimen acquired by Ed Milas (Rarcoa) at the 1991 ANA Convention.

NOTES

Additional auction appearances (may be one or more of the coins listed above):

- Capt. John W. Haseltine's sale of January 15, 1879, Lot 284.
- Ed. Frossard's sale of June 1879, Lot 708, \$5.40. (Possibly not a Proof; the price seems too low for a Proof novodel.)
- Capt. John W. Haseltine's sale of his reference collection, June 1880, Lot 983.
- Chapman brothers' sale of the Wilcox Collection, November 1901, Lot 324.

MARKET NOTES

The following auction offerings are in chrono-

logical sequence and give an idea of the market at the times indicated, although it is not known if all specimens actually found buyers at the prices listed:

- 1879, June. Frossard sale. \$5.40²
- 1880, June. Haseltine sale.
- 1910, September. Mougey specimen. \$18.00.
- 1913, November. Lyman specimen. \$30.00.
- 1919, August. Lyman specimen.
- 1945, January. Lyman specimen. \$210.00.
- 1945, June. Newcomer specimen. \$220.00.
- 1947, June. Newcomer specimen. \$300.00.
- 1950, June. Mougey specimen. \$280.00.
- 1963, January. Lyman specimen.
- 1964, March. Mougey specimen.
- 1972, May. Lyman specimen. \$14,000.00.
- 1978, September. Lyman specimen. \$40,000.00.
- 1982, February. Lyman specimen. \$39,000.00.
- 1984, January. Newcomer specimen. \$68,750.00.
- 1984, August. Lyman specimen. \$74,800.00.
- 1986, June. Lyman specimen. \$41,800.00.
- 1986, July. Mougey specimen. \$55,000.00.
- 1989, January. Newcomer specimen. \$85,250.00.
- 1989, July. Newcomer specimen. \$165,000.00.
- 1991, May. Mougey specimen. \$264,000.00.

1803 Proof Novodel: Summary of Characteristics

Enabling legislation: None

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Statutory weight: 416 grains; .8924 silver, balance copper (statute irrelevant to novodels). Novodels weigh 419 to 423 grains.

Melt-down (silver value) in year minted: Not relevant; coins not minted in 1803.

Dies prepared: Obverse: 1; Reverse 1 (the same reverse die was used to strike all 1801-2-3-4 novodels)

Business strikes: None

Proof mintage: Probably at least 10-15

Approximate population Proof-65 or better: 2 or 3 (URS-2)

Approximate population Proof-60 to 64: 1 or 2 (URS-1)

Commentary

The 1803 Proof novodel dollar is much rarer than its better known cousin, the 1804; the 1801 and 1802 novodels are also rarer than the 1804.

¹ Per telephone call from Ed Milas to the author, December 21, 1992.

² This appearance probably does not represent a Proof novodel 1803 dollar, but a business strike with prooflike surface.

1804 Proof Novodel Dollar

Mintage

Class I: 8 to 10 or more
Class II: 5 or more made
Class III: 6 or more made

Numismatic Information

Three classes of 1804 dollars: Dollars dated 1804 can be divided into three classes, per Eric P. Newman and Kenneth E. Bressett:

1804 Class I, years ago often called “original.” Lettered edge. Eight known, Proofs. Issue of circa November 1834 and possibly a few years before and/or after that time. Produced openly, and with no intent to deceive.

1804, Class II, years ago sometimes called the “first restrike.” Plain edge. Made secretly in 1858 by workmen at the Mint. Possibly unique. Now in the Mint Collection at the Smithsonian.

1804 Class III, years ago called “second restrike.” Lettered edge (edge lettered after striking). Six known. Made secretly at the Mint, perhaps all c. 1858, but with edges lettered at the Mint years later in the late 1860s or early 1870s. Kenneth E. Bressett’s current thinking is reflected in this commentary:¹

There is some possibility that the 1804 Class III dollars were edge lettered as early as 1869, but I tend to think they were made around 1875, along with the 1801-2-3 Proofs, and all released about the same time (1876), mostly through dealer J.W. Haseltine.

A History of the 1804 Dollar

First Mentioned in the 1840s

Although the Mint Director’s Report listed 19,570 dollars having been struck in 1804, no collectors had heard of the existence of an 1804-dated dollar until in 1842 Jacob R. Eckfeldt and William E. DuBois, of the Philadelphia Mint, caused to have published *A Manual of Gold and Silver Coins of All*

Nations, Struck Within the Past Century. Shown on one of the plates was a United States silver dollar dated 1804, but with no accompanying commentary.

On May 9, 1843, Matthew A. Stickney, a prominent collector from Boston, came to the Philadelphia Mint and obtained for his cabinet an 1804 dollar by exchanging a 1785-dated IMMUNE COLUMBIA piece in gold.

During the 1840s numismatics was in its infancy in America, and probably no more than a dozen or two numismatists collected silver dollars by date, and even this estimate may be on the high side. Apparently, Stickney told others of his acquisition, and during the next 20 years a number of collectors acquired 1804 dollars by trade, or, more likely, private purchase either directly or indirectly from Mint officials.

Creation of the 1804 Class I Dollars

The fame of the 1804 dollar grew, and by the late nineteenth century it was the most written-about and discussed of all United States coins. Many were the theories of how they were minted and distributed.

In 1962 Eric P. Newman and Kenneth E. Bressett completed *The Fantastic 1804 Dollar*, a book which compiled earlier printed information on the coin and, using new insights and research methodology, unraveled the mystery of this famous issue. R.W. Julian has contributed much to the disclosure of the circumstances under which the 1804-dated dollars were struck, and Walter H. Breen and Don Taxay have been valuable contributors to knowledge as well.

It seems that in 1831 or shortly thereafter, the Mint contemplated making new silver dollars for cir-

¹ Letter to the author, December 22, 1992.

ulation. In anticipation of this, some specimen coins dated 1804 were made from dies which employed old punches. There was no intent to deceive, just to provide examples of the silver dollar denomination for congressional consideration and study purposes.

In 1834 and 1835 the United States Mint desired to prepare specimen Proof sets of United States coins for presentation to certain foreign dignitaries, royalty, and others. During these years no regular silver issues were being made. In fact, none had been made since 1803-dated coinage. The Mint records were checked and it was found that 19,570 silver dollars were minted in 1804. In 1834 and 1835 it apparently was not realized that these pieces were dated 1803, so it was reasonable to assume that the last-minted American silver dollar bore the date 1804.

To complete the 1834 and 1835 Proof sets it was desired to include specimens of the silver dollar denominations. The silver dollar or "crown" size piece is traditionally one of the highlights of any country's coinage, and omitting this from an American presentation set would have been a serious error. The United States Mint did not want to produce silver dollars dated 1834-1835, for there was no authorization to make these, and none was currently being produced for circulation. Thus, it was desired to include top-grade specimens of the last date in which silver dollars were regularly issued, in this case 1804 (or so it was thought).

Specimens of 1804-dated dollars were on hand from 1831, or else a few more were made in 1834. Thus the presentation sets contained the beautiful crown-size silver dollar coin. The same thing happened with the \$10 gold piece. Mint records were checked and it was found that the \$10 gold pieces or eagles were last minted in 1804. In this instance pieces actually were minted with the 1804 date. New dies for a Proof 1804 eagle were made, and specimens were included in presentation sets. However, since regular issue 1804 \$10 pieces were made as well, the Proof 1804 pieces today do not stand out a single rarity so far as the date is concerned.

With the 1804 silver dollar it was soon realized that a rarity was created. During this time the Mint officials were building the Mint Cabinet of rare coins. Also at the same time James Ross Snowden, director of the Mint, actively traded coins with and sold coins to collectors. Others at the Mint made restrikes and special pieces secretly, without the ap-

proval or knowledge of Snowden.

The appeal of the rare 1804 silver dollar was soon recognized, and at the Mint in 1858 and later, additional pieces (these being of the Class II and Class III varieties) were secretly struck for distribution to collectors.

Specimens of 1804-dated dollars minted in the 1830s from Reverse X (per Newman and Bressett nomenclature) came to be known as "originals" and, later, Class I dollars. Examples minted in 1858 and later years used the Reverse Y die and were once known as "first restrikes" and "second restrikes" respectively, but are now referred to as Class II and Class III dollars.

Appeal of the 1804 Dollar

Today there are 15 known specimens of the 1804 silver dollar, several of which are impounded in public collections and museums. Only occasionally does an example come on the market, and when one does it usually creates a numismatic sensation. The Garrett Collection specimen auctioned by my firm in 1980 realized \$400,000, setting an all time record (at that time) auction price for an American silver coin.

Interestingly, during the decades of the 1970s and 1980s a spate of 1804 dollars appeared on the market, as recognition of their extreme value became evident, and owners sought to realize a profit. During this period, the following 1804 dollars were bought and sold:

- King of Siam specimen (Class I)
- Weyl-Dexter specimen (Class I)
- Mickley specimen (Class I)
- Berg-Garrett specimen (Class III)
- Adams specimen (Class III)
- Davis specimen (Class III)
- Idler specimen (Class III)

This extreme market turnover of seven different coins during such a relatively short period is all the more remarkable when it is considered that the other known 1804 dollars were not available for sale during that period and were mostly in museums or estates, as follows:

- Smithsonian Institution (Class I)
- Eliasberg estate (Class I)
- Childs estate (Class I)
- Omaha museum (Class I)
- Specimen (Cohen coin) stolen in 1967 (Class I)
- Smithsonian Institution (Class II)
- American Numismatic Association Museum (Class III)

American Numismatic Society Museum (Class III)

In other words, if a coin was not “tied down” in an estate or museum, or missing as stolen, during the 20-year period 1970-1990, it came on the market. Remarkable!

Doubtless, many of the new owners (and some of the coins changed hands *several times* during the period) sought to bask in the limelight that the ownership of an 1804 dollar has brought to leading numismatists and important collections in the past. The comment of noted dealer B. Max Mehl, made in the William Forrester Dunham Sale catalogue in 1941, nicely summarizes the 1804 dollar’s appeal to collectors:

In all the history of numismatics of the entire world there is not today and there never has been a single coin which was and is the subject of so much romance, interest, comment, and upon which so much has been written and so much talked about and discussed as the United States silver dollar of 1804.

Now that the mystery of the 1804 dollars as well as those Proof novodel “restrikes” dated 1801-1803 has been documented and publicized by Eric P. Newman, Kenneth Bressett, Walter H. Breen, R.W. Julian, Don Taxay, and others, collectors are closer to knowing the exact status of the pieces. The fact that 1804 dollars were not made in 1804, or in any

year close to 1804, and that the Class II and III coins were secretly produced and distributed, does not seem to make a great deal of difference. The fame attached to the 1804 dollars overwhelms any thoughts concerning their origin, as amply attested by the Garrett coin’s price of \$400,000 in 1980 and the Dexter coin’s realization of \$990,000 in 1989, both of which sales occurred long after the research of Newman and Bressett reached print.

Likewise the fame of the 1913 Liberty nickel, whose parentage has been questioned, outshines its detractors. Among smaller denomination United States coins it is without doubt the best-known and most-admired landmark among non-collectors.

On the other hand, rarities which are bluebloods, examples being the 1802 half dime, 1823/2 and 1827/3 quarters, and a few others, do not capture the public’s fancy to such an extent. Indeed, the 1802 half dime and 1823/2 quarter dollar, highly publicized as rarities in auctions during the nineteenth and early twentieth centuries, have been largely forgotten in recent decades, except by specialists! Consistency, logic, and what scholars think *should be* right are not necessarily attributes of our hobby. Perhaps such unpredictability is what makes numismatics fascinating!

Varieties

Class I 1804 Dollar. BB-304.

• **OBVERSE:** A later (circa 1830s) Mint copy of the general type with Draped Bust originally used 1795-1803, with bust of Miss Liberty at the center, 7 stars left and 6 right, LIBERTY above, and the date 1804 below. Later (as used in the 1830s) style of denticulated border.

On the left, stars 1 and 2 are spaced closer together than are any of the others. Stars 2-3 and 4-5 are more widely spaced than any others. On the right, stars 12-13 are the closest together, and stars 10-11 have the widest separation. In LIBERTY, the I is tilted slightly to the right, with the left bottom serif

being slightly too high, and the right bottom serif slightly too low.

The left tip of the highest curl is missing, a flaw caused by a broken portrait punch. This flaw also is represented on the 1801 novodel, but not the 1802 and 1803.

Obverse die used to strike Class I, II, and III 1804 dollars.

• **REVERSE:** As preceding. See description under 1801 Proof novodel dollar. This differs from Reverse Y used to strike Class II and III 1804 dollars, to which refer.

“Reverse X” die used to strike 1801, 1802, 1803, and Class I 1804 novodel silver dollars.

• **DIE STATES:**

Die State I: Perfect obverse die without cracks. Perfect reverse die without cracks. Does not exist.

Die State II: Mint Collection specimen: Obverse: With hairline crack beginning to the left of the top of I in LIBERTY, nearly touching the upper right of the serif of L, and in line with the top of the L, extending through LIBER, to top of the left upper serif of T. Reverse: With hairline crack from right side of I, through TE, and through the center of D. (Data from photograph, Newman-Bressett, pp. 36, 54; the details are not as fine as might be seen from actual inspection of the coin.)

Die State III: King of Siam specimen: Obverse: With hairline crack beginning to the left of the top of L in LIBERTY, about 60% of the way toward the nearest upper point of star 7, and in line with the top of the L, extending through LIBER, to top of the left upper serif of T, then at a slight angle toward the border, ending above the junction of the upright of T and its left arm. Reverse: With hairline crack from top right serif of N, sloping slightly downward through ITED, and ending just past the left edge of the second denticle past the D. Crack resumes, and is hardly visible, at the leftmost feather (presumably, the crack extends from D to the feather, or at least die weakness exists, but is not visible). Struck prior to the 1802 and 1803 Proof dollars. (Data from inspection of coin.)

• **COLLECTING NOTES:** The historical record shows that 1804 Class I dollars were created for legitimate reasons, and were openly produced at the Mint. As such, among the three classes of dollars bearing this date, the 1804 Class I would seem to be the most desirable from a numismatic viewpoint—although it cannot be denied that the “naughty” background of the Class II and III dollars adds to the appeal of those issues and for any U.S. silver coin.

Of the eight known specimens of the 1804 Class I dollar, just two—the King of Siam coin (part of a set) and the Weyl-Dexter coin—have come on the market in recent years. The Weyl-Dexter piece sold for \$990,000, a record for the issue.

• **REGISTRY OF KNOWN SPECIMENS:** The registry of 1804 Class I, II, and III silver dollars is

adopted, expanded, and updated from *The Fantastic 1804 Dollar*, by Eric P. Newman and Kenneth E. Bressett, 1962; Kenneth E. Bressett’s updated listing furnished to the author in 1987 in connection with the King of Siam Proof set offering; (especially, for new information) “The Fantastic 1804 Dollar: 25th Anniversary Follow-Up,” by Eric P. Newman and Kenneth E. Bressett, in *Coinage of the Americas Conference*, American Numismatic Society, 1987; and *Walter Breen’s Complete Encyclopedia of U.S. and Colonial Coins*, 1988. In addition, Eric P. Newman and Kenneth E. Bressett were among those who reviewed and made comments concerning this section of the manuscript of the present book. In addition, certain basic information is from “The Dollar of 1804,” in *The Nummatist*, July 1937, which includes a reprint of John A. Nexsen’s listing of 1804 dollars and their owners, originally published in the *American Journal of Numismatics*, April 1891.

1. Mint Cabinet Specimen, Impaired Proof

• Chief Coiner Adam Eckfeldt, who presented it to the following. (Coin in his possession circa 1834-1838)

• Mint Cabinet, formed beginning in 1838. This coin, illustrated in the 1842 book by Jacob R. Eckfeldt and William E. DuBois, *A Manual of Gold and Silver Coins of All Nations, Struck Within the Past Century*, was the first notice collectors saw in print that an 1804-dated dollar existed, although fanciful pictures of such pieces had been published in cambists (exchange rate publications) earlier. (1838 to date)

• National Coin Collection (Mint Cabinet), Smithsonian Institution.

415.2 grains. Edge lettering crushed, like two of the 1802s. Proof, cleaned on several occasions. Nicks and friction spots.

2. The Stickney Specimen, Impaired Proof

• Adam Eckfeldt (c. 1834-1838)

• Mint Cabinet Collection, as a duplicate. (1838-1843)

• Matthew Adams Stickney Collection, acquired from the Mint on May 9, 1843, by trading a gold IMMUNE COLUMBIA for it. Stickney kept it until his death, after which it descended to his daughter. (1843-1894)

• Stickney’s daughter. (1894-1907)

• Henry Chapman’s sale of the Stickney Collection, June 25-29, 1907, Lot 849, \$3,600.00. Sold to the following. (1907)

• Col. James Ellsworth. (1907-1923)

• Wayte Raymond and John Work Garrett (bought the Ellsworth Collection privately; Garrett kept the coins he needed, not including the 1804 dollar). Raymond sold the 1804 dollar to the following in March 1923. (1923)

• William Cutler Atwater. (1923-1946)

• B. Max Mehl’s sale of the Atwater Collection, June 1946, Lot 213, \$10,500.00. (1946)

• Louis E. Eliasberg (1946-1976)

- Louis E. Eliasberg estate (1976 to date)

415.3 grains. Edge lettering crushed. Proof, cleaned and with rubbing.

3. King of Siam Specimen (in set), Proof-65

• Adam Eckfeldt/Mint, November 1834, in cased set of Proof coins dated 1834, plus the 1804 dollar and 1804 "re-strike" (from new dies) \$10 gold, to the following. At some point, the half dime and possibly an early-style quarter eagle were lost from the set.¹ (1834-1836)

• State Dept., April 4, 1836, gift to King Ph'ra Naga Klao of Siam (in cased Proof set of 1834). (1836-?)

• King Mongkut, died in 1868. The set descended to his 15-year-old son, who gave it to the following (in cased Proof set of 1834). (?-1868)

• King Chulalongkorn, who is believed to have given it to the following (in cased Proof set of 1834). (1868-?)

• Anna Leonowens. Passed to the following. Anna was of course known as Anna of Siam (whose reminiscences were published in Margaret Landon's book, *Anna and the King of Siam*, in 1944; later made into a musical stage play, *The King and I*).² Sold by the ladies to the following. (c. 1950s) (in cased Proof set of 1834). (c. after 1868-1950s)

• Believed to have been descended through the Leonowens family (in cased Proof set of 1834). Brought to Spink & Son, Ltd., 5 King Street, St. James, London, England, by two older ladies, who showed it to Donald Crowther, then of the Spink staff. The ladies are believed to have been descendants of Anna Leonowens, governess to Chulalongkorn at the court of Rama IV (Mongkut). The half dime was missing from the set.

• David Spink personally; not the property of the firm bearing his family name, Spink & Son, Ltd. David Spink first informed the numismatic fraternity of this coin's existence in a talk given at the 1962 ANA Convention in Detroit (in cased Proof set of 1834). (1950s-1979)

• Lester Merkin, who as agent for David Spink, was paid a reported \$1 million for the cased Proof set of 1834 in August 1979 by the following (when a photograph of the set was taken in the early 1960s for publication, an 1834 half dime was temporarily inserted). Sold to the following. (1979)

• Elvin I. Unterman, Garrison, New York, (in cased Proof set of 1834). Exhibited at the Smithsonian Institution, 1983. Offered with other material in the Bowers and Merena King of Siam Sale, October 14, 1987, Lot 2209. The set was reserved by the consignor at \$2 million; reserve not met. A large, full-color poster was issued depicting the 1804 dollar. The set was consigned at fixed price to the following in May 1989. (1979-1989)

• Stack's, as agent for the owner. Sold to the following on October 18, 1989, for a "figure well in excess of \$2 million." (1989)

• The Rarities Group (Martin Paul) and Continental Rarity Coin Fund I (Greg Holloway) (in cased Proof set of 1834). (1989-1990)

• Superior Galleries' Father Flanagan Boy's Town Sale, May 1990, Lot 3364. Set graded by PCGS, including the 1834 half cent, Proof-66 RB; 1834 cent, Proof-66 BN; 1834 dime, Proof-67; 1834 quarter dollar, Proof-65; 1834 half dollar, Proof-65; 1804-dated silver dollar, Proof-65; 1834 \$2.50 gold, Proof-64; 1834 \$5 gold, Proof-64; 1804 "re-strike" \$10 gold, Proof-63. Sold for \$2,900,000 + 10% buyer's fee (in cased Proof set of 1834). Ira Goldberg, of Superior Galleries, commented as follows:³ "On the King of Siam specimen set we made a guarantee of \$2,750,000, meaning if the set failed to sell we guaranteed to buy it. It sold for \$2,900,000. plus the 10% buyer's fee." (1990)

• Iraj Sayeh (Los Angeles investor and coin dealer) and Terry Brand (Los Angeles industrialist) (in cased Proof set of 1834). Consigned to the following. (1990 to 1993)

• Superior Galleries auction of January 31 and February 1, 1993. Lot 1196. Offered without pre-sale reserve, but the consignors were given the opportunity to bid on the lot. Sold to the following for \$1,650,000 plus 10%.

• Dwight Manley, Spectrum Numismatics, Newport Beach, California.

415.5 grains. Edge lettering crushed. Proof-65.

4. The Watters Specimen, Proof-65 (?)

• Adam Eckfeldt, November 1834, to the following (in cased Proof set of 1834). (1834-1835)

• State Dept., October 1, 1835, Imá, Sayyid Sa'id of Muscat⁴ (in cased Proof set of 1834). (1835-?)

• Private collections (in cased Proof set of 1834). (?-?)

• C.A. Watters, Liverpool, England. Ebenezer Locke Mason, Jr., American coin dealer, claimed that Watters saw it in the window of a pawnshop and bought it for 12 shillings; this and several other comments, some contradictory, have since been discredited. By this time the coins were no longer in their original presentation case. (before 1879-1917)

• Glendining & Co. sale of the Watters estate, June 14, 1917, Lot 227 (now with *partial* Proof set of 1834 containing the half dime, quarter, half dollar, and dollar, and possibly also the half cent, cent, and dime offered separately in the same sale, mixed with groups of other coins under Lots 240, 246, 250, 254, 278, and 283; no mention of presentation case). Sold to the following for £330 (\$1,603.80) (1917)

¹ There is an opening approximately the size of a quarter eagle in the box; it may have been the case that the set originally contained two coins of this denomination, a specimen of the pre-August 1, 1834 style with motto in addition to the Classic Head quarter eagle now in the set. Carl Carlson has suggested that a small medal depicting President Andrew Jackson (Julian PR-33 variety) may have been used instead of a second quarter eagle.

² Pedigree information courtesy of David Enders Tripp, letter to the author, July 24, 1992.

³ Letter to the author, July 29, 1992.

⁴ A territory known in 1992 as the Sultanate of Oman.

- Henry Chapman, who sold it for \$2,500.00 on June 20, 1918, to the following. (1917-1918)
 - Virgil Brand (by now, a single coin no longer kept with a case or other coins from the set). (1918-1926)
 - Virgil Brand estate. David Enders Tripp provided this information:¹ "On Virgil Brand's death the estate remained somewhat in limbo for a number of years. After having been appraised by both Burdette G. Johnson and Henry Chapman, the division was ultimately made. According to my notes, the 1804 dollar was part of the group called 'Rarities,' and his brother Armin drew group 'B' (which also included the 1822 half eagle). The 1804 dollar became officially his on November 1, 1933." (1926-1933)
 - Armin W. Brand. Apparently traded to the following (Charles E. Green, trading as R. Green, advertising in *The Numismatist*, said the coin came from Horace Brand). See following listing. (1933-?)
 - Horace Louis Philip Brand. Brand, the other brother of Virgil M. Brand, advertised in *The Numismatist* and elsewhere, and claimed at one time to sell to "dealers only," although this was not a fixed policy. In April 1942 the coin was advertised in *The Numismatist* by R. Green, who did so on behalf of Horace Brand, as evidenced by the text: "This great rarity, now a part of Mr. Horace L. Brand's collection, was purchased by his brother, Virgil M. Brand. . . . This is perhaps the finest condition of any piece known, light blue, evenly colored, a perfect Proof." Sold to the following. (?-1945)
 - Charles E. Green, Chicago dealer who sold it for \$5,000.00 to the following. An announcement to this effect appeared on page 1293 of *The Numismatist*, November 1945. (1945)
 - C.F. Childs. (1945-1955)
 - C.F. Childs estate (Chicago). (1955 to date)
- 416.7 grains. Edge lettering crushed. Blue-toned Choice Proof. Proof-65.

5. Dexter Specimen, Proof-63 (counterstamped)

- Adam Eckfeldt. (1834-?)
- Unknown intermediaries. (?-?)
- Brothers S. Hudson Chapman and Henry Chapman, Jr., Philadelphia coin dealers, who apparently "laundered" the coin by sending it to Germany to be included in the following sale.²
- Adolph Weyl sale held in Berlin, Germany, October 13, 1884, Lot 159, \$216.00. Sold to the following. (1884)
- S. Hudson and Henry Chapman (Chapman brothers). (1884-1885)
- Chapman brothers' sale of May 14-15, 1885, Lot 354, \$1,000.00. Purchased by the following as agent for Dexter. The coin opened at \$500, jumped to \$600, and rose in \$5 and \$10 increments to the final price, at which the audience broke into applause and stamped their feet. "In superb Extremely Fine condition, with beautiful surface, as fine as, if not the finest of seven known." (1885)

- J.W. Scott, Scott Stamp & Coin Company. Purchased as agent for the following. (1885)
- James Vila Dexter (life dates: 1834-1899), Denver, Colorado. Apparently, Dexter stamped his initial D on a cloud below O (of OF) on the reverse, the second cloud from the right. (1885-1899)
- Dexter estate. (1899-1903)
- Roland G. Parvin, executor of the Dexter estate. Sold for a reported \$2,000.00 (Lyman H. Low claimed the price was \$1,500) to the following on November 5, 1903. (1903)
- H.G. Brown, Portland, Oregon. At the time, this coin was the subject of much discussion in *The Numismatist*. (1903-1904)
- Lyman H. Low's sale of Part I of the Brown Collection, October 11, 1904, Lot 431, \$1,100.00. "Extremely Fine, with a brilliant, prooflike surface, and unimpaired since its last public appearance at an auction sale in Philadelphia, in May 1885, where it was purchased by order of J.V. Dexter." Sold to the following, who traveled from Chicago to New York to buy the piece. (1904)

Appropriate to the preceding, Low printed the following on the inside front cover of a subsequent auction catalogue dated May 19, 1904:

"1804 DOLLAR.

"So much has been said about the last 1804 dollar, which changed hands in January last, and so many articles have appeared in newspapers and periodicals concerning it, that I feel inclined to tell the part I took in it.

"The dollar was first offered in a sale in Berlin, held by the late Adolph Weyl, and was purchased on an order from this country. It shortly afterwards appeared in Philadelphia (in 1886) and was purchased by Mr. J.B. Dexter, of Denver, Colo. Mr. Dexter died a few years ago and his widow sold it to Mr. Parvin. This gentleman had much correspondence with various parties who desired to purchase it, but until Mr. H.G. Brown of Portland, Oregon, communicated with him on the subject, no serious negotiations were entered into. The piece was finally forwarded to Mr. Brown, who was allowed 60 days for consideration and opportunity to verify its pedigree, and to become assured of its genuineness. Mr. Brown forwarded the coin to me for my critical opinion. I found the coin had all the peculiarities of this particular and excessively rare issue of 1804, and I also recognized it as the identical one which was purchased by Mr. Dexter, and as the No. 12 of the 13 specimens known, of which Mr. Jno. A. Nexsen printed in the *Journal of Numismatics* a most carefully prepared list, and to whom I had the pleasure of showing the piece.

"LYMAN H. LOW"

- William Forrester Dunham, Chicago. Sold with his entire collection to the following in 1939. (1904-1939).
- B. Max Mehl (purchased for his inventory, although few people knew this). (1939-1941)
- B. Max Mehl's sale of the Dunham Collection, June 3, 1941, Lot 1058, \$4,250.00. "A brilliant semi-proof, with an even, beautiful iridescent medium purple surface." (1941)

¹ Letter to the author, July 24, 1992.

² Cf. Eric P. Newman, "Keeping Up with the 1804 Dollar History," *The Numismatist*, March 1970, p. 310.

- Charles M. Williams, Cincinnati, Ohio. (1941-1950)
- Abe Kosoff and Sol Kaplan, sold for a reported \$10,000.00 by private treaty in 1950 on behalf of Williams to the following. (1950)
- Harold Bareford. (1950-1981)
- Stack's sale of the Bareford Collection, October 22-23, 1981, Lot 424, \$280,000.00. "Brilliant Proof. Second or third finest preserved specimen." Sold to the following. (1981)
- Rarcoa (Ed Milas), Chicago, Illinois. Sold to the following for \$425,000.00. in 1985.¹ (1981-1985)
- Leon Hendrickson and George Weingart. (1985-1989)
- Rarcoa's section of Auction '89, July 7, 1989, Lot 247, \$990,000.00. "Choice brilliant Proof, toned a beautiful purple iridescent color." (1989)
- American Rare Coin Fund Limited Partnership (Hugh Sconyers, manager). (1989 to date)
- 415.8 grains. Edge lettering crushed. Brilliant Proof, dipped; D counterstamped on cloud on reverse similar to the "D" found on Dexter's hard times tokens.

6. Parmelee Specimen, Proof-63(?)

- Adam Eckfeldt/Mint. (1834-1835 to circa 1845-1849)
- Unknown lady (c. 1845-1849), who allegedly bought it from the Mint for face value during the administration of James Knox Polk, 1845-1849. Sold to the following in 1868. (circa 1845-1849 to 1868)
- E. Harrison Sanford. (1868-1874)
- Edward Cogan's sale of the Sanford Collection, November 27, 1874, Lot 99, \$700.00. "This dollar I guarantee is original and a remarkably fine impression, and is known to be one of, if not the *most* rare piece in the American series, not more than four or five being known to collectors in the United States." (1874)
- Lorin G. Parmelee, Boston bean baker. At one time, Parmelee owned what was generally acknowledged to be the most complete collection of United States coins in private hands. (1874-1890)
- New York Coin & Stamp Company's sale of the Parmelee Collection, June 25-27, 1890, Lot 817, \$570.00. "Stars nearly all with rounded centers, otherwise a sharp perfect impression of this most famous coin." (1890)
- Byron Reed, willed to the following. (1890-1891)
- Omaha City Library, Omaha, Nebraska. While there it and other coins were the object of burglary attempts; in 1966 it was removed to a bank vault for safety. Transferred in the 1980s to the following for display: Western Heritage Museum, Omaha. (1891 to date)
- 412 grains (reported). Brilliant Proof, flat stars. Edge lettering crushed. Proof-63(?)

7. Mickley Specimen, Proof-50

- Adam Eckfeldt/Mint. (1834-?)
- Henry C. Young (a teller for the Bank of Pennsylvania, c.1850, supposedly retrieved from a deposit at face value). (1850 to later in the decade)

- Joseph J. Mickley. (before 1859-1867)
- W. Elliott Woodward's sale of the Mickley Collection, October 28, 1867, Lot 1696, \$750.00. "It has been in circulation, but it is still in the finest condition, retaining its brilliancy of surface, and being entirely uninjured." (1867)
- William A. Lilliendahl. Sold to the following. (1867-1868)
- Edward Cogan. Sold to the following "at an advance on \$750.00" (per information quoted by B. Max Mehl in his 1941 Dunham sale catalogue). (1868)
- William Sumner Appleton. Given in 1905 to the following. (1868-1905)
- Massachusetts Historical Society. (1905-1970)
- Stack's sale of coins from the Massachusetts Historical Society Collection, October 23-24, 1970, Lot 625, \$77,500.00. "Very nearly Uncirculated, nice steel tone, slight friction on the high points." Sold to the following. (1970)
- Chicago private collection. (1970-1974)
- Stack's (as agent for the following; sale at \$150,000.00. took place in January 1974).²
- Reed Hawn. (1974 to date)
- 416.4 grains. Edge lettering crushed. Called "AU" (Proof-50).

8. Cohen Specimen, VF

- Adam Eckfeldt/Mint. (1834-5-?)
- Unknown intermediaries. (?)
- Purchased "over the counter" at the exchange office of Edward Cohen, Richmond, VA. Apparently, the coin remained with Edward Cohen for a long period of time, and this fact was known by the following owner, who was Edward's uncle. (c. 1865)
- Col. Mendes I. Cohen, Baltimore, Maryland. Cohen had one of the finest collections of American coins at the time. (1865-1875)
- Edward Cogan's sale of the Cohen Collection, October 15, 1875, Lot 535, \$325.00. Bought by the following. (1875)
- Henry S. Adams, Boston, Massachusetts. (1875-1876)
- Edward Cogan's sale of the Adams Collection, November 1, 1876, Lot 356, \$500.00. "This exceedingly rare dollar was purchased by Mr. Adams at the sale of Colonel Cohen's collection, in October last. The impression is not so fine as of two that had been sold some years previous, but warranted original. Extremely rare." (1876)
- Lorin G. Parmelee, Boston bean baker, and the owner of the most complete collection of United States coins. Sold to the following for \$600.00 in 1878. (1876-1878)
- H.G. Sampson, dealer; intermediary in the transaction. Sold to the following for \$625.00 in 1878. (1878)
- Major William Boerum Wetmore, New York City, New York. (1878-1906)
- Chapman brothers' sale of the Wetmore Collection, June 27, 1906, Lot 208, \$720.00. (1906)
- Chapman brothers (bought for inventory). Sold in July 1906 to the following.

¹ Undated note from Ed Milas in response to the author's query to him dated August 26, 1992.

² Per letter from Reed Hawn to the author, July 24, 1992.

- James L. Manning, Albany, New York. (1906-1921)
- B. Max Mehl's sale of the Manning Collection, May 17, 1921, Lot 778, \$2,500 + 5% = \$2,625.00. Bought by the following. (1921)
- Elmer S. Sears. Sold to the following. (1921-1922)
- B. Max Mehl, who sold it to the following for \$3,200.00. (1922)

• Lamot du Pont. About three years after du Pont purchased it, Mehl offered \$5,000.00 to reacquire the coin; the offer was declined. (1922-1952)

• Willis du Pont. Included in the armed robbery of the du Pont coins October 1967. Recovered in April 1993.

410.21 grains. Very Fine with many nicks and scratches. Edge lettering crushed. Of all Class I dollars, this coin has the greatest evidence of wear.

Class II 1804 Dollar. BB-305.

This photo was reproduced directly from The Fantastic 1804 Dollar, by Eric P. Newman and Kenneth Bressett.

• **OBVERSE:** As preceding.

Obverse die used to strike Class I, II, and III 1804 dollars.

• **REVERSE:** The reverse, known as Reverse Y (per Newman and Bressett nomenclature) is another Mint copy of the Heraldic Eagle reverse type used to coin silver dollars of the dates 1798-1803, but is not precisely identical to any die of that era. Undoubtedly, it was punched out at the Mint at the same time that Reverse X was made, in the early 1830s. However, it is believed that Reverse Y was not used for coinage until circa 1858.

Reverse Y was made by using a Heraldic Eagle punch, and adding details including the letters of UNITED STATES OF AMERICA, one arrow (to the 12 already in the die) and the berries. Twelve of the arrows were part of the eagle punch (the 13th arrow, with its tiny shaft and head to the right of the two leftmost large shafts, was added by hand and differs slightly on this as compared to the 1801 novodel dollar reverse), as was the olive branch (except the berries) and, I believe, E PLURIBUS UNUM (with a linear flaw on the hub connecting the tops of E and P). As was the case with the reverse used on the 1801-2-3 novodels and the 1804 Class I, old letter punches, the Small Letters font of 1798 or a similar set, were used; the lopsided T, with the left serif

shorter than the right, is distinctive. This identical die was used to coin the so-called Class III 1804 dollars.

The A in STATES is centered over cloud 3. O in OF over junction between clouds 7 and 8. Arc star pattern as standard after 1798. UNITED STATES OF AMERICA in the same general font as used 1798-1803. 12 arrows perfectly formed and delineated (and a 13th added by hand), far better than any definition seen on any original business strike dollar c. 1798-1803. Top right berry slightly higher on branch than top left berry. The border denticles are more beadlike (later style) than toothlike (original style).

"Reverse Y" die used to strike Class II and III 1804 novodel silver dollars.

• **EDGE:** The edge on the Class II dollar is *plain*, unlike all other 1801-2-3-4 novodel dollars.

• **DIE STATES:**

Die State I: Mint Collection specimen, the only one known: Obverse: Crack through top of LIBER to upper left of T. Reverse: Die without cracks. (Data from photograph, Newman-Bressett, p. 36; the details are not as fine as might be seen from actual inspection of the coin.)

• **COLLECTING NOTES:** Just one Class II dollar is known today, from a mintage estimated to have been five pieces. It is overstruck on a Bern (Switzerland) shooting taler dated 1857 and has a plain edge.

The piece is believed to have been made at the Mint by George and Theodore Eckfeldt, circa 1858-9.

Electrotype copies of this piece were later made at the Mint for sale to collectors. Three or four pieces are known, one having been formerly listed as a copper pattern by Edgar H. Adams and William H. Woodin in their 1913 text on pattern coins. Another was in the Spier Collection in San Francisco in the 1900s. In 1992, Craig Whitford sold a specimen

owned by the National Bank of Detroit Money Museum.

• **REGISTRY OF KNOWN SPECIMENS:**

I. Mint Cabinet Specimen

- Mint Cabinet Collection. (c. 1858-9 to date)
- National Coin Collection (Mint Cabinet Collection), Smithsonian Institution.

381.5 grains. Plain edge; high wire rim. Reverse slightly misaligned; 0 in date aligned with the second T in STATES.

Class III 1804 Dollar. BB-306.

• **OBVERSE:** As preceding.

Obverse die used to strike Class I, II, and III 1804 dollars.

• **REVERSE:** As preceding. See description under 1804 Class II dollar.

"Reverse Y" die used to strike Class II and III 1804 novodel silver dollars.

• **NOTES:**

The obverse and reverse of the 1804 Class III dollars are as Class II. However, Class III dollars have lettered edges. The edge was lettered *after* the coins were struck. Probably struck circa 1858, with edges lettered years later, sometime in the late 1860s or, more likely, circa 1875.

The dies were in the Mint until at least the late 1860s or early 1870s. The die orientation of the Class II and Class III 1804 dollars is identical—the 0 in the date is opposite in the dies to the second T in STATES—and is unlike the normal 180° orientation of the Class I dollars. This would seem to indicate that Class II and Class III dollars were struck at the same time, and this was c. 1858.¹

• **DIE STATES:**

Die State I: Du Pont specimen (on loan to the ANA; from photograph furnished by ANA Museum Curator Robert Hoge): Obverse: With hairline crack beginning to the left of the top of L in LIBERTY, about 60% of the way toward the nearest upper point of star 7, and in line with the top of the L, extending through LIBER, to top of the left upper serif of T, then at a slight angle toward the border, ending above the junction of the upright of T and its left arm; this crack being that seen on Die State III of the Class I 1804 dollars; PLUS additional crack beginning at left side of top serif of L, just below the crack just described, and continuing left to touch the outermost point of star 7, continuing to and ending at the outermost point of star 6. Reverse: Die without cracks. Rust spots as follows: at upper left of U in UNITED and in field near it, toward eagle's tail; to lower left of star below cloud 7; between tops of letters O and F in OF. Bebee specimen (also on loan to the ANA; from photograph furnished by Robert Hoge): Die states similar to preceding, except later obverse die break possibly not as advanced toward the left (photograph and/or surface of coin not sharp enough for positive comparison). Obverse and reverse rims of both coins have been filed down. The obverse of the du Pont coin is slightly doubled, from striking.

• **COLLECTING NOTES:** There are only six specimens known of the Class III dollar. Interest-

¹ A view held strongly by Kenneth E. Bressett. Letter to the author, December 12, 1992.

ingly, all except the du Pont coin have come on the market in recent decades, some specimens several times.

Unlike the 1804 Class I dollars, most of which have some Proof surface remaining, the majority of Class III dollars show evidence of "circulation." It is believed that this wear was given to the coins by Mint officials and/or their agents, in an effort to further the illusion that such coins were once used in the channels of commerce. Exceptions are provided by the Linderman and Idler specimens, which retain Proof finish.

• **REGISTRY OF KNOWN SPECIMENS:** The registry of Class III 1804 dollars (novodels with lettered edge) follows. All are pictured in Newman-Bressett (1962) and, in many instances, in the auction catalogues mentioned.

1. Berg Specimen, EF-40

- U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)
- Captain John W. Haseltine. Probably "laundered" through the following. (1875)
- Koch & Co., Vienna. (1875)
- O.H. Berg, Baltimore, Maryland. (1875-1883)
- J.W. Haseltine's sale of the Berg Collection, May 23-24, 1883, Lot 568, \$740.00. Purchased by the following as agent for Garrett. (1883)
- George W. Cogan, acting as agent for Garrett. Sold to the following for \$740.00 plus \$25 commission, or \$765.00. (1883)
- Thomas Harrison Garrett, Baltimore, Maryland, son of the founder of the Baltimore & Ohio Railroad. (1883-1888)
- Thomas Harrison Garrett estate and Robert Garrett. (1888-1919)
- John Work Garrett, who retained it until his death on June 26, 1942, after which it passed with his collection to the following under terms of his will. (1919-1942)
- The Johns Hopkins University, Baltimore, Maryland. (1942-1980)
- Bowers and Ruddy Galleries' sale of the Garrett Collection, March 27-27, 1980, Lot 698, \$400,000.00. (1980)
- Larry Hanks (Pullen & Hanks). Sold to the following on April 17, 1980, for a sum reported to be near \$500,000.00. (1980)
- Sam Colavita, New Jersey rare coin dealer. Placed on consignment for a time with professional numismatist Ed Hipps; not sold. Consigned to the following. (1980-1982)
- Pullen & Hanks Long Beach Collector Series I Sale, Long Beach, February 6, 1982, Lot 1076, \$190,000.00, where it was

bought back by an agent for the owner.¹ Sold soon thereafter by Sam Colavita to the following. (1982)

- Mike Levinson Collection, Texas. Sold to the following. (1982-1984)
- Pennsylvania private collection. Consigned to the following. (1984-1986)
- Harry Einstein Sale, Bowers and Merena, June 24-25, 1986, Lot 1736, \$187,000.00. Sold to the following. (1986)
- Rarities Group, Inc. (Martin Paul). Sold to the following in November 1986. (1986)
- American Coin Portfolios (Dan Drykerman), for the following. (1986)
- Sommer Collection. (1986 to date)

402.8 grains. Edge lettering blundered and doubled in areas. Double struck on reverse; some stars above eagle doubled and overlapped, branch doubling has produced several "extra" berries, larger and flattened, doubling of shield has obscured lower part of IB letters in PLURIBUS, double outline on ribbon above UM and adjacent wing edge. Reverse slightly rotated (0 in date is aligned with the second T in STATES). EF-40.

2. Adams Specimen, EF-45 Cleaned

- U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)
- Capt. John W. Haseltine (who exhibited it at the Jewett Collection Sale on January 24-25, 1876, stating that it was from a private English source, and offered it for \$600.00. It is not known whether Haseltine owned the coin). (1875-1876)
- Haseltine's "Centennial Sale" I, March 30, 1876, Lot 194, \$395.00 (A.N.S. catalogue copy says \$345). Bought by Haseltine himself, either as a buy-in or for his stock if the coin was consigned by someone else.² "Fine impression of this extremely rare dollar; about as fine as the one sold in the Sanford sale and a great deal finer than the one in the Cohen sale; guaranteed genuine and original." (1876)
- Capt. John W. Haseltine. Sold soon thereafter for \$550.00 to the following. (1876)
- Phineas Adams, Manchester, New Hampshire. Sold to the following. (1876-circa 1880)
- Henry Ahlborn, Boston coin dealer and publisher of coin premium lists. Sold to the following as part of a "full set of dollars" for \$1,800.00 the collection. (c. 1880)
- John P. Lyman, Boston, Massachusetts. (c. 1880-1913)
- S. Hudson Chapman's sale of the Lyman Collection, November 7, 1913, Lot 16, \$340.00. Described in the catalogue as Very Fine, with the reverse slightly double struck. Sold to the following. (1913)
- Waldo C. Newcomer, Baltimore, Maryland. (1913-1932)
- B. Max Mehl sale (on consignment from Newcomer) to the following. (1932)
- Col. Edward H.R. Green and Green estate. Sold to the following for a reported \$3,200.00. (1932-1940)

¹ *Numismatic News*, February 27, 1982, p. 3.

² This information courtesy of P. Scott Rubin.

•A.J. Allen, Plainfield, New Jersey. Sold to the following. (1940-1946)

•Frederick C.C. Boyd, East Orange, New Jersey. Consigned to the following. (1946)

•Numismatic Gallery (Abe Kosoff and Abner Kreisberg). On consignment from Boyd, the coin was sold to the following. (1946)

•Percy A. Smith, Portland, Oregon. Shown by Smith at 9/14/46 Oregon Numismatic Society meeting. cf. *Numismatist* (10/49) p. A455 for Mehl ad for the Smith consignment. Consigned to the following. (1946-1950)

•B. Max Mehl's Golden Jubilee Sale (Jerome Kern and other collections), May 23, 1950, Lot 804, \$3,250.00. (1950)

•Amon G. Carter. (1950-?)

•Amon G. Carter, Jr. (who exhibited it widely); owned until his death in 1982. (?-1982)

•Amon G. Carter, Jr. family.

•Stack's sale of the Carter Collection, January 18-21, 1984, Lot 241, \$198,000.00. Sold to the following. (1984)

•John Nelson Rowe III, as agent for the following.

•L.R. French, Jr., Texas numismatist. (1984-1989)

•Stack's sale of the L.R. French, Jr. Family Collection, January 18, 1989, Lot 15, \$242,000.00. Sold to the following. (1989)

•Rarities Group, Inc. (Martin Paul). Sold to the following for \$275,000.00 in February 1989. (1989)

•National Gold Exchange, Tampa, Florida (Mark Yaffe). Sold to the following in March or April 1989, for a price over \$300,000.00.¹ (1989)

•Heritage Rare Coin Galleries (Jim Halperin and Steve Ivy), Dallas, Texas. Sold to the following. (1989)

•Midwest collection.

416.25 grains. Edge lettering fairly sharp. 0 in date aligned with the second T in STATES. EF-45 (PCGS).

3. Davis Specimen, EF Cleaned

•U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)

•Capt. John W. Haseltine. Sold to the following on October 23, 1877, for \$500; guaranteed to be genuine. (1875-1877)

•Robert Coulton Davis, Philadelphia druggist and collector of patterns, regular issues, and other coins. Davis obtained a letter dated September 17, 1878, from William E. DuBois, curator of the Mint Cabinet, stating in part: "I have no doubt that his dollar is one of the original issue—and not a 'restrike' from Mint dies." Sold it back to the following for \$1,050.00 in 1883. (1877-1883)

•Capt. John W. Haseltine. Sold it to the following for \$1,200.00. (1883)

•George M. Klein, Vicksburg, Mississippi. (1883-1888)

•W. Elliot Woodward's sale of the Vicksburg Collection (Woodward's 95th sale), Part I (Klein Collection), May 21-25, 1888, Lot 1940, \$660.00. "Extremely Fine, the finest original [*sic*] dollar of this date ever offered at auction; struck on a

lustrous planchet as occasionally met with in the coinage of the years 1795-1803, entirely different in appearance from the brilliant Proof restrikes of which several specimens have within a few years made their appearance in the market." (1888)

•J. Colvin Randall, purchaser at the above sale as agent for Robert Coulton Davis, who had owned the coin earlier. (1888)

•Robert Coulton Davis. (1888)

•Robert Coulton Davis estate (1888-1890)

•Capt. John W. Haseltine, who sold it to the following for \$850.00. (1890)

•John M. Hale, Philipsburg, Pennsylvania. (1890-1897)

•John M. Hale family; R.H. Hull (1897-1950)

•Parke-Bernet Galleries' sale of the Hull Collection, May 11, 1950, Lot 221, \$3,400.00. Sold to the following.

•Mrs. Fullerton, daughter of Henry P. Graves, as agent at the sale for her father. (1950)

•Henry P. Graves. (1950-1952)

•Henry P. Graves estate. (1952-1954)

•Stack's Davis-Graves Sale, April 8-10, 1954, Lot 1333, \$8,000.00. (1954). Sold to the following.

•Ben H. Koenig, New York numismatist. (1954-1960)

•Stack's sale of the Fairbanks (Koenig) Collection, December 10, 1960, Lot 576, \$28,000.00. Sold to the following. (Underbidder at \$27,000.00 was Q. David Bowers bidding for Ambassador R. Henry Norweb.) (1960).

•Samuel Wolfson, Jacksonville, Florida. (1960-1963)

•Stack's Wolfson Collection Sale, May 3, 1963, Lot 1394, \$36,000.00. Sold to the following. (1963)

•Norton Simon, California entrepreneur. (1963-1971)

•James H.T. McConnell, Jr. (1971 to date)

415.9 grains. Edge lettering doubled and blundered in places. 0 in date aligned with the second T in STATES. EF, cleaned. W.E. DuBois falsely called it "original" in a letter 9/17/1878, quoted in Breen's *Proof coins and complete Encyclopedias*, 1978 and 1989, and there illustrated. Exhibited at 1985 ANA Convention at Julian Leidman's table.

4. Linderman Specimen, Proof-63

•U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)

•Mint Director Henry R. Linderman, whose widow claimed he bought it, presumably from a dealer (per commentary of B. Max Mehl in the Ten Eyck catalogue, quoting an affidavit of July 1, 1887, in which the director's widow Emily Linderman said the price had been so high to her late husband as to require installment payments). Probably, Linderman obtained it directly from the Mint, where it is believed to have been struck c. 1858, with the edge lettering applied separately at a later date, after James Ross Snowden's departure in 1861. In a list of 1804 dollars and their owners published in the *American Journal of Numismatics*, April 1891, John A. Nexsen made this forthright statement: "Dr. Henry

¹ Information concerning the purchase and sale price by National Coin Exchange is from a communication to the author from Mark Yaffe.

R. Linderman, of Philadelphia, obtained this dollar from the U.S. Mint, with which institution he was connected from 1853 to 1879."

- Linderman estate. (1887-1888). Consigned to the following:

- Lyman H. Low's sale of the Linderman Collection, June 28, 1887, where the piece is said to have sold for \$332.50. "1804 Beautiful sharp Proof; evenly centered, edge lettered." However, Newman and Bressett state that the sale did not take place, and the piece was reoffered, this time by Scott (see below). (1887)

- J.W. Scott's sale of the Linderman Collection, February 1888, Lot 40, \$470.00. Sold to the following. (1888)

Scott's catalogue description is given herewith:

"Dollar, 1804. A beautiful sharp Proof; evenly centered, edge lettered. The finest known specimen of this valuable coin. This piece has the advantage over the few existing specimens, in being the property of the late director of the Mint, Dr. Linderman, which alone is a guarantee of its being struck in the U.S. Mint; it is from the same dies as that in the Mint Cabinet. The edge lettering on this is distinct; * * * HUNDRED CENTS * * ONE * * DOLLAR * * OR * * UNIT. The latest impressions are said to have plain edges, and others have muddled inscriptions, but this is of neither sort. At previous sales, inferior specimens have sold for \$1,000 and \$1,200. The perfection of the one now offered should command a large advance on all preceding prices."

- James Ten Eyck, Albany, New York. (1888-1910)

- James Ten Eyck estate. (1910-1922)

- B. Max Mehl's sale of the Ten Eyck Collection, May 2, 1922, Lot 394, \$840.00. Sold to the following. (1922)

- Lammot du Pont, Wilmington, Delaware. (1922-1952)

- Willis H. du Pont. Brilliant Proof. Involved in the October 5, 1967 armed robbery of the du Pont coins at the du Pont home in Cocoonut Grove, Florida, during which coins reported to be worth \$1.5 million were stolen; this 1804 dollar retrieved March 31, 1982, through the efforts of Tom DeLorey, the F.B.I., and others.¹ Loaned to the following in 1982. (1952-1967, in other hands 1967-1982, recovered 1982 and loaned to date)

- On loan exhibit to the ANA Museum, Colorado Springs. (1982 to date)

413.52 grains. Blundered edge lettering. Proof-63.²

5. Driefus-Rosenthal Specimen, EF Nicked

- U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)

- Freed slave and his son, probably just a nice story. (?-1893)

- W. Julius Driefus, Nos. 3 and 4 South Wharves, Alexandria, VA. Said to have been purchased from the son of a freed

slave who had held the coin for over 40 years. Driefus bought the coin in 1893 for \$100.00 and sold it to the following in satisfaction for a debt of \$500.00. (1893)

- Isaac Rosenthal, 190 Berks St., Philadelphia, of the firm of Joseph Rosenthal's Sons, Philadelphia scrap iron dealer. The following acted as agent in the coin's sale by Rosenthal. (1893-1894)

- Philadelphia Mint Superintendent Oliver C. Bosbyshell, who acted as agent in the sale of the coin to the following. The transaction was accompanied by a letter attesting to the coin's genuineness, signed by Mint Engraver Charles E. Barber and Mint Cabinet Curator R.A. McClure, 1894. (1894)

- Col. James W. Ellsworth. (1894-1923)

- Wayte Raymond and John Work Garrett (who bought the Ellsworth Collection intact in 1923). Sold to the following. (1923-1924)

- Gutttag Brothers, agent for the following. (1924)

- Farran Zerbe, who added it to his Moneys of the World exhibit. Zerbe exhibit sold to the following in 1929. (1924-1929)

- Chase Manhattan Bank Money Museum. Operated in New York City until 1978, when the expenses involved prompted the Chase Manhattan Bank to close the facility. The coin was given to the following in 1979. (1929-1979)

- American Numismatic Society. (1979 to date)

EF, nicked, probably someone's pocket piece. Edge lettering blundered and doubled in places. 0 in date aligned with the second T in STATES.

6. Idler Specimen, Proof-62

- U.S. Mint. (struck c. 1858, edge lettered in the mid-1870s)

- Capt. John W. Haseltine, who was probably the primary sales agent for Class III dollars. Perhaps he kept this specimen for his own use, after having acquired it from the Mint in the mid-1870s.

- Capt. John W. Haseltine and Stephen K. Nagy, who acquired coins from the Idler estate in 1907 and publicized them in 1908. (1907-1908)

- Henry O. Granberg.³ (1908-?)

- William Cutler Atwater. (?-1940)

- William Cutler Atwater estate. (1940-1946)

- B. Max Mehl's sale of the Atwater Collection, June 11, 1946, Lot 214, \$2,875.00. Sold to the following.

- Will W. Neil. (1946-1947)

- B. Max Mehl's sale of the Neil Collection, June 17, 1947, Lot 31, \$3,125.00. Sold to the following.

- Edwin Hydeman, York, Pennsylvania. (1947-1972)

- Abe Kosoff's sale of the Edwin Hydeman Collection, March 3-4, 1961, Lot 994, \$29,000.00 (believed to have been

¹ See Newman and Bressett, "The Fantastic 1804 Dollar: 25th Anniversary Follow-Up," in *Coinage of the Americas Conference*, American Numismatic Society, 1987, pp. 170-172, for details concerning the recovery of the coin and the subsequent trial of the person who had it.

² Grade per letter from ANA Museum Curator Robert W. Hoge to the author, September 11, 1992.

³ Another Granberg "1804" dollar, listed as Lot 320 in B. Max Mehl's sale of July 13, 1913, was a fake.

bought back by the consignor or retained by the auctioneer, Abe Kosoff, in partnership with Sol Kaplan). The cataloguer claimed to have turned down an offer of \$50,000.00 for the coin made before the sale.

- Reoffered by Abe Kosoff with the Dr. Judd Collection, Lot 45b, *Illustrated History of U.S. Coinage*, 1962. Fixed prices were quoted to interested parties. Advertised at \$100,000 (*Numismatist*, 1/72 p. 67), but sold for a reported \$80,000.00 to the following, amid much publicity in 1972.

- World-Wide Coin Investments, Atlanta. (John Hamrick and Warren Tucker). Sold to the following for a price estimated to be between \$110,000.00 and \$150,000.00. (1972-1973)

- Bowers and Ruddy Galleries, Inc. First offered for sale in *Rare Coin Review* No. 19. Priced at \$165,000.00. Sold to the following for an undisclosed sum. (1973-1974)

- Continental Coin Galleries. Sold to the following in September 1974 for a reported \$200,000.00. (1974)

- Mark Blackburn. Subsequently offered for sale by Continental Coin Galleries at \$225,000.00, and rumored to have been shipped to the Swiss Bank Corporation, Zurich.¹ (1974-1979)

- Larry Demerer, well-known professional numismatist. Sold for \$175,000.00 to the following. (1979)

- Superior Galleries, who bought it on behalf of Jerry Buss, Los Angeles sports team owner. Ira Goldberg, of Superior Galleries, commented as follows:² "I acquired the Idler 1804 dollar from Larry Demerer and I believe I paid \$175,000.00. I sold it to Jerry [Buss] for \$200,000.00 and of course, Jerry sold it in his sale of January 1985 as Lot 1337. . . . There is an interesting anecdote to this as Jerry and I were sitting in his box watching a Lakers game one night, he turned to me and said he wanted to own the "big three"—the 1804 dollar, the 1913 Liberty nickel and the 1894-S dime. He asked me what I

thought it would take to buy all three coins. I wrote down figures of each on a napkin, in fact the napkin had mustard stains from the hot dog I was eating. I believe the numbers were as follows: 1894-S dime \$100,000, 1804 dollar \$200,000, 1913 nickel \$250,000. Jerry took the napkin and he initialed it and told me go get them. That was basically our deal." (1979)

- Jerry Buss. (1979-1985)

- Superior Galleries' sale of the Buss Collection, January 28-30, 1985, Lot 1337, \$308,000.00. "Mint State 60+. Restrike (usually catalogued and referred to as a Proof). Well struck, although a trifle weak in the centers, slightly dishd and wholly prooflike on both sides. The toning is quite attractive featuring a natural blending of grayish and violet hues turning slightly iridescent, particularly on the reverse." Sold to the following. (1985)

- Aubrey and Adeline Bebee, who sent in on loan to the following in February 1989, and donated it to the following in January 1991. "At the time it was received, the coin carried an appraisal, for insurance purposes, of \$500,000. Later, after the sale of the Dexter specimen, we were instructed through a subsequent appraisal to value the piece at \$1 million"³ (1985-1991)

- American Numismatic Association Museum, Colorado Springs. (1991 to date)

411 grains. Proof-62.⁴ Rust on eagle's head. Weakly struck at centers. Sharpest edge lettering of any 1804 dollar (per Newman-Bressett). 0 in date aligned with the second T in STATES. Cf. *Coin World*, 2/14/79, p. 1; 1/5/83, p. 57, *Sports Illustrated*, 6/18/79. The illustration identified as the Idler coin in *The Fantastic 1804 Dollar* was incorrect; the Adams specimen was shown; the correct photograph appeared in the Atwater sale and all subsequent public offerings.

1804 Class I, II, III: Summary of Characteristics

Enabling legislation: None

Designer of obverse: Robert Scot (after Stuart), model by John Eckstein

Designer of reverse: Robert Scot (from the Great Seal)

Statutory weight: 416 grains; .8924 silver, balance copper (statute irrelevant to this issue).

Melt-down (silver value) in year minted: Irrelevant, as mintage of 1804-dated dollars occurred over a

span of decades, beginning circa 1834.

Dies prepared: Obverse: 1; Reverse 2

Business strikes dated 1804: None

Business strike mintage for calendar year 1804 (all coins had earlier dates): 19,570 (all struck from dies dated earlier; none dated 1804; figures do not include pieces reserved for the Assay Commission; these are given in parentheses); Delivery figures by day: January 27: 2,500 (+2); January 19:

¹ As a principal of Bowers and Ruddy Galleries in 1974, I recall selling the coin to Continental; the subsequent relationship between Continental and Mark Blackburn, reported here as given by Newman and Bressett in their "25th Anniversary" article, is not otherwise known to me.

² Letter to the author, July 29, 1992.

³ Letter to the author from Robert W. Hoge, curator ANA Museum, September 11, 1992.

⁴ Grading per Kenneth E. Bressett, communication to the author, August 1992. In 1984 the author graded it as having the sharpness of EF, but struck as a Proof and still retaining Proof surface in the fields. In a communication to the author, September 11, 1992, ANA Museum Curator Robert W. Hoge graded it as Proof-60+.

8,000 (+2); February 1: 5,500 (+1); February 11: 730 (+1); March 27: 2,840 (+1). Presumably, all of these coins were dated 1803.

Mintage of Class I novodels: Possibly 8 to 10, of which 8 are known today. Mintage began in the early 1830s.

Mintage of Class II novodels: Believed to have been five, of which one is known today. At least three of the others are believed to have been melted at the Mint. Mintage circa 1858.

Mintage of Class III novodels: Possibly 6 to 10, of which 6 are known today. Mintage circa 1858; edges lettered at the Mint in the mid-1870s.

Population and Condition Census: See itemized registries of Class I, II, and III silver dollars given earlier.

Commentary

The 1804 silver dollar is the most famous United States coin rarity. 15 specimens can be traced.

What Others Have Said About the 1804 \$1

Stickney on the 1804 Dollar (1867)

The following letter from Matthew Adams Stickney to dealer Edward Cogan was reprinted in the August 1867 issue of the *American Journal of Numismatics* and in Henry Chapman's 1907 sale of the Stickney Collection. It furnishes an interesting commentary on the numismatic scene during the middle of the nineteenth century.

"Salem, July 2, 1867

"Edward Cogan, Esq., New York.

"Dear Sir:

"I have received from some friendly hand, perhaps yours, the June number of the *American Journal of Numismatics*, in which you notice a paragraph from a California paper, and say truly, that I would not have parted with the dollar of 1804 for twice what was stated I was offered for it.

"I was applied to by letter, July 4, 1866, by Mr. T.A. Andrews of Charlestown, Mass., for the dollar of 1804, which he understood I had in my possession, and wished to obtain by purchase, for a friend in California, or information where he could get another. In reply, I stated: 'I have a genuine Proof dollar of the United States coinage of 1804; I do not dispose of any coins not duplicates, at any price. It is not likely that if I parted with this dollar, I could ever obtain another, as I have been told by a gentleman (W. Elliot Woodward, Esq.), largely engaged in selling coins at auction, that he thought that it might bring one thousand dollars.'

"On the 18th of November, 1866, Mr. Andrews wrote me again, offering in the name of his friend '\$1,000 in currency or the value of gold coin,' saying: 'I merely make the offer as requested to do, being aware that you stated that you did not dispose of coins except duplicates.' I declined the offer the 23d of the same month.

"No mention was made of this offer to any one afterwards, and the first notice I received of the California paragraph was from Mr. Poole, a Professor in a College at Mexico—who supposed I was the gentleman meant in the notice he had seen

in California—when returning to his native place, South Danvers [Massachusetts]; and who called on me soon after. Of the genuineness of my U.S. dollar of 1804, I think there cannot be entertained a doubt, as it was handed me directly from the cabinet of the U.S. Mint in Philadelphia, on the 9th of May, 1843, by one of its officers, (Mr. W.E. DuBois,) who still then considered any more valuable than any other of the series, and I only desired it to help make up the Chronological Series, which I perhaps was the first to attempt to make, of U.S. coins.

"Jacob G. Morris, Esq., of Philadelphia, (lost on board of the *Arctic*, on his return from Europe in 1854)¹ whom I visited at the same time, in a letter received from him soon after he writes: 'I have never cared for making a collection of American coins of each year's coinage: it is only where the style has been altered, or where there is any peculiarity in the Coin, differing from those in general circulation, that I have cared for them; nor do I see the utility of it to a collector.' Dr. Roper and others were of the same opinion.

"This dollar has never been out of my house since, or even handled by those who called to see it; and I was very careful that Monsieur Vattemare,² when at my house, should not by some sleight of hand exchange it.

"It is a perfect specimen; and I was not aware that there was any other original one existing, save the one left in the Cabinet of the Mint. It was obtained with other coins, by an honorable exchange of Pine-Tree money, and rarities not in their collection, one piece of which, has since proved to be of exceeding rarity: the "Immune Columbia" in gold, 1785—which Mr. DuBois notices as a guinea re-struck and bearing the date of 1783, p. 129 of his work on the Collection of coins belonging to the U.S. Mint, 1846—and which I had obtained, the day before, of Beebee & Parshell's in New York.

"As regards the authenticity of other specimens of the U.S. dollar of 1804, I have no knowledge. Those having dollars of that date (Cohen and Mickley) were not then known at the Mint as collectors, as appears by the list of which I send you a

¹ QDB note: The 3,000-ton side-wheel steamer *Arctic* sunk September 27 off Cape Race, Newfoundland, following a collision with the propeller-driven *Vesta*, a French vessel of only 250 tons displacement. About 300 lives were lost. Also lost was a 1733 Rosa Americana two-penier.

² QDB note: See commentary concerning Vattemare under the introduction to 1795 Draped Bust coinage.

copy, then obtained, 1843, from Mr. DuBois, which remains, in his hand-writing, in my possession, with the addition of names of Philip Hone of New York and Robert Gilmore of Baltimore, which were added in the hand-writing of the late John Allan of New York, who was also a distinguished collector.

"Amateurs of coins:—Dr. Roper J.G. Morris, Esq.; Mr. David (nephew of Mr. Morris); Mr. W.G. Mason; C.C. Ashmead; John Reeve; Mr. Cooper, Camden; H.A. Muhlenberg, Reading; Rev. Dr. Robbins of Hartford (my uncle); Edward B. Wynn, Hamilton.

"I have been for nearly 50 years a systematic collector of coins; and for a very long period, almost without a competitor; and very many of the rare coins which now enrich other cabinets were, by great solicitation, obtained from me. My facilities for collecting coins were remarkably good, through the friendship of Beebe & Parshell's Bullion Exchange, 22 1/2 Wall St., N.Y. I received from them, quarterly, from 1843, rare coins I was in search of, at par; and under all the changes of the firm, they continued to favor me till 1854, when, in consequence of ill health, I gave up my business.

"You are at liberty to make what use you may please of my letter, if I have communicated anything that may be of interest to the American Numismatic and Archaeological Society, of which I should be glad to be a member, but age and distance prevent.

"I am, with esteem, Yours Truly,

"Matthew A. Stickney,

"119 Boston St."

A View of the 1804 Dollar (1876)

The Coin and Stamp Journal, Kansas City, Missouri, February 1876, included the following:

"DOLLAR OF 1804. The Mint report shows the coinage of dollars of this year to have been 19,570. But there can be no doubt that the records are wrong, for if that number of pieces had been put into circulation it could hardly become as rare as it is, and the numerous errors in the early records of the Mint proves plainly that they can not be relied on.

"The few public sales of this coin that we find were,

"The one in Mr. Mickley's collection, which was sold in 1867, and brought \$750. Described: 'This piece is regarded by all American collectors as the gem of Mr. Mickley's collection. It has been in circulation, but is still in the finest condition, retaining its brilliancy of surface, and being entirely uninjured. It was obtained many years ago from the Bank of Pennsylvania, and is beyond question, not only *genuine* but *original*. Of the four specimens known, two, it is certain, were struck at a period subsequent to 1804, and till one was recently obtained by Col. Cohen from Richmond, this was supposed to be the only original one existing.'

"The dollar in the collection of Prof. J.M. Macallister, sold Sept. 24, 1873, for \$75.00. Described: 'Fine; and if a genuine original dollar of this date, very valuable. There being some controversy on this point, it is due the owner to say that he proposes personally to offer proof of its authenticity, and to guarantee the same to the purchaser. This assurance from the very responsible owner, and the right of private judgment,

which in such a case will always be exercised, reduces the affair to a sufficiently fine point, and there we will leave it.' [The coin was subsequently judged to be false.]

"At the Sanford sale Nov. 27, 1874, the price received was \$700.00. Described: 'This dollar I guarantee is original, and a remarkably fine impression, and is known to be one of, if not the *most* rare piece in the American series, not more than four or five being known to collectors in the United States.'

"The one sold at the Stenz sale May 17, 1875, as the price shows, was very doubtful, and brought only \$3.75. Described: 'Stained and somewhat rubbed, but still in Very Good condition. (Accompanying this coin is the following note: 'Obtained through great personal exertions from Dr. Liebig, from the collection of his intimate friend, the celebrated Prof. Schledchausen, now deceased.' This information is interesting, yet the great traveler may have been imposed upon, the motive to do it was large, on account of the extreme rarity and great value of a dollar of this date. It would be rash to decide absolutely against its authenticity, but the purchaser must exercise his own judgment.')[A false coin.]

"The last one sold, at Col. Cohen's sale Oct. 25, 1875, for \$325.00. Described: 'This extremely rare dollar was procured from Richmond, Virginia, where it was known to Col. Cohen to exist for many years before it came into his possession. It has been more circulated than either of the two previously sold at auction, and has every appearance of having been struck off in the year of its date, and is guaranteed to be original.' "

The Coin and Stamp Journal, March 1876, continued the study:

"Previous to Col. Cohen's sale, the five genuine dollars of this date, were in the hands of the following gentlemen: Col. M.I. Cohen, Baltimore, Md.; W.S. Appleton, Boston, Mass.; M.A. Stickney, Salem, Mass.; L.G. Parmelee, Boston, Mass.; The U.S. Mint, Philadelphia.

"Mr. Stickney, in the *American Journal of Numismatics*, says in regard to his piece: 'I have a genuine Proof dollar of the United States coinage of 1804. On the 18th of Nov., 1866, Mr. Andrews wrote me again, offering in the name of his friend, \$1,000 in currency for the dollar I declined the offer on the 23rd of the same month.' "

Smith on the 1804 Dollar (1881)

The following is from A.M. Smith, *The Illustrated History of the U.S. Mint*, 1881:

"The rarest United States coin is the double eagle of 1849 of which there is only one in existence and belongs to the U.S. Mint Cabinet. The next in rarity is the half eagle of 1815, of this date there are only seven specimens known to exist. The silver dollar of 1804 is also one of the rare coins; of this dollar only 10 genuine specimens are known to exist, all of which are now held by collectors. Of the 1804 dollar several restrikes have been made. To obtain a fine one from original dies it would cost at least \$1,000."

Mason on the 1804 Dollar (1885)

The following is from Mason's *Monthly Illustrated Coin Collector's Magazine*, May 1885, pages 121-122:

"CORRESPONDENCE.

"WASHINGTON, D.C., April 23, 1885.

"MASON & Co.

"Gents,—Is there not more to be said about the 1804 United States dollars than is generally known among collectors? It has frequently been stated, that the dies of this dollar have been destroyed, and that, before being destroyed, there were struck off, at the United States Mint in Philadelphia upon two occasions, several specimens. How is it in regard to this matter? and how many 1804 dollars are extant? and where located?

"JUSTITIA.

"REPLY.

"We can only give the stories current during the exhibition of specimens of the 1804 United States silver dollars to coin dealers and collectors; and one of these rumors was to the effect, that either Adam Eckfeldt or his son surreptitiously struck off in 1858 three specimens of the 1804 dollars, each having a plain edge. These specimens were exhibited to us in 1860, by Eckfeldt, Jun., and offered for sale at seventy dollars each. They were very fine Proof-looking pieces, and one of them was sold to a coin dealer (William Idler of Pennsylvania), and sold by him to a collector, and afterwards recovered through the efforts of R.C. Davis, and, with the other two specimens, returned to a committee for destruction, at the United States Mint. The dies were then sealed up until Marshal Millward's directorship of the Mint during the latter years of the Rebellion, and then taken out of a safe, unsealed, and a number of old dollars, smoothed down, used as planchets, in consequence of having the lettered edges, and several (some rumors gave the number as twelve) 1804 dollars struck.¹ After this second use of the dies in an illegal manner, they were defaced and destroyed.

"We give this story just as we heard it; and would add, that one of these pieces was exhibited at a coin sale in New York, in our presence and the presence of Mr. [Joseph N.T.] Levick and Professor [Charles E.] Anthon, and, perhaps, Edward Cogan. The piece seemed to be dishing, or sunken, in the field; was bright as a Proof, but the edge was unmistakably old, and apparently the edge of an old dollar; while all pronounced the piece lighter in weight than the silver dollar of early dates. Another of these restrikes turned up subsequently in Morristown, N.J., and one was in the possession of a Mr. Thatcher of Philadelphia; another in Liverpool, as late as 1874. In regard to the present ownership of the original 1804 dollars and the re-strikes, we are unable to locate more than seven or eight specimens; viz., one in the United States Mint (perhaps two); one in Mr. L.G. Parmelee's cabinet, Boston; one in Salem, Mass. (Col. M.A. Stickney, owner); one in the Furman Cabinet, Providence, R.I.; the Cohen dollar, in W.B. Wetmore's cabinet; one in R.C. Davis's cabinet, Philadelphia; one in W.S. Appleton's cabinet; and one now in Chapman's hands, to be sold on the 14th of the present month. It is our impression that a full 'baker's dozen' of 1804

dollars is extant; but, more or less, the fact remains, that either original or re-strike will bring over one thousand dollars at a public coin-sale."

Scott on the 1804 Dollar (1893)

The following is from Scott's 1893 catalogue, page 28:

"1804 Dollar. The dies for these coins are known to have existed, and from them it is believed that about 20 impressions have been taken, but we do not think that any were struck in the year that the coins are dated, hence we class them as restrikes. The dies were destroyed in 1869."

Haseltine on the 1804 Dollar (1908)

In remarks before the American Numismatic Association Convention, 1908, Capt. John W. Haseltine stated the following, here quoted in part:²

"One of the old-time dealers, and also a collector, was the late Mr. William Idler of this city, at the time when Mr. Cogan was also a dealer in Philadelphia. Mr. Idler was my father-in-law, and he was very reticent about his collection, and would seldom show his coins even for sale, partly caused by the many pattern and experimental coins that he had, which he was afraid might be seized.

"Hence the many remarkable pieces that I and Mr. Stephen K. Nagy (who were the purchasers of his collection) found in it. Some of those were not known to exist prior to his death, including the 1884 trade dollar and some unique U.S. pieces in gold. But as it is not proper for me to advertise my business at this meeting I will not name them.

"I have been asked to say something about the 1804 dollar, but the pros and cons about this interesting subject are so vast that any remarks upon it I must defer until I consider the time more propitious. I will say this, however, that somewhere about 1867, or, as near as I can remember, about the time of the explosion at the U.S. Mint, and so many of the old dies were displaced from where they were packed away, I saw the 1804 dollar dies."

Mehl's Phony 1804 Dollar (1913)

Numerous times throughout American numismatic history, phony "1804" dollars have been offered for sale. During the nineteenth and early twentieth century they were staple items as "fillers" in many collections.

An embarrassing situation concerns a forgery offered as authentic by none other than B. Max Mehl, who in his H.O. Granberg Collection Sale, July 14, 1913, described the subject coin, Lot 320, as follows:

"1804. Bust of Liberty facing to right; six stars on right and seven on left. Above, the word LIBERTY; date, 1804, below. Reverse, heraldic eagle with U.S. shield on breast, head turned to left, holding in its beak a ribbon which is inscribed E PLURIBUS UNUM; above, a semi-circle of clouds extend-

¹ Harry E. Salyards, M.D. note, per letter to the author, January 15, 1993: "For five of the six Class III specimens for which weights are known, this certainly *isn't* true, as their weights are within 5 grains of the 416 grain standard (and planing them down would certainly have removed more silver than that).

² From *Mehl's Numismatic Monthly*, October 1908. "The 1908 Convention of the American Numismatic Association," by E.H. Adams.

ing from wing to wing; 13 stars about eagle's head, one of which touches the lower part of eagle's beak, while the upper is free from it; a bunch of 12 arrows in right talon and an olive branch in his left; UNITED STATES OF AMERICA around. Edge lettered HUNDRED CENTS ONE DOLLAR OR UNIT, which is distinct in all parts. Weight 420 grains.

"VG condition; the only weak part is the E PLURIBUS UNUM, which is practically worn off. The effects of circulation are evenly distributed. A long, old scratch on reverse and a few smaller nicks on bust are the only defects, and outside of these it will easily muster as 'VG.' In velvet case. This specimen of 'King of American Coins' is of a different die variety than the other known specimens; its most distinct difference is its date, of which the bottom of the figure 4 tapers off from the upright as it approaches the bottom horizontal line corresponding and symmetrical with the figure 1.

"Both its obverse and reverse dies are different from the dies of any dollars of 1800, 1801, 1802 and 1803. The upright of the figure 4 is twice the distance from the figure O than is the figure 1 on the dollar of 1801. The reverse is of an entirely different die than any of the early dollars, particularly in the spacing of the letters in legend. The original owner of this coin was a Mr. Levi Robbin of Bradford, Maine. From him it passed to the possession of Mrs. Harriet Strout, at whose death it passed into the possession of Mr. Carl Strout, from whom Mr. Granberg purchased it in 1906. Mr. Strout was at that time connected with the Pinkerton Detective Agency at Seattle, Washington.

"The 1804 dollar has been the cause of more difference of opinion than any other U.S. coin. The late DeWitt S. Smith, one of the most prominent and respected collectors of his time, wrote the former owner of this coin as follows:

"The 1804 dollar is certainly a very interesting coin, and has had more written about it than any American coin. There is always a question in regard to it, and many authorities will differ about it. One thing I have noticed, when anyone (dealer or collector) has one to sell he thinks it is genuine, but when some other party has one to sell, the same man will discredit it."

"The only question of the 1804 dollar herein offered, since it is of different die than the so-called 'known variety,'—(the one with straight bottom 4 not symmetrical with balance of date and weak lettering on edge)—would be its date, principally the figure 4. Before purchasing this coin, as can readily be imagined, Mr. Granberg was thoroughly convinced of its genuineness. The only way to test the genuineness of a date is by the heat test. This 1804 dollar was heated to a white heat without showing any indication of having had the date tampered with in any way. The figures remaining in true line, bright and solid.

"The following extracts from correspondence between the former owner and the General Superintendent of the Pinkerton Detective Agency at Philadelphia, to whom coin was sent to have it tested at the Mint, show the severe test this dollar withstood:

"May 3rd, 1906.

"I am in receipt of your letter of April 28th, wherein you request that the officials of the Mint test the 1804 dollar as to its genuineness. I have had the test made, and enclose you herewith reports showing result of the same. The figure '4'

withstood a very severe heat test.'

"(Signed) H.W. BEARCE, Genl. Supt.

"The following is an extract from the report above referred to:

"April 24th, 1906.

"In accordance with instructions received to go to the United States Mint with the silver dollar date 1804 and ascertain if it is one of the original coinage or not—I was directed to the Curator, T.L. Comparette, who examined it carefully with a strong glass and said that from all appearances it was an original one, as the letters, stars and edge had every appearance of it, but he would not be able to say positive if it had been filled in or date changed by an expert engraver unless it was left with him for a day or two for very careful examination,—but that could be only positively determined by putting it under a heating process. . . . Mr. Comparette said he could not place any value on the coin as he does not feel justified in saying the coin is an original one without having it for a day or two for examination, but said the coin had several marks on it which are very favorable to it and spoke very favorably on the coin.

"Upon being pressed for its value he said that IF IT STOOD THE HEAT TEST it is worth about nine hundred dollars.'

"Report of the Heat Test

"May 3rd, 1906.

"In accordance with instructions received from General Superintendent Bearce I called at the U.S. Mint with the 1804 dollar. I saw the Curator and told him the owner of the dollar wished to have it tested by heating as he had previously suggested. He took me to the Chief Engraver, who gave the dollar what he termed 'a severe test,' by heating the '4' and endeavored to pick and knock it off, BUT IT REMAINED FAST.'

"(Signed) CHAS. F. DAHLEN, Operative.

"From the General Superintendent to the former owner, referring to above report:

"I today caused an operative to call on the Curator of the U.S. Mint in this city, taking with him the 1804 silver dollar you sent me. I enclose you herewith the operative's report.

"As I understand it, the test is made by heat to determine whether the date or any portion of it has been tampered with; for instance, the dollar might have been of false date or a portion of the '4' soldered on, but of course, when it is heated, if any portion of it was soldered on, it is detached and its spuriousness of the date exposed.'

"The original letters and reports are sold with the dollar.

"From the severe tests the coin withstood, the careful consideration Mr. Granberg gave it before being thoroughly convinced of its absolute 'atmosphere of genuineness,' its weight, edge, lettering, and everything else pertaining to it, proves beyond a doubt that it is not only a genuine Dollar of '1804' but that it is a Dollar of 1804—STRUCK IN 1804!"

Notwithstanding Mehl's assertion that it was "beyond a doubt that it is not only a genuine Dollar of '1804' but that it is a Dollar of 1804—STRUCK IN 1804!" he must have had second thoughts, or perhaps some reader of his catalogue enlightened him, for on the prices realized list the erstwhile

highly prized "King of American Coins" was ignominiously marked "Withdrawn."

How soon we forget: The February 5, 1949 issue of *The Saturday Evening Post*, p. 33, shows Mehl examining a coin with a glass, with the caption: "I have never been taken in by any counterfeit."

Taxay on Restrikes in General (1963)

The following is from *Counterfeit Mis-Struck and Unofficial U.S. Coins*, by Don Taxay and supplies the rationale for the Mint's creating special coins for collectors:

"On June 3, 1853, the Hon. James Ross Snowden was appointed ninth Director of the Mint, a position which he maintained for eight years. Snowden, a fervent perpetrator of Robert Patterson's work, fortunately bequeathed to us many records of his own numismatic activities while associated with the Mint. Perhaps the most reliable answer to the second question then may be found through a scrutiny of these records as they appear in the National Archives.

"The first is a letter dated January 22, 1859 from Snowden to the secretary of the Treasury, Howell Cobb. Snowden writes:

"Sir, we are duly pressed upon, by Collectors of Coins from all parts of the Country either by letter or in person, for specimens of pattern pieces of coin, and rare types. A few of these have been in every case issued—some of them got into the hands of dealers and are sold at excessive prices. I propose with your approbation, to check this traffic, and at the same time gratify a taste which has lately increased in this country, and seems to be increasing every day, namely by striking some of each kind and affixing a price to them, so that the profits may inure to the benefit of the Mint Cabinet of Coins and ores which is the property of the United States; an exact amount of which will be kept and rendered to the Department.'

"What a revealing letter this is! It not only states that patterns and other rare coins have 'in every case' been restruck for the purpose of obliging solicitors, but also that there have been no regulations of any kind governing distribution. Snowden, who had previously expressed grave doubts over the legality and propriety of striking medals other than those ordered by the government, now finds the distribution of *unauthorized coins* not only proper, but worthy of every consideration. The only thing that troubles the director is that the numismatic department is not taking in a large enough slice of the profits!

"It may be asked how the all-bountiful Snowden was able 'in each case' to oblige the collector who appealed to him. The answer lies in the fact that both Franklin Peale and his successor, George K. Childs, had prophetically taken to collecting the old hubs and dies, and had amassed a representative stock dating back to about 1800. Thus, when John K. Curtis wrote to Director Snowden, early in January 1859, regarding the possibility of obtaining an 1851 dollar, Snowden replied that 'one could be struck from the dies of that year.'

"Another interchange which is of considerable interest begins with a letter from one P. Clayton to Director Snowden:

" 'Dear Sir,

" 'If you have specimens in copper of the new \$20, also

model half & quarter dollars & specimen cents struck last year before settling on the new device now used—& can spare them without detriment to the public interest, I would like to have them—My object is to give them to a friend who seems to have a passion for specimens of coins.'

"Snowden's reply is dated Jan. 24, 1859. . . . It begins with the provocative caption '*Unofficial*,' and then goes on to say:

" 'Dear Sir,

" 'I have rec'd your note of the 22nd inst. and learn from it that you are acquiring a personal knowledge of the 'passion for specimen coins' which possesses so many people in our country. On Saturday I had nine applications of a similar character—today (now 12 o'clock) I have had three. It was in view of this increasing, as well as troublesome, taste that I made the request mentioned in my official letter of last Saturday (22nd inst.) which I hope will deserve the sanction of the department. In reference to the specimens you ask for I have to state that the trial piece in copper of the double eagle of 1859 which I left at the Department is the only one I had: I have a few of the specimen cents but not all the varieties. I could send you two or three of these, but perhaps it will be best to defer sending them until the new arrangement is made, when your friend, and all other collectors of Coins, AND THEIR NAME IS LEGION, can be supplied to their heart's content.'

"Since the Director specifically requests permission to enlarge his numismatic sideline, we can assume that he did not consider the proposal entirely beyond reproach. Possibly, in the back of his mind, he recalled the terse statements in the laws of 1792 and 1837 which specified that *all coins bear the year of their issue!* Thus, if permission *had* been granted, we can be sure that Snowden would have preserved it as he did other important records. Furthermore, the 'new arrangement' was to establish rules and regulations for the distribution of the restrikes, 'an exact amount of which (would) be kept and rendered to the department.' The absence of any such records must therefore be taken as conclusive evidence that Snowden's proposal did *not* meet with the approbation of the Secretary of the Treasury. We can well imagine the director's discomfiture at the refusal of his harmless request. News of the 'great dispensation' had already been bruited about by Clayton and others who were waiting on tenterhooks for the fateful hour. In such a situation what could poor James Ross do?

"The best answer can, perhaps, be found in a correspondence between the Philadelphia coin dealer Edward Cogan and Director Snowden. On June 14, 1859, Cogan writes:

" 'I have been applied to by a great many collectors of American coins wishing to be informed whether the report now current—that there are many of the pattern cents being restruck at the Mint for the purpose of exchanging them for Washington pieces is true—the only answer I can give is that the many pieces shown me lately would tend to confirm the report. A rumor of this kind uncontradicted will tend to depreciate the value of every fine piece in whatever collection it may be found and I should be glad if you would give it the most unqualified denial.

"Snowden replied:

" 'It is quite true that I have caused a number of pattern or specimen cents to be struck for the purpose of exchanging

them for Washington pieces whenever opportunities to do so occur. If you possess any Washington pieces I would be much obliged if you will send me a list of them, and if there are any among them which I desire for the Cabinet I would be pleased to procure them by giving you in exchange other interesting medals or coins.'

"The above letter, as frank as it is accommodating, unravels the 'Gordian knot' in a multitude of Mint mysteries. It solves for one thing the enigma of why the 1856 Flying Eagle cent, which W.C. Prime listed in 1861 as 'Rarity 5' of six categories, is today far more common than any other single pattern. It explains also the sudden appearance of a dozen different varieties of this famous cent in the collections of prominent Philadelphia numismatists, and the conspicuous absence of all but the original from the Cabinet of the Mint.

"There is but little doubt that behind much of Snowden's complacency lay the belief that he was only acting in the long line of Mint tradition."

Taxay on the 1804 \$1 (1963)

The following is from *Counterfeit, Mis-Struck and Unofficial Coins*, by Don Taxay, page 82:

"In 1842, the four-year-old Mint collection appeared in the first numismatic edition published in the United States, *A Manual of Gold & Silver Coins of All Nations*, by Jacob Eckfeldt and William DuBois—'assayers of the Mint of the U.S.' One curious feature of the Eckfeldt-DuBois book was an engraving of an 1804 silver dollar, *a coin which, a few years earlier, was unknown either in the Mint Cabinet or in any U.S. collection.*

"In 1843, Matthew Stickney discovered not one but two 1804 dollars at the Philadelphia Mint and obtained one of the pieces in trade for an Immune Columbia cent struck in gold, together with several smaller coins from his own collection. The transaction is described by Stickney in a letter to Edward Cogan, July 2, 1867:

"Of the genuineness of my U.S. dollar of 1804 I think there cannot be entertained a doubt, as it was handed me directly from the cabinet of the U.S. Mint in Philadelphia on the 9th of May, 1843, by one of its officers (William E. DuBois) who still holds the same situation there and can testify to it. It was not then considered any more valuable than any other of the series, and I only desired it to help make up the chronological series, which I perhaps was the first to attempt to make of U.S. coins.'

"Within the next quarter of a century two other 1804 dollars were allegedly culled from circulation, one in a Philadelphia bank, the other, in 1865, in a Richmond, Virginia exchange office. These became known as the Mickley and Cohen dollars after the cabinets in which they resided.

"In 1868 a fifth specimen was purchased by E.H. Sanford from an elderly lady who claimed to have obtained it (for the price of one dollar) from the Mint during Polk's administration. This subsequently became known as the Parmelee specimen. In 1884, a sixth identical dollar was purchased in Berlin from the Adolph Weyl collection by Messrs. S.H. and H. Chapman of Philadelphia. A seventh 1804 dollar turned up in England, and was purchased at a Glendining sale in 1917.

"Two years after the discovery of the Mickley dollar,

Stickney, in cataloguing his collection, wrote, 'As regards the authenticity of other specimens of the U.S. dollar of 1804, I have no knowledge. Those having dollars of that date (Cohen and Mickley) were not then known to the Mint as collectors as appears by the list of which I send to you a copy, then obtained, 1843, from Mr. DuBois, which remains, in his handwriting, in my possession. . . .'

"Before long, a vehement discussion arose over the merits of each of the seven 1804 dollars. Stickney and Parmelee regarded as conclusive evidence of authenticity the fact that their pieces could be traced directly to the Mint. Cohen and Mickley, as would be expected, argued with an opposite logic.

"Modern scholars, however, are of the opinion that *none of the alleged 'originals' could have been struck before the renovation of Mint machinery, 1832-36.* There are several reasons for this:

"First of all, the coins show indisputable evidence of having been struck in a tightly fitting collar, of the type not used at the Mint prior to that time. (This collar was first noted in connection with the Gobrecht dollars and halves of 1836, when it was said 'to give a mathematical equality to the diameters.) The edge lettering, which was applied previous to the striking, is flattened—a result of the planchet being forced against the collar under pressure of the blow.

"Secondly, the beaded border present on all specimens was introduced on silver coins in 1828, and not noted on the dollar prior to 1836. This border, with a raised blank rim around it, was specifically mentioned by the Mint Director, Samuel Moore, in a letter of August 8, 1829, to Secretary of the Treasury S.D. Ingham, relating to the half dimes of 1829, 'like the Di(s)mes this year, *superior to any coins heretofore issued.*'

"Thirdly, it was not until 1817 that facilities for making Proofs (such as the Stickney and Mint Cabinet specimens) were introduced in the United States.

"Fourthly, the top-most curl of Liberty's hair is cropped off in a manner unlike that on any genuine silver dollars of the 1795-1803 period, though it is identical to that on the Proof restrike dollars of '1801.'

"Fifthly, the date and letter punches are almost identical to those on the 1804 (plain 4) restrike eagle, and the reverse is the same as that of the restrike dollars of 1801, 1802 and 1803. And finally, the 1804s are first recorded as being extant, in 1842. Furthermore, the missing top curl and modern letter punches indicate that the dies for the 1804 dollar are not much older than the coins themselves!

"In 1858, a second chapter was added to the confusion when the son of George Eckfeldt, who had charge of the dies in the engraver's department, surreptitiously struck off several plain edge specimens using a new reverse die. (Per Newman-Bressett, *The Fantastic 1804 Dollar.*) Ebenezer Mason, in reminiscing about his early days as a coin dealer on 2nd Street, Philadelphia (Mason's *Coin Collector's Magazine*, June 1882), further tells us that: 'Here was offered by young Eckfeldt three genuine U.S. 1804 dollars at \$70 each, and nearly all the rare 1/2 cents in dozens of duplicates were purchased.'

"It should be pointed out, however, that the cutting of a new reverse die was a project not likely to have undertaken

without an order from the director. Snowden, as we have learned, was preparing for 'the new arrangement' when he would begin restriking on a grand scale. In all probability, 'young Eckfeldt' gained possession of the 1804 dollar dies and clandestinely struck off several pieces ahead of schedule. Snowden may have been waiting for an opportune time to sound out Secretary Cobb, but Eckfeldt waited for nothing!

"It seems strange to us today that such overt chicanery could soon be forgotten. And yet, in May 1868, the *American Journal of Numismatics* reported: 'It is perhaps not generally known that in 1858 certain dollars of 1804, re-struck from the original dies, without collars, and therefore having plain edges, found their way out of the Mint. Major Nichols, of Springfield, had one of these at the cost of \$75 and Mr. Cogan had one, but both were on solicitation returned to their source.'

"We may ask how the Hon. James Ross Snowden reacted on learning that another of his restless protégés had gone into business for himself. Did the director make a clean breast of the whole affair? Did he arrange for better security measures? Did he dispose of young Eckfeldt?

"For the first answer we need only examine the contents of a few letters now preserved in the National Archives. The first letter dated July 19, 1860 reads: 'Will you please inform me that the 1804 Dollar has been restruck at the Mint as I have heard that several have been seen and offered for sale. . . .' Snowden replied: 'In response to your inquiry I have to state that no specimen of the dollar of 1804 has been struck at the Mint; and I am informed by the foreman of the dies that there are no means of doing so.'

"Another correspondence between Director Snowden and a Mr. Jeremiah Colburn of the appraiser's office in Boston is highly provocative. On July 18, 1860 Mr. Colburn writes:

" 'I have just received from your city a dollar of 1804 the price of which is \$75.00, the person who sends it says—I feel perfectly satisfied that if not an original that it is from the original die. I shall be greatly obliged if you will inform me if the die is in the Mint and if any specimens have been struck from it.

" 'My opinion is that the die of this dollar is by the same hand that cut the die of a famous Washington Half Dollar which appeared a few months ago.'

"While no reply by Snowden can now be located, another letter from Mr. Colburn, three days later, reads that 'it seems to be the general opinion that the 1804 dollar was struck from the Mint die lately.'

"The next letter, dated July 23 and written by Director Snowden, requests that 'the Dollar of 1804 which is supposed to have been struck from the Mint Dies' be sent to him, to which Mr. Colburn, on the 25th, replies: 'I have returned the dollar of 1804 to the person from whom I received it. I was not willing to pay the price he wanted for it. I think without a doubt it was struck from the die now at the Mint.'

"As we have already learned, the director retrieved three of the coins 'that never were' from persons who had purchased them from young Eckfeldt for \$75.00 each. William

DuBois, assayer and Curator of Numismatics at the Philadelphia Mint, later testified that all but one of the restrikes were then destroyed in his presence, and that the lone exception (a bizarre creation struck over a cut-down Swiss shooting thaler, Bern, 1857) was retained for the Mint Cabinet.

"As a result of the 'Eckfeldt incident,' a series of controls (heaven forbid there should not be reforms!) were now introduced, one of which required that all dies not in use be sealed up, and a list of these filed with the director of the Mint. The words 'in use,' however meant not only business use (an antiquated concept proper to a Mint whose only function is to provide the country with a circulating medium), but also numismatic use. All orders for 'cabinet coins' were to be submitted with a description of these pieces, the number struck, and the recipient.

"This would have been a disastrous rule if actually enforced, but such was the ingenuity of a young Eckfeldt that any such danger was averted. Thus we read in the catalogue of the Ferguson Haines Collection (Oct. 1880), prepared by W.E. Woodward:
